

CISCO FIREPOWER MANAGEMENT CENTER REMEDIATION MODULE FOR ACI, VERSION 1.0.2 QUICK START GUIDE

Created: December 2, 2021

1 About the Cisco Firepower Management Center Remediation Module for ACI

With the Cisco Firepower Management Center Remediation Module for ACI, when an attack on your network is detected by the Firepower Management Center, the offending endpoint can be completely quarantined in the Application Policy Infrastructure Controller (APIC) so that no further traffic is allowed to go in or out of that endpoint. The following illustration shows the relationship between the Firepower Management Center (FMC) and the APIC when the Remediation Module is installed:

FMC to APIC Rapid Threat Containment

The illustration above shows the following process of quarantining a network attack in the APIC:

- Step 1** An endpoint with an infected application in an endpoint group (EPG) launches an attack on your network. The attack is blocked inline by either a Cisco Firepower Next-Generation Firewall (physical or virtual), a Cisco ASA with FirePOWER Services, or a Cisco FirePOWER Appliance (physical or virtual).
- Step 2** An attack event is generated and sent to the FMC. The attack event includes information about the infected endpoint.
- Step 3** The attack event is configured to trigger the remediation module for APIC, which used the APIC northbound (NB) API to contain the infected endpoint in the ACI fabric.
- Step 4** The APIC quickly contains or quarantines the infected application workload into an isolated microsegment (uSeg) EPG.

**Note**

Currently, this only works with east-west traffic, where the attacking host is deployed in the ACI and learned on the APIC. An attack from an external, outside source connected to the fabric by L3Out and its north-south traffic is not blocked.

Behavior Supported in Version 1.0.2

**Note**

In VMware Distributed Virtual Switch (DVS) and Bare Metal deployments, not all switches can support uSeg quarantine functionality on the APIC. Contact your Cisco representative to determine which model(s) of the Cisco Nexus 9000 Series switches to order if you plan to use the uSeg quarantine feature in DVS and Bare Metal deployments.

This release enables you to quarantine offending endpoints that are detected by the Firepower Management Center, using the APIC version 1.2(7). For version 1.0.2 of the Cisco Firepower Management Center Remediation Module for ACI, the supported behavior when endpoints are quarantined is described in the following table:

	Cisco Application Virtual Switch (AVS)	VMware Distributed Virtual Switch (DVS)	Bare Metal
Verified in IPS inline mode	Yes	Yes	Yes
EPG bridge mode	Yes	Yes	Yes
EPG routed mode	Yes	No	No
Multiple IP to one MAC checking	No	Yes	Yes
Create only an IP address filter uSeg attribute	Yes	No	No
Create both an IP address filter and a MAC address filter uSeg attribute	No	Yes	Yes

2 Deploy the Cisco Firepower Management Center Remediation Module for ACI

Download, Install, and Configure the Cisco Firepower Management Center Remediation Module for ACI

To download, install, and configure the Cisco Firepower Management Center Remediation Module for ACI, complete the following procedure:

Step 1 Download the remediation module.

a. Go to the software download page:

<https://software.cisco.com/download/home/286259687/type/286311510/release/ACI>

b. Download the Cisco Firepower Management Center Remediation Module for ACI.

Step 2 Install the remediation module.

- a. On the **Policies** tab of the FMC GUI, select the **Actions > Modules** sub-tab.
- b. In the Install a New Module dialog box, click **Choose File** as shown below.
- c. Select the file for the APIC/FMC Remediation Module.
- d. Click **Install**.

When successfully installed, the Cisco Firepower Management Center Remediation Module for ACI is displayed in the list of installed remediation modules:

The screenshot shows the Cisco FMC GUI with the 'Policies' tab selected. The 'Modules' sub-tab is active, displaying a table of installed remediation modules. Below the table, an 'Install a new module' dialog box is open, showing a 'Choose File' button and an 'Install' button. The dialog box also indicates 'No file chosen'.

Module Name	Version	Description	
APIC/FirePOWER Remediation Module	1.0.2	APIC/FirePOWER Remediation Module	 
Cisco IOS Null Route	1.0	Block an IP address in a Cisco IOS router	 
Nmap Remediation	2.0	Perform an Nmap Scan	 
pxGrid Adaptive Network Control (ANC) Policy Assignment	1.0	Apply or clear an ANC policy for the endpoint at the involved IP addresses	 
pxGrid Mitigation	1.0	Perform a pxGrid mitigation against the involved IP addresses	 
Set Attribute Value	1.0	Set an Attribute Value	 

Install a new module

No file chosen

- Step 3** Create an instance of the remediation module for each APIC server in your network.
- Click the edit icon for the remediation module in the list of installed remediation modules (on the **Policies** tab and **Actions > Modules** sub-tab, as shown above).
 - Enter an **Instance Name** and optional **Description**.
 - Enter the IP address, username, and password for the APIC server.
 - Click **Create**.

Analysis Policies Devices Objects AMP Intelligence

Edit Instance

Instance Name	<input type="text" value="RemIns102"/>
Module	APIC/FirePOWER Remediation Module(v1.0.2)
Description	<input type="text" value="Quarantine a bad EP (End Point)"/>
APIC server username	<input type="text" value="admin"/>
APIC server password	<input type="password" value="....."/>
<i>Retype to confirm</i>	<input type="password" value="....."/>
APIC cluster instance 1 IP	<input type="text" value="172.23.37.154"/>
APIC cluster instance 2 IP	<input type="text"/>
APIC cluster instance 3 IP	<input type="text"/>
APIC cluster instance 4 IP	<input type="text"/>
APIC cluster instance 5 IP	<input type="text"/>

- Step 4** Create a Remediation Type for each instance of the APIC/FMC Remediation Module.
- On the **Policies** tab and **Actions > Instances** sub-tab, click the edit icon for the instance of the APIC/FMC Remediation Module that you just created.
 - Select **Quarantine an End Point on APIC**.
 - Click **Add**.
 - Click **Save**.

Configured Remediations

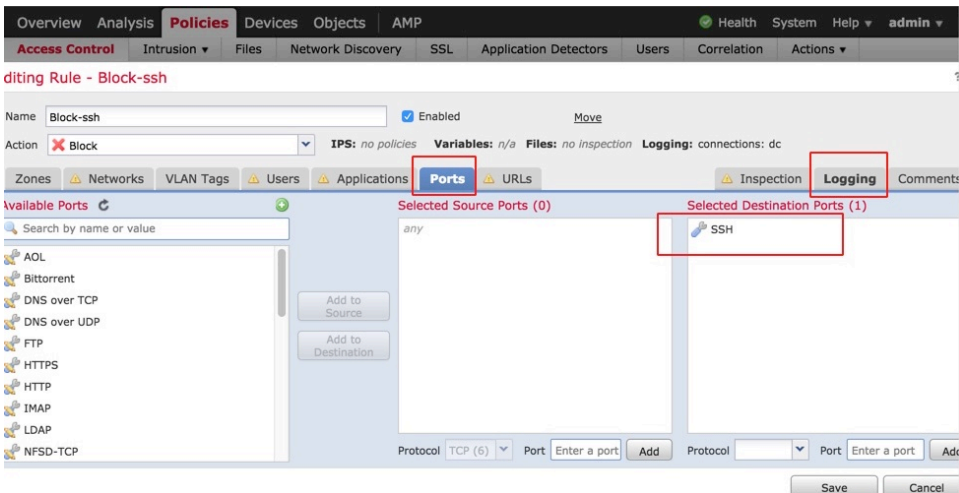

Remediation Name	Remediation Type	Description	
QuarantineBadEP	Quarantine an End Point on APIC		 
Add a new remediation of type		<input type="text" value="Quarantine an End Point on APIC"/>	<input type="button" value="Add"/>

Step 5 Configure an access control policy.

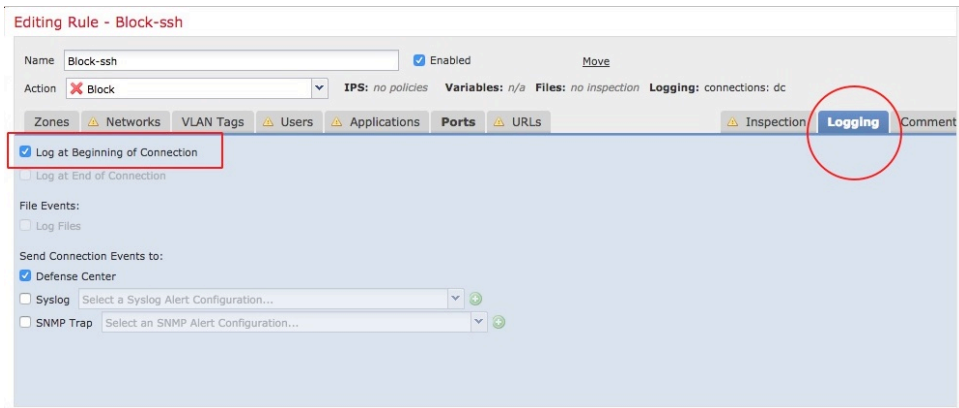

- a. Navigate to Policies > Access Control > Rules to add a rule (for example, a Block-ssh rule).
- b. Click the Edit icon for the Standard Rules to configure a rule to block SSH.

- c. Select Block for the Action.
- d. On the Ports tab, select SSH from the list of protocols for the Destination Port and click Add.

- e. Click **Save**.
- f. On the **Logging** tab, select **Log at Beginning of Connection**.
- g. Click **Save**.

Step 6 Configure a correlation rule.

- a. Navigate to **Policies > Correlation > Rule Management**.
- b. Enter a Rule Name.
- c. In the “Select the type of event for this rule” section, select a **connection event occurs** and **at either the beginning or the end of the connection**.
- d. Click the drop-down icon and select **Access Control Policy** and the name of the access control policy that you previously configured in Step 5.
- e. Click **Add condition** and change the operator from **OR** to **AND**.
- f. Select **Access Control Rule Name**, select **Is**, and select the rule you created (such as **Block-ssh** in this example).
- g. Click **Save**.

Overview Analysis **Policies** Devices Objects AMP Health System Help admin

Access Control Intrusion Files Network Discovery SSL Application Detectors Users **Correlation** Actions

Alerts Remediations Groups

Policy Management **Rule Management** White List Traffic Profiles

Rule Information Add Connection Tracker Add User Qualification Add Host Profile Qualification

Rule Name: BlockSSHRule

Rule Description: BlockSSHRule

Rule Group: Ungrouped

Select the type of event for this rule

If a connection event occurs at either the beginning or the end of the connection and it meets the following conditions:

Add condition Add complex condition
Access Control Policy is MyAccessControlPolicy
AND Add condition Add complex condition
Access Control Rule Name is Block-ssh

Rule Options Add Inactive Period

Snooze: If this rule generates an event, snooze for 0 hours

Inactive Periods: There are no defined inactive periods. To add an inactive period, click "Add Inactive Period".

Save Cancel

- Step 7** Associate the instance of the remediation module with a correlation rule as a response.
- Navigate to **Policies > Correlation > Policy Management**.
 - Enter a Policy Name and optional Policy Description and Default Priority.
 - Click **Add Rules** and select **BlockSSHRule**.
 - Click **Add** and click on the red-colored Responses icon.
 - Select **QuarantineBadEP (Remediation)** from the **Unassigned Responses** box to **Assigned Responses** box.
 - Click **Update** and **Save**.

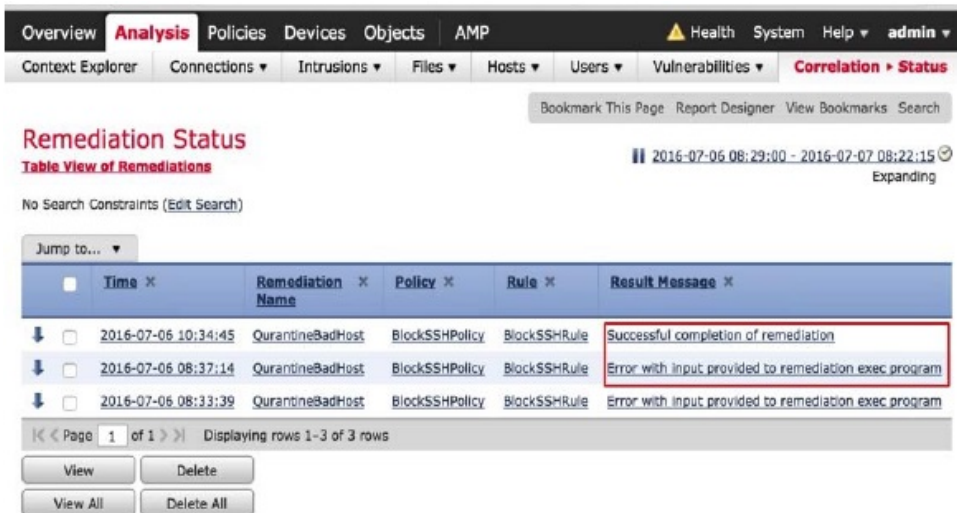

The screenshot displays the Palo Alto Networks management console. The top navigation bar includes 'Overview', 'Analysis', 'Policies', 'Devices', 'Objects', and 'AMP'. Below this, a secondary bar shows 'Access Control', 'Intrusion', 'Files', 'Network Discovery', 'SSL', 'Application Detectors', 'Users', 'Correlation', and 'Actions'. The main content area is titled 'Policy Management' and contains sub-tabs for 'Rule Management', 'White List', and 'Traffic Profiles'. The 'Correlation Policy Information' section shows fields for 'Policy Name' (BlockSSHPolicy), 'Policy Description' (BlockSSHPolicy), and 'Default Priority' (None). Below this is the 'Policy Rules' section, which contains a table with columns for 'Rule', 'Responses', and 'Priority'. The table lists 'BlockSSHRule' under the 'Rule' column and 'QuarantineBadEP (Remediation)' under the 'Responses' column. Both 'BlockSSHRule' and 'QuarantineBadEP (Remediation)' are circled in red. There are 'Save' and 'Cancel' buttons at the top right of the form, and an 'Add Rules' button below the 'Policy Rules' section.

Verify that the Remediation Executed Properly

Because remediations can fail for various reasons, complete the following steps to verify that no error messages are listed for the remediation status on the Cisco FMC.

Step 1 On the **Analysis** tab of the FMC GUI, select the **Correlation > Status** tab.

Step 2 In the Remediation Status table, find the row for your policy and view the result message.

The screenshot shows the Cisco FMC Remediation Status page. The navigation bar includes tabs for Overview, Analysis (selected), Policies, Devices, Objects, and AMP. The main menu includes Context Explorer, Connections, Intrusions, Files, Hosts, Users, Vulnerabilities, and Correlation > Status (selected). The page title is "Remediation Status" with a sub-link "Table View of Remediations". The time range is "2016-07-06 08:29:00 - 2016-07-07 08:22:15" and the status is "Expanding". There are no search constraints. A table with 5 columns (Time, Remediation Name, Policy, Rule, Result Message) displays three rows of remediation results. The first row shows a successful completion, while the second and third rows show errors.

Time	Remediation Name	Policy	Rule	Result Message
2016-07-06 10:34:45	QuarantineBadHost	BlockSSHPolicy	BlockSSHRule	Successful completion of remediation
2016-07-06 08:37:14	QuarantineBadHost	BlockSSHPolicy	BlockSSHRule	Error with input provided to remediation exec program
2016-07-06 08:33:39	QuarantineBadHost	BlockSSHPolicy	BlockSSHRule	Error with input provided to remediation exec program

Step 3 If the remediation was successful, continue to the next section.

Step 4 If an error is shown, the end point may still be quarantined if subsequent remediation events are successful. When you see an error, go the next section to verify that the quarantine happened.

If the quarantine of the end point was eventually successful, you can ignore all of its error messages.

Check the Result of the Quarantine

Note

In DVS and Bare Metal deployments, not all switches can support uSeg quarantine functionality on the APIC. If the quarantine fails, contact your Cisco representative to determine which model(s) of the Cisco Nexus 9000 Series switches you must use.

- Step 1** On the **Tenants** tab of the APIC GUI, expand the infected application in the left panel, expand uSeg EPGs, and select the EPG quarantine for the offending end point.
- Step 2** In the right panel, select the **Policies** tab and the **General** sub-tab.
- Step 3** Verify that one or more uSeg attributes were created on the APIC server.

The screenshot displays the APIC GUI configuration for the 'quarantine-epg11' policy. The left sidebar shows the navigation tree with 'EPG quarantine-epg11' selected. The main panel shows the 'Policy' tab for 'quarantine-epg11' with the 'General' sub-tab active. The 'Properties' section shows various settings, including 'uSeg EPG: true', 'pcTag(sclass): 32772', and 'Bridge Domain: ed/bd-ext'. A table at the bottom lists 'uSeg Attributes' with columns for Name and Value, showing '192.168.103.21' and 'IP Address: 192.168.103.21'.

Name	Value
192.168.103.21	IP Address: 192.168.103.21

**Note**

For VMware DVS and Bare Metal (in bridged mode), two attributes (filters) are automatically created when an endpoint is quarantined, one attribute for the IP address and one attribute for the MAC address. Therefore, to remove the quarantine, you must delete both attributes.

Step 4 If the quarantine was not successful (no uSeg attributes were created), you can manually quarantine the IP address, as described in the next section.

Manually Quarantine an IP Address

If the quarantine was unsuccessful, optionally complete the following steps to manually quarantine the IP address.

- Step 1** Identify the IP address of the end point that you want to quarantine.
- On the **Analysis** tab on the FMC GUI, select the **Correlation > Status** sub-tab.
 - On the Remediation Status page, find the time stamp of entry for the unsuccessful quarantine and make note of the source IP address.
 - On the **Operations** tab, select **EP Tracker**, enter the IP address, and press **Enter**.
 - If no information is displayed, the end point cannot be quarantined. If more than one IP address is displayed, look for the one in the offending tenant.
- Step 2** If you can identify the EPG of the end point that you want to quarantine, create a uSeg EPG attribute corresponding to this end point.
- On the **Tenants** tab of the APIC GUI, use the information from Step 1 to find the EPG and make note of the bridge domain.
 - Expand the EPG and make note of the domain profile name.
 - On the **Tenants** tab, expand the **Application Profiles**, and right-click **uSeg EPG**.
 - Enter a name for the uSeg EPG, in this format: “quarantine-EPG_name_of_the_EP.”
 - Select the bridge domain of the EPG from Step 2a.
 - Add an IP filter attribute by clicking the plus sign on lower right and entering the IP address for the name and filter.
 - Click **Next Step** and select the same domain profile from Step 2b.
 - Set the **Deployment Immediacy** to **Immediate**.
 - Click **Update** and then click **Finish**.

- j. For DVS and Bare Metal, in addition to creating an IP address filter attribute, you must also create a MAC address filter attribute.

For IP filter, use the IP address as the name. For MAC filter, use the IP address plus an underscore and the last three octets of the MAC address as a name.

To find the MAC address, go to the APIC Object Store Browser by navigating to: https://apic_IP_address/visore.html. Use the IP address of the endpoint to run a query and display the MAC address.

APIC Object Store Browser

- k. Right-click on **Domains (VMs and Bare Metals)** under the newly created uSeg EPG, and add a domain association with the same name and Domain Type as the original EPG.
- l. For Bare Metal, right-click on **Static Leafs**, and select **Statically Link With Node**.

Step 3 Verify that no traffic can go into or out from this endpoint.

For example, after an IP address is quarantined, pinging it should fail.
