Einführung

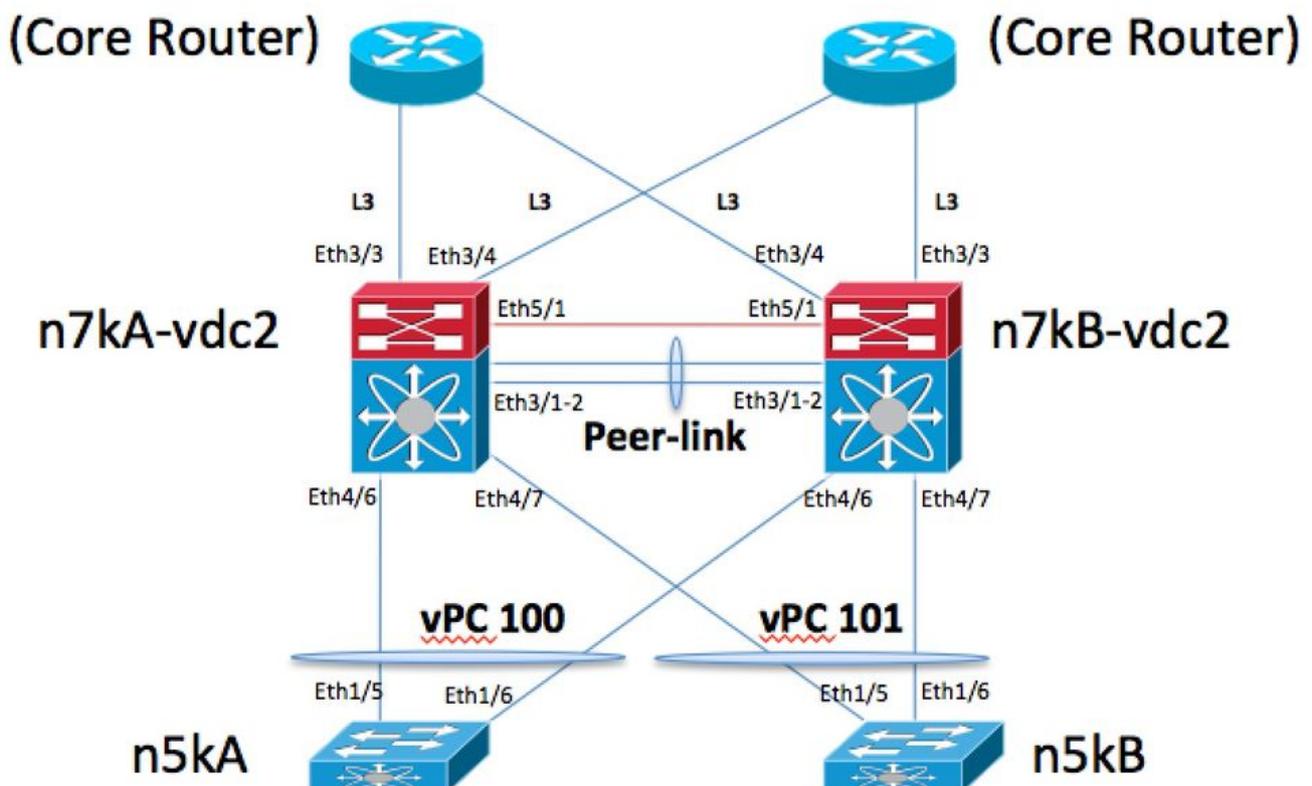

In diesem Dokument werden die vPC-Objektverfolgung, ihre Verwendung und ihre Funktionsweise beschrieben.

vPC-Objektverfolgung

Netzwerkdiagramm

Das für diese Demonstration verwendete Netzwerkdiagramm ist wie folgt:

vPC Object Tracking Topology

Die vPC-Peer-Verbindung ist Port-Channel 1. Ethernet 5/1 ist die vPC Peer-Keepalive-Verbindung. Es gibt zwei Core-Router, die über L3/30-Verbindungen e3/3 und e3/4 an jedem N7K-Gerät angeschlossen sind. N5KA und N5KB simulieren L2-Switches vPC, die auf vPC 100 und vPC 101 angeschlossen sind. N7KA ist das primäre vPC-Gerät.

vPC-Objektverfolgung wird in einem Szenario wie diesem verwendet. Es wird ein M132-Modul für die vPC-Peer-Verbindung sowie die L3-Uplinks zum Core verwendet. Wenn Sie aufgrund eines HW-Fehlers das M132-Modul verlieren, gehen sowohl die vPC-Peer-Verbindung als auch die L3-Uplinks verloren. Wenn dies auf der sekundären vPC-Box (N7KB) der Fall wäre, wäre dies kein Problem, da der primäre betriebliche Peer die vPC-Port-Channels und VLAN-Schnittstellen auf der sekundären betrieblichen Ebene außer Kraft setzen würde. Das Problem besteht im Fall eines Hardware-Ausfalls auf dem operativen primären Gerät (N7KA). Wenn Sie die Objektverfolgung nicht verwenden, werden alle vPC-Port-Channels auf N7KB sowie die VLAN-Schnittstellen außer Kraft gesetzt. Die Peer-Verbindung ist ebenfalls inaktiv. In diesem Szenario wäre es nicht möglich, den Core-Datenverkehr in unsere vPC-VLANs zu leiten.

Die Objektverfolgung umgeht dies, indem sie vPC auf den betriebsbereiten primären Switch herunterfährt, sodass wir nicht in dieses Szenario gelangen, in dem die VLAN-Schnittstellen und vPC-Port-Channels auf dem Gerät heruntergefahren werden, das die verbleibenden Uplinks zum Kern hat.

Hier sehen Sie die vPC-Peer-Keepalive-Nachrichten mit Ethalyzer:

Jetzt befinden Sie sich in diesem Zustand. N7KA ist der primäre vPC-Peer, aber es beendet das Senden von vPC-Peer-Keepalive-Nachrichten an N7KB, sodass N7KB nicht ausgesetzt wird. N7KB ist das einzige System mit Uplinks.

Hinweis: e3/4 auf N7KB stellt eine Verbindung zu einem anderen VDC auf N7KA her, weshalb auch dieser ausfiel. Der Punkt ist, dass Sie die Schnittstellen in N7KB und in N7KA nachverfolgt haben, sodass das Senden von Nachrichten an N7KB auf dem Peer-Keepalive-Link gestoppt wird.

Ethanalyzer-Ausgabe von N7KA:

(Nach dem Syslog TRACK_INTFS_DOWN senden wir keine Peer-Keepalive-Nachrichten mehr an N7KB, sondern nur noch von N7KB, das 1.1.1.2 ist.)

Details zum vPC-Peer-Keepalive-Ausfall:

Führen Sie den Test erneut aus, um zu sehen, was mit der Peer-Keepalive-Verbindung geschieht.

Senden Sie die Keepalives bidirektional - derzeit ist alles in Betrieb:

```
