## Introduction

This document describes the steps to configure, verify and troubleshoot Cisco Meeting Server (CMS) multiple WebBridges (WB) over Expressway for WebRTC.

## Prerequisites

### Requirements

Cisco recommends that you have knowledge of these topics:

- Expressway X8.11 and above
- CMS server 2.3 and above
- Network Address Translation (NAT)
- Traversal Using Relays around NAT (TURN)
- Session Traversal Utilities for NAT (STUN)
- Domain Name System (DNS)

Configuration prerequisites:

- In order to refer to a guide for a single WB proxy via Expressway, [click here](#)
- Database clustering of all CMS nodes, [click here](#) for the configuration guide
- WB, Extensible Messaging and Presence Protocol (XMPP) and CallBridge (CB) configured and enabled on CMS, [click here](#) for the configuration guide
- Clustering of the CB nodes, [click here](#) for the configuration guide

## Components Used

- Expressway X8.11

- CMS 2.3.4 (3 Nodes)

The information in this document was created from the devices in a specific lab environment. If your setup is live, ensure that you understand the potential impact of any command or configuration changes.

## Background Information

Support of WebRTC proxy with multiple WB via Expressway has been added to Expressway from version X8.11, which enables the redundancy and load balancing across WB.

In versions prior to X8.11 only load balancing is supported and connections fail when the WB chosen by the Expressway is down.

Expressway-C discovers the WB IP addresses by querying DNS with the use of the **Guest account client URI**, and from X8.11, then uses round-robin to distribute WebRTC connections evenly amongst those WBs.

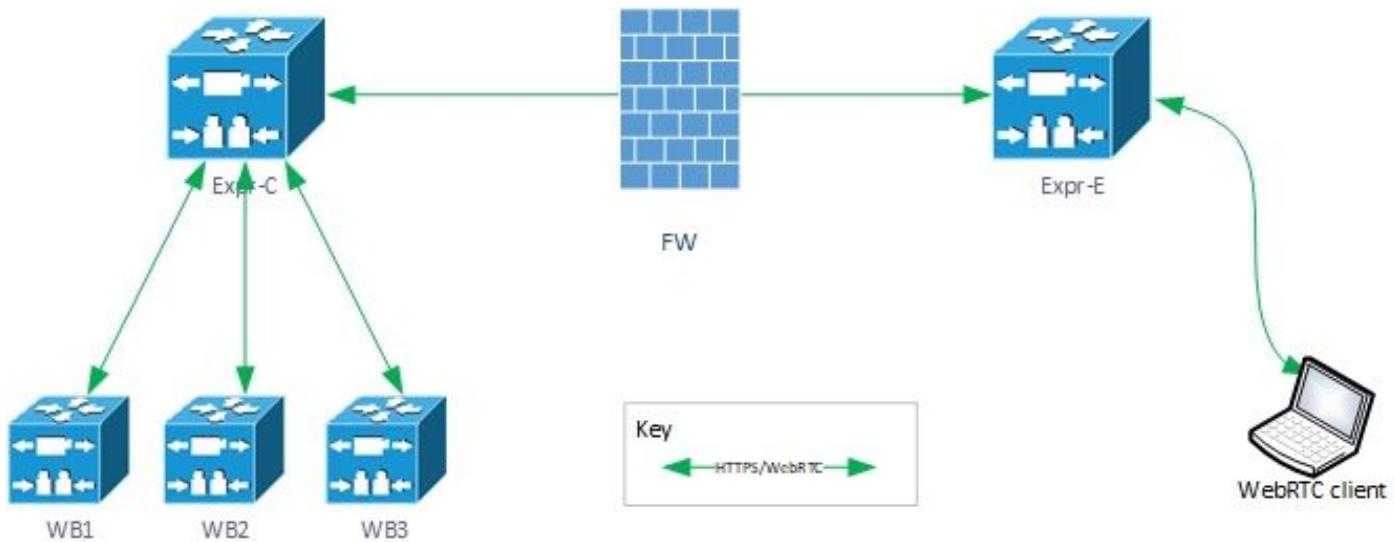

Expressway-C now maintains a dynamic list of IP addresses that it knows are WB with the use of these processes:

- It queries the DNS (every 60 minutes approximately) with the use of the (**Guest account client URI**) in order to detect any deliberate changes to your deployment; for example, host addresses being added to or removed from the Service (SRV) record
- It then probes the host addresses returned by DNS to check if they are reachable and that they are WB (with the use of an API call)
- If an address is not reachable, or the host is not a WB, then the Expressway-C stops to send WebRTC connections to that address and such addresses are marked with the **Failed** status on CMS page on the Expressway-C

**Note:** This document focuses on the multiple WB integration onto the Expressway and not the complete configuration of the WebRTC proxy which is covered in the guide on the first bullet point on the Configuration prerequisites.

## Configure

### Network Diagram

## Configurations

1. Configure these DNS SRV records for each WB nodes to which the Guest account client URI resolves:

In this example, the following applies:

Guest account client URI: **joinext.vngtp.cms**

WB1 FQDN: **cmsvngtp.vngtp.cms**

WB2 FQDN: **cms2.vngtp.cms**

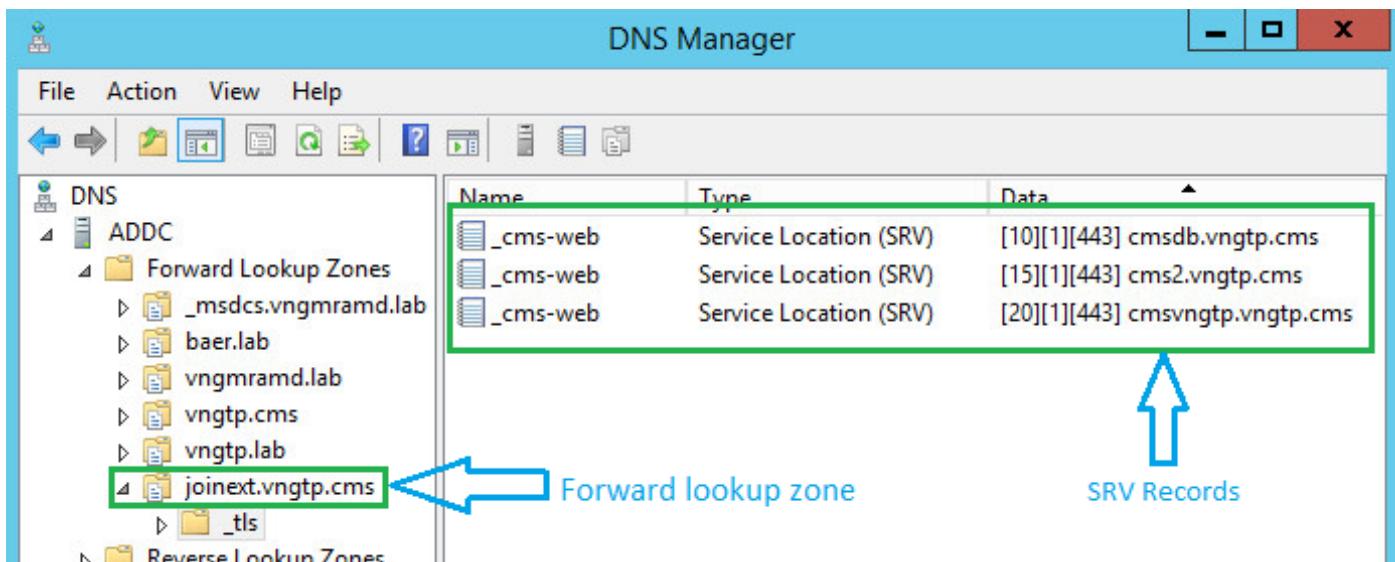

WB3 FQDN: **cmsdb.vngtp.cms**

**Note:** The below assumes that **cmsdb.vngtp.cms** has more capacity than the other callbridges so the priority is lower to allow more connections to go there from the Expressway-C.

These DNS SRV records are configured for each host Fully Qualified Domain Name (FQDN):

SRV Record	Port	Priority	Weight	Resolves to
_cms-web._tls.joinext.vngtp.cms	443	20	1	cmsvngtp.vngtp.cms
_cms-web._tls.joinext.vngtp.cms	443	15	1	cms2.vngtp.cms
_cms-web._tls.joinext.vngtp.cms	443	10	1	cmsdb.vngtp.cms

Example from DNS server:

**Note:** To allow for better load balancing of WebRTC connections via Expressway (assuming that all the servers have the same capacity) ensure that the priority and weight are the same for all the SRV records above, see below example:

SRV Record	Port	Pri ori ty	Weig ht	Resolves to
_cms-web._tls.joinext.vngtp.cms	443	0	0	cmsvngtp.vngtp.cms
_cms-web._tls.joinext.vngtp.cms	443	0	0	cms2.vngtp.cms
_cms-web._tls.joinext.vngtp.cms	443	0	0	cmsdb.vngtp.cms

2. Integrate WB onto Expressway-C with the use of the external FQDN (to be used by the external party):

- Navigate to **Configuration > Unified Communications > Cisco Meeting Server**
- Enter the FQDN in the **Guest account client URI**
- Then select **Save**

An example is shown on this image:

The screenshot shows the 'Cisco Meeting Server' configuration page. The 'Meeting Server configuration' tab is selected. Under 'Meeting Server Web Proxy', there is a dropdown menu set to 'Enable' and a 'Guest account client URI' input field containing 'joinext.vngtp.cms'. The 'Save' button at the bottom-left is highlighted with a green box.

# Verify

Use this section in order to confirm that your configuration works properly.

Check to ensure that the Expressway-C has been able to connect to all the WB to which the FQDN resolves.

Navigate to **Configuration > Unified Communications > Cisco Meeting Server**.

Once the Expressway-C has been able to reach the WB, the Status will be **Active**, as shown in this image:

Guest account client URI resolved to the following targets				
Name	Address	Priority	Weight	Status
joinext.vngtp.cms	192.168.1.66	20	1	Active
joinext.vngtp.cms	192.168.1.211	15	1	Active
joinext.vngtp.cms	192.168.1.212	10	1	Active

Some log review of what happens when the WB is added to the Expressway-C:

a. Expressway-C creates an object UUID for the Webbridge FQDN on its database for the command executions:

```
2018-07-09T14:09:10.773+02:00 vcsc httpd[8724]: web: Event="System Configuration Changed"
Detail="commands/cmsadd/uuid - created with value: 'd86cf754-dc5c-438f-900f-51e5c702b94e' Src-ip="192.168.1.5" Src-port="51223" User="admin" Level="1" UTCTime="2018-07-09 12:09:10"
2018-07-09T14:09:10.773+02:00 vcsc httpd[8724]: web: Event="System Configuration Changed"

```

b. Queries DNS for the SRV records **\_cms-web.\_tls.<WB\_FQDN>**, in this example **\_cms-web.\_tls.joinext.vngtp.cms**:

```
2052018-07-09 12:09:11.029192.168.1.64192.168.1.61DNS91Standard query 0xfb10 SRV _cms-web._tls.joinext.vngtp.cms
2062018-07-09 12:09:11.032192.168.1.61192.168.1.64DNS246Standard query response 0xfb10 SRV _cms-web._tls.joinext.vngtp.cms SRV 15 1 443 cms2.vngtp.cms SRV 20 1 443 cmsvngtp.vngtp.cms SRV 10 1 443 cmsdb.vngtp.cms A 192.168.1.211 A 192.168.1.66 A 192.168.1.212
```

c. Creates individual entries in its database for each WB in relation to the external join URI used to integrate them:

2018-07-09T14:09:11.187+02:00 vcsc UTCTime="2018-07-09 12:09:11,187" Event="System Configuration Changed" Node="clusteredb@127.0.0.1" PID="<0.488.0>" Detail="xconfiguration edgeCmsServerAddresses uuid cb7d5de8-1ab3-4a0d-a52a-8dbc885effeb name: joinext.vngtp.cms name: joinext.vngtp.cms"

2018-07-09T14:09:11.206+02:00 vcsc UTCTime="2018-07-09 12:09:11,206" Event="System Configuration Changed" Node="clusteredb@127.0.0.1" PID("<0.488.0>" Detail="xconfiguration edgeCmsServerAddresses uuid b151839e-a0dd-4176-bbed-ad28e05e9283 name: joinext.vngtp.cms address: 192.168.1.212"
2018-07-09T14:09:11.206+02:00 vcsc UTCTime="2018-07-09 12:09:11,206" Event="System Configuration Changed" Node="clusteredb@127.0.0.1" PID("<0.488.0>" Detail="xconfiguration edgeCmsServerAddresses uuid b151839e-a0dd-4176-bbed-ad28e05e9283 name: joinext.vngtp.cms priority: 10"
2018-07-09T14:09:11.206+02:00 vcsc UTCTime="2018-07-09 12:09:11,206" Event="System Configuration Changed" Node="clusteredb@127.0.0.1" PID("<0.488.0>" Detail="xconfiguration edgeCmsServerAddresses uuid b151839e-a0dd-4176-bbed-ad28e05e9283 name: joinext.vngtp.cms weight: 1"
2018-07-09T14:09:11.206+02:00 vcsc UTCTime="2018-07-09 12:09:11,206" Event="System Configuration Changed" Node="clusteredb@127.0.0.1" PID("<0.488.0>" Detail="xconfiguration edgeCmsServerAddresses uuid b151839e-a0dd-4176-bbed-ad28e05e9283 name: joinext.vngtp.cms port: 443"

```

d. The Expressway-C creates general access rules for HTTPS and WebSocket traffic in the **HTTP allow list** in the **Automatic inbound rules for the general path to the WB**:

Type	Protocol	Ports	Match type	Path	Methods
Meeting Server web bridges	https	443	Prefix	/	GET, POST, PUT, HEAD, DELETE
Meeting Server web bridges	wss	443	Prefix	/	GET, POST, PUT, HEAD, DELETE

## Troubleshoot

This section provides information you can use in order to troubleshoot your configuration.

Here are some typical issues seen after you integrate WB onto the Expressway:

1. Priority and Weight are not seen on the CMS page on the Expressway-C, as shown on the image:

The screenshot shows the 'Cisco Meeting Server' configuration page under 'Meeting Server configuration'. It includes fields for 'Meeting Server Web Proxy' (set to 'Enable') and 'Guest account client URI' (set to 'joinext.vngtp.cms'). Below this, a table titled 'Guest account client URI resolved to the following targets' lists three entries. The 'Priority' and 'Weight' columns for these entries are highlighted with a red box.

Guest account client URI resolved to the following targets				
Name	Address	Priority	Weight	Status
joinext.vngtp.cms	192.168.1.66	-	-	Active
joinext.vngtp.cms	192.168.1.211	-	-	Active
joinext.vngtp.cms	192.168.1.212	-	-	Active

Logs required:

- Diagnostic logs that include **tcpdump** from the Expressway-C Navigate to **Maintenance > Diagnostics > Diagnostic Logging** Ensure that **Take tcpdump while logging** is checked, then select **Start New Log**

What to look for in the logs:

a. In the diagnostic logs:

- Open the diagnostic logs with the use of a text editor (for example **Notepad++**), then search for the join URL with the use of the **Find All in Current Document** option
- You will see in logs that the Expressway-C doesn't create the individual WB UUID with the use of their actual FQDN, instead do so with the use of the general join URL, as shown in this log snippet:

```
2018-07-13T14:44:21.688+02:00 vcsc UTCTime="2018-07-13 12:44:21,688" Event="System Configuration Changed" Node="clusteredb@127.0.0.1" PID=<0.488.0> Detail="xconfiguration edgeCmsServerAddresses uuid 0ab708c9-4ce1-47b3-9bb6-2964baf39bb3 name: joinext.vngtp.cms guid: 97d8fa86-7de4-4410-9767-7bc8b1eeaced"

### b. In the packet capture:

- Filter with the use of the string **DNS**
- In the result, you'll see that the DNS query for SRV records fail, as shown in this image:

**eth0\_diagnostic\_logging\_tcpdump0\_vcsc\_2018-07-13\_12\_44\_29.pcap**

No.	Time	Source	Destination	Protocol	Length	Info
15	2018-07-13 12:44:07.963	192.168.1.64	192.168.1.61	DNS	74	Standard query 0x00a6 AAAA vcse.vngtp.lab
16	2018-07-13 12:44:07.963	192.168.1.64	192.168.1.61	DNS	135	Standard query response 0x00a6 AAAA vcse.vngtp.lab SOA addc.vngmramd.lab
112	2018-07-13 12:44:11.619	192.168.1.64	192.168.1.61	DNS	85	Standard query 0x13ea PTR 200.36.48.10.in-addr.arpa
130	2018-07-13 12:44:12.927	192.168.1.64	192.168.1.61	DNS	85	Standard query response 0x13ea Server failure PTR 200.36.48.10.in-addr.arpa
162	2018-07-13 12:44:17.931	192.168.1.64	192.168.1.61	DNS	85	Standard query 0xc823 PTR 200.36.48.10.in-addr.arpa
167	2018-07-13 12:44:21.568	192.168.1.64	192.168.1.61	DNS	91	Standard query 0xd373 SRV _cms-web._tls.joinext.vngtp.cms
168	2018-07-13 12:44:21.568	192.168.1.64	192.168.1.61	DNS	172	Standard query response 0xd373 No such name SRV _cms-web._tls.joinext.vngtp.cms SOA addc.vngmramd.lab
169	2018-07-13 12:44:21.569	192.168.1.64	192.168.1.61	DNS	104	Standard query 0x9792 SRV _cms-web._tls.joinext.vngtp.cms.vngmramd.lab

### Solution:

Check and ensure that you have these in the DNS server used by the Expressway-C:

- Forward Lookup Zone (FLZ) with the **Guest account client URI** and not just for the domain in the URI
- Ensure that you have the SRV records (**\_cms-web.\_tls.<WB\_FQDN>**) configured in this FLZ and that it contains the relevant Priority and Weight

### 2. One or more WB are in the **Active** status after you add the cluster with the use of the external join URL, as shown in this image:

Guest account client URI resolved to the following targets				
Name	Address	Priority	Weight	Status
joinext.vngtp.cms	192.168.1.211	15	1	Active
joinext.vngtp.cms	192.168.1.212	20	1	Failed
joinext.vngtp.cms	192.168.1.66	10	1	Active

Logs required:

- Diagnostic logs that include **tcpdump** from the Expressway-C
- Packet capture from the server shows the **Failed** state with the use of the command **pcap <interface>** on the command line interface (CLI), where the interface is the listening interface of the WB

What to look for in the logs:

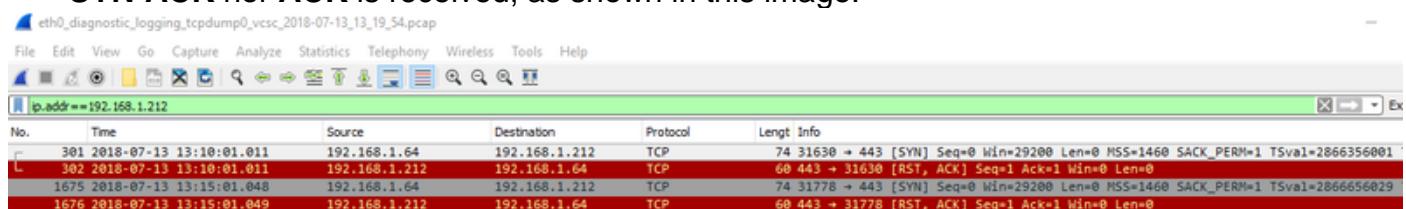

a. Diagnostic logs:

- Find All in Current Document** with the use of the IP address of the failed WB
- The error here is seen in the logs:

Detail="CMS check failed" Address="192.168.1.212", Error="[Errno 111] Connection refused"

b. In the packet capture:

- Filter on the packet capture with the use of the string **ip.addr==<IP address of the failed WB>**
- You will see **TCP SYN** messages sent from the Expressway-C to the WB and in this case no **SYN-ACK** nor **ACK** is received, as shown in this image:

- WB pcap will show that these **TCP SYN** messages arrive but no response (**SYN-ACK** nor **ACK**) is sent.

Solution:

Ensure that WB is enabled on that CMS node with the use of the command **webbridge enable** on the CLI.
