## Introduction

This document describes how to add additional VLANs, if necessary, after the initial installation of HyperFlex.

These are the steps to add more VLANs:

1. Create the VLAN within Unified Computing System Manager (UCS Manager).
2. Allow the VLAN on the Unified Computing System (UCS) vNIC templates.
3. Create a port-group/VLAN on the vSwitches.

All of this can be achieved when you run the `post_install` script from the HyperFlex installer.

## Add Additional VLANs After Installation of HyperFlex

Add VLAN 999 to UCS and to the port-groups that correspond to all the servers.

### Initial Setup

VLAN 999 does not exist in the `vm-network` vSwitch.

It also does not exist in the VLANs on UCS Manager.
