Related Information

Introduction

This document discusses the setup of an EtherChannel between a Cisco Catalyst 5500 switch and a Catalyst 6500 switch, both running Catalyst OS (CatOS). Any Catalyst 4500/4000, 5500/5000, or 6500/6000 series switch running CatOS could have been used in this scenario to obtain the same results. EtherChannel can be called Fast EtherChannel (FEC) or Gigabit EtherChannel (GEC), depending on the speed of the interfaces or ports used to form the EtherChannel.

In this example, two Fast Ethernet (FE) ports from each of the switches have been bundled into an FEC. Throughout this document, the terms "Fast EtherChannel", "Gigabit EtherChannel", "port channel", "channel", and "port group" all refer to EtherChannel.

This document includes only the configuration files from the switches and the output from the related sample **show** commands. For further details on how to configure an EtherChannel between Catalyst switches, refer to the following document:

- [Configuring EtherChannel Between Catalyst 4000, 5000, and 6000 Switches Running CatOS](#)

This document does not provide configurations using the Link Aggregation Control Protocol (LACP). For more information on configuring LACP, refer to the following document:

- [Configuring LACP \(802.3ad\) Between a Catalyst 6000 and a Catalyst 4000](#)

Prerequisites

Requirements

There are no specific requirements for this document.

Components Used

The information in this document is based on these software and hardware versions:

- Catalyst 5500 switch running CatOS 6.3(7) software
- Catalyst 6500 switch running CatOS 7.2(2) software

Note: Before configuring the channel between the CatOS switches, refer to the following document:

- System Requirements to Implement EtherChannel on Catalyst Switches

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

For more information on document conventions, refer to Cisco Technical Tips Conventions.

Background Theory

EtherChannel may be configured unconditionally (using channel mode on), or it may be configured by having the switch negotiate the channel with the far end using the Port Aggregation Protocol (PAgP) (using channel mode desirable).

Note: Catalyst switches running CatOS support PAgP, and therefore desirable mode is recommended for setting up an EtherChannel between these devices. PAgP protects against any misconfigurations between the two devices. Channel mode on can be useful when the far end device does not support PAgP and you need to set up the channel unconditionally. The silent or non-silent keywords are available with auto and desirable channel modes. The silent keyword is enabled by default on all ports for Catalyst 4500/4000 or 6500/6000, and on copper ports of Catalyst 5500/5000 series switches. The non-silent keyword is enabled by default on all fiber ports (FE and Gigabit Ethernet [GE]) for Catalyst 5500/5000 series switches. It is recommended to use the default silent or non-silent keyword when connecting between Cisco switches.

For more details on PAgP and EtherChannel, go to the Technical Documentation for your release of CatOS software found on the Cisco Switches product pages. Refer to the sections *Configuring Fast EtherChannel and Gigabit EtherChannel* or *Configuring EtherChannel*. You may wish to use your browser Find feature to locate these sections.

Another good reference is the *EtherChannel / Port Aggregation Protocol* section of the following document:

- Best Practices for Catalyst 4000, 5000, and 6000 Series Switch Configuration and Management

Configure

In this section, you are presented with the information to configure the features described in this document.

Note: To find additional information on the commands used in this document, use the Command Lookup Tool [↗](#) (registered customers only) .

Network Diagram

This document uses this network setup:

Catalyst 5500

Catalyst 6509

Configurations

This document uses these configurations:

- Catalyst 5500 Switch
- Catalyst 6500 Switch

Note: The configurations listed in this document have been implemented by configuring the EtherChannel using PAgP negotiation through the recommended desirable mode.

Catalyst 5500 Switch

Verify

This section provides information you can use to confirm your configuration is working properly.

show Commands

Certain **show** commands are supported by the Output Interpreter Tool [🔗](#) (registered customers only), which allows you to view an analysis of **show** command output.

To check the port channel in a CatOS switch, issue the following commands:

- **show port capabilities** *module*
- **show port channel**
- **show port channel** *module/port*
- **show port channel info**

To check the Spanning Tree Protocol (STP) status in a CatOS switch, issue the following commands:

- **show spantree**
- **show spantree** *vlan*
- **show spantree** *module/port*

Sample show Command Output

Catalyst 5500 Switch

show port capabilities module

This command is used to check whether the module is capable of channeling. It also shows what other ports are allowed to form the channel with this port.

```
cat5500> (enable) show port capabilities 4
Model                WS-X5225R
Port                 4/1
Type                 10/100BaseTX

```

!--- Output suppressed.

show port channel

This command, along with the **show port channel info** command, is used to check the status of the port channel.

```

cat5500> (enable) show port channel
Port  Status      Channel
Mode                                Admin Ch
                                      Group Id
-----
 4/1  connected  desirable silent      50  865
 4/2  connected  desirable silent      50  865
-----

Port  Device-ID                                Port-ID                                Platform
-----
 4/1  TBA04380080 (cat6500)                    4/1                                    WS-C6506
 4/2  TBA04380080 (cat6500)                    4/2                                    WS-C6506
-----

```

Note: Ports 4/3 and 4/4 are shown in the output above if they are in the not-connected status.

If you have the output of a **show port channel** command from your Cisco device, you can use the Output Interpreter Tool [🔗](#) (registered customers only), to display potential issues and fixes.

show spantree module/port

```

cat5500> (enable) show spantree 4/1
Port                Vlan  Port-State  Cost      Prio  Portfast  Channel_id
-----
 4/1-2              1     forwarding  12        32   disabled  865

cat5500> (enable) show spantree 4/2
Port                Vlan  Port-State  Cost      Prio  Portfast  Channel_id
-----
 4/1-2              1     forwarding  12        32   disabled  865

```

Note: Output of the **show spantree module/port** command for ports 4/1 and 4/2 is identical since these ports are grouped together in one channel with the Channel ID of 865.

Catalyst 6500 Switch

show port capabilities module

This command is used to check whether the module is capable of channeling. It also shows what other ports are allowed to form the channel with this port.

```

cat6500> (enable) show port capabilities 4/1
Model                WS-X6248-RJ-45
Port                 4/1
Type                 10/100BaseTX
Speed                auto,10,100
Duplex                half,full
Trunk encap type     802.1Q,ISL
Trunk mode           on,off,desirable,auto,nonegotiate
Channel             yes
Broadcast suppression no
Flow control         receive-(off,on),send-(off)
Security             yes
Dot1x                 yes
Membership           static,dynamic
Fast start           yes
QOS scheduling       rx-(1q4t),tx-(2q2t)
CoS rewrite          yes

```

```

ToS rewrite          DSCP
UDLD                 yes
Inline power        no
AuxiliaryVlan       1..1000,1025..4094,untagged,dot1p,none
SPAN                 source,destination
COPS port group     4/1-48
Link debounce timer yes

```

show port channel

This command, along with the **show port channel info** command, is used to check the status of the port channel.

```

cat6500> (enable) show port channel
Port  Status      Channel
-----
4/1   connected   desirable silent
4/2   connected   desirable silent
-----
Port  Device-ID          Port-ID          Platform
-----
4/1   069001645(cat5500) 4/1             WS-C5500
4/2   069001645(cat5500) 4/2             WS-C5500

```

Note: Ports 4/3 and 4/4 are shown in the output above if they are in the not-connected status.

If you have the output of a **show port channel** command from your Cisco device, you can use the Output Interpreter Tool [🔗](#) (registered customers only), to display potential issues and fixes.

show port channel info

```

cat6500> (enable) show port channel info

4/14                       1    not-connected      100       32 disabled 0

```

!--- Output suppressed.

If you have the output of a **show spantree** command from your Cisco device, you can use the Output Interpreter Tool [🔗](#) (registered customers only), to display potential issues and fixes.

show spantree module/port

```

cat6500> (enable) show spantree 4/1
Port                        Vlan Port-State      Cost      Prio Portfast Channel_id
-----
4/1-2                    1    forwarding        12      32 disabled 865

cat6500> (enable) show spantree 4/2
Port                        Vlan Port-State      Cost      Prio Portfast Channel_id
-----
4/1-2                    1    forwarding        12      32 disabled 865

```

Note: Output of the **show spantree module/port** command for ports 3/1 and 3/2 is identical since these ports are grouped together in one channel with the Channel ID of 865.

Special Consideration Using Unconditional on Channel Mode

Cisco recommends using PAgP for port channel configuration, as described in Background Theory, above. If for any reason you are configuring the EtherChannel unconditionally (using channel mode on), it is

recommended that you create a port channel by following the steps below. This avoids possible problems with STP during the configuration process. STP loop detection may disable the ports if one side is configured as a channel before the other side can be configured as a channel.

1. Set the ports to be used in port channeling to disable mode on the first switch by issuing the **set port disable** *module/port* command.
2. Create the port channel (port group) on the first switch and set the channel mode to on.
3. Create the port channel on the second switch and set the channel mode to on.
4. Re-enable the ports that were disabled earlier on the first switch by issuing the **set port enable** *module/port* command.
