Introduction

This document describes how to configure the Point-to-Point Protocol (PPP) over Ethernet (PPPoE) client on the Cisco Secure PIX Firewall. PIX OS version 6.2 introduces this function and is targeted for the low-end PIX (501/506).

PPPoE combines two widely accepted standards, Ethernet and PPP, in order to provide an authenticated method of assigning IP addresses to client systems. PPPoE clients are typically personal computers connected to an ISP over a remote broadband connection, such as DSL or cable service. ISPs deploy PPPoE because it supports high-speed broadband access using their existing remote access infrastructure and because it is easier for customers to use. PIX Firewall version 6.2 introduces PPPoE client functionality. This allows small office, home office (SOHO) users of the PIX Firewall to connect to ISPs using DSL modems.

Currently, only the outside interface of the PIX supports this function. Once the configuration is also on the outside interface, there is encapsulation of all traffic with PPPoE/PPP headers. The default authentication mechanism for PPPoE is Password Authentication Protocol (PAP).

PPPoE provides a standard method of employing the authentication methods of the PPP over an Ethernet network. When used by ISPs, PPPoE allows authenticated assignment of IP addresses. In this type of implementation, the PPPoE client and server are interconnected by Layer 2 bridging protocols that run over a DSL or other broadband connection.

The user has the option to configure Challenge Handshake Authentication Protocol (CHAP) or MS-CHAP manually. PIX OS versions 6.2 and 6.3 do not support Layer 2 Tunneling Protocol (L2TP) and Point-to-Point Tunneling Protocol (PPTP) with PPPoE.

PPPoE is composed of two main phases:

- **Active Discovery Phase** In this phase, the PPPoE client locates a PPPoE server, called an access concentrator. During this phase, a Session ID is assigned and the PPPoE layer is established.
- **PPP Session Phase** In this phase, PPP options are negotiated and authentication is performed. Once the link setup is completed, PPPoE functions as a Layer 2 encapsulation method, allowing data to be transferred over the PPP link within PPPoE headers.

At system initialization, the PPPoE client establishes a session with the AC by exchanging a series of packets. Once the session is established, a PPP link is set up, which includes authentication using Password Authentication (PAP) protocol. Once the PPP session is established, each packet is encapsulated in the PPPoE and PPP headers.

Prerequisites

Requirements

There are no specific requirements for this document.

Components Used

The information in this document is based on these software and hardware versions:

- PIX 501 with PIX OS version 6.3(4)
- Cisco 1721 router with Cisco IOS® Software Release 12.3(10) configured as a PPPoE server

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

Refer to the Cisco Technical Tips Conventions for more information on document conventions.

Configure

This section presents you with the information you can use in order to configure the features this document describes.

Note: In order to find additional information on the commands this document uses, use the Command Lookup Tool (registered customers only) .

Network Diagram

This document uses this network setup:

Configurations

This document uses these configurations.

- Cisco 1721 Router as PPPoE Server
- PIX (501 or 506) as PPPoE Client

In this lab test, a Cisco 1721 router acts as a PPPoE server. You do not need this in your home/remote office since your ISP hosts the PPPoE server.

Cisco 1721 Router as PPPoE Server

Verify

This section provides information you can use in order to confirm that your configuration works properly.

Certain **show** commands are supported by the Output Interpreter Tool (registered customers only) , which allows you to view an analysis of **show** command output.

- **show ip address outside pppoe** Displays the current PPPoE client configuration information.
- **show vpdn tunnel pppoe** Displays tunnel information for the specific tunnel type.
- **show vpdn session pppoe** Displays the status of PPPoE sessions.
- **show vpdn pppinterface** Displays the interface identification value of the PPPoE tunnel. A PPP virtual interface is created for each PPPoE tunnel.
- **show vpdn group** Displays the group defined for the PPPoE tunnel.
- **show vpdn username** Displays the local username information.

This is the output for the **show ip address outside pppoe** command:

```

501(config)#show ip address outside pppoe

PPPoE Assigned IP addr: 11.11.11.1 255.255.255.255 on Interface: outside
Remote IP addr: 172.21.48.30

```

This is the output for the **show vpdn tunnel pppoe** command:

```

501(config)#show vpdn tunnel pppoe

PPPoE Tunnel Information (Total tunnels=1 sessions=1)

Tunnel id 0, 1 active sessions
time since change 20239 secs
Remote MAC Address 00:08:E3:9C:4C:71
3328 packets sent, 3325 received, 41492 bytes sent, 0 received

```

This is the output for the **show vpdn session pppoe** command:

```

501(config)#show vpdn session pppoe

PPPoE Session Information (Total tunnels=1 sessions=1)

```

```
Remote MAC is 00:08:E3:9C:4C:71
Session state is SESSION_UP
Time since event change 20294 secs, interface outside
PPP interface id is 1
3337 packets sent, 3334 received, 41606 bytes sent, 0 received
```

This is the output for the **show vpdn pppinterface** command:

```
501(config)#show vpdn pppinterface

PPP virtual interface id = 1
PPP authentication protocol is PAP
Server ip address is 172.21.48.30
Our ip address is 11.11.11.1
Transmitted Pkts: 3348, Received Pkts: 3345, Error Pkts: 0
MPPE key strength is None
  MPPE_Encrypt_Pkts: 0,  MPPE_Encrypt_Bytes: 0
  MPPE_Decrypt_Pkts: 0,  MPPE_Decrypt_Bytes: 0
  Rcvd_Out_Of_Seq_MPPE_Pkts: 0
```

This is the output for the **show vpdn group** command:

```
501(config)#show vpdn group
vpdn group pppoex request dialout pppoe
vpdn group pppoex localname cisco
vpdn group pppoex ppp authentication pap
```

This is the output for the **show vpdn username** command:

```
501(config)#show vpdn username
vpdn username cisco password *****
```

Troubleshoot

This section provides information you can use in order to troubleshoot your configuration.

Troubleshooting Information

These are sample debugs from common misconfigurations on the PIX. Turn on these debugs.

```
pix#show debug
debug ppp negotiation
debug pppoe packet
debug pppoe error
debug pppoe event
```

- Authentication fails (for example, bad username/password).

Troubleshooting Commands

Certain **show** commands are supported by the Output Interpreter Tool (registered customers only) , which allows you to view an analysis of **show** command output.

Note: Refer to Important Information on Debug Commands before you issue **debug** commands.

- **debug pppoe packet** Displays packet information.
- **debug pppoe error** Displays error messages.
- **debug pppoe event** Displays protocol event information.
- **debug ppp negotiation** Allows you to see if a client passes PPP negotiation information.
- **debug ppp io** Displays the packet information for the PPTP PPP virtual interface.
- **debug ppp upap** Displays PAP authentication.
- **debug ppp error** Displays PPTP PPP virtual interface error messages.
- **debug ppp chap** Displays information about whether a client passes authentication.

Use these commands in order to enable debugging for the PPPoE client:

!--- Displays packet information.

```
501(config)#debug pppoe packet
```

!--- Displays error messages.

```
501(config)#debug pppoe error
```

!--- Displays protocol event information.

```
501(config)#debug pppoe event
```

Debugging When You Use the ppp ms-chap Command for Authentication

When you configure PPP MS-CHAP authentication, this line is the only change that you need in the PIX (all the rest remain the same).

The **vpdn group pppoex ppp authentication pap** command changes to **vpdn group pppoex ppp authentication mschap**.

Enable debug for the new authentication method.

```

501(config)#debug ppp negotiation
501(config)#debug ppp io
501(config)#debug ppp upap
501(config)#debug ppp error
501(config)#debug ppp chap
PPP virtual access open, ifc = 0

```

Known Caveats in PIX OS Version 6.2 and 6.3

- If the default route is already configured, PIX does not establish the PPPoE because it cannot overwrite the existing default route with the default route that the PPPoE supplies. If you wish to use the default route from the server (**setroute** option), the user needs to erase the default route on the

configuration.

- You define username and one PPPoE server only.

Known Caveats in PIX OS Version 6.3

- When you enable PPPoE and Open Shortest Path First (OSPF) and **write memory** performs after the retrieval of an IP address , the downloaded default route through PPPoE or DHCP saves to the configuration. The workaround is to perform **write memory** before the address downloads from the PPPoE server.
- The PPPoE **setroute** option, which you use to generate a default route, is not compatible with the OSPF dynamic routing protocol on the PIX Firewall. The default route that the PPPoE generates is removed from the routing table when the "network" statement is configured under the OSPF process. The workaround is to use static routes.
