Related Information

Introduction

This document describes the new, high-availability features for site-to-site IPSec VPN networks. Hot Standby Router Protocol (HSRP) is often used to track routers' interface status to achieve failover between routers. However, because no internal correlation exists between IPSec and HSRP, HSRP does not track the state of IPSec security associations (SAs) and IPSec requires schemes in order to synchronize with HSRP failover when it occurs. These are some highlights of the schemes used to provide a closer coupling between IPSec and HSRP:

- Internet Key Exchange (IKE) keepalive is used to allow IPSec to detect HSRP failover in time.
- The crypto map applied on a specific router interface is linked with the HSRP group already configured on that interface to make IPSec aware of HSRP setup. This also allows IPSec to use the HSRP virtual IP address as the Internet Security Association and Key Management Protocol (ISAKMP) identity of the HSRP routers.
- The reverse route injection (RRI) feature is used to allow dynamic routing information updates during the HSRP and IPSec failover.

Note: This Document describes how to use Hot Standby Router Protocol (HSRP) with VPN. HSRP is also used to track failed ISP links. In order to configure redundant ISP links on routers, refer to Analyzing IP Service Levels Using the ICMP Echo Operation. Here the source device is the router and the destination device is the ISP device.

Prerequisites

Requirements

There are no specific prerequisites for this document.

Components Used

The information in this document is based on these software and hardware versions:

- Cisco 7200 Series Routers
- Cisco IOS® Software Release 12.3(7)T1, c7200-a3jk9s-mz.123-7.T1

The information presented in this document was created from devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If you are working in a live network, ensure that you understand the potential impact of any command before using it.

Conventions

Refer to Cisco Technical Tips Conventions for more information on document conventions.

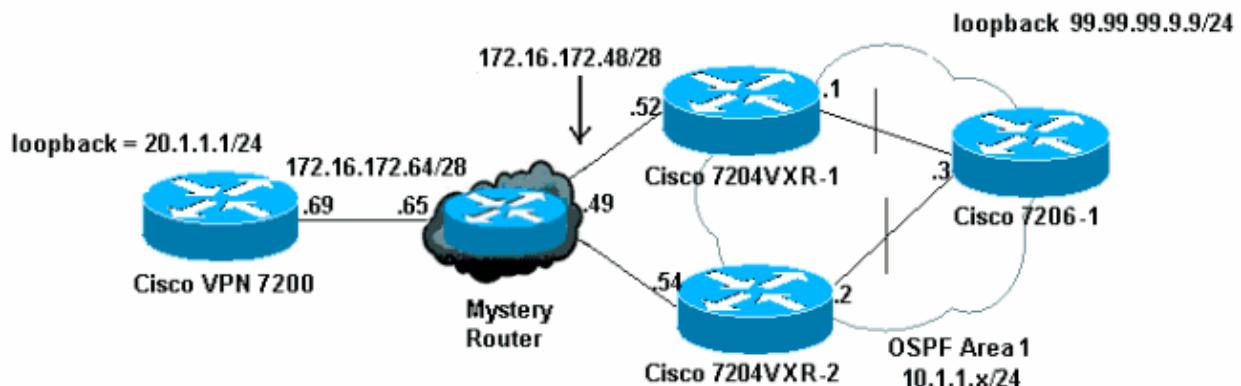

Configure

In this section, you are presented with the information to configure the features described in this document.

Note: Use the Command Lookup Tool (registered customers only) to obtain more information on the commands used in this section.

Network Diagram

This document uses this network setup:

Configurations

This document uses these configurations:

- Cisco VPN 7200 Configuration
- Cisco 7204VXR-1 Configuration
- Cisco 7204VXR-2 Configuration
- Cisco 7206-1 Configuration

How Does It Work?

This example demonstrates how HSRP and IPSec failover work together using the above setup and configuration. Three aspects are highlighted in this case study:

- HSRP failover due to interface failure.
- How IPSec failover happens after HSRP failover. As can be seen, IPSec failover here will be "stateless" failover.
- How the routing information changes caused by the failover are dynamically updated and propagated to internal networks.

Note: The test traffic here is Internet Control Message Protocol (ICMP) packets between the loopback IP address of the Cisco 7206–1 (99.99.99.99) and the loopback IP address of the Cisco VPN 7200 (20.1.1.1) and simulates the VPN traffic between the two sites.

Normal Circumstance (Before Failover)

Before failover, the Cisco 7204VXR–1 is the primary HSRP router and the Cisco VPN 7200 has IPSec SAs with the Cisco 7204VXR–1.

When the crypto map is configured on the interface, the RRI feature injects a VPN route to match the configured IPSec access control list (ACL) and the **set peer** command statement in the crypto map. This route is added to the routing table of the primary HSRP router 7204VXR–1.

The output of the **debug crypto ipsec** command indicates the addition of VPN route 20.1.1/24 to the Routing Information Base (RIB).

```

IPSEC(rte_mgr): VPN Route Added 20.1.1.0 255.255.255.0
via 172.16.172.69 in IP DEFAULT TABLE

```

The routing table on the primary HSRP router yields a static route to 20.1.1/24, which is redistributed by Open Shortest Path First (OSPF) to the secondary HSRP router, 7204VXR-2, and to the internal router, 7206-1.

The next hop for the VPN route 20.1.1/24 injected as a static route into the RIB of router 7204VXR-1 is the IP address of the remote crypto peer. In this case, the next hop for the VPN route 20.1.1/24 is 172.16.172.69. The IP address of the next hop of the VPN route is resolved via a recursive route lookup as shown in this Cisco Express Forwarding table:

```
7204VXR-1#show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF,
      IA - OSPF inter area, N1 - OSPF NSSA external type 1,
      N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
      E2 - OSPF external type 2, i - IS-IS, su - IS-IS summary,
      L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area,
      * - candidate default, U - per-user static route
      o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

      99.0.0.0/32 is subnetted, 1 subnets
O       99.99.99.99 [110/2] via 10.1.1.3, 00:11:21, FastEthernet0/1
20.0.0.0/24 is subnetted, 1 subnets
S       20.1.1.0 [1/0] via 172.16.172.69
      172.16.0.0/28 is subnetted, 2 subnets
C       172.16.172.48 is directly connected, FastEthernet0/0
S       172.16.172.64 [1/0] via 172.16.172.49
      10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
C       10.1.1.0/24 is directly connected, FastEthernet0/1
S       10.48.66.0/23 [1/0] via 10.1.1.2

7204VXR-1#show ip cef 20.1.1.0 detail
20.1.1.0/24, version 66, epoch 0, cached adjacency 172.16.172.49
0 packets, 0 bytes
via 172.16.172.69, 0 dependencies, recursive
next hop 172.16.172.49, FastEthernet0/0 via 172.16.172.64/28
valid cached adjacency
```

The secondary HSRP router and the internal router 7206-1 learn this VPN route via OSPF/. Network administrators do not need to input the static route manually. More importantly, the routing changes caused by the failover are updated dynamically.

```
7204VXR-2#show ip route

```

After HSRP and IPSec Failover

The failover was triggered by shutting down Fa0/0 on the Cisco 7204VXR-1. You will see similar behavior if the other interface, Fa0/1, is down because HSRP also tracks the status of this interface.

When the Cisco VPN 7200 receives no response to IKE keepalive packets sent to the primary HSRP router, the router tears down the IPSec SAs.

This **debug crypto isakmp** command output shows how the IKE keepalive detects the outage of the primary router:

```
ISAKMP (0:1): received packet from 172.16.172.53 (I) QM_IDLE
ISAKMP (0:1): processing HASH payload. message ID = 1585108592
ISAKMP (0:1): processing NOTIFY ITS_ALIVE protocol 1
spi 0, message ID = 1585108592, sa = 61C3E754
ISAKMP (0:1): sending packet to 172.16.172.53 (I) QM_IDLE
ISAKMP (0:1): purging node -1484552386
ISAKMP (0:1): deleting node 1585108592 error FALSE
    reason "informational (in) state 1"
ISAKMP (0:1): purging node 642343711
ISAKMP (0:1): sending packet to 172.16.172.53 (I) QM_IDLE
ISAKMP (0:1): purging node -523181212
ISAKMP (0:1): purging node -2089541867
ISAKMP (0:1): incrementing error counter on sa: PEERS_ALIVE_TIMER

ISAKMP (0:1): sending packet to 172.16.172.53 (I) MM_NO_STATE
ISAKMP (0:1): purging node -248155233
ISAKMP (0:1): peer does paranoid keepalives.

IPSEC(key_engine): got a queue event...
```

```

IPSEC(key_engine_delete_sas): rec'd delete notify from ISAKMP
IPSEC(key_engine_delete_sas): delete all SAs shared with 172.16.172.53
ISAKMP (0:1): purging node 958118275

```

When failover occurs on the Cisco 7204VXR-1 primary HSRP router, the device becomes a standby router. Existing ISAKMP and IPsec SAs are torn down. The Cisco 7204VXR-2 secondary HSRP router becomes active and establishes new IPsec SAs with the Cisco VPN 7200.

Output of the **debug standby events** command shows events related to HSRP.

```

HSRP: Fa0/0 API Software interface going down
HSRP: Fa0/0 API Software interface going down
HSRP: Fa0/0 Interface down
HSRP: Fa0/0 Grp 1 Active: b/HSRP disabled
HSRP: Fa0/0 Grp 1 Active router is unknown, was local
HSRP: Fa0/0 Grp 1 Standby router is unknown, was 172.16.172.54
HSRP: Fa0/0 Grp 1 Active -> Init
%HSRP-6-STATECHANGE: FastEthernet0/0 Grp 1 state Active -> Init
HSRP: Fa0/0 Grp 1 Redundancy "VPNHA" state Active -> Init
%Crypto-5-SESSION_STATUS: Crypto tunnel is DOWN.
    Peer 172.16.172.69:500 Id: 172.16.172.69
HSRP: Fa0/0 Grp 1 Redundancy enquiry for VPNHA succeeded
HSRP: Fa0/0 API Add active HSRP addresses to ARP table
%LINK-5-CHANGED: Interface FastEthernet0/0,
    changed state to administratively down
HSRP: API Hardware state change
%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/0,
    changed state to down

```

Because the interface is shut down, the HSRP state changes to "Init".

```

paal#show standby

Hello time 3 sec, hold time 10 sec
Next hello sent in 0.116 secs
Preemption enabled
Active router is local
Standby router is unknown
Priority 100 (default 100)
Track interface FastEthernet1/0 state Up decrement 10
IP redundancy name is "VPNHA" (cfgd)

```

With RRI enabled, the VPN routes are updated dynamically during the failover. The static route 20.1.1.0/24 is removed, and Cisco 7204VXR-1 router learns the route from the Cisco 7204VXR-2 router.

The output from the **show ip route** command demonstrates this dynamic update.

```

7204VXR-1#show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF,
      IA - OSPF inter area, N1 - OSPF NSSA external type 1,
      N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
      E2 - OSPF external type 2, i - IS-IS, su - IS-IS summary,
      L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area,
      * - candidate default, U - per-user static route
      o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

      99.0.0.0/32 is subnetted, 1 subnets
O         99.99.99.99 [110/2] via 10.1.1.3, 02:46:16, FastEthernet0/1
20.0.0.0/24 is subnetted, 1 subnets
O E2     20.1.1.0 [110/20] via 10.1.1.2, 00:08:35, FastEthernet0/1
      172.16.0.0/28 is subnetted, 1 subnets
O E2     172.16.172.64 [110/20] via 10.1.1.2, 00:07:56, FastEthernet0/1
      10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
C       10.1.1.0/24 is directly connected, FastEthernet0/1
S       10.48.66.0/23 [1/0] via 10.1.1.2

```

The static VPN route is injected into the routing table on the Cisco 7204VXR-2 router.

```

7204VXR-2#show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF,
      IA - OSPF inter area, N1 - OSPF NSSA external type 1,
      N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
      E2 - OSPF external type 2, i - IS-IS, su - IS-IS summary,
      L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area,
      * - candidate default, U - per-user static route
      o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

      99.0.0.0/32 is subnetted, 1 subnets
O         99.99.99.99 [110/2] via 10.1.1.3, 03:04:18, FastEthernet1/0
20.0.0.0/24 is subnetted, 1 subnets
S       20.1.1.0 [1/0] via 172.16.172.69
      172.16.0.0/28 is subnetted, 2 subnets
C       172.16.172.48 is directly connected, FastEthernet0/0
S       172.16.172.64 [1/0] via 172.16.172.49
      10.0.0.0/24 is subnetted, 1 subnets
C       10.1.1.0 is directly connected, FastEthernet1/0

```

Internal router 7206-1 learns the 20.1.1/24 route to the remote VPN peer from its OSPF neighbor router, 7204VXR-2. These routing changes occur dynamically through the combination of HSRP/RRI and OSPF.

```
7206-1#show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF,
      IA - OSPF inter area, N1 - OSPF NSSA external type 1,
      N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
      E2 - OSPF external type 2, i - IS-IS, su - IS-IS summary,
      L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area,
      * - candidate default, U - per-user static route
      o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

      99.0.0.0/32 is subnetted, 1 subnets

After the Original HSRP Primary Router Recovers from an Outage

After the service recovers on the Cisco 7204VXR-1 original HSRP primary router, the device resumes position as active router because it has a higher priority and because HSRP preempt is configured.

The **show** and **debug** command output from different routers shows another switchover of HSRP and IPSec. The ISAKMP and IPSec SAs are reestablished automatically, and the routing information changes are updated dynamically.

This sample output shows that router 7204VXR-1 changes its state to "Active".

```
