exports.BasicSourceMapConsumer =
  BasicSourceMapConsumer;

An IndexedSourceMapConsumer instance represents a parsed source map which we can query for information. It differs from BasicSourceMapConsumer in that it takes "indexed" source maps (i.e. ones with a "sections" field) as input.

The only parameter is a raw source map (either as a JSON string, or already parsed to an object). According to the spec for indexed source maps, they have the following attributes:

- version: Which version of the source map spec this map is following.
- file: Optional. The generated file this source map is associated with.
- sections: A list of section definitions.

Each value under the "sections" field has two fields:

- offset: The offset into the original specified at which this section begins to apply, defined as an object with a "line" and "column" field.
- map: A source map definition. This source map could also be indexed, but doesn't have to be.

Instead of the "map" field, it's also possible to have a "url" field specifying a URL to retrieve a source map from, but that's currently unsupported.

Here's an example source map, taken from the source map spec[0], but modified to omit a section which uses the "url" field.

{
  version : 3,
  file : "app.js",
  sections : [
    {
      offset : { line:100, column:10 },
      map : {
        version : 3,
        file : "section.js",
        sources : [ "foo.js", "bar.js" ],
        names : [ "src", "maps", "are", "fun" ],
        mappings : "AAAA,E;;ABCDE;"
      }
    }
  ]
}

}
}

This is an implementation of binary search which will always try and return the index of the
closest element if there is no exact hit. This is because mappings between original and generated line/col pairs
are single points and there is an implicit region between each of them, so a miss just means that you aren't
on the very start of a region.

@param aNeedle The element you are looking for.
@param aHaystack The array that is being searched.
@param aCompare A function which takes the needle and an element in the array and returns -1, 0, or 1 depending on whether the needle is less than, equal to, or greater than the element,
respectively.
@param aBias Either 'binarySearch.GREATEST_LOWER_BOUND' or 'binarySearch.LEAST_UPPER_BOUND'. Specifies whether to return the closest element that is smaller than
or greater than the one we are searching for, respectively, if the exact element cannot be found. Defaults
to 'binarySearch.GREATEST_LOWER_BOUND'.

\nexports.search = function search(aNeedle, aHaystack,
aCompare, aBias) {
  if (aHaystack.length === 0) {
    return -1;
  }

  var index = recursiveSearch(-1,
aHaystack.length, aNeedle, aHaystack,
aCompare, aBias ||
exports.GREATEST_LOWER_BOUND);
  if (index < 0) {
    return -1;
  }

  // We have found either the
  exact element, or the next-closest element than
  // the one we are searching for. However, there may be more than
  one such
  // element. Make sure we always return the smallest of these.
  while (index - 1 >= 0) {
    if
    (aCompare(aHaystack[index], aHaystack[index - 1], true) !== 0) {
      break;
    }
    --index;
  }

  return
  index;
};

\n // It turns out that some (most?) JavaScript engines don't self-host
\n `Array.prototype.sort`. This
  makes sense because C++ will likely remain
\n // faster than JS when doing raw CPU-intensive sorting. However,
  when using a
\n // custom comparator function, calling back and forth between the VM's C++ and
\n // JIT'd JS is
  rather slow and loses JIT type information, resulting in
\n // worse generated code for the comparator function than
  would be optimal. In
\n // fact, when sorting with a comparator, these costs outweigh the benefits of
\n // sorting in
  C++. By using our own JS-implemented Quick Sort (below), we get
\n // a ~3500ms mean speed-up in
  `bench/bench.html`.

\n * Swap the elements indexed by `x` and `y` in the array `ary`.
\n * @param
  {Array} ary
\n * The array.
\n * @param {Number} x
\n * The index of the first item.
\n * @param
  {Number} y
\n * The index of the second item.
\n *
\n function swap(ary, x, y) {
  var temp = ary[x];
  ary[x] =
  ary[y];
  ary[y] = temp;
}

\n * Returns a random integer within the range `low .. high` inclusive.
\n *
