## Einführung

In diesem Dokument wird beschrieben, wie die Web-Passthrough-Funktion auf einem Wireless LAN Controller (WLC) konfiguriert wird.

## Voraussetzungen

### Anforderungen

In diesem Dokument wird davon ausgegangen, dass die Erstkonfigurationen bereits auf dem WLC abgeschlossen sind.

### Verwendete Komponenten

Die Informationen in diesem Dokument basierend auf folgenden Software- und Hardware-Versionen:

- Ein 5760 WLC, der Code für Version 3.3 ausführt
- Cisco Aironet Lightweight Access Point der Serie 3600
- Native Wireless-Komponente von Microsoft Windows 7

Die Informationen in diesem Dokument beziehen sich auf Geräte in einer speziell eingerichteten

Testumgebung. Alle Geräte, die in diesem Dokument benutzt wurden, begannen mit einer gelöschten (Nichterfüllungs) Konfiguration. Wenn Ihr Netz Live ist, überprüfen Sie, ob Sie die mögliche Auswirkung jedes möglichen Befehls verstehen.

## Web-Passthrough auf Wireless LAN-Controllern

Web-Passthrough ist eine Lösung, die in der Regel für den Gastzugriff verwendet wird. Der Prozess des Web-Passthrough ähnelt dem der Web-Authentifizierung, jedoch sind für den Web-Passthrough keine Authentifizierungsdaten erforderlich.

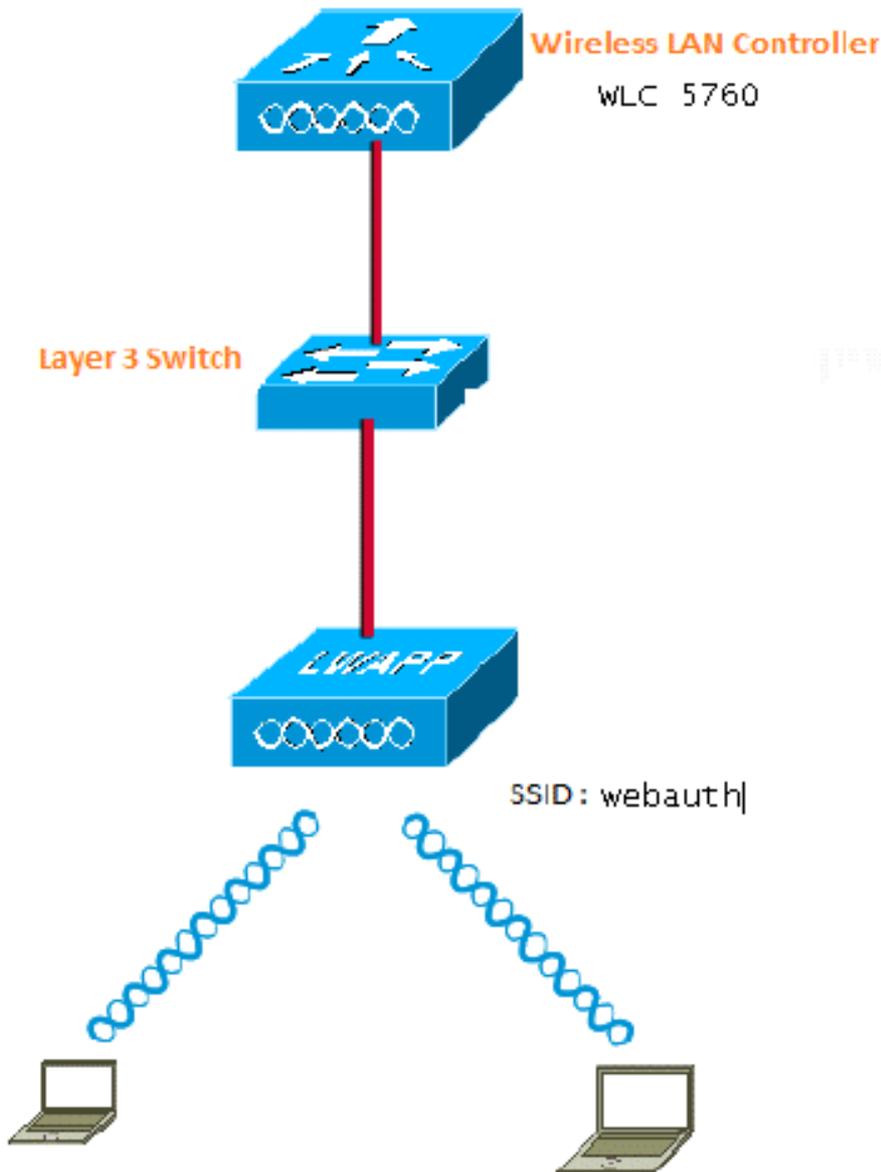

Beim Web-Passthrough werden Wireless-Benutzer auf die Seite mit den Nutzungsrichtlinien umgeleitet, wenn sie versuchen, das Internet zum ersten Mal zu verwenden. Sobald die Benutzer die Richtlinie akzeptieren, können sie im Internet surfen. Diese Umleitung zur Richtlinienseite wird vom WLC vorgenommen.

In diesem Beispiel wird eine VLAN-Schnittstelle auf einem separaten Subnetz des WLC erstellt. Anschließend wird ein separater Wireless LAN (WLAN)/Service Set Identifier (SSID) erstellt und mit Web-Passthrough konfiguriert, der dieser VLAN-Schnittstelle zugeordnet ist.

**Hinweis:** Der Web-Passthrough-Modus bietet keine Datenverschlüsselung.

## Konfiguration

Das Netzwerkdiagramm ist wie folgt:

Sie können diese Konfiguration mit der CLI oder der GUI abschließen.

## Konfiguration mit der CLI

Konfigurieren Sie DHCP-Snooping für die VLANs, die Sie für Clients verwenden. In diesem Beispiel wird **VLAN20** für Clients verwendet. Der Pool wird auf demselben WLC konfiguriert.

**10GigabitEthernet1/0/1** vom **WLC 5760** wird mit dem Uplink-Switch verbunden. Wenn der DHCP-Server auf dem Server außerhalb des WLC oder auf einem externen DHCP-Server konfiguriert ist, müssen Sie den DHCP-Snooping- und Relay-Informationen vertrauen.

```
ip device tracking
ip dhcp snooping vlan 12,20,30,40
ip dhcp snooping
!
ip dhcp pool vlan20
network 20.20.20.0 255.255.255.0
```

```

default-router 20.20.20.1

interface Vlan20
 ip address 20.20.20.1 255.255.255.0

interface TenGigabitEthernet1/0/1
 switchport trunk native vlan 12
 switchport mode trunk
 ip dhcp relay information trusted
 ip dhcp snooping trust

 security web-auth parameter-map web
 session-timeout 1800

```

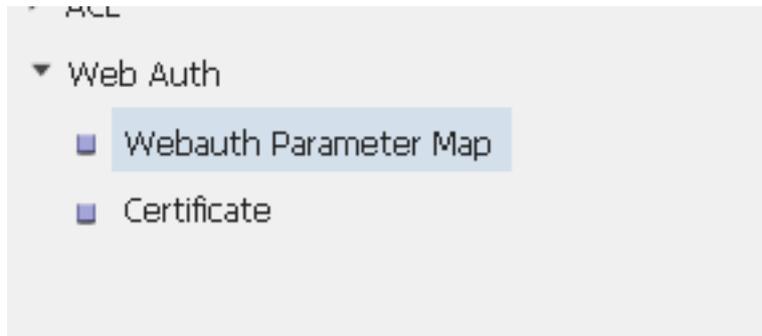

## Konfiguration mit der GUI

Führen Sie diese Schritte aus, um die Konfiguration auf der Benutzeroberfläche durchzuführen.

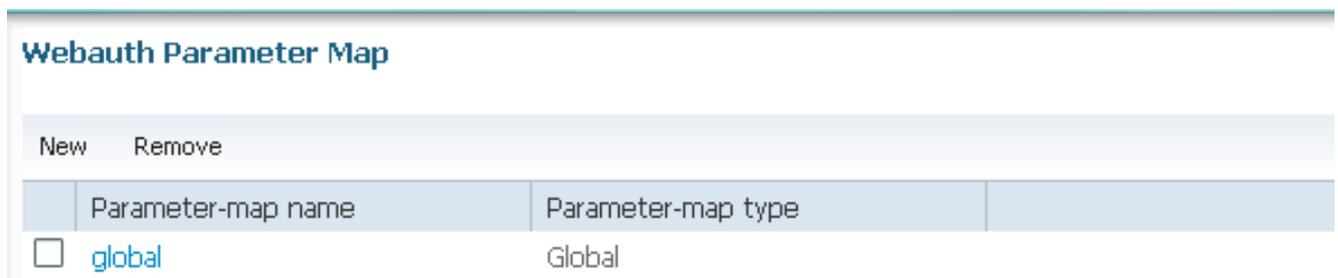

1. Navigieren Sie in der WLC-GUI zu **Configuration > Security**:

2. Navigieren Sie in der rechten unteren Ecke der **Security**-Seite zu **Webauth > Webauth Parameter Map**:

3. Wählen Sie **global** für die Standardparameterzuordnung aus:

4. Navigieren Sie zu **Webauth Parameter Map > Edit**, um die virtuelle IP-Adresse zu konfigurieren. In diesem Beispiel ist es **192.169.200.1**. Ändern Sie Type in **agree**, sodass der globale Parameter zur **Zustimmung** (Web-Passthrough) wird.

**Hinweis:** Es ist **nicht** obligatorisch, die globale Parameterzuordnung für die Zustimmung zu konfigurieren.

## Webauth Parameter Map

Webauth Parameter Map > Edit

|                                 |   |
|---------------------------------|---|
| Parameter-map name              | global  |
| Banner                          | <div style="border: 1px solid black; height: 80px; width: 100%;"></div> |
| Maximum HTTP connections(1-200) | <input type="text" value="30"/>   |
| Timeout (1-65535 in minutes)    | <input type="text" value="2"/>  |
| Type                            | <input type="text" value="consent"/>                                    |
| Turn-on Consent with Email      | <input type="checkbox"/>  |
| Virtual IPv4 Address            | <input type="text" value="192.168.200.1"/>                              |
| Virtual IPv4 hostname           | <input type="text"/>  |

5. Erstellen Sie die Parameterzuordnung, und wählen Sie die **Zustimmung** für den Typ aus. In diesem Beispiel wird **web** als Parameterzuordnungsname verwendet, der unter dem WLAN für den Zugriff der Benutzer auf die Seite Consent (Zustimmung) verwendet wird.

## Webauth Parameter Map

Webauth Parameter Map > Edit

|                                 |   |
|---------------------------------|---|
| Parameter-map name              | web   |
| Banner                          | <div style="border: 1px solid black; height: 80px; width: 100%;"></div> |
| Maximum HTTP connections(1-200) | <input type="text" value="30"/>   |
| Timeout (1-65535 in minutes)    | <input type="text" value="2"/>  |
| Type                            | <input type="text" value="consent"/>                                    |
| Turn-on Consent with Email      | <input type="checkbox"/>  |

Im Folgenden finden Sie eine Screenshot-Darstellung der Parameterzuordnungen in der GUI:

## Webauth Parameter Map

New Remove

|                          | Parameter-map name | Parameter-map type |  |
|--------------------------|--------------------|--------------------|--|
| <input type="checkbox"/> | global             | Global             |  |
| <input type="checkbox"/> | web                | Named              |  |

6. Navigieren Sie in der WLC-GUI zu **Configuration > Wireless > WLAN**, um ein neues WLAN zu erstellen. In diesem Beispiel ist **Webauth** dem **VLAN20** zugeordnet:

**WLAN**  
WLAN > Edit

General Security QOS AVC Advanced

Profile Name Webauth  
Type WLAN  
SSID Webauth  
Status   
Security Policies Web-Auth  
(Modifications done under security tab will appear after applying the changes.)  
Radio Policy All  
Interface/Interface Group(G) VLAN0020  
Broadcast SSID   
Multicast VLAN Feature

7. Navigieren Sie zu **WLAN > Edit > Security > Layer2**, und wählen Sie **None** for Layer 2 Security:

**WLAN**

WLAN > Edit

General Security QOS AVC Advanced

Layer2 Layer3 AAA Server

Layer 2 Security

MAC Filtering

Fast Transition

Over the DS

Reassociation Timeout

8. Navigieren Sie zu **WLAN > Edit > Security > Layer3**, und wählen Sie die entsprechende Einstellung für die **Webauth Parameter Map** aus. In diesem Beispiel ist es **Web**.

**WLAN**

WLAN > Edit

General Security QOS AVC Advanced

Layer2 Layer3 AAA Server

Web Policy

Conditional Web Redirect

Webauth Profile

Webauth Parameter Map

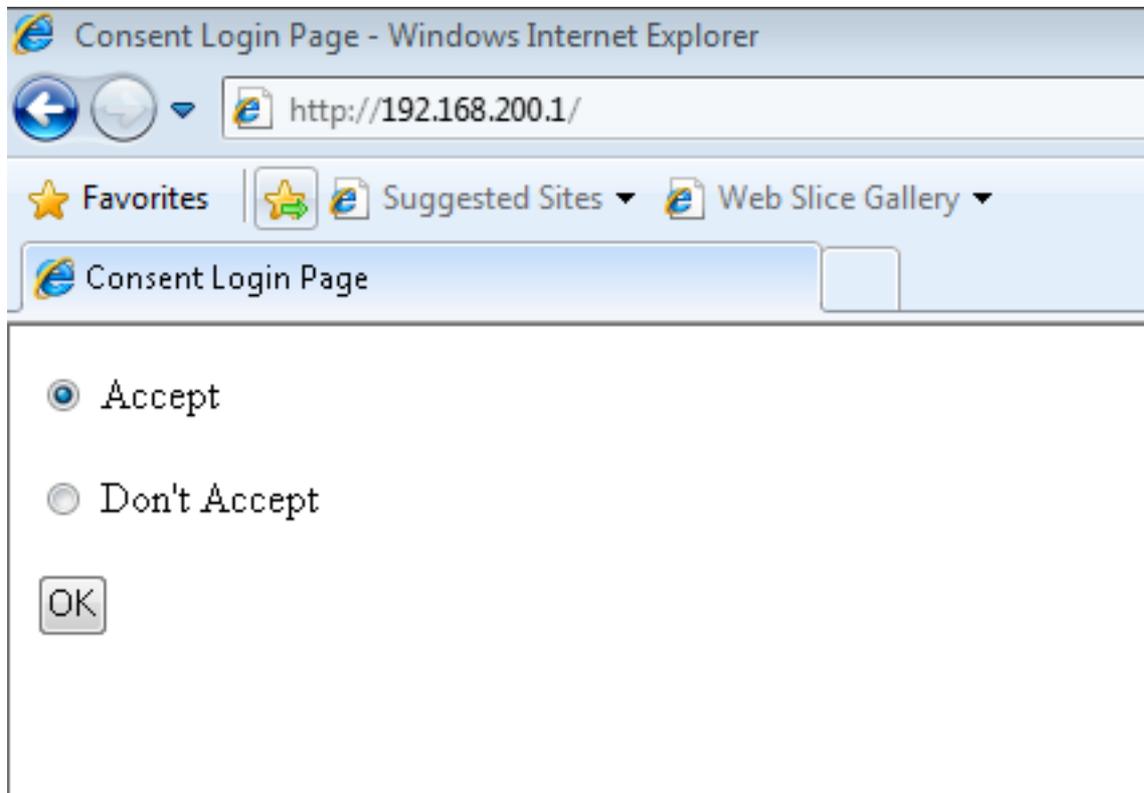

Webauth On-mac-filter Failure

Preauthentication IPv4 ACL

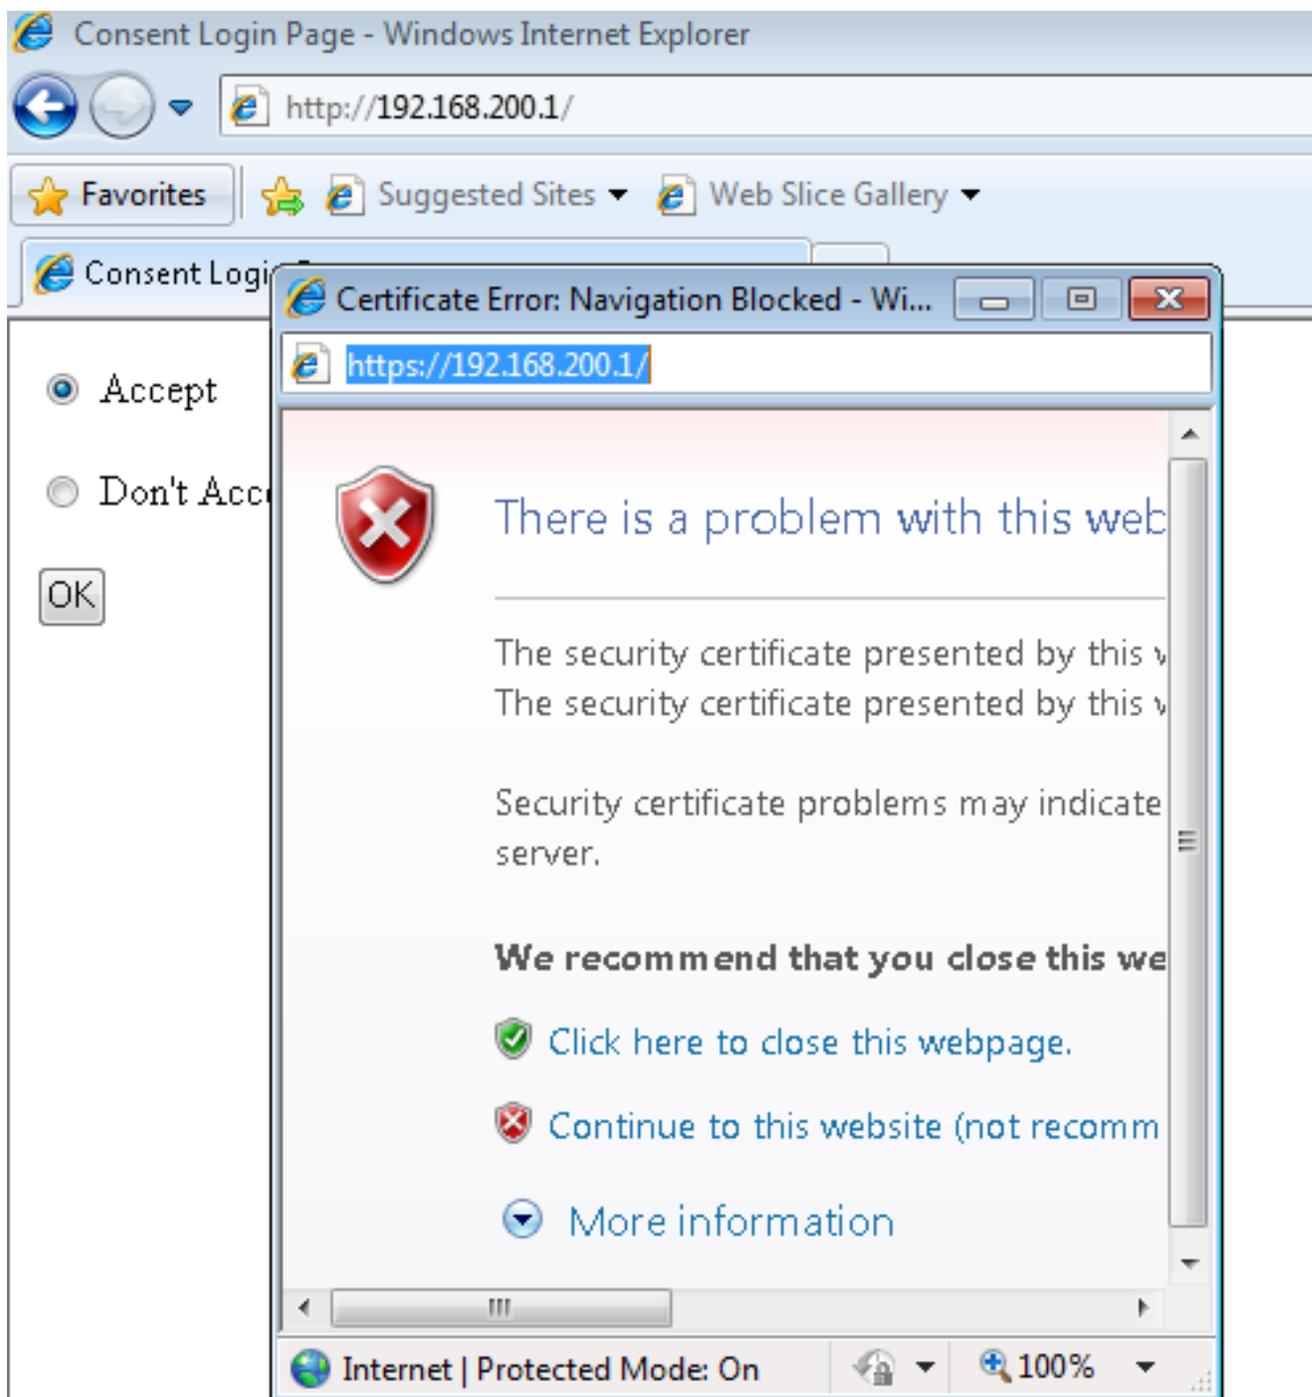

Preauthentication IPv6 ACL

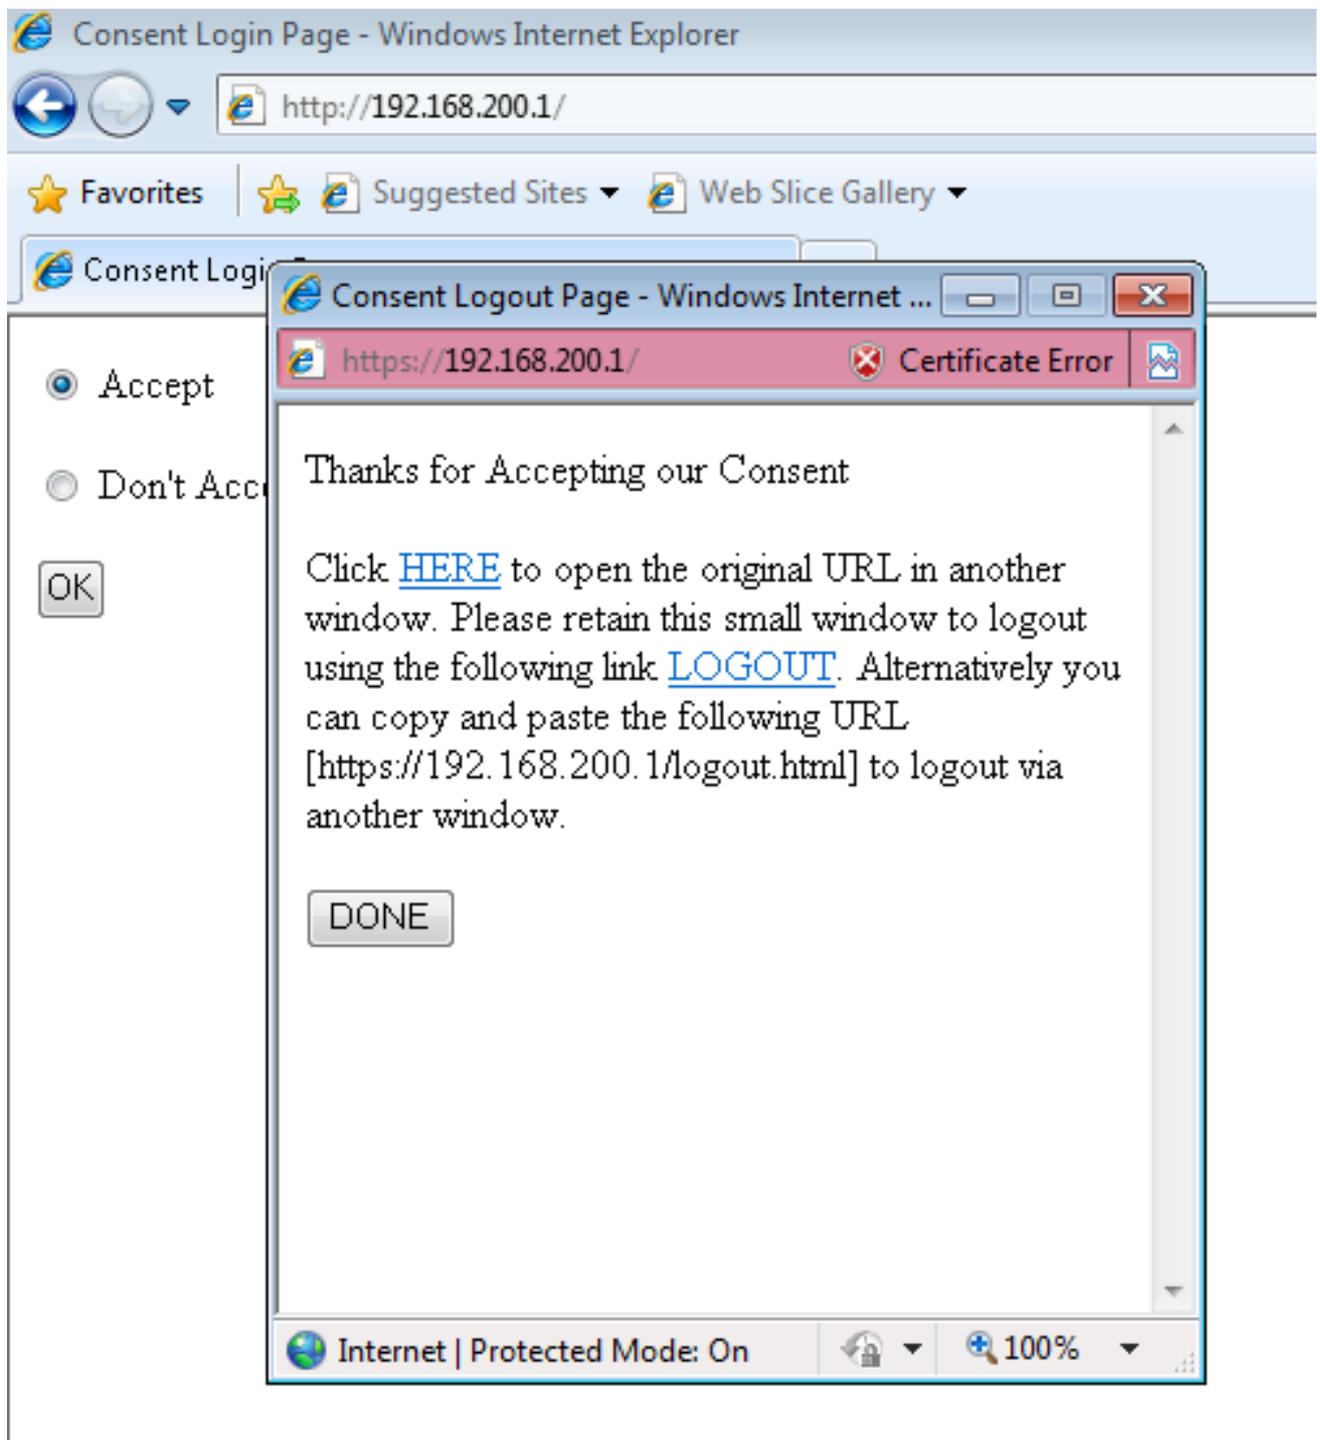

9. Speichern Sie die Konfiguration, und sie kann getestet werden.
10. Nachdem Sie eine Verbindung zum WLAN hergestellt haben, erhält der Client die IP-Adresse. Wenn Sie versuchen, den Browser mit der virtuellen IP-Adresse zu öffnen, wird die **Seite für die Einverständniserklärung** angezeigt, und Sie müssen auf das Optionsfeld **Akzeptieren** klicken.

**Hinweis:** Wenn Sie über eine gültige DNS-Konfiguration verfügen, müssen Sie die virtuelle IP-Adresse nicht manuell im Browser eingeben.

11. Wenn Sie auf **Akzeptieren** klicken, wird die Seite für die erfolgreiche Authentifizierung gestartet, auf der Sie zur angeforderten Seite navigieren können.

## Clientbeispiel

Hier ist die Paketerfassung vom Client-Laptop, wenn der Client den DHCP empfängt:

| No. | Time               | Source     | Destination     | Protocol | Length | Source Port | Destination Port | Info                                     |
|-----|--------------------|------------|-----------------|----------|--------|-------------|------------------|--|
| 1   | 09:35:55.540590000 | 0.0.0.0    | 255.255.255.255 | DHCP     | 346    | 68          | 67               | DHCP Request - Transaction ID 0xd73023c4 |
| 2   | 09:35:55.546600000 | 20.20.20.1 | 20.20.20.6      | DHCP     | 342    | 67          | 68               | DHCP ACK - Transaction ID 0xd73023c4     |

Nachdem der Client die IP-Adresse erhalten hat, öffnet der Client den Browser und gibt die virtuelle IP-Adresse ein.

**Hinweis:** Wenn der DNS korrekt konfiguriert ist, müssen Sie die virtuelle IP-Adresse nicht im Browser eingeben.

|     |                    |                              |               |         |      |     |     |   |
