Introduction

This document describes the troubleshooting tips for first-time deployments of Zero Touch Provisioning (ZTP).

ZTP was introduced to reduce human interaction in the provision of XR devices. ZTP uses an implementation of the Preboot eXecution Environment (iPXE).

Background Information

ZTP can perform:

- Auto-Configuration update: Download and apply the XR configuration after image installation
- Script execution: Download and execute the user-defined script files. Various methods/functions can be implemented as a part of script execution: Multiple packages updateSMU installationVerificationseXR decides which of the actions to perform based on the contents of the first line in the file If the file starts with **!! IOS XR** denotes a configuration file and performs apply_config.Similarly, the files that start with **#! /bin/bash** or **#! /bin/sh** or **#!/usr/bin/python** denotes a script file, and perform script execution.Support for python is introduced from eXR 6.2.2eXR iPXE supports Trivial File Transfer Protocol (TFTP), File Transfer Protocol (FTP), and Hypertext Transfer Protocol (HTTP). Hypertext Transfer Protocol Secure (HTTPS) is not supported as it cannot predict which signature to verify.

Linux Server Configuration

iPXE is an enhancement over PXE that requires TFTP/FTP/HTTP for image/configuration download and uses Dynamic Host Configuration Protocol (DHCP) to get/provide information for the image and configuration.

DHCP Configuration

In a later example, there is a review of a packet capture to confirm the DHCP operation.

HTTP Server Requirements

HTTP server must be reachable from the Mgmt Ethernet interface.

Troubleshooting Tips

When the Linux server is set up, Perform DHCP/HTTP server reachability and functionality Check.

In this setup, a single Linux server is used as DHCP/HTTP server. If there are separate servers for these functions, verify these steps on all the servers, if needed.

```
[root@xxxxxxxxxxxx]# service dhcpcd status
Redirecting to /bin/systemctl status dhcpcd.service
dhcpcd.service - DHCPv4 Server Daemon
   Loaded: loaded (/usr/lib/systemd/system/dhcpcd.service; disabled; vendor preset: disabled)
     Active: active (running) since Mon 2017-05-29 10:30:59 PDT; 15h ago
       Docs: man:dhcpcd(8)
              man:dhcpcd.conf(5)
    Main PID: 26913 (dhcpcd)
      Status: "Dispatching packets..."
     CGroupl: /system.slice/dhcpcd.service
              26913 /usr/sbin/dhcpcd -f -cf /etc/dhcp/dhcpcd.conf -user dhcpcd -group dhcpcd --no-pid
<SNIP>
```

Hint: Some lines were ellipsized, use -l to show in full.

```
[root@xxxxxxxx]# service httpd status
Redirecting to /bin/systemctl status httpd.service
httpd.service - The Apache HTTP Server
   Loaded: loaded (/usr/lib/systemd/system/httpd.service; disabled; vendor preset: disabled)
     Active: active (running) since Fri 2017-05-26 05:50:30 PDT; 3 days ago
       Docs: man:httpd(8)
              man:apachectl(8)
  Process: 28088 ExecStop=/bin/kill -WINCH ${MAINPID} (code=exited, status=0/SUCCESS)
  Process: 11036 ExecReload=/usr/sbin/httpd $OPTIONS -k graceful (code=exited, status=0/SUCCESS)
    Main PID: 28095 (httpd)
      Status: "Total requests: 0; Current requests/sec: 0; Current traffic: 0 B/sec"
     CGroupl: /system.slice/httpd.service
              11037 /usr/sbin/httpd -DFOREGROUND
              11038 /usr/sbin/httpd -DFOREGROUND
              11039 /usr/sbin/httpd -DFOREGROUND
              11040 /usr/sbin/httpd -DFOREGROUND
              11041 /usr/sbin/httpd -DFOREGROUND
              26998 /usr/sbin/httpd -DFOREGROUND
              27426 /usr/sbin/httpd -DFOREGROUND
              27427 /usr/sbin/httpd -DFOREGROUND
              27428 /usr/sbin/httpd -DFOREGROUND
              27889 /usr/sbin/httpd -DFOREGROUND
```

```
28095 /usr/sbin/httpd -DFOREGROUND

May 26 05:50:30 xxxxx systemd[1]: Starting The Apache HTTP Server...
May 26 05:50:30 xxxxx systemd[1]: Started The Apache HTTP Server.
May 27 03:16:01 xxxxx systemd[1]: Reloaded The Apache HTTP Server.
May 28 03:37:01 xxxxx systemd[1]: Reloaded The Apache HTTP Server.
```

Enable Router To Get IP Address With DHCP

```
Interface MgmtEth 0/RP0/CPU0/0
Ipv4 address dhcp
Shut/no shut
```

Verify HTTP Server Is Functional

- Test that <http://<ip>-<servername>> is works.
- Open a browser to the IP address/server name.

If DHCP or HTTP fails to work, there can be firewall issues or reachability problems.

To check the firewall properties on the server perform these commands or add the specific protocols:

Use IP tables command to verify firewall rules:

```
Iptables -L -n
Chain IN_public_allow (1 references)
target     prot opt source          destination
ACCEPT    udp  --  0.0.0.0/0      0.0.0.0/0
ACCEPT    tcp  --  0.0.0.0/0      0.0.0.0/0
ACCEPT    tcp  --  0.0.0.0/0      0.0.0.0/0
                                         udp dpt:67 ctstate NEW
                                         tcp dpt:80 ctstate NEW
                                         tcp dpt:22 ctstate NEW
```

Use this firewall command to list the entries allowed:

```
[root@xxxxxxxxx ~]# firewall-cmd --list-all
public (active)
  target: default
  icmp-block-inversion: no
  interfaces: enp2s0f0
  sources:
  services: dhcp dhcpcv6-client http ssh
  ports:
  protocols:
  masquerade: no
  forward-ports:
  sourceports:
  icmp-blocks:
  rich rules:
```

Use the commands to permanently allow ports:

```
firewall-cmd --permanent --add-service=http
firewall-cmd --permanent --add-service=dhcp
```

Enable Packet capture on DHCP server:

```
tcpdump -i <interface id> port (bootpc & bootps & port http) -s 0(buffer size) -w <dest. File name>
```

ex: tcpdump -i enp2s0f0 port 67 or port 68 or port 80 -s 0 -w iPXEboot.pcap

How To Start ZTP?

Manually Initiate ZTP

Use **ZTP initiate** exec CLI command to invoke ZTP. By default, the interface used for ZTP is MGMTEth. To initiate this process on other interfaces use this option:

ZTP initiate interface <type> <number> <cr>

OR

Ztp initiate <cr>

Boot The Router With iPXE

1. From Calvados, initiate the reload CLI command:

This command causes a router to reload, which initiates the iPXE boot.

Note: User-class information is interpreted as a **Malformed option** due to a bug in Wireshark.

2. The router initiates DHCP Discover, notice that user-class is populated with iPXE option:

	-5500=.F OC2026R3
	8ZM.exr- config.

In this Discover, notice that user-class info includes *.exr-config. Since the DHCP is configured to either return **Config file** or **Script** (ie. Else statement in `etc/dhcp/dhcpd.conf`).

7. DHCP server returns the required file information in option 67:

The script can be included as a response from the DHCP server and have them copy the image/configuration. This can also be used as a post-install script like in the below example.

Post-Install Automation

Various automation can be performed post-installation on the eXR software.

In this example, this script installs all required packages and applies the Config. This is a slightly modified version of **ztp_helper.sh**. This script is invoked from xr-linux-shell:

```
RP/0/RP0/CPU0:NCS-5502-A#more disk0:/ztp/ztp_helper_file.sh
Wed May 31 00:55:54.529 UTC
#!/bin/bash
#####
# Install config and additional packages
#####

source /disk0:/ztp/ztp_helper.sh
