## Einführung

In diesem Dokument wird beschrieben, wie das in die IOS-Images integrierte Tool Command Language (TCL)-Skript tm\_wanmon.tcl für den Cisco IOS1000 Connected Grid Router (CGR) behoben und verifiziert wird. Wenn dieses Skript aktiviert ist, fungiert es als WAN-Überwachungssoftware (Wide Area Network) für WAN-Schnittstellen und führt zunehmend störende Aktionen durch, um eine Wiederherstellung nach einem Ausfall der WAN-Verbindung oder des Tunnels zu ermöglichen.

Wenn WANMON auf dem Router aktiviert ist, wird das Skript in das Verzeichnis tmpsys:/eem\_policy/ extrahiert, und das Skript kann mithilfe dieses Befehls angezeigt werden; Router#more tmpsys:eem\_policy/tm\_wanmon.tcl.

## Voraussetzungen

### Anforderungen

Cisco empfiehlt, das TCL-Skript zu aktivieren, wie in dieser Dokumentation beschrieben:

[http://www.cisco.com/c/en/us/td/docs/routers/connectedgrid/cgr1000/ios/software/15\\_4\\_1\\_cg/WAN\\_Mon.html](http://www.cisco.com/c/en/us/td/docs/routers/connectedgrid/cgr1000/ios/software/15_4_1_cg/WAN_Mon.html).

Software-Mindestanforderungen: Cisco IOS Version 15.4(1)CG

### Verwendete Komponenten

Die Informationen in diesem Dokument basieren auf dem CGR1120/CGR1240.

Die Informationen in diesem Dokument wurden von den Geräten in einer bestimmten Laborumgebung erstellt. Alle in diesem Dokument verwendeten Geräte haben mit einer leeren (Standard-)Konfiguration begonnen. Wenn Ihr Netzwerk in Betrieb ist, stellen Sie sicher, dass Sie

die potenziellen Auswirkungen eines Befehls verstehen.

## Fehlerbehebungsmethode

Wenn WANMON konfiguriert ist und auf einem CGR ausgeführt wird, kann das Debuggen für das Skript aktiviert werden, wenn Sie diese Konfiguration der Gerätekonfiguration hinzufügen:

```
Router(config)#event manager environment wanmon_debug all
```

### Skript überprüfen

```
Router(config)#event manager policy tm_wanmon.tcl authorization bypass
Router(config)#event manager environment wanmon_if_list1 {GigabitEthernet2/1 {recovery {5 25}
{90 180} {600 100}} }
Router(config)#event manager environment wanmon_debug all

*Aug 8 21:24:14.555: %HA_EM-6-LOG: tm_wanmon.tcl: Command: enable      <----- WANMON is orienting
itself to privileged exec mode by sending the 'enable' command to IOS
*Aug 8 21:24:14.775: %HA_EM-6-LOG: tm_wanmon.tcl: Output:
*Aug 8 21:24:14.775: %HA_EM-6-LOG: tm_wanmon.tcl: CGR1000#      <----- Output from IOS tells
WANMON that it is now at the privileged exec prompt
*Aug 8 21:24:14.789: %HA_EM-6-LOG: tm_wanmon.tcl: context_retrieve succeeded      <----- The
router was able to successfully retrieve WANMON polling data

```

## Häufiges Problem beim Ausführen von Skript

### Syntaxfehler

Eine Situation kann entstehen, wenn Sie glauben, dass WANMON funktioniert, wenn es konfiguriert ist, aber es hat tatsächlich keine Auswirkungen. In einer Umgebung, in der das WANMON-Skript nicht richtig funktioniert hat, wurde diese Debugausgabe beobachtet:

```

*Aug 8 21:44:14.487: %HA_EM-6-LOG: tm_wanmon.tcl: Command: enable
*Aug 8 21:44:14.601: %HA_EM-6-LOG: tm_wanmon.tcl: Output:
*Aug 8 21:44:14.601: %HA_EM-6-LOG: tm_wanmon.tcl: CGR1000#
*Aug 8 21:44:14.617: %HA_EM-6-LOG: tm_wanmon.tcl: context_retrieve succeeded
*Aug 8 21:44:14.617: %HA_EM-6-LOG: tm_wanmon.tcl: last_run: 1249767255
*Aug 8 21:44:14.617: %HA_EM-6-LOG: tm_wanmon.tcl: exec_count: 1

*Aug 8 21:44:14.895: %HA_EM-1-LOG: tm_wanmon.tcl: Configuration error: Interface gig does not
exist. Please check configuration. <----- If there is a syntax error in the WANMON
statements, you will see "Configuration error" in the output following the raw session output
*Aug 8 21:44:14.899: %HA_EM-6-LOG: tm_wanmon.tcl: Processing all interface config
*Aug 8 21:44:14.915: %HA_EM-6-LOG: tm_wanmon.tcl: context_save succeeded
```

Gemäß dieser Ausgabe wird das Skript nicht erfolgreich ausgeführt, da zwischen dem Schnittstellennamen und den zugehörigen Nummern ein Leerzeichen steht. Der Befehl, der diesen Fehler verursacht hat, war:

```
event manager environment wanmon_if_list1 {gig 2/1 {recovery {5 25} {90 180} {400 100}} }
```

Die richtige Konfiguration sollte lauten:

```
event manager environment wanmon_if_list1 {gig2/1 {recovery {5 25} {90 180} {400 100}} }
```

## Internet Protocol Service Level Agreement (IPSLA) - Down

Wenn WANMON mehrere Schnittstellen mit IPSLA abfragt.

Bei IPSLA-Operationen kann es schwierig sein, sofort den Fehlerort zu bestimmen. Diese Debug-Ausgabe zeigt, was geschieht, wenn zwei Schnittstellen von WANMON mit IP SLA auf jeder Schnittstelle überwacht werden:

```
*Aug 9 19:55:36.433: %HA_EM-6-LOG: tm_wanmon.tcl: Command: enable
*Aug 9 19:55:36.547: %HA_EM-6-LOG: tm_wanmon.tcl: Output:
*Aug 9 19:55:36.547: %HA_EM-6-LOG: tm_wanmon.tcl: CGR1000#
*Aug 9 19:55:36.565: %HA_EM-6-LOG: tm_wanmon.tcl: context_retrieve succeeded
*Aug 9 19:55:36.565: %HA_EM-6-LOG: tm_wanmon.tcl: last_run: 1249847563
