\* Creates unintercepted coroutine without receiver and with result type `[T]`.

\* This function creates a new, fresh instance of suspendable computation every time it is invoked.

\* To start executing the created coroutine, invoke `resume(Unit)` on the returned `[Continuation]` instance.

\* The `[completion]` continuation is invoked when coroutine completes with result or exception.

\* Note that `[completion]` of this function may get invoked in an arbitrary context.

\* `[Continuation.intercepted]` can be used to acquire the intercepted continuation.

\* Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and `[completion]` happens in the invocation context established by `[ContinuationInterceptor]`.

The compiler produces the code relevant for the target module system, for example, in case of CommonJS,\n\n * it
will import the declaration via the `require(...)` function.\n\n *\n\n The annotation can be used on top-level external
declarations (classes, properties, functions) and files.\n\n *\n\n In case of file (which can't be `external`) the following rule
applies: all the declarations in\n\n * the file must be `external`. By applying `@JsModule(...)` on a file you tell
the compiler to import a JavaScript object\n\n * that contain all the declarations from the file.\n\n *\n\n Example:\n\n
*\n\n * ``` kotlin\n\n * @JsModule("jquery")\n\n * external abstract class JQuery() {\n\n * // some declarations here\n\n * }\n\n
*\n\n * @JsModule("jquery")\n\n * external fun JQuery(element: Element): JQuery\n\n * ```\n\n *\n\n *\n\n @property import
name of a module to import declaration from.\n\n * It is not interpreted by the Kotlin compiler, it's passed as is
directly to the target module system.\n\n *\n\n @see JsNonModule\n\n

*\n\n Some JavaScript libraries
are distributed both as a standalone downloadable piece of JavaScript and as a module available\n\n * as an npm
package.\n\n * To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the
`@JsNonModule` annotation.\n\n *\n\n For example:\n\n * ``` kotlin\n\n * @JsModule("jquery")\n\n * }\n\n
*\n\n * @JsNonModule\n\n * @JsName("$")\n\n * external abstract class JQuery() {\n\n * // some declarations here\n\n * }\n\n

This annotation marks the standard library API that is considered experimental and is not subject to the [general compatibility guarantees] (<https://kotlinlang.org/docs/reference/evolution/components-stability.html>) given for the standard library: the behavior of such API may be changed or the API may be removed completely in any further release. Beware using the annotated API especially if you're developing a library, since your library might become binary incompatible with the future versions of the standard library. Any usage of a declaration annotated with `@ExperimentalStdlibApi` must be accepted either by annotating that usage with the [OptIn] annotation, e.g. `@OptIn(ExperimentalStdlibApi::class)` or by using the compiler argument `-Xopt-in=kotlin.ExperimentalStdlibApi`.

of a function from the calls in the annotated function parameter of that function.
When this annotation is
placed on a generic function parameter of a function,
it enables to infer the type arguments of that generic
function from the lambda body passed to that parameter.
The calls that affect inference are either members
of the receiver type of an annotated function parameter or
extensions for that type. The extensions must be
themselves annotated with @BuilderInference.
Example: we declare
fun <T>
sequence(@BuilderInference block: suspend SequenceScope<T>().->Unit): Sequence<T>
and use it
like
val result = sequence { yield("result") }
Here the type argument of the resulting sequence
is inferred to `String` from
the argument of the [SequenceScope.yield] function, that is called inside the lambda
passed to [sequence].
Note: this annotation is experimental, see [ExperimentalTypeInference]
on how to opt-in for it.

 * Polymorphic elements can be extracted from the coroutine context using both element key and its supertype key.

 * class DerivedElement : BaseElement() {
 *     companion object Key :
 * AbstractCoroutineContextKey<BaseElement, DerivedElement>(BaseElement, { it as? DerivedElement })
 * }
 * // Now it is possible to query both `BaseElement` and `DerivedElement`
 * someContext[BaseElement] // Returns BaseElement?, non-null both for BaseElement and DerivedElement instances
 * someContext[DerivedElement] // Returns DerivedElement?, non-null only for DerivedElement instance
 * ``

In this case, the [Continuation] provided to the [block] shall be\n \* resumed by invoking [Continuation.resumeWith] at some moment in the\n \* future when the result becomes available to resume the computation.\n \* \n \* Otherwise, the return value of the [block] must have a type assignable to [T] and represents the result of this suspend function.\n \* It means that the execution was not suspended and the [Continuation] provided to the [block] shall not be invoked.\n \* As the result type of the [block] is declared as `Any?` and cannot be correctly type-checked,\n \* its proper return type remains on the conscience of the suspend function's author.\n \* \n \* Invocation of [Continuation.resumeWith] resumes coroutine directly in the invoker's thread without going through the\n \* [ContinuationInterceptor] that might be present in the coroutine's [CoroutineContext].\n \* It is the invoker's responsibility to ensure that a proper invocation context is established.\n \* [Continuation.intercepted] can be used to acquire the intercepted continuation.\n \* \n \* Note that it is not recommended to call either [Continuation.resume] nor [Continuation.resumeWithException] functions synchronously\n \* in the same stackframe where suspension function is run. Use [suspendCoroutine] as a safer way to obtain current\n \* continuation instance.\n

`package kotlin.time`

\* A source of time for measuring time intervals.

\* The only operation provided by the time source is `[markNow]`. It returns a `[TimeMark]`, which can be used to query the elapsed time later.

\* @see `[measureTime]` \* @see `[measureTimedValue]`

`@SinceKotlin("1.3") @ExperimentalTime` `public interface TimeSource` {

- \* Marks a point in time on this time source.
- \* The returned `[TimeMark]` instance encapsulates the captured time point and allows querying
  - the duration of time interval `[elapsed]` `[TimeMark.elapsedNow]` from that point.

`public fun markNow(): TimeMark`

- \* The most precise time source available in the platform.
- \* This time source returns its readings from a source of monotonic time when it is available in a target platform, and resorts to a non-monotonic time source otherwise.

`public object Monotonic : TimeSource by MonotonicTimeSource` {

- override fun `toString(): String = MonotonicTimeSource.toString()`

`public companion object` {

- \* Represents a time point notched on a particular `[TimeSource]`. Remains bound to the time source

- public abstract fun `elapsedNow(): Duration`
- \* Returns a time mark on the same time source that is ahead of this time mark by the specified `[duration]`.

- public open operator fun `plus(duration: Duration): TimeMark = AdjustedTimeMark(this, duration)`
- \* Returns a time mark on the same time source that is behind this time mark by the specified `[duration]`.

- \* Note that the value returned by this function can change on subsequent invocations.
- \* If the time source is monotonic, it can change only from ``false`` to ``true``, namely, when the time mark becomes behind the current point of the time source.
- public fun `hasPassedNow(): Boolean = !elapsedNow().isNegative()`
- \* Returns false if this time mark has not passed according to the time source from which this mark was taken.
