EoGRE Tunneling Overview

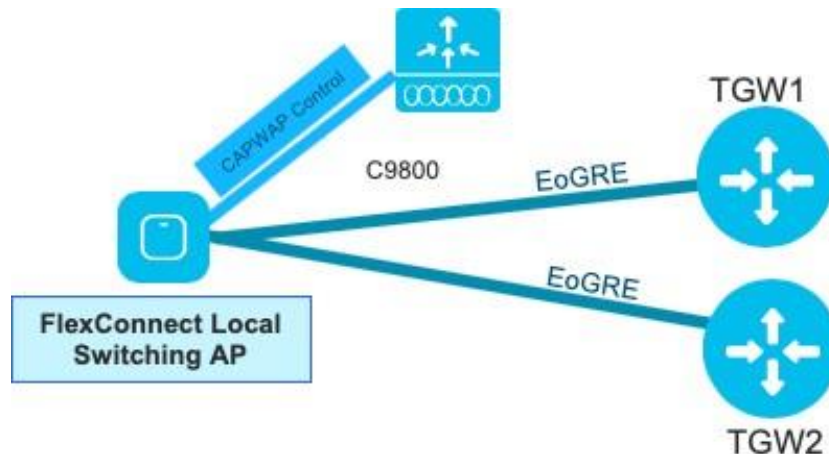

Ethernet over GRE (EoGRE) is a new aggregation solution for aggregating Wi-Fi traffic from hotspots. This solution enables customer premises equipment (CPE) devices to bridge the Ethernet traffic coming from an end host, and encapsulate the traffic in Ethernet packets over an IP GRE tunnel. When the IP GRE tunnels are terminated on a service provider broadband network gateway, the end host's traffic is terminated and subscriber sessions are initiated for the end host.

C9800 EoGRE Tunnel in Local Mode

- CAPWAP Control (AP-WLC) - encrypted
- CAPWAP Data (AP-WLC) – optional as encrypted
- EoGRE Data (C9800-TGW)-not encrypted

C9800 EoGRE Tunnel in FlexConnect Mode

- CAPWAP Control (Flex AP-C9800)
- EoGRE Data (Flex AP-TGW)
- Once tunnel is established – data flows from FC AP directly to the TGW

Benefits of EoGRE Tunneling

- Client can maintain IP address and policy across heterogeneous access networks with different technologies and/or vendors.
- Bypass MAC address scaling limitation of the L2 switch connecting to the WLC.

The EoGRE Tunneling offers the following benefits for mobile operators:

- Reduces network congestion by reducing OpEx and increasing network efficiency by offloading 3G and 4G traffic.
- Provides access to 3G and 4G core in spite of a lack of weak cell signal, leading to subscriber retention.
- Lowers CapEx on per user basis or bandwidth basis in dense metro environments.

The EoGRE tunneling offers the following benefits for wireline and Wi-Fi operators:

- Provides Wi-Fi security and subscriber control.
- Delivers scalable, manageable, and secure wireless connectivity.
- Enables new revenue-sharing business models.
- Delivers a Wi-Fi platform that offers new location-based services.

The EoGRE tunneling offers the following benefits for subscribers:

- Provides enhanced quality of experience to subscribers on Wi-Fi networks.
- Provides unified billing across access networks.
- Provides mobility across radio access technologies—3G or 4G to Wi-Fi and Wi-Fi to Wi-Fi.
- Provides multiple options within the Wi-Fi platform, thereby enabling location-based services.
- EoGRE Tunnels support IPv4 and IPv6 in Local and Flex Connect Modes
- EoGRE supports primary and secondary TGWs Failover and Redundancy
- Support EoGRE tunnels for 802.1x, open WLANs and PSK begin with release 17.2
- Support IPv4 and IPv6 wireless clients
- Support DHCP option 82 insertion on EOGRE Tunnel
- Support AAA override for EoGRE users
- Support for Tunnel Gateway as Radius-proxy
- Support up to 10 Tunnel Gateways
- Support Accounting ad-interim updates

- Support definition of EoGRE Domains
- Support per-realm filters to choose target domain per user
- Support VLAN tagging in per-realm filters
- Support VLAN override per WLAN
- Support for Wave-1 and Wave-2 APs
- Enhanced number (4094) of EoGRE VLANs support
- AAA-proxy Gateway configuration enhancement

Platform Support

Catalyst wireless platforms 9800-40, 9800-80, 9800-CL and C9800-L

11ac Wave 1 and Wave 2 Access Points: AP18xx, 2802, 3802, 4800, 1540, 1560, 1700, 2700, 3700, 1570

All WiFi6 or Catalyst 9100 series Access Points.

Supported releases IOS-XE -17.2 in CLI and WebUI modes.

EoGRE Tunnel Design Options

C9800 Controller EoGRE Tunnel configuration

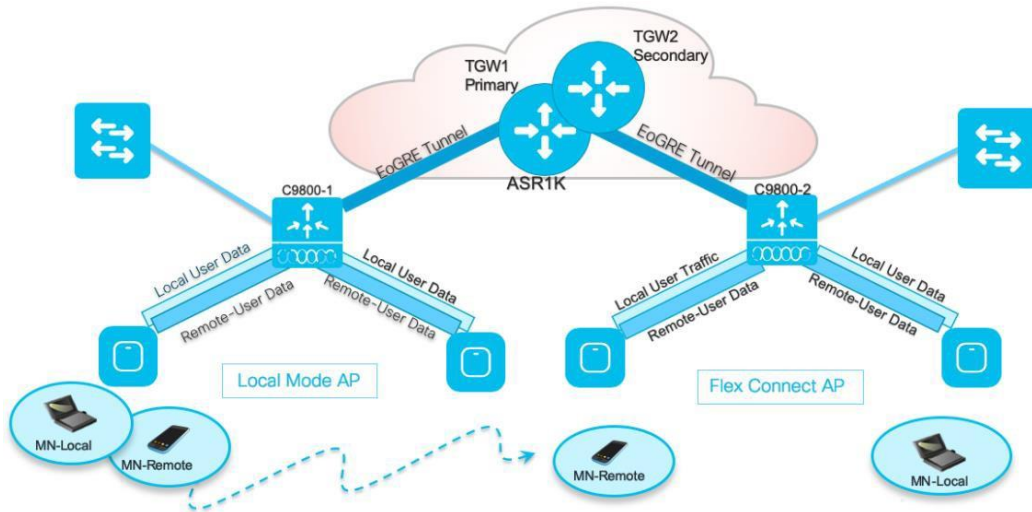

- CAPWAP Control Path (AP-WLC)
- CAPWAP Data Path (AP-WLC)
- EoGRE Data Flow (WLC-TGW)

In this design model, a tunnel gets generated from WLC to the tunnel gateway such as ASR 1000. Begin with IOS-XE release 16.12, controllers support up to 10 tunnel Gateway configurations and 10 EoGRE Tunnel Domains. Each configured Tunnel profile is applied per Domain. Each profile can also be configured with a realm. When realms are configured, it will be a username followed by “@”. Realm is a string after @, for example, in [user_name@cisco.com](#) the realm is “cisco.com”. Two or more tunnels can be configured for redundancy, so that when the primary or active tunnel fails, the secondary or standby tunnel will take over the operation of the EoGRE tunnel. Intra-controller and Inter-controller mobility are also supported with the EoGRE tunnel configuration.

Tunnels can be configured to be part of a single VLAN- only single VLAN tag supported in the Ethernet frame.

- Tunnel Domains are redundancy grouping of tunnels. Configuration specifies a primary and a secondary tunnel, together with redundancy model.
- Tunnel Rules are in charge of realm filtering, each client has a realm assigned in its username for instance, for username [mike@cisco.com](#), hence “cisco.com” is the realm.
- Rules allow user to define what domain to use for each realm. Also, they allow to define the VLAN tagging for client traffic going toward that TGW.

- Filters cannot have wildcards (*) in the realm configuration to catch all.

Only one type of tunnel is supported per WLAN. EoGRE is supported on either Open, WPA-2 PSK or 802.1x based WLANs. Other authentication modes are not supported in the present release by the tunneled clients. See the table below for all modes in release 17.2 and above

Method name	First release supported	Mode
PSK	17.2	Local/Flex (central auth)
Open	16.12	Local/Flex (central auth)
LWA	16.12	Local/Flex (central auth)
Dot1x	16.12	Local/Flex (central auth)
CWA	16.12	Local/Flex (central auth)

When Open or PSK based SSID WLAN is used, either all local/simple or all tunneled clients are supported but cannot be mixed on the same WLAN. However, 802.1x authenticated simple or tunneled EoGRE clients are supported on the same WLAN.

It is now possible to assign EoGRE Tunnel Profiles to WLANs based on authentication if configured with AAA override; clients will be separated into local or tunneled mode. The WLC supports two types of user’s traffic such as:

- Remote-Tunneled and Local on the same WLAN.
- Local users’ traffic is defined as traffic that is locally bridged by the Controller. Remote-Tunneled user traffic is defined as traffic of remote-tunnel users and is tunneled by the Controller to a TGW. AAA override for EoGRE users is supported. Tunnel gateway can also act as Authentication/Authorization and/or Accounting proxy. AAA-proxy option allows for forwarding AAA requests to tunnel gateways

If AAA Override is enabled on the controller for EoGRE 802.1x authenticated clients:

Configuring EoGRE Tunneling

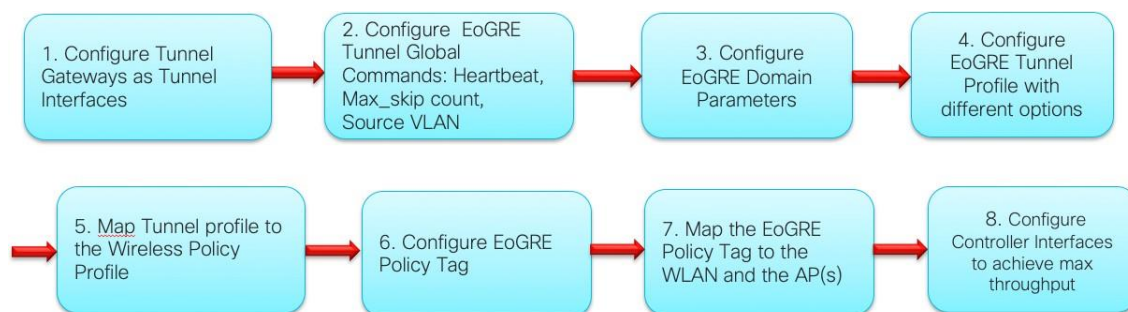

- AAA override is enabled, the above rule-filtering is overridden by AAA reply for a given client. Radius server will provide in its reply what Domain and what VLAN to use for the client
- Controller parses Access Accept and looks for MPC-Protocol-Type, such as EoGRE
- If the Protocol-Type AV Pair exists, Controller looks for all parameters related to that tunnel-type. The static profile is ignored and the AAA provided parameters are used to setup tunnel.
- If AVP is not present, Controller uses static profile on WLC to determine tunnel type based on the realm extracted from username.
- If some of the parameters are not present, the authentication fails. For example, if everything is present except T-GW IP, then the client authentication fails.
- If the MPC-Protocol-Type is None, then it will be simple IP.

Some of the attributes that can be returned by the AAA server are:

- User-Name
- Calling-Station-Id
- gw-domain-name
- mn-service
- cisco-mpc-protocol-interface
- eogre_vlan_id
- Primary or Secondary TGW

Configuring EoGRE Tunneling

Below are EoGRE Tunnel configuration steps on the C9800 controller

Note: In release IOS-XE 17.1 and above CLI and WebUI configuration options are available.

Step 1: On the C9800 EoGRE Tunnel Global Interface configure EoGRE Tunnel “heartbeat interval”, “heartbeat max-skip- Heartbeats (simple ping packets) are the way tunnel connectivity is checked. The heartbeat timeout (interval between heartbeats)

The max-skip-count (maximum number of heartbeats that can be dropped before declaring a tunnel down and perform failover)

```
Cat9800(config)#tunnel eogre heartbeat interval ?
<60-600> heartbeat interval (seconds)

Cat9800(config)#tunnel eogre heartbeat max-skip-count?
<3-10> Tolerable dropped heartbeats count" and Source VLAN

C9800(config)#tunnel eogre source vlan?
<1-4094> Vlan interface number
```

Note: Global Source interface can be overridden by specific per-tunnel source interface The client VLAN will be resolved in this order:

The one returned in AAA if there is an aaa-override and an eogre vlan parameter in AAA data. The one configured in tunnel profile

The one configured in rules

```
Vlan < wireless management interf>
```

Same configuration done from the WebUI

The screenshot shows the Cisco Catalyst 9800-CL Wireless Controller WebUI. The breadcrumb navigation is Configuration > Tags & Profiles > EoGRE. The 'Global Config' tab is selected, showing three configuration fields: Heartbeat Interval(seconds)* set to 60, Max Heartbeat Skip Count* set to 3, and Interface Name set to Vlan70. A left sidebar contains navigation options: Dashboard, Monitoring, Configuration, Administration, and Troubleshooting.

Verify the heartbeat configuration with the show command as shown in the example below:

```
spwifi-ewlc-11#sh tunnel eogre global-configuration
Heartbeat interval      : 60
Max Heartbeat skip count : 3
Source Interface        : Vlan11
```

Verify the configured tunnel details with the following show command as shown in the example below:

```

spwifilewlc-11#sh tunnel eogre gateway det
spwifilewlc-11#sh tunnel eogre gateway detailed
Gateway : Tunnel1
Mode : IPv4
IP : 179.0.0.50
Source : Vlan11 / 180.11.0.11
State : Up
SLA ID : 17
MTU : 1480
Up Time: 2 days 12 hours 58 minutes 35 seconds

03/02/2019 02:39:21.138 1 CREATE 0

```

Step 2: Configure Tunnel Gateways as Tunnel Interfaces

```

interface Tunnel1
 tunnel eogre source Vlan70 no ip address
 tunnel source Vlan70
 tunnel mode ethernet gre ipv4 p2p tunnel destination 179.0.0.50
 !

```

```

interface Tunnel2 no ip address
 tunnel source Vlan70
 tunnel mode ethernet gre ipv4 p2p tunnel destination 179.0.0.54

```

Same configuration from the WebUI

The screenshot shows the Cisco WebUI configuration interface. On the left, the 'Configuration' menu is expanded. The main area shows the 'EoGRE' configuration page with the 'Gateways' tab selected. A table lists two gateways: 'Tunnel1' and 'Tunnel2'. The 'Edit Gateway' panel on the right shows the configuration for 'Tunnel1', including Tunnel Id (1), Destination address (179.0.0.50), Source Interface (Vlan70), AAA Proxy (ENABLED), Encryption Type (UNENCRYPTED), and Key Phrase.

Step 2a: AAA-proxy related Gateway specific configuration, see WebUI configuration in the screen shot example above.

When Tunnel Gateway is behaving as AAA proxy server, the only piece of configuration needed is the server key:

Configuring EoGRE Tunneling

```
tunnel eogre interface Tunnel <tunnel_id> aaa proxy key 0 <key>
```

Note: No other piece of AAA config is needed, and this simplifies configuration of the overall EoGRE features in the IOS-XE deployments.

After tunnel configuration is done verify with the show command:

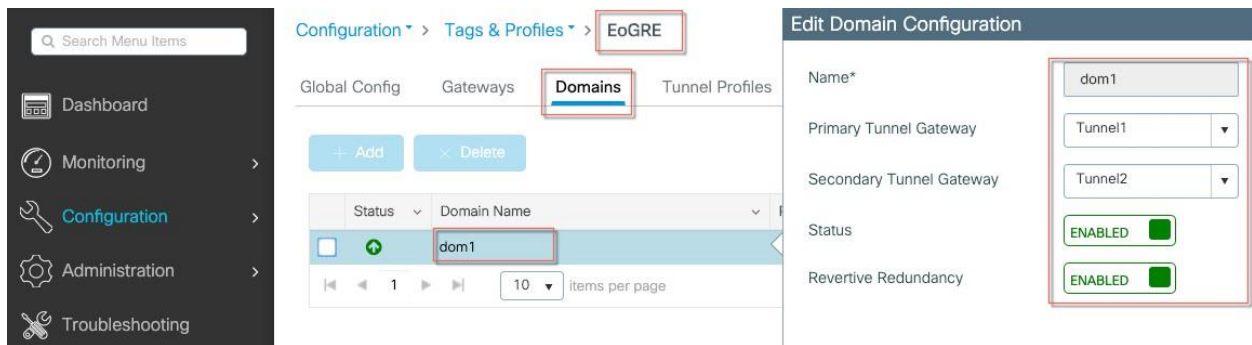

```
spwif1-ewl1c-11#sh tunnel eogre gateway summary
```

Name	Type	Address	AdminState	State	Clients
Tunnel1	IPv4	179.0.0.50	Up	Up	501
Tunnel2	IPv4	179.0.0.54	Up	Up	0
Tunnel3	IPv4	179.0.0.58	Up	Up	500
Tunnel4	IPv4	179.0.0.62	Up	Up	0
Tunnel5	IPv4	179.0.0.66	Up	Up	500
Tunnel6	IPv4	179.0.0.70	Up	Up	0
Tunnel7	IPv4	179.0.0.74	Up	Up	501
Tunnel8	IPv4	179.0.0.78	Up	Up	0

Step 3: On the C9800 EoGRE Tunnel Global Interface configure domain Ex: tunnel eogre domain dom1

```
primary Tunnel1 secondary Tunnel2
redundancy revertive (If primary is UP, primary will be the active GW, no matter the state of
secondary)
Cat9800(config)#tunnel eogre domain dom1 Cat9800(config-eogre-domain)# Cat9800(config-eogre-domain)#?
default Set a command to its defaults
exit Exit sub-mode
no Negate a command or set its defaults
primary primary gateway
redundancy redundancy model
secondary secondary gateway
shutdown Disable the tunnel profile
```

Same configuration done from the WebUI

Verify the configured tunnel details with the following show command as shown in the example below:

```
spwif1-ewl1c-11#sh tunnel eogre domain summary
```

Domain Name	Primary Gw	Secondary Gw	Active GW	Redundancy	AdminState
dom1	Tunnel1	Tunnel2	Tunnel1	Revertive	Up
dom2	Tunnel3	Tunnel4	Tunnel3	Revertive	Up
dom3	Tunnel5	Tunnel6	Tunnel5	Revertive	Up
dom4	Tunnel7	Tunnel8	Tunnel7	Revertive	Up

Step 4: On the C9800 EoGRE Tunnel Global Interface configure EoGRE Profile with DHCP options, Rules and Realm filters.

```
Cat9800(config)#wireless profile tunnel eogre-sp-basic Cat9800(config-tunnel-profile)#?
aaa-override AAA Policy Override
default Set a command to its defaults
dhcp-opt82 Configure DHCP Option 82 for tunneled clients
exit Exit sub-mode
gateway-accounting-radius-proxy Gateway Accounting Radius Proxy gateway-radius-proxy Gateway Radius
Proxy
no Negate a command or set its defaults
```

Configuring EoGRE Tunneling

```
rule                               Rule to choose domain
shutdown                           Disable tunnel profile
```

Note: In Open or PSK type WLAN Authentication: only wildcard (*) rule is acceptable. The main rationale is that with dot1x we have a Network Access Identifier (NAI) (e.g. user@domain) that we receive through the EAP Identify exchange in the other cases we do not have such information to classify the client through the rules and therefore the only rule supported is the (*) rule.

Dot1X: NAI = <user>@<realm> (Realm e.g. = cisco.com)

Example:

```
wireless profile tunnel eogre-sp-basic
dhcp-opt82 circuit-id ap-ethmac,vlan
dhcp-opt82 delimiter ;
dhcp-opt82 enable
dhcp-opt82 remote-id ap-mac,ssid-nam
```

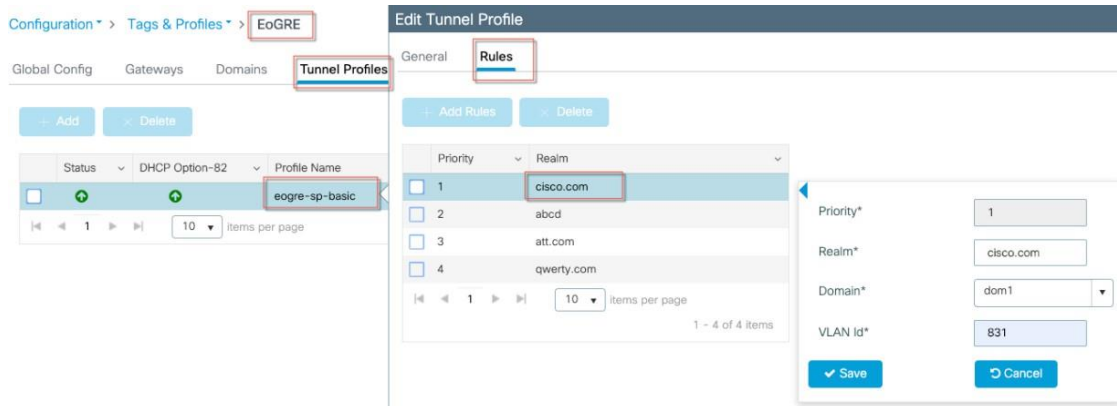

Same Configuration done from the WebUI interface

Step 5: On the C9800 EoGRE Tunnel Global Interface configure EoGRE Profile with Rules and Realm filters.

```
Rule 1 realm-filter cisco.com domain dom1 vlan 831
rule 2 realm-filter abcd.com domain dom2 vlan 833
rule 3 realm-filter att.com domain dom3 vlan 835
rule 4 realm-filter qwerty.com domain dom1 vlan 831
```

Same configuration done from the WebUI interface

Configuring EoGRE Tunneling

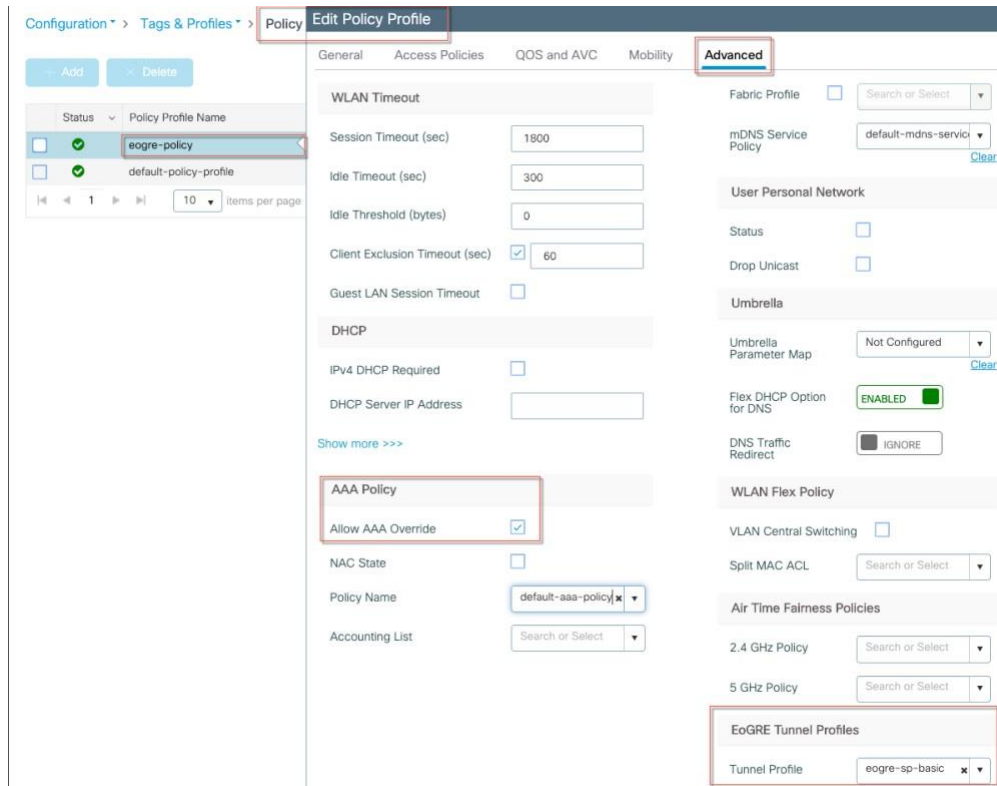

Step 6: Map the earlier created Tunnel Profile to the Wireless Policy Profile wireless profile

```
policy eogre-sp-local-basic
aaa-override
```

Configuring EoGRE Tunneling

```
no central switchin
session-timeout 86400
tunnel-profile eogre-sp-basic
vlan 135
no shutdown
```

Same configuration can be done on the WebUI interface

Use Show command as in the example below to display the profile mapping

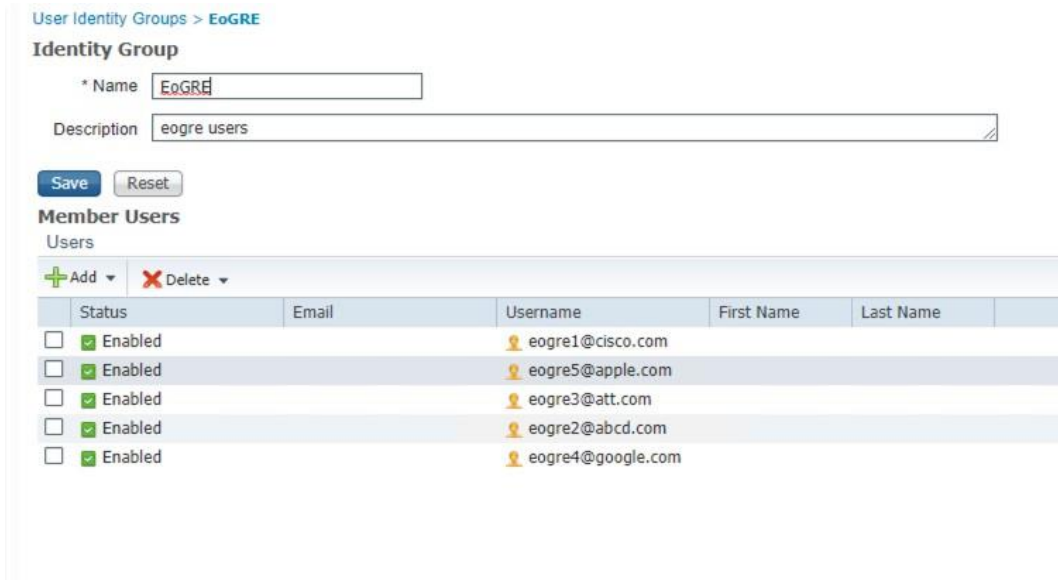

```

spwif1-ewlc-11#sh wireless profile policy detailed eogre-sp-local-basic
Policy Profile Name      : eogre-sp-local-basic
Description              :
Status                  : ENABLED
VLAN                    : 135
Multicast VLAN          : 0
Passive Client          : DISABLED
ET-Analytics            : DISABLED
StaticIP Mobility       : DISABLED
WLAN Switching Policy
  Flex Central Switching : ENABLED
  Flex Central Authentication : ENABLED
  Flex Central DHCP       : ENABLED
  Flex NAT PAT            : DISABLED
  Flex Central Assoc     : ENABLED
WLAN Flex Policy
  VLAN based Central switching : DISABLED
WLAN ACL
  IPV4 ACL                : Not Configured
  IPV6 ACL                : Not Configured
  Layer2 ACL              : Not Configured
  Preauth urlfilter list  : Not Configured
  Postauth urlfilter list : Not Configured
WLAN Timeout
  Session Timeout        : 86400
  Idle Timeout           : 300
  Idle Threshold         : 0
WLAN Local Profiling
  Subscriber Policy Name  : Not Configured
  RADIUS Profiling       : DISABLED
  HTTP TLV caching       : DISABLED
  DHCP TLV caching       : DISABLED
CTS Policy
  Inline Tagging         : DISABLED
  SGACL Enforcement     : DISABLED
  Default SGT            : 0
WLAN Mobility
  Anchor                 : DISABLED
AVC VISIBILITY
  IPV4 Flow Monitors
    Ingress              : wireless-avc-basic
    Egress
  
```

Step 7: (Optional) Configure EoGRE profile with AAA override.

Examples 1: On ISE Create Users NAI (Name@realm) and Identity Group:

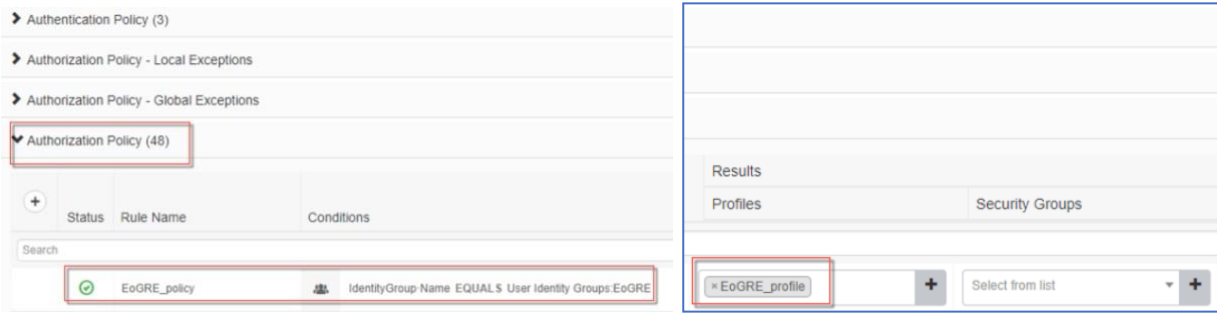

Example 2: Create Authorization profile with EoGRE specific attributes to be returned to Controller:

Example 3: Create Authorization Policy mapping user Identity Group to EoGRE Authorization profile

Configuring EoGRE Tunneling

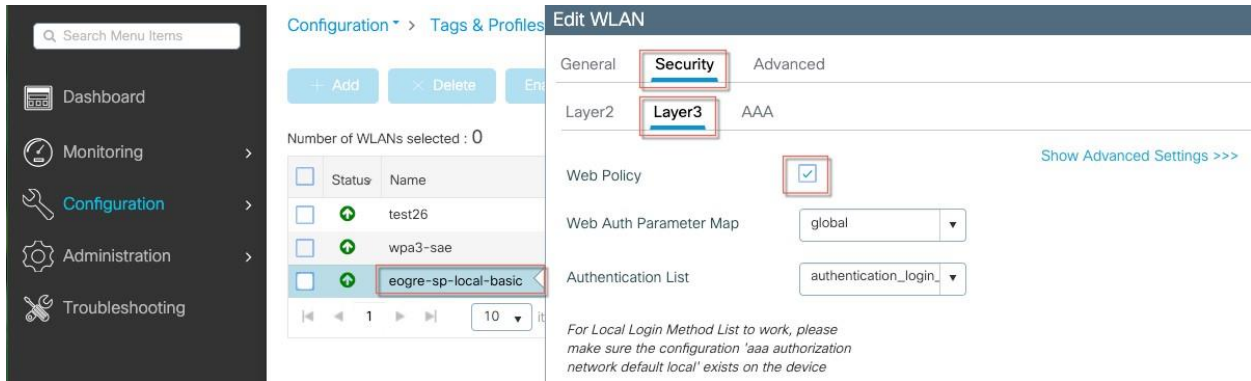

Step 8: On the C9800 create WLAN and Map Policy Tag to WLAN and AP

```
Cat9800 (config)#wireless tag policy eogre-sp-tag-local
Cat9800 (config-policy-tag)#?
default Set a command to its defaults
description Add a description for the policy tag
exit Exit sub-mode
no Negate a command or set its defaults
remote-lan Map a Remote-Lan profile to a policy profile
wlan Map a WLAN profile to a policy profile
```

Example:

```
wlan eogre-webauth 9 eogre-webauth
wlan eogre-sp-local-basic 8 eogre-sp-local-basic
tag policy eogre-sp-tag-local
tag site eogre-sp-local-sitel
tag policy eogre-sp-tag-local
security web-auth
security web-auth authentication-list lwa_external
security web-auth parameter-map lwa_external
no shut
```

Same configuration done from the WebUI interface

After WLAN is created with policy profile tag the default-policy-tag or any other Policy Tag created with the WLAN and Policy Profiles as shown in the example below.

Configuring EoGRE Tunneling

Configuration > Tags & Profiles > **Tags**

Edit Policy Tag

Changes may result in loss of connectivity for some clients that are associated to APs with this Policy Tag.

Name*

Description

▼ WLAN-POLICY Maps: 2

+ Add - Delete

WLAN Profile	Policy Profile
<input type="checkbox"/> test26	default-policy-profile
<input type="checkbox"/> eogre-sp-local-basic	eogre-policy

1 - 2 of 2 items

Also verify that all appropriate tags are mapped to the all desired APs as shown in the example below under Configuration>Wireless Setup>Advanced>Tag APs.

Configuration > Wireless Setup > Advanced

Tag APs

Number of APs: 7
Selected Number of APs: 0

AP Name	AP Model	AP MAC	AP Mode	Admin Status	Operation Status	Policy Tag	Site Tag	RF Tag	Location	Country
<input type="checkbox"/> AP1815T.F116.4278	AIR-AP1815T-B-K9	0042.5a0a.eb20	Local	Enabled	Registered	default-policy-tag	default-site-tag	default-rf-tag	default location	US
<input type="checkbox"/> AP00FC.BA01.C818	C9117AXI-B	00fc.ba01.d460	Local	Enabled	Registered	default-policy-tag	default-site-tag	default-rf-tag	default location	US
<input type="checkbox"/> AP04EB.409E.2094	C9130AXI-B	04eb.409f.6b00	Local	Enabled	Registered	default-policy-tag	default-site-tag	default-rf-tag	default location	US
<input type="checkbox"/> AP7cad.74ff.d0e6	AIR-CAP3702I-A-K9	08cc.68cc.b3c0	Local	Enabled	Registered	default-policy-tag	default-site-tag	default-rf-tag	default location	US
<input type="checkbox"/> APA023.9FD8.EA78	AIR-AP3802I-B-K9	40ce.24bf.9200	Local	Enabled	Registered	default-policy-tag	default-site-tag	default-rf-tag	default location	US
<input type="checkbox"/> AP2702I.89be.5580	AIR-CAP3702I-A-K9	5087.89be.8ac0	Local	Enabled	Registered	default-policy-tag	default-site-tag	default-rf-tag	default location	US
<input type="checkbox"/> AP0042.68A1.020A	AIR-AP3802I-B-K9	cc16.7e32.6ed0	Local	Enabled	Registered	default-policy-tag	default-site-tag	default-rf-tag	default location	US

1 - 7 of 7 items

Verify Policy Mapping with the following show Command:

```

spwifi-ewlc-11#sh wireless tag policy detailed eogre-sp-tag-local
Policy Tag Name : eogre-sp-tag-local
Description      :

Number of WLAN-POLICY maps: 3
WLAN Profile Name      Policy Name
-----
eogre-avc              eogre-avc
eogre-webauth          eogre-sp-local-basic
eogre-sp-local-basic   eogre-sp-local-basic

Number of RLAN-POLICY maps: 0

```

Step 9: (Optional Recommended Configuration) On the C9800 configure source interfaces for a better throughput

Step 9a: C9800 4 ports bundled in Ether-channel on the Controller and switch side. Enable load balancing based on source destination IP.

```

conf t
port-channel load-balance src-dst-ip

```

Step 9b: Use different source interfaces on each tunnel as shown in the example below:

```

interface Tunnel1
no ip address
tunnel source Vlan1443
tunnel mode ethernet gre ipv4 p2p
tunnel destination 40.253.0.2
interface Tunnel2
no ip address
tunnel source Vlan1446
tunnel mode ethernet gre ipv4 p2p
tunnel destination 40.253.0.6
interface Tunnel3
no ip address
tunnel source Vlan1447
tunnel mode ethernet gre ipv4 p2p
tunnel destination 40.253.0.10
interface Tunnel4
no ip address
tunnel source Vlan1448
tunnel mode ethernet gre ipv4 p2p
tunnel destination 40.253.0.14

```

Step 9c: Choose IP of source interface, such that, the traffic flows will take different links for each src-dest IP pair.

Ex: Hash result for following three flows are bucket 2, 10, 2, one member link. This will not give max throughput, as all flows go through link 2.

- Client traffic on Tunnel1 – Src IP: 40.143.0.72 Dest IP: 40.253.0.2
- Client traffic on Tunnel2 – Src IP: 40.146.0.72 Dest IP: 40.253.0.6
- Client traffic on Tunnel3 – Src IP: 40.147.0.72 Dest IP: 40.253.0.10

Ex: Hash result for following three flows are bucket 2, 1, 3, three member links. This will maximize throughput achieved. Note the Source IPs are different from above

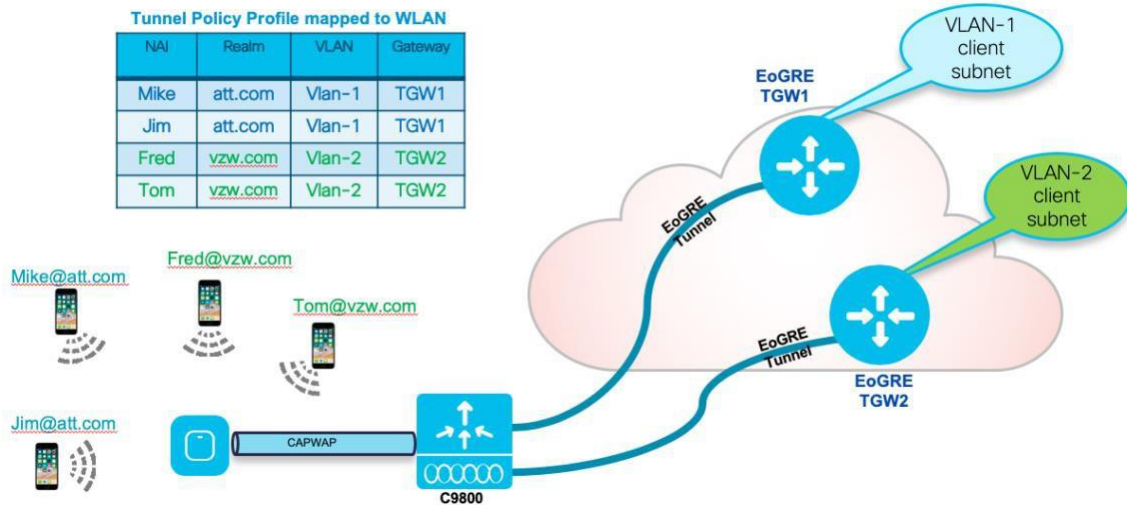

- Client traffic on Tunnel1 – Src IP: 40.143.0.72 Dest IP: 40.253.0.2
- Client traffic on Tunnel2 – Src IP: 40.146.0.94 Dest IP: 40.253.0.6
- Client traffic on Tunnel3 – Src IP: 40.147.0.74 Dest IP: 40.253.0.10

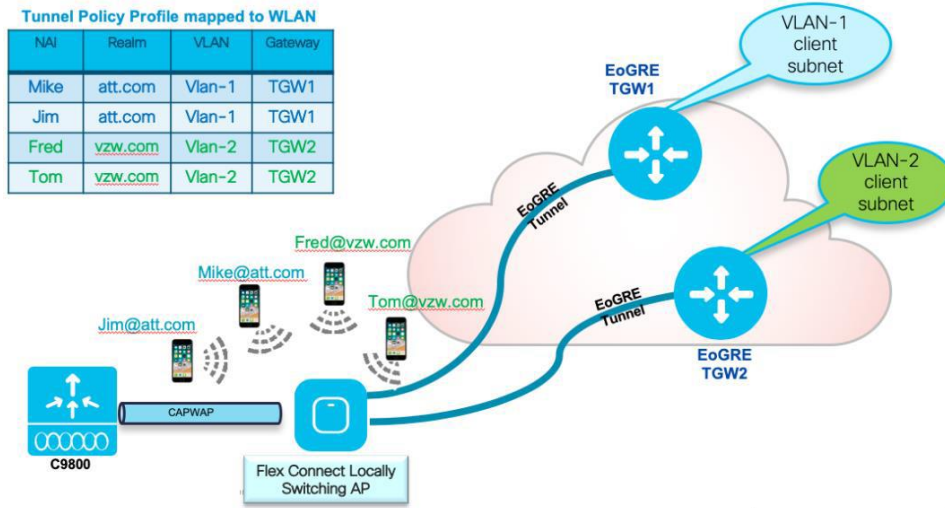

Step 9d: Use CLI command to determine the link a particular flow would take. CLI is available in IOS-XE 16.2 and above code. CLI will plug in arbitrary source and destination IP addresses, and the output will be the best link the traffic flow will take. This command is applicable for Local Mode APs with EoGRE tunnel only.

```
sh platform software port-channel link-select interface port-channel 4 ipv4 <src_ip> <dest_ip> "
```

Typical Deployment C9800 – Local Mode EoGRE Topology

Typical Deployment FC-AP – FlexConnect Mode EoGRE Topology

In case of Flex, the Access Point creates the EoGRE tunnels towards Tunnel Gateways and EoGRE module in WLC takes care of handling the control path for wireless clients and manageability for tunnels. When Flex Connect AP joins the controller the Tunnel Manager on the controller will push the global EoGRE parameters and the whole set of the Domains and Tunnel configurations to the FC AP.

For Flex Connect mode, C9800 controller does the following:

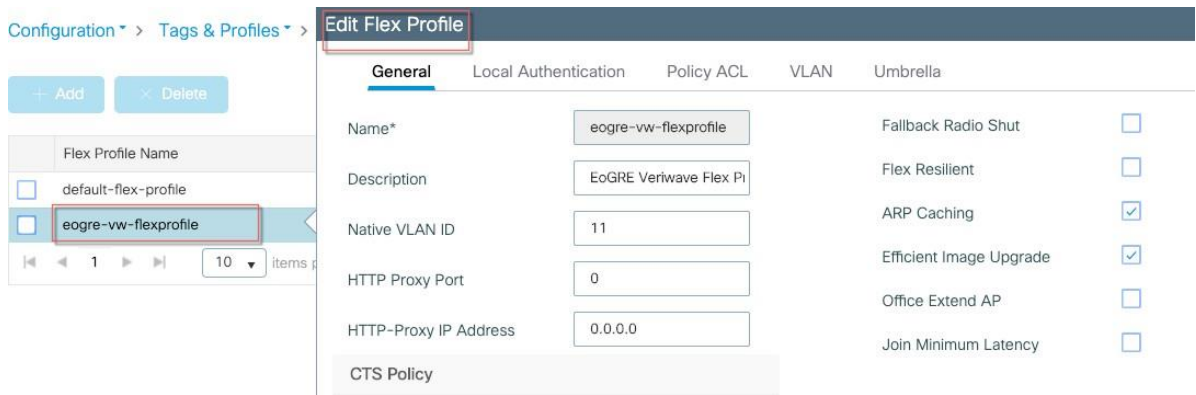

- Pass Domain and TGW configuration to APs
- Allow Tunnel creation on Access Points
- Implement (or proxy) AAA functionalities for APs

EoGRE with FlexConnect sample configuration is below:

Below please see FlexConnect example configurations in both CLI and also followed by the WebUI modes.

```
wireless tag site eogre-vw-sitetag
flex-profile eogre-vw-flexprofile
no local-site
```

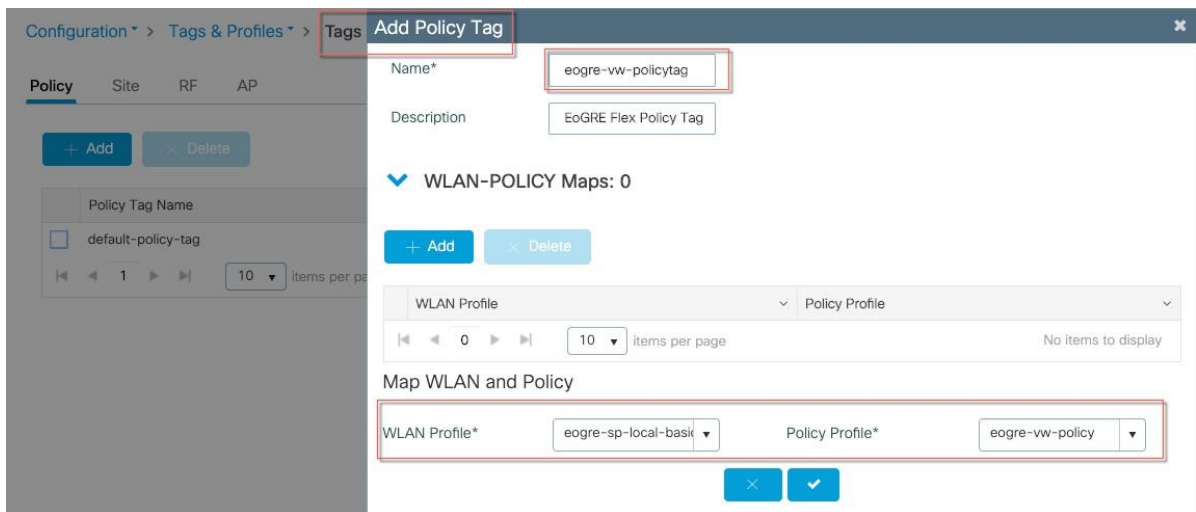

Typical Deployment FC-AP – FlexConnect Mode EoGRE Topology

```
wireless profile flex eogre-vw-flexprofile
local-auth radius-server-group vw
native-vlan-id 11
vlan-name flexvlan
vlan-id 140
```

```
wireless tag policy eogre-vw-policytag
wlan eogre-sp-local-basic policy eogre-vw-policy
```

Typical Deployment FC-AP – FlexConnect Mode EoGRE Topology

```
wlan eogre-sp-local-basic 8 eogre-sp-local-basic
no security ft over-the-ds
no security ft adaptive
security dot1x authentication-list spwifi_dot1x
no shutdown
```

Configuration > Tags & Profiles > WLANs

+ Add × Delete Enable WLAN Disable WLAN

Number of WLANs selected : 0

<input type="checkbox"/>	Status	Name	ID	SSID	Security
