## Introduction

This sample configuration illustrates a router configured for mode configuration (user gets an IP address from the pool), wild-card pre-shared keys (all PC clients share a common key), and network address translation (NAT). In this configuration, an off-site user can enter the network and have an internal IP address assigned from the pool. To users, it appears that they are inside the network. Because private addressing, hence NAT, is involved, the router must be told what to translate and what not to translate.

## Prerequisites

### Requirements

There are no specific requirements for this document.

### Components Used

The information in this document is based on these software and hardware versions:

- Cisco IOS® Software Release 12.0.7T or later
- Hardware that supports this software revision
- CiscoSecure VPN Client 1.0/10A or 1.1 (shown as 2.0.7/E or 2.1.12, respectively, go to **Help > About** to check)

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

## Conventions

For more information on document conventions, refer to the Cisco Technical Tips Conventions .

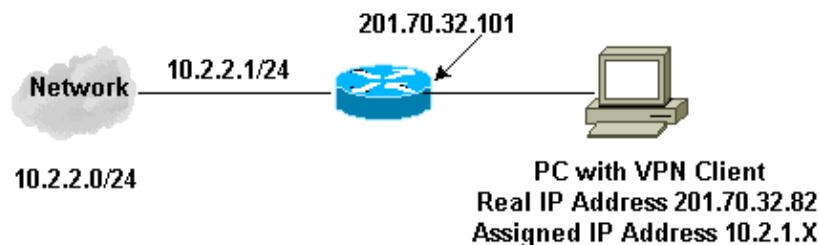

## Configure

In this section, you are presented with the information to configure the features described in this document.

**Note:** To find additional information on the commands used in this document, use the Command Lookup Tool (registered customers only) .

### Network Diagram

This document uses the network setup shown in this diagram.

## Configurations

This document uses these configurations.

- VPN Client
- Router

VPN Client Configuration	
Network Security policy:	
1- Myconn	<pre>My Identity = ip address     Connection security: Secure     Remote Party Identity and addressing         ID Type: IP subnet         10.2.2.0         Port all Protocol all      Connect using secure tunnel         ID Type: IP address         201.70.32.101</pre>
Authentication (Phase 1)	
Proposal 1	<pre>    Authentication method: pre-shared key     Encryp Alg: DES     Hash Alg: MD5     SA life: Unspecified     Key Group: DH 1</pre>
Key exchange (Phase 2)	
Proposal 1	<pre>    Encapsulation ESP</pre>

```

Encrypt Alg: DES
Hash Alg: MD5
Encap: tunnel
SA life: Unspecified
no AH

2- Other Connections
Connection security: Non-secure
Local Network Interface
Name: Any
IP Addr: Any
Port: All

```

## Verify

This section provides information you can use to confirm your configuration is working properly.

Certain **show** commands are supported by the Output Interpreter Tool (registered customers only) , which allows you to view an analysis of **show** command output.

- **show crypto engine connections active** Shows the encrypted and decrypted packets.
- **show crypto ipsec sa** Shows the phase 2 security associations.
- **show crypto isakmp sa** Shows the phase 1 security associations.

## Troubleshoot

This section provides information you can use to troubleshoot your configuration.

### Troubleshooting Commands

**Note:** Before issuing **debug** commands, refer to Important Information on Debug Commands.

These debugs must run on both IPSec routers (peers). Clearing security associations must be done on both peers.

- **debug crypto ipsec** Displays the IPSec negotiations of phase 2.
- **debug crypto isakmp** Displays the ISAKMP negotiations of phase 1.
- **debug crypto engine** Displays the traffic that is encrypted.
- **clear crypto isakmp** Clears the security associations related to phase 1.
- **clear crypto sa** Clears the security associations related to phase 2.

## Sample Debug Output
