Introduction

This document provides a complete example configuration that defines custom triggers for Auto Smartports. This example uses custom triggers based on the built-in device classifier. This is a good alternative for classification of non-Cisco devices when Organizationally Unique Identifiers (OUIs) cannot be used. Another alternative to the use of the built-in device classifier is to trigger based on the RADIUS attribute-value pair *auto-smart-port*=(custom event trigger). RADIUS triggers are outside the scope of this document.

Note: More information is available in the Auto Smartports Configuration Guide, Release 15.0(2)SE.

Prerequisites

Requirements

There are no specific requirements for this document.

Components Used

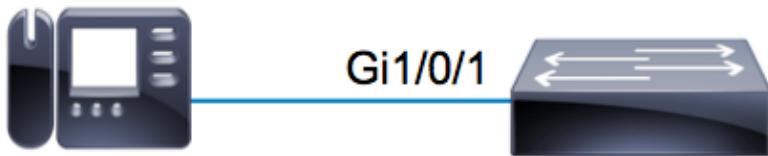

The information in this document is based on these software and hardware versions:

- Cisco Catalyst 3750-X Series Switch
- Cisco IOS® Version 15.2.1E

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Configure

Network Diagram

In this example, an Avaya IP Phone is connected on **Gi1/0/1** on a 3750X switch. This example uses the built-in device classifier and the Link Layer Discovery Protocol (LLDP) information from the phone in order to auto-configure the port.

Ensure Profiles are Present

Ensure that the device classifier has the built-in profiles for the desired device. As of Version 15.2.1E, there are over 250 built-in profiles. See the Appendix at the end of this document for the full list. The profiles are **only** bundled with the **.tar** images. Based on your version of code, the profiles are stored in either:

- **flash:<running_ios>/dc_default_profiles.txt**
- **flash:dc_profile_dir/dc_default_profiles.txt**

You can force Cisco IOS to refresh the profile list if you disable and reenable the device classifier. In this example, you want to ensure that the profiles for Avaya are present.

```
c3750x#dir flash:dc_profile_dir/
Directory of flash:dc_profile_dir/

      531  -rwx        143335  Mar 30 2011 02:14:22 +00:00  dc_default_profiles.txt

57671680 bytes total (28816384 bytes free)

c3750x(config)#no macro auto monitor
c3750x(config)#macro auto monitor

c3750x#show macro auto monitor type string Avaya
      Valid          Type          Profile Name
      ======  ======  ======
      Valid          Default       Avaya-Device
      Valid          Default       Avaya-IP-Phone
                                         min Conf     ID
                                         ======  =====
                                         10          3
                                         20          4
```

Enable LLDP

For this example, the device classifier uses information with the LLDP frame. For this to work, LLDP must be enabled.

```
c3750x(config)# lldp run
```

Create Custom Event Trigger

The syntax for a custom trigger is `shell trigger <trigger_name> <trigger_description>`. Use the name **AVAYA_IP_PHONE** and this description: *This is for an avaya IP phone.*

```
c3750x(config)# shell processing full
c3750x(config)# shell trigger AVAYA_IP_PHONE This is for an avaya IP phone
```

Associate Trigger with Desired Profile

This example matches off the Profile Name of **Avaya-IP-Phone**, so it ties the trigger to that profile.

```
c3750x(config)# macro auto trigger AVAYA_IP_PHONE
c3750x(config-macro-trigger)# profile Avaya-IP-Phone
```

Define the Macro

The macro is the real power of Auto Smartport. The device classifier detects when a certain type of device is connected, and based on that classification, you can apply a specific configuration. This example applies a VLAN, voice VLAN, and a description to the port. When the device is removed, you remove the previously-applied configuration. This example is easily extended to include Quality of Service (QoS) and other security configurations.

```
c3750x(config)# macro auto execute AVAYA_IP_PHONE  {
if [[ $LINKUP == YES ]]; then
conf t
interface $INTERFACE

macro description $TRIGGER
description ***** AVAYA PHONE *****
switchport access vlan 100
switchport mode access
switchport voice vlan 200
exit
fi
if [[ $LINKUP == NO ]]; then
conf t
interface $INTERFACE
no macro description $TRIGGER
no description ***** no more avaya phone *****
no switchport access vlan 100
no switchport mode access
no switchport voice vlan 200
exit
fi
end
}
```

Globally-Enable Macro Processing

For the events to successfully trigger, macro processing must be globally-enabled.

Note: All ports have processing enabled by default.

Before you enable macro processing globally, be sure to disable processing on ports that should be excluded via the **no macro auto processing** command.

```
c3750x(config)# macro auto global processing
```

Complete Configuration

Here is the complete configuration for this example:

```
c3750x#show run / sec lldp/shell/macro
shell processing full
shell trigger AVAYA_IP_PHONE This is for an avaya IP phone
lldp run
macro auto execute AVAYA_IP_PHONE  {
  if [[ $LINKUP == YES ]]
    then conf t
    interface $INTERFACE
    macro description $TRIGGER
    description ***** AVAYA PHONE *****
    switchport access vlan 100
    switchport mode access
    switchport voice vlan 200
    exit
  fi
  if [[ $LINKUP == NO ]]
    then conf t
    interface $INTERFACE
    no macro description $TRIGGER
    no description ***** no more avaya phone *****
    no switchport access vlan 100
    no switchport mode access
    no switchport voice vlan 200
    exit
  fi
end
macro auto trigger AVAYA_IP_PHONE
  profile Avaya-IP-Phone
macro auto global processing
```

Verify

For any shell verifications, you must first enable **Cisco IOS.sh** for the current terminal session.

```
c3750x#terminal shell
c3750x#terminal shell trace
```

In order to verify that the trigger and macro functions exist and are successfully mapped together, enter this command:

```
c3750x#show shell triggers AVAYA_IP_PHONE
User defined triggers
-----
Trigger Id: AVAYA_IP_PHONE
Trigger namespace: DEFAULT
Trigger description: This is for an avaya IP phone
Trigger mapping function:
function AVAYA_IP_PHONE_func()
{
  if [[ $LINKUP == YES ]]
    then conf t
    interface $INTERFACE
    macro description $TRIGGER
    description ***** AVAYA PHONE *****
    switchport access vlan 100
    switchport mode access
    switchport voice vlan 200
    exit
}
```

```

fi
if [[ $LINKUP == NO ]]
then conf t
interface $INTERFACE
no macro description $TRIGGER
no description ***** no more avaya phone *****
no switchport access vlan 100
no switchport mode access
no switchport voice vlan 200
exit
fi
end
}

```

When the port with the Avaya IP phone comes online, this sequence of events displays:

```

%LINK-3-UPDOWN: Interface GigabitEthernet1/0/1, changed state to up
%AUTOSMARTPORT-5-INSERT: Device Avaya-IP-Phone detected on interface
GigabitEthernet1/0/1,
executed AVAYA_IP_PHONE

```

In order to verify that the device is correctly classified as **Avaya-IP-Phone**, enter this command:

```
c3750x#show macro auto monitor device interface g1/0/1
Summary:
```

MAC_Address	Port_Id	Profile Name	Device Name
(device mac)	G1/0/1	Avaya-IP-Phone	AVAYA, INC

In order to verify that the macro configuration is successfully applied, enter this command:

```
c3750x# show run interface g1/0/1
!
interface GigabitEthernet1/0/1
description ***** AVAYA PHONE *****
switchport access vlan 100
switchport mode access
switchport voice vlan 200
macro description AVAYA_IP_PHONE
spanning-tree portfast
end
```

Troubleshoot

There is currently no specific troubleshooting information available for this configuration.

Appendix

Here are the built-in device classifier profiles as of Version 15.2.1E:
