```

Returns a [Map] where keys are elements from the given sequence and values are produced by the [valueSelector] function applied to each element.

If any two elements are equal, the last one gets added to the map.

The returned map preserves the entry iteration order of the original sequence.

The operation is `_terminal_`.

Accumulates value starting with
the first character and applying [operation] from left to right
to current accumulator value and each character.

Throws an exception if this char sequence is empty. If the char sequence can be empty in an expected way,
please use [reduceOrNull] instead. It returns `null` when its receiver
is empty.

```

Returns a new string obtained by replacing each substring of this char sequence that matches the given regular expression `regex` with the given `replacement`. The `replacement` can consist of any combination of literal text and `$`-substitutions. To treat the replacement string literally escape it with the `[kotlin.text.Regex.Companion.escapeReplacement]` method.

```

public inline fun CharSequence.replace(regex: Regex, replacement: String): String = regex.replace(this, replacement)

```

Returns a new string obtained by replacing each substring of this char sequence that matches the given regular expression `regex` with the result of the given function `transform` that takes `MatchResult` and returns a string to be used as a replacement for that match.

```

public inline fun CharSequence.replace(regex: Regex, noinline transform: (MatchResult) -> CharSequence): String = regex.replace(this, transform)

```

Replaces the first occurrence of the given regular expression `regex` in this char sequence with specified `replacement` expression. @param replacement A replacement expression that can include substitutions. See `[Regex.replaceFirst]` for details.

```

public inline fun CharSequence.replaceFirst(regex: Regex, replacement: String): String = regex.replaceFirst(this, replacement)

```

Returns a copy of this string having its first character replaced with the result of the specified `transform`, or the original string if it's empty.

```

@sample samples.text.Strings.replaceFirstChar

marker\n\n/**\n * Gives a declaration (a function, a property
```

```
or a class) specific name in JavaScript.\n *\n * This may be useful in the following cases:\n *\n * * There are two
```

```
functions for which the compiler gives same name in JavaScript, you can\n *\n * mark one with `@JsName(...)` to
```

```
prevent the compiler from reporting error.\n *\n * * You are writing a JavaScript library in Kotlin. The compiler
```

```
produces mangled names\n *\n * for functions with parameters, which is unnatural for usual JavaScript developer.\n *\n *
```

```
You can put `@JsName(...)` on functions you want to be available from JavaScript.\n *\n * * For some reason you
```

```
want to rename declaration, e.g. there's common term in JavaScript\n *\n * for a concept provided by the declaration,
```

```
which is uncommon in Kotlin.\n *\n * * Example:\n *\n * * ``` kotlin\n *\n * class Person(val name: String) {\n *\n * fun
```

```
hello() {\n *\n * println("Hello $name!")\n *\n * }\n *\n * @JsName("helloWithGreeting")\n *\n * fun
```

```
hello(greeting: String) {\n *\n * println("$greeting $name!")\n *\n * }\n *\n *
```

```
}\n *\n * * `@property name` the name which compiler uses both for declaration itself and for all references to
```

```
the declaration.\n *\n * It's required to denote a valid JavaScript identifier.\n *\n *
```

```
*\n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, FUNCTION, PROPERTY, CONSTRUCTOR,
```

```

```
The compiler produces the code relevant for the target module system, for example, in case of CommonJS,\n *\n * it
```

```
will import the declaration via the `require(...)` function.\n *\n * * The annotation can be used on top-level external
```

```
declarations (classes, properties, functions) and files.\n *\n * In case of file (which can't be `external`) the following rule
```

```
applies: all the declarations in\n *\n * the file must be `external`. By applying `@JsModule(...)` on a file you tell the
```

```
compiler to import a
```

```
JavaScript object\n *\n * that contain all the declarations from the file.\n *\n * * Example:\n *\n * * ``` kotlin\n *\n *
```

```
@JsModule("jquery")\n * external abstract class JQuery() {\n *\n * // some declarations here\n *\n * }\n *\n *
```

```
@JsModule("jquery")\n * external fun JQuery(element: Element): JQuery\n *\n * * `@property import name
```

```
of a module to import declaration from.\n *\n * It is not interpreted by the Kotlin compiler, it's passed as is
```

```
directly to the target module system.\n *\n * * @see JsNonModule\n
```

```
*\n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, PROPERTY, FUNCTION, FILE)\npublic
```

```
annotation class JsModule(val import: String)\n\n/**\n * Denotes an `external` declaration that can be used without
```

```
module system.\n *\n * By default, an `external` declaration is available regardless your target module system.\n *\n *
```

```
However, by applying [JsModule] annotation you can make a declaration unavailable to *plain* module system.\n *\n *
```

```
Some JavaScript libraries are distributed both as
```

```
a standalone downloadable piece of JavaScript and as a module available\n *\n * as an npm package.\n *\n * To tell the
```

```
Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation.\n *\n *
```

```
For example:\n *\n * * ``` kotlin\n *\n * @JsModule("jquery")\n *\n * @JsNonModule\n *\n * @JsName("$")\n *\n * external
```

```
abstract class JQuery() {\n *\n * // some declarations here\n *\n * }\n *\n * * @JsModule("jquery")\n *\n * @JsNonModule\n
```

```
* @JsName("$")\n * external fun JQuery(element: Element): JQuery\n *\n * * `@see JsModule\n
```

```
*\n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, PROPERTY, FUNCTION, FILE)\npublic
```

```
annotation class JsNonModule\n\n/**\n * Adds prefix to `external` declarations in a source file.\n *\n *
```

```
JavaScript does not have concept of packages (namespaces). They are usually emulated by nested objects.\n *\n * The compiler
```

```
turns references to `external` declarations either to plain unprefix names (in case of *plain* modules)\n *\n * or to
```

```
plain imports.\n *\n * However,
```

if a JavaScript library provides its declarations in packages, you won't be satisfied with this. You can tell the compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)` annotation. Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations. Example:

```

@file:JsQualifier("my.jsPackageName") package
some.kotlinPackage external fun foo(x: Int) external fun bar(): String
@property value
the qualifier to add to the declarations in the generated code. It must be a sequence of valid JavaScript
identifiers separated by the `.` character. Examples of valid qualifiers are: `foo`, `bar.Baz`, `_$0.f`
@see JsModule @Retention(AnnotationRetention.BINARY) @Target(AnnotationTarget.FILE) public
annotation class JsQualifier(val value: String) Exports top-level declaration
on JS platform. Compiled module exposes declarations that are marked with this annotation without name
mangling. This annotation can be applied to either files or top-level declarations. It is currently
prohibited to export the following kinds of declarations:
* `expect` declarations
* inline functions with
reified type parameters
* suspend functions
* secondary constructors without `@JsName`
* extension properties
* enum classes
* annotation classes
Signatures of exported declarations must
only contain "exportable" types:
* `dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`,
`Double`
* `BooleanArray`, `ByteArray`, `ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`
* `Array<exportable-type>`
* Function types with exportable parameters and return types
* `external` or
`@JsExport` classes and interfaces
* Nullable counterparts of types above
* Unit return type. Must not be nullable
This annotation is experimental, meaning that restrictions
mentioned above are subject to change.
