Introduction

Cisco's iSCSI drivers, which reside on the server, are a key component of an iSCSI solution. These iSCSI drivers intercept SCSI commands, encapsulate them into IP packets, and redirect them to the Cisco SN 5420, Cisco SN 5428, Cisco SN5428, Cisco MDS/IPS-8. This document provides sample configurations for Solaris iSCSI host to MDS/IPS-8.

Before You Begin

Conventions

Cisco MDS 9000 that is used in this document refers to any Fibre Channel (FC) switch product in the MDS 9000 family (MDS 9506, MDS 9509, MDS 9216).

IPS blade refers to IP Storage Services Module. For more information on document conventions, see the [Cisco Technote Conventions](#).

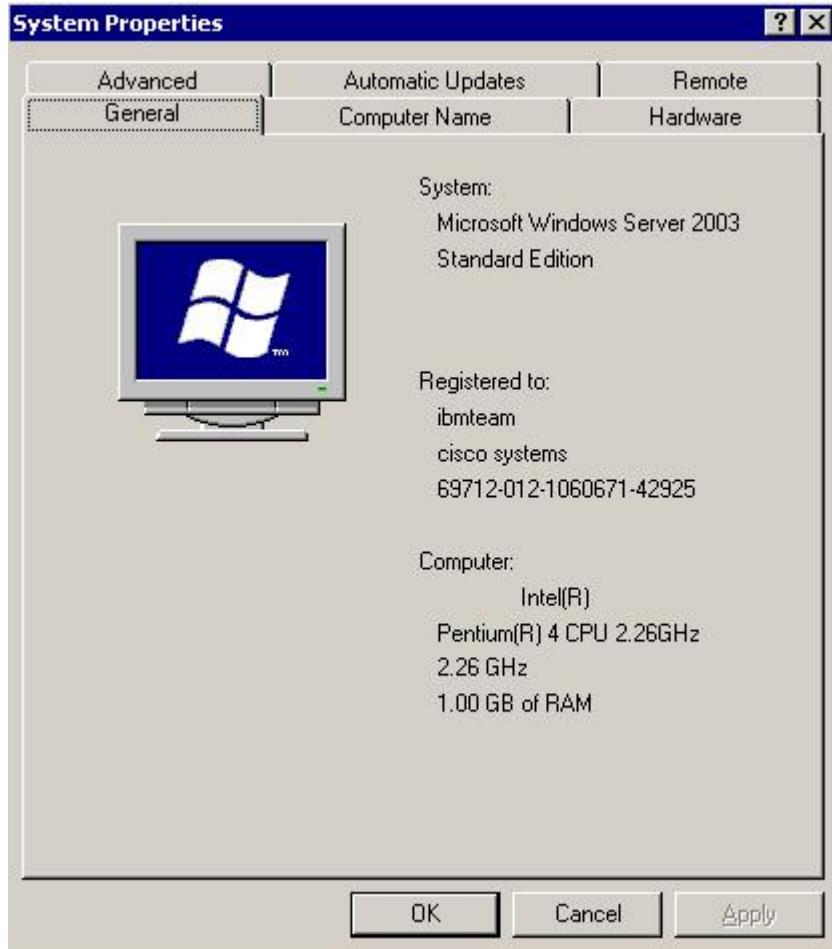

Prerequisites

- Install the iSCSI driver that is compatible to your Windows Server 2003 version. The most current version of the driver can be found at the [Cisco iSCSI Driver for Windows Server 2003](#) (registered customers only) page on Cisco.com. The README.txt file is included in the driver zip(tar) file. The README contains information about the license agreement, driver installation configuration instructions, and a technical overview of the driver architecture.
- The Cisco iSCSI Driver for Microsoft Windows 2003 requires Windows Server 2003 Enterprise Edition or Standard Edition or Web Edition.

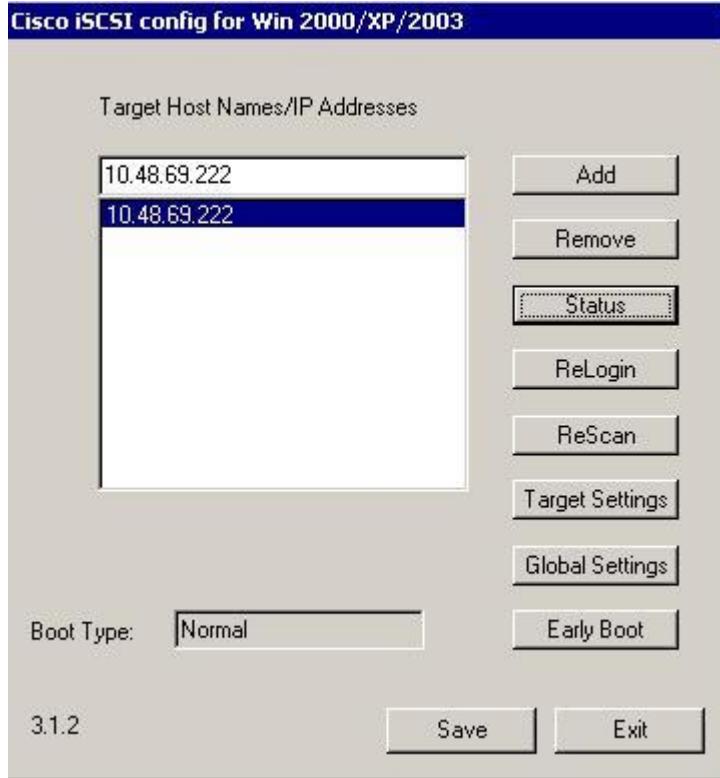

Components Used

The information in this document is based on the software and hardware versions below.

- Host with Windows Server 2003 Standard Edition

- Cisco iSCSI Driver 3.1.2 for Windows Server 2003. iSCSI driver version can be seen at the bottom left of the i window.

- Cisco MDS 9216 with Software Version 1.2(1a)

```

The information presented in this document was created from devices in a specific lab environment. All of the devices in this document started with a cleared (default) configuration. If you are working in a live network, ensure that you understand the potential impact of any command before using it.

Background Theory

The IP Storage module provides IP hosts access to FC storage devices. The IPS module is DS-X9308-SMIP. It provides transparent SCSI routing. IP hosts using iSCSI protocol can transparently access SCSI (FCP) targets on the FC network. The host sends SCSI commands encapsulated in iSCSI protocol data units (PDUs) to a MDS 9000 IPS port over a TCP/IP connection. On the IPS module, connectivity is provided in the form of Gigabit Ethernet (GE) interfaces that are appropriately configured. The IPS module enables you to create virtual iSCSI targets and maps them to physical FC targets available on the SAN. It presents the FC targets to IP hosts as if the physical targets were locally attached to the IP network.

Each iSCSI host that requires access to storage via the IPS module needs to have a compatible iSCSI driver installed. Using the iSCSI protocol, the iSCSI driver allows an iSCSI host to transport SCSI requests and responses over an IP network. From the perspective of a host operating system, the iSCSI driver appears to be a SCSI transport driver similar to a FC driver for a peripheral channel in the host. From the perspective of the storage device, each IP host appears as a FC host.

Routing SCSI from the IP host to the FC storage device consists of the following main actions:

- Transporting iSCSI requests and responses over an IP network between hosts and the IPS module.
- Routing SCSI requests and responses between hosts on an IP network and the FC storage device (converting FCP and vice versa). This routing is performed by the IPS module.
- Transporting FCP requests or responses between the IPS module and FC storage devices.

The IP Storage module does not import FC targets to iSCSI by default. Either dynamic or static mapping must be configured before the IPS module makes FC targets available to iSCSI initiators. When both are configured, statically mapped FC targets have a configured name. In this configuration you will see an example of static mapping. With dynamic mapping, each iSCSI host connects to the IPS module a new FC N port is created and the nWWNs and pWWNs allocated for this N port are different. Use the static mapping method if you need to obtain the same nWWNs and pWWNs for the iSCSI host each time it connects to the IPS module.

connects to the IPS module. Static mapping can be used on the IPS module to access intelligent FC storage arrays t access control and LUN mapping/masking configuration based on the initiator's pWWNs and/or nWWNs.

You can control access to each statically-mapped iSCSI target by specifying a list of IPS ports on which it will be adv specifying a list of iSCSI initiator node names allowed to access it. FC zoning-based access control and iSCSI-based control are the two mechanisms by which access control can be provided for iSCSI. Both methods can be used simu In this configuration default zoning has been permitted for specific VSAN. IPS modules use both iSCSI node name-b FC zoning-based access control lists to enforce access control during iSCSI discovery and iSCSI session creation.

- **iSCSI discovery:** When an iSCSI host creates an iSCSI discovery session and queries for all iSCSI targets, t module returns only the list of iSCSI targets this iSCSI host is allowed to access based on the access control |
- **iSCSI session creation:** When an IP host initiates an iSCSI session, the IPS module verifies if the specified i (in the session login request) is a static mapped target, and if true, verifies if the IP host's iSCSI node name is access the target. If the IP host does not have access, its login is rejected.

The IP Storage module creates a FC virtual N port (the N port may already exist) for this IP host and does a FC name query for the FCID of the FC target pWWN that is being accessed by the IP host. It uses the IP host virtual N port's p requester of the name server query. Thus, the name server does a zone-enforced query for the pWWN and responds query. If the FCID is returned by the name server, then the iSCSI session is accepted. Otherwise, the login request is

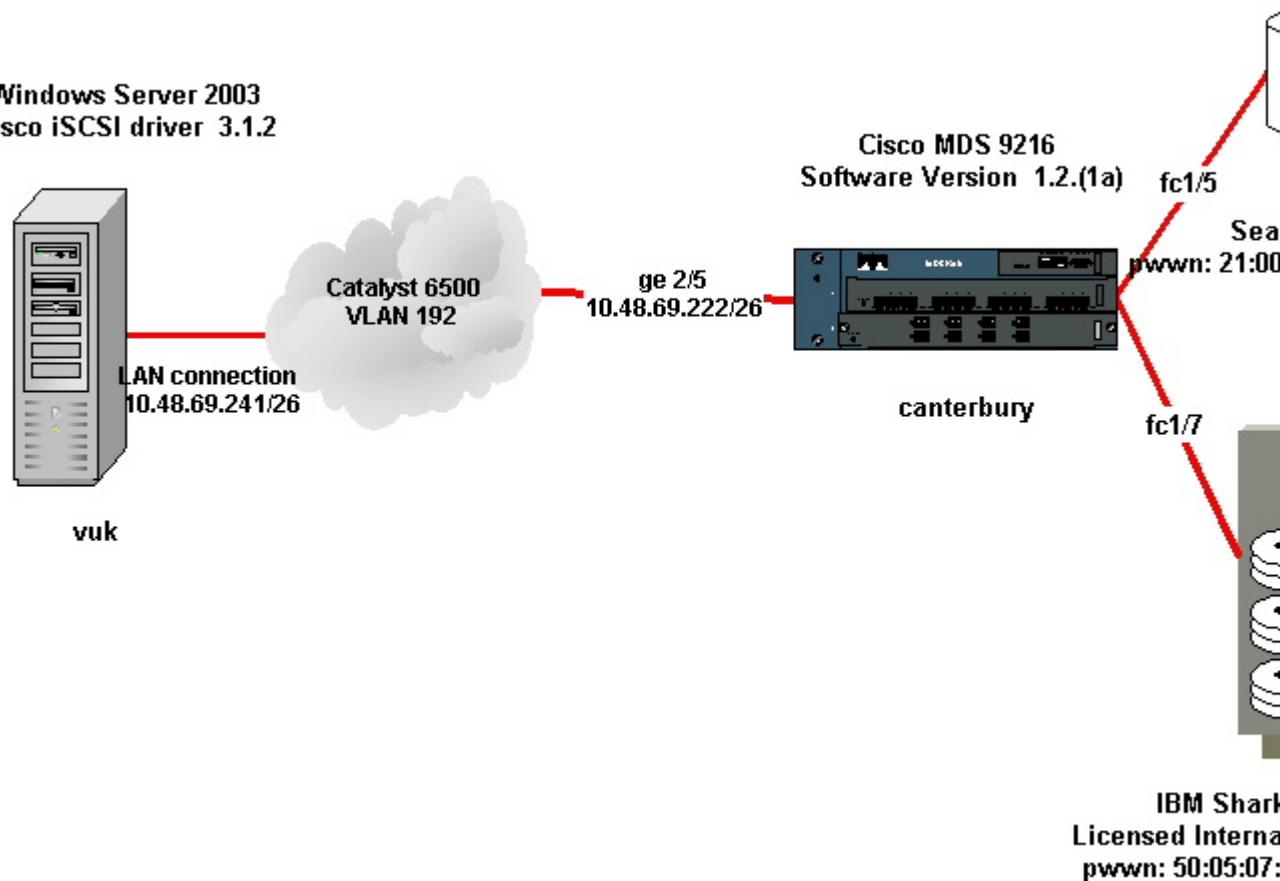

Configure

In this section, you are presented with the information to configure the MDS 9216 and Cisco iSCSI Driver for Solaris.

Note: To find additional information on the commands used in this document, use the [Cisco MDS 9000 Family Command Reference](#) and [Cisco MDS 9000 Family Software Configuration Guide](#).

Network Diagram

This document uses the network setup shown in the diagram below.

Configurations

This document uses the configurations shown below.

- Vuk (Windows Server 2003)
- Canterbury (MDS 9216)

Vuk (Windows Server 2003)

The initial configuration tasks consist of the following actions:

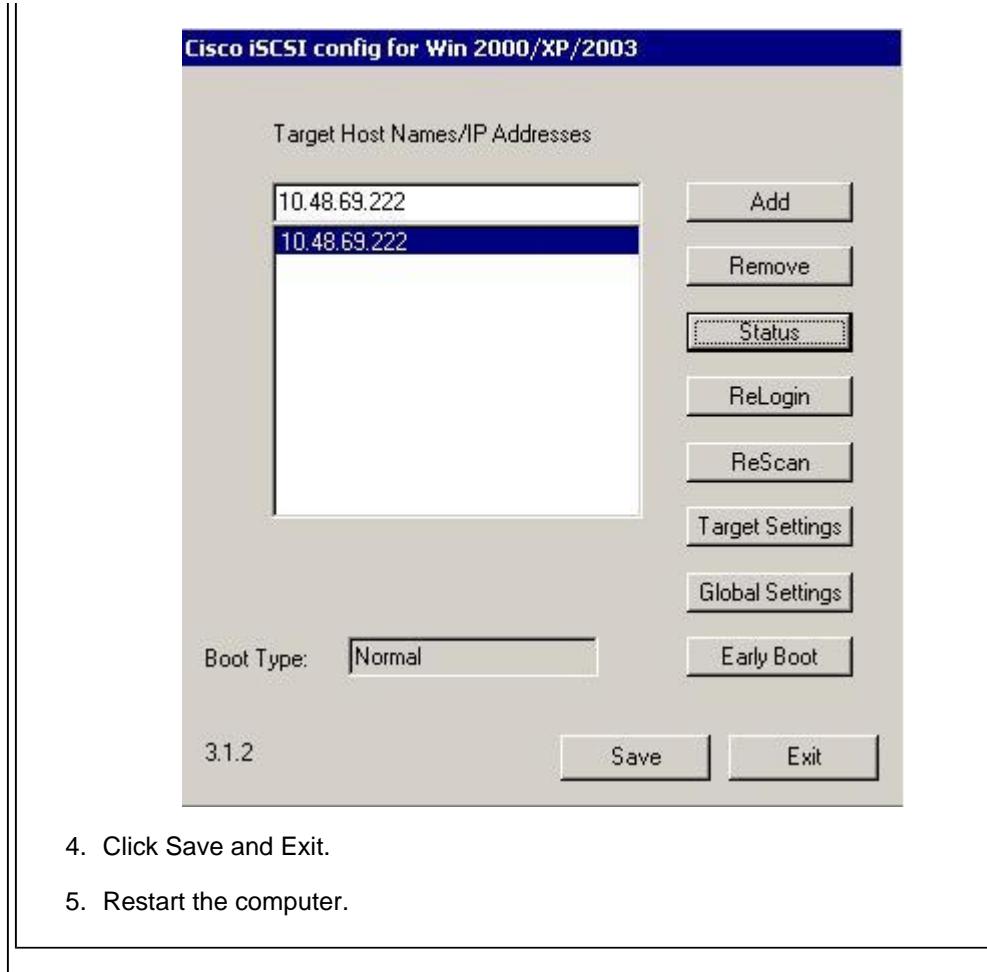

- Setting the iSCS Itarget IP addresses of MDS 9000 series systems that the driver will access.
- Setting the iSCSI target authentication user name and passwords.
- Saving the iSCSI target configuration, and setting the driver's boot type.

To configure the driver, perform the following steps:

1. Log on to the computer as a user with administrator privileges.
2. Click **Start**, point to **Settings**, click **Control Panel** and then double click **iSCSI Config**.

The **lscsi Config** program causes the Cisco iSCSI config for Win 2000/XP/2003 dialog box to be displayed.

3. At the Cisco iSCSI config for Win 2000 dialog box, configure the IP address of a SCSI routing instance in an MDS 9000 series system as follows:
 - a. At the **Target Host Names/IP Addresses** text box, type the IP address of a SCSI routing instance in an MDS 9000 Series system. In this configuration example, the IP address is 10.48.69.222.
 - b. Click **Add**. The IP address is displayed in the display area below the **Target Host Names/IP Addresses** text box.

4. Click Save and Exit.
5. Restart the computer.

Verify

This section provides information you can use to confirm your configuration is working properly.

- **show zone status** - displays Zone information.
- **show fcns database vsan 222** - displays Name Server information for a specific VSAN.
- **show flogi database vsan 222** - displays FLOGI Server information for a specific VSAN.
- **show vsan membership** - displays interface information for different VSANs.
- **show iscsi initiator detail** - displays iSCSI initiator information.
- **show iscsi initiator iscsi-session detail** - displays detailed information for iSCSI initiator session.
- **show iscsi initiator fcp-session detail** - displays detailed information for iSCSI initiator FCP session.
- **show ips stats tcp interface gigabitethernet 2/5 detail** - displays TCP statistics for specific GE interface.
- **show iscsi virtual-target configured** - displays iSCSI virtual targets that have been configured on the MDS 9000.
- **show iscsi initiator configured** - displays iSCSI initiators that have been configured on the MDS 9000.
- **show ips arp interface gigabitethernet 2/5** - displays IPS arp information for specific GE interface.
- **show scsi-target lun vsan 222** - displays SCSI devices for specific VSAN(for mapping FC-LUNs to iSCSI-LUNs).
- **show int iscsi 2/5** - displays iSCSI interfaces.
- **show iscsi stats iscsi 2/5** - displays iSCSI statistics.
- **show int gigabitethernet 2/5** - displays GE interface.
- **show ip route** - displays IP route information.

Troubleshoot

This section provides information you can use to troubleshoot your configuration.

Note: To find additional information on Troubleshooting IP Storage Issues, use the [Cisco MDS 9000 Family Troubleshooting Guide](#).

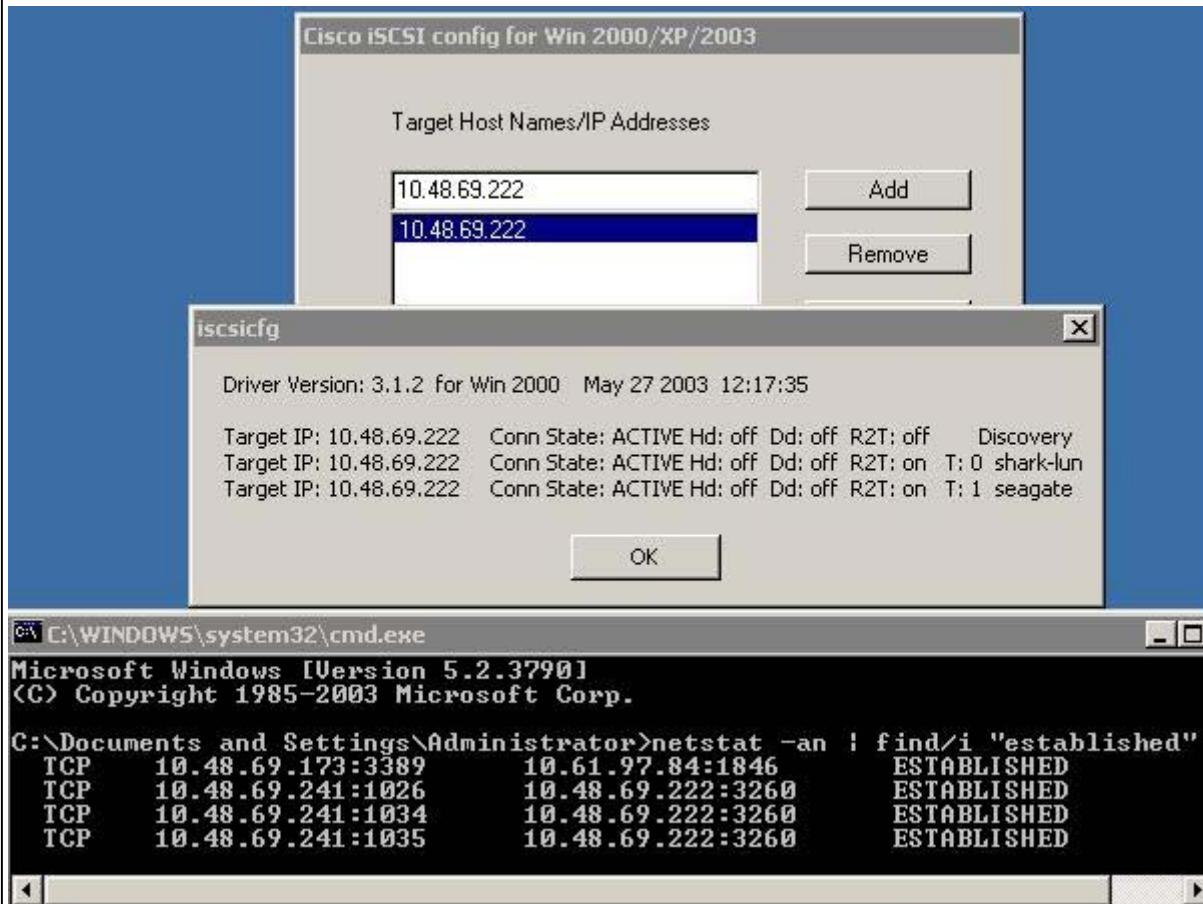

Troubleshooting Procedure

Below is troubleshooting information relevant to this configuration.

- Displays from Vuk (Windows Server 2003)
- Displays from Canterbury Cisco MDS 9216

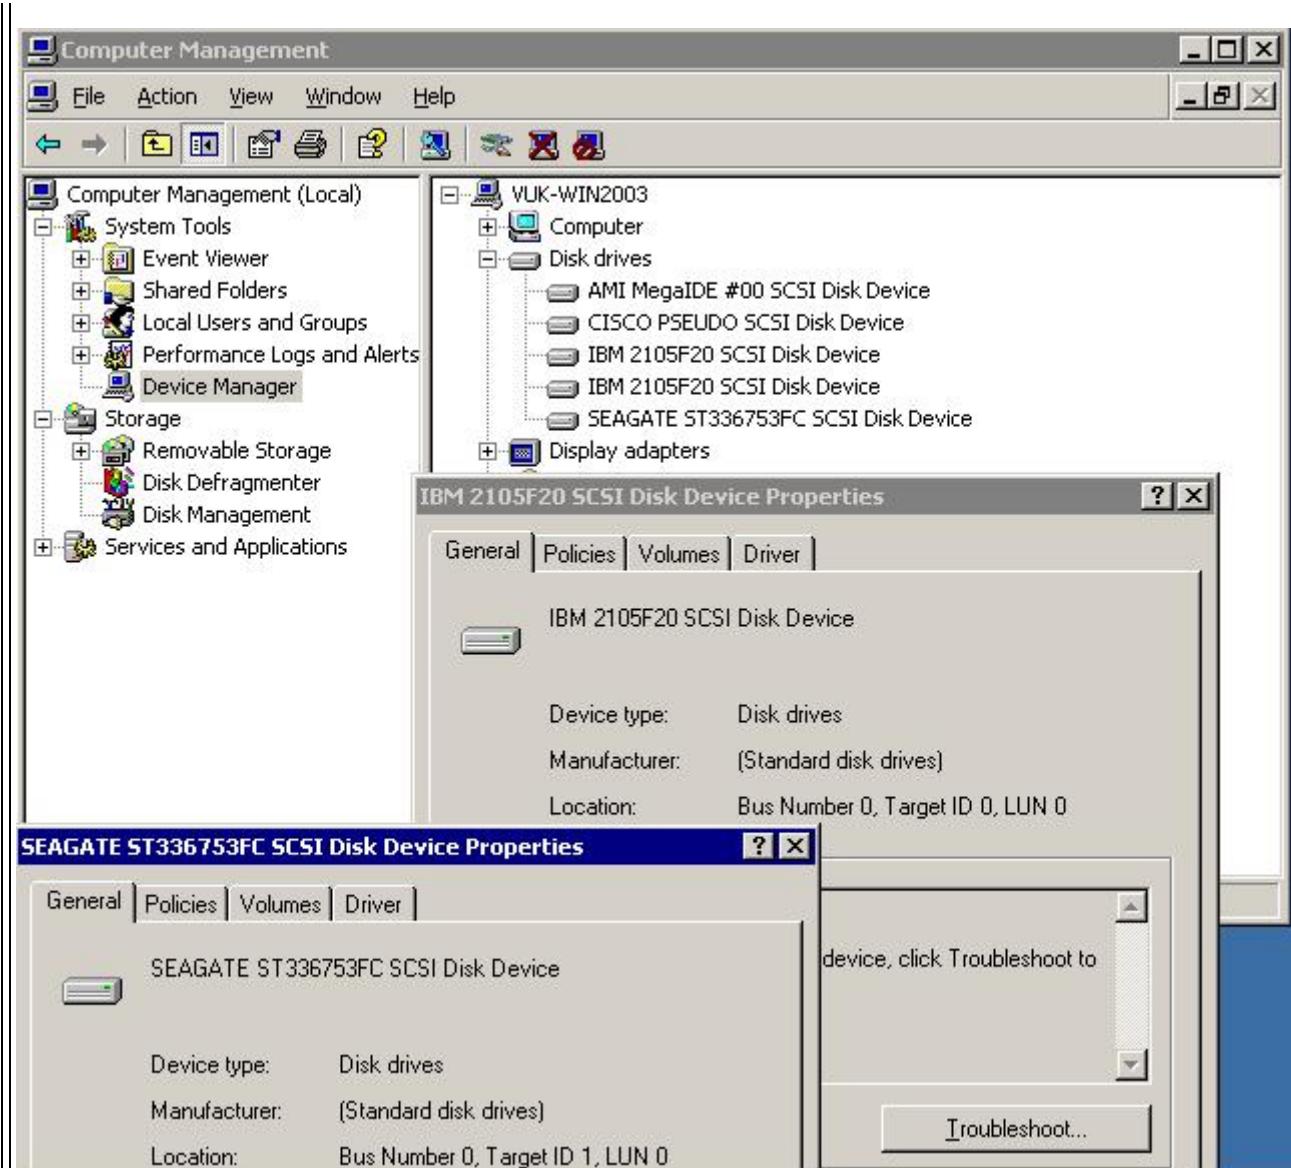

Displays from Vuk (Windows Server 2003)

On the **Cisco iSCSI config** window, click on **Status** to check if the host has successfully logged into the iSCSI target command line, issue **netstat -an | find/i "established"** to see ESTABLISHED TCP sessions between 10.48.69.222.

To see the new disks, right click **My Computer** on the desktop. Double click on **Computer Manager**.

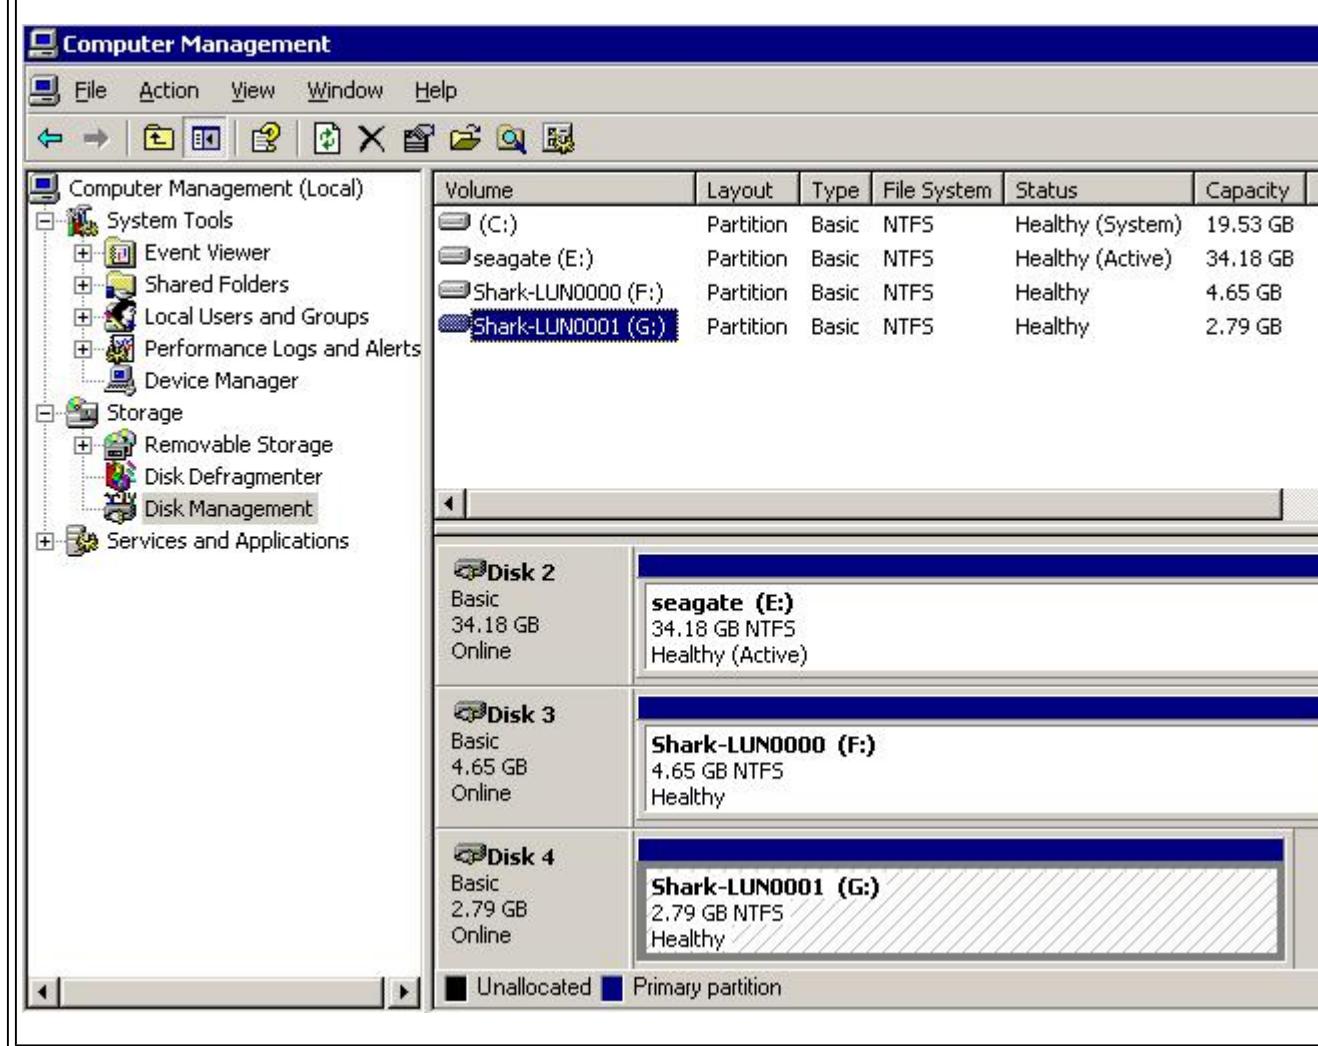

In the console tree under **System Tool**, click **Device Manager**

For the proper functioning of the driver under Windows 2003 Server, the driver needs to create a pseudo disk drive, as an unknown disk under the Disk Management MMC application. The user can ignore this, as it does not affect the functioning of the system in any way. It must **not** be deleted.

To manage the storage, right click **My Computer** on the desktop. Double click on **Computer Manager**.

In the console tree under **Storage**, click **Disk Management**.

Displays from Canterbury (Cisco MDS 9216)

Fabric Manager and Device Manager Displays

This section provides screen captures from MDS Fabric Manager 1.2(2) and Device Manager 1.2(2).

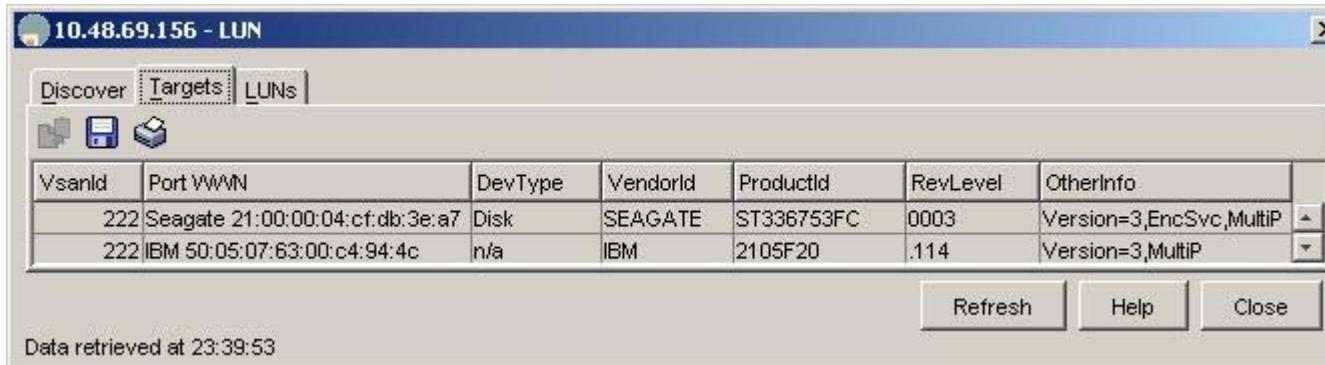

Topology diagram from the Fabric Manager

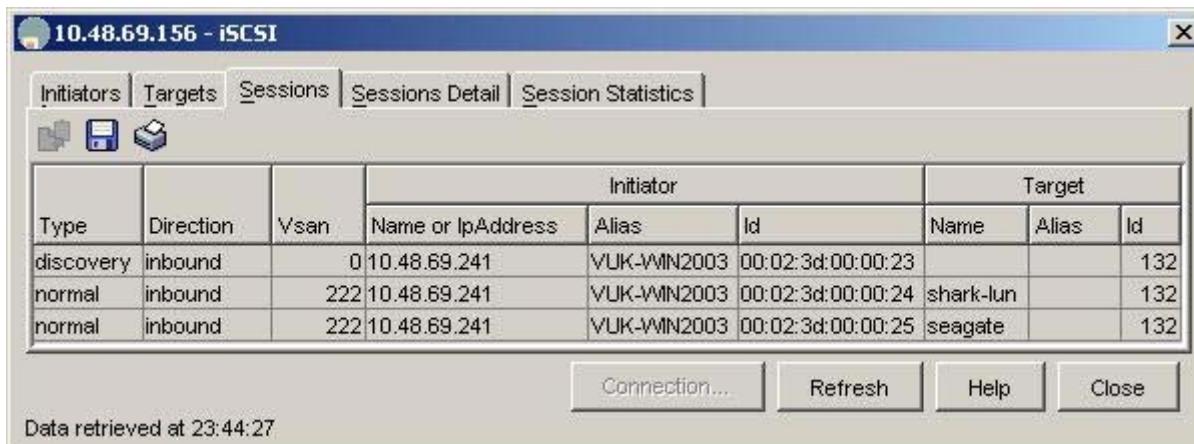

Select **FC-LUNs** to display the pWWNs, LUN IDs, and the capacity of your LUNs from the Device Manager.

Select **FC-LUNs** to display the Targets from the Device Manager.

Select **IP-iSCSI** to display the iSCSI sessions from Device Manager.

IBM Shark Definitions

This section provides screen capture from Enterprise Storage Server Specialist (ESSS).

One host has been defined on the ESS with static WWPN 21:03:00:0c:30:6c:24:42 that has been defined for initiator volumes have been assigned to this host.

Specialist - shark1

The screenshot shows the 'Enterprise Storage Server Specialist' application window. On the left is a vertical menu bar with the following items:

- TotalStorage Solutions
- Status
- Problem Notification
- Communications
- Storage Allocation
- Users
- Licensed Internal Code

The main content area has two tables:

Host Systems

Nickname	Host Type	Attachment	WWPN	Hostname/IP Addr
sonja_fci1	PC Server (Win 2000 or Win NT 4.0)	FC	2800000653389EA0	sonja
sonja_fci2	PC Server (Win 2000 or Win NT 4.0)	FC	2900000653389EA0	sonja
vuk-iscsi	PC Server (Win 2000 or Win NT 4.0)	FC	2103000C306C2442	vuk

Assigned Volumes

Volume	Vol Type	Size	Storage Type	Location	LSS
012-22196	Open System	05.0 GB	RAID Array	Device Adapter Pair 1 Cluster 1, Loop A Array 2, Vol 018	LSS: 0x010
