Configure 802.1X Authentication with PEAP, ISE 2.1 and WLC 8.3

Contents

Introduction

This document describes how to set up a Wireless Local Area Network (WLAN) with 802.1x security and Virtual Local Area Network (VLAN) override.

Prerequisites

Requirements

Cisco recommends that you have knowledge of these topics:

- 802.1x
- Protected Extensible Authentication Protocol (PEAP)
- Certification Authority (CA)
- Certificates

Components Used

The information in this document is based on these software and hardware versions:

- WLC v8.3.102.0
- Identity Service Engine (ISE) v2.1
- Windows 10 Laptop

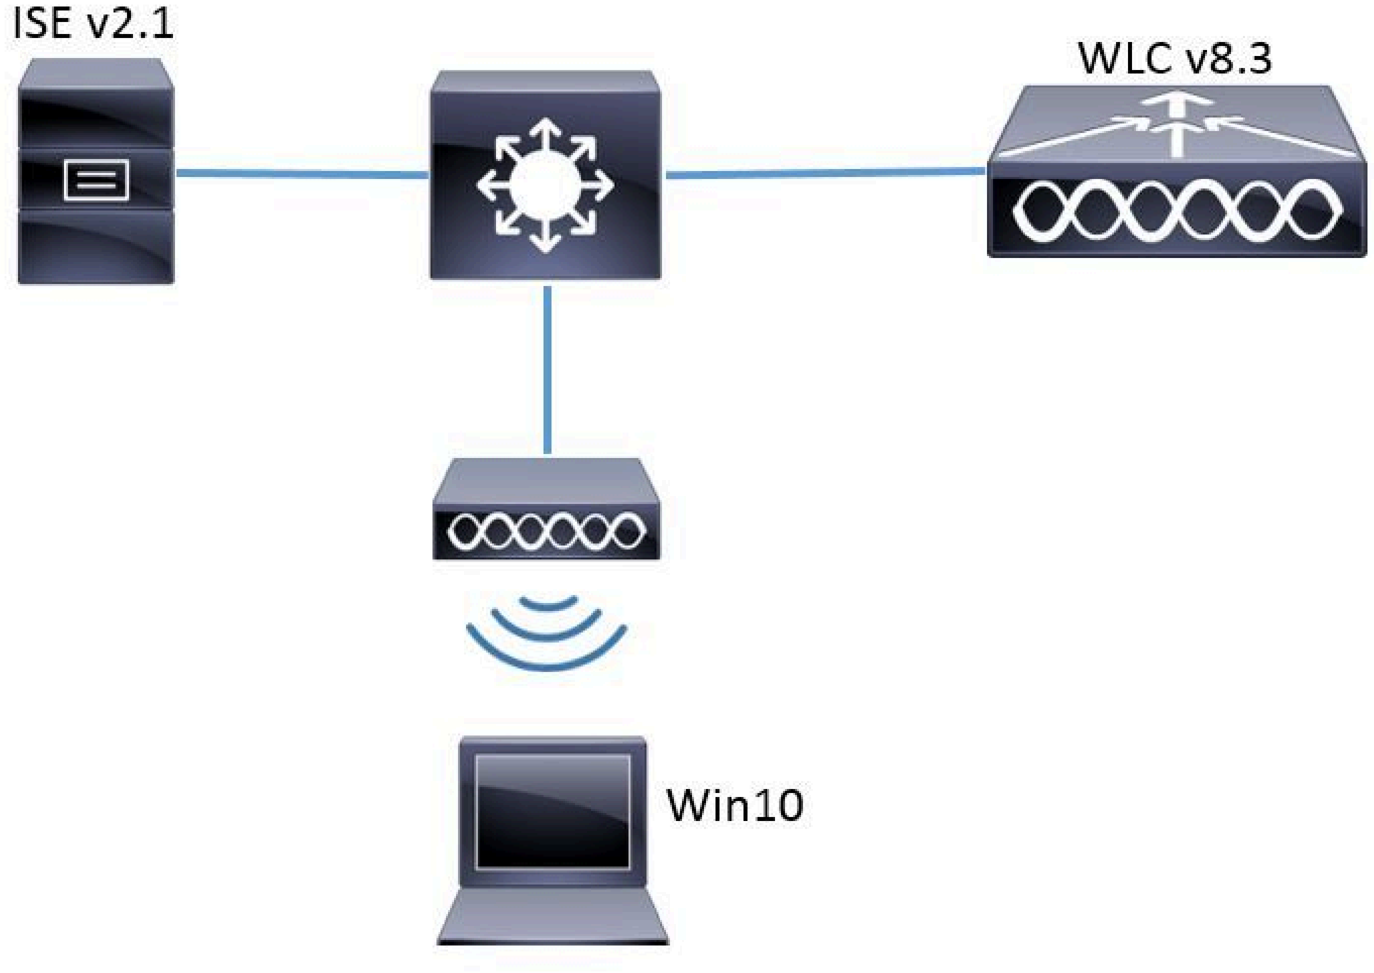
The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

Background Information

When you set up a WLAN with 802.1x security and VLAN, you can override with Protected Extensible Authentication Protocol as Extensible Authentication Protocol (EAP).

Configure

Network Diagram



Configuration

The general steps are:

1. Declare RADIUS Server on WLC and vice versa to allow communication with each other.

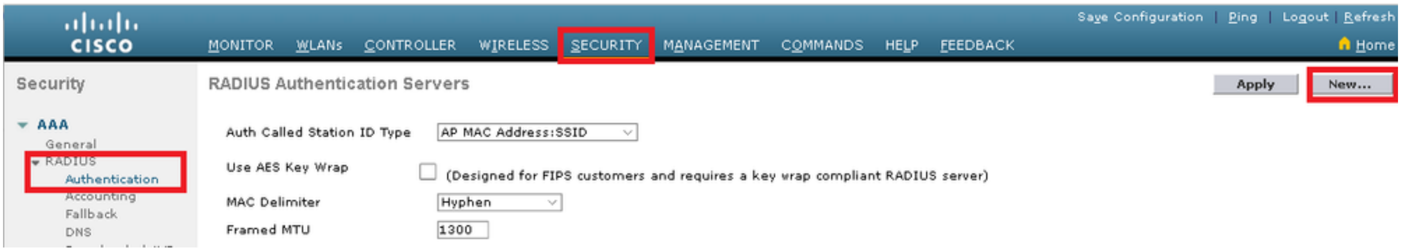
2. Create the Service Set Identifier (SSID) in the WLC.
3. Create the authentication rule on ISE.
4. Create the authorization profile on ISE.
5. Create the authorization rule on ISE.
6. Configure the endpoint.

Declare RADIUS Server on WLC

In order to allow communication between RADIUS server and WLC, you need to register RADIUS server on WLC and vice versa.

GUI:

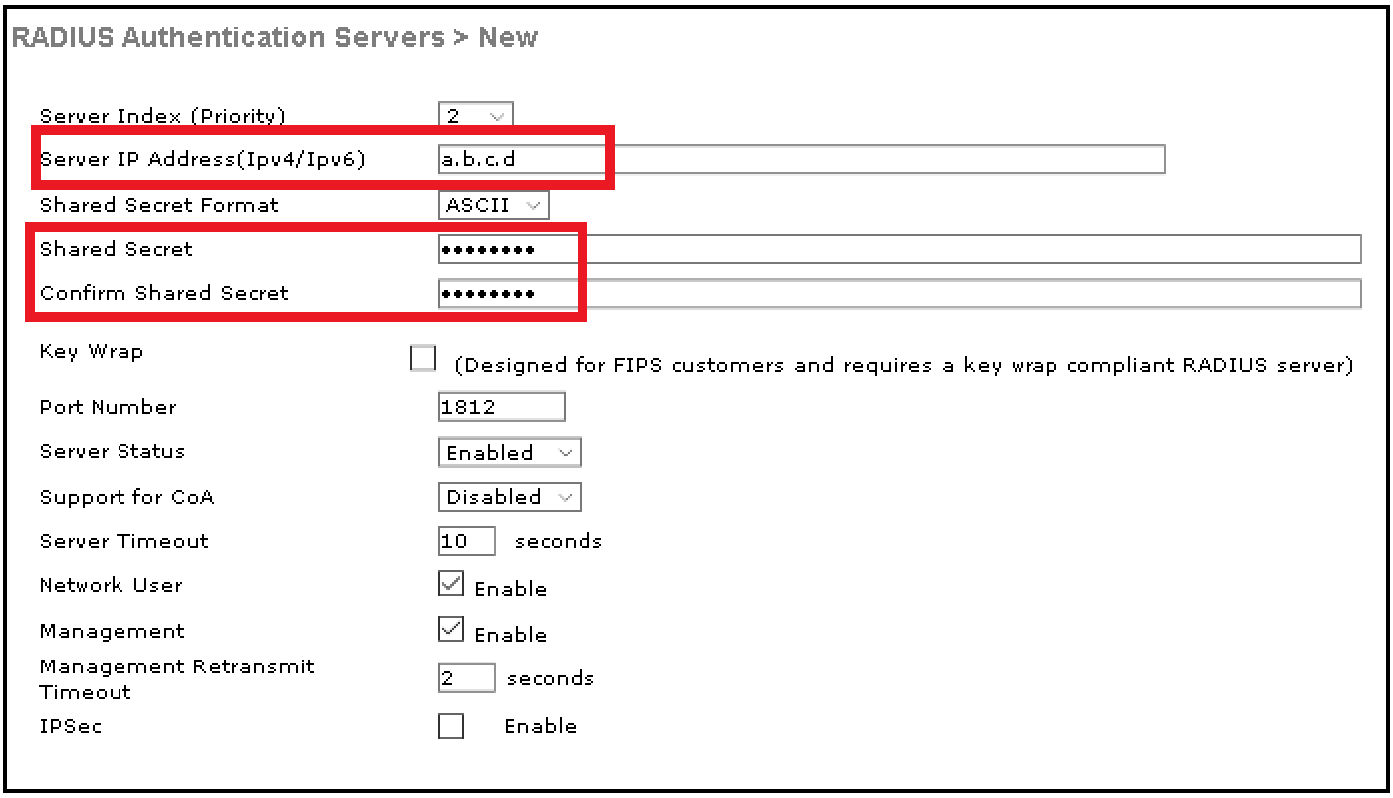
Step 1. Open the GUI of the WLC and navigate to **SECURITY** > **RADIUS** > **Authentication** > **New** as shown in the image.



RADIUS Authentication Servers

Auth Called Station ID Type	AP MAC Address:SSID
Use AES Key Wrap	□ (Designed for FIPS customers and requires a key wrap compliant RADIUS server)
MAC Delimiter	Hyphen
Framed MTU	1300

Step 2. Enter the RADIUS server information as shown in the image.



RADIUS Authentication Servers > New

Server Index (Priority)	2
Server IP Address(Ipv4/Ipv6)	a.b.c.d
Shared Secret Format	ASCII
Shared Secret	••••••••
Confirm Shared Secret	••••••••
Key Wrap	□ (Designed for FIPS customers and requires a key wrap compliant RADIUS server)
Port Number	1812
Server Status	Enabled
Support for CoA	Disabled
Server Timeout	10 seconds
Network User	☑ Enable
Management	☑ Enable
Management Retransmit Timeout	2 seconds
IPSec	□ Enable

CLI:

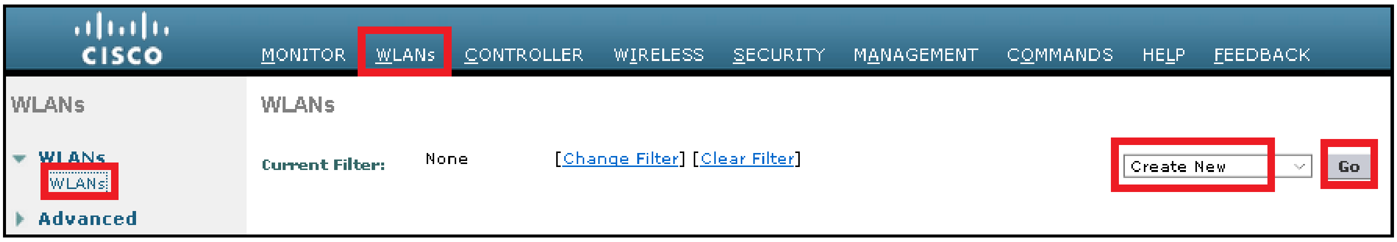
```
> config radius auth add <index> <a.b.c.d> 1812 ascii <shared-key>
> config radius auth disable <index>
> config radius auth retransmit-timeout <index> <timeout-seconds>
> config radius auth enable <index>
```

<a.b.c.d> corresponds to the RADIUS server.

Create SSID

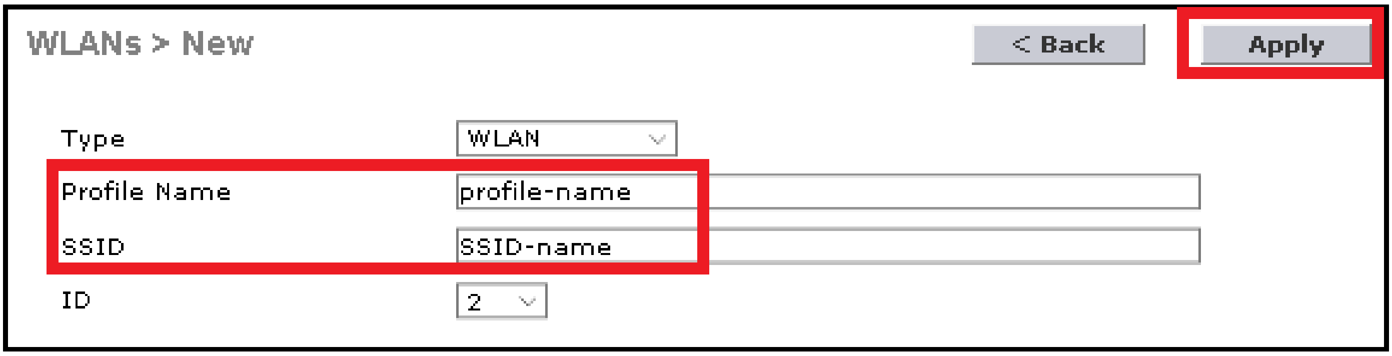
GUI:

Step 1. Open the GUI of the WLC and navigate to **WLANs > Create New > Go** as shown in the image.



Current Filter: None

Step 2. Choose a name for the SSID and profile, then click **Apply** as shown in the image.



Type WLAN
Profile Name profile-name
SSID SSID-name
ID 2

CLI:

```
> config wlan create <id> <profile-name> <ssid-name>
```

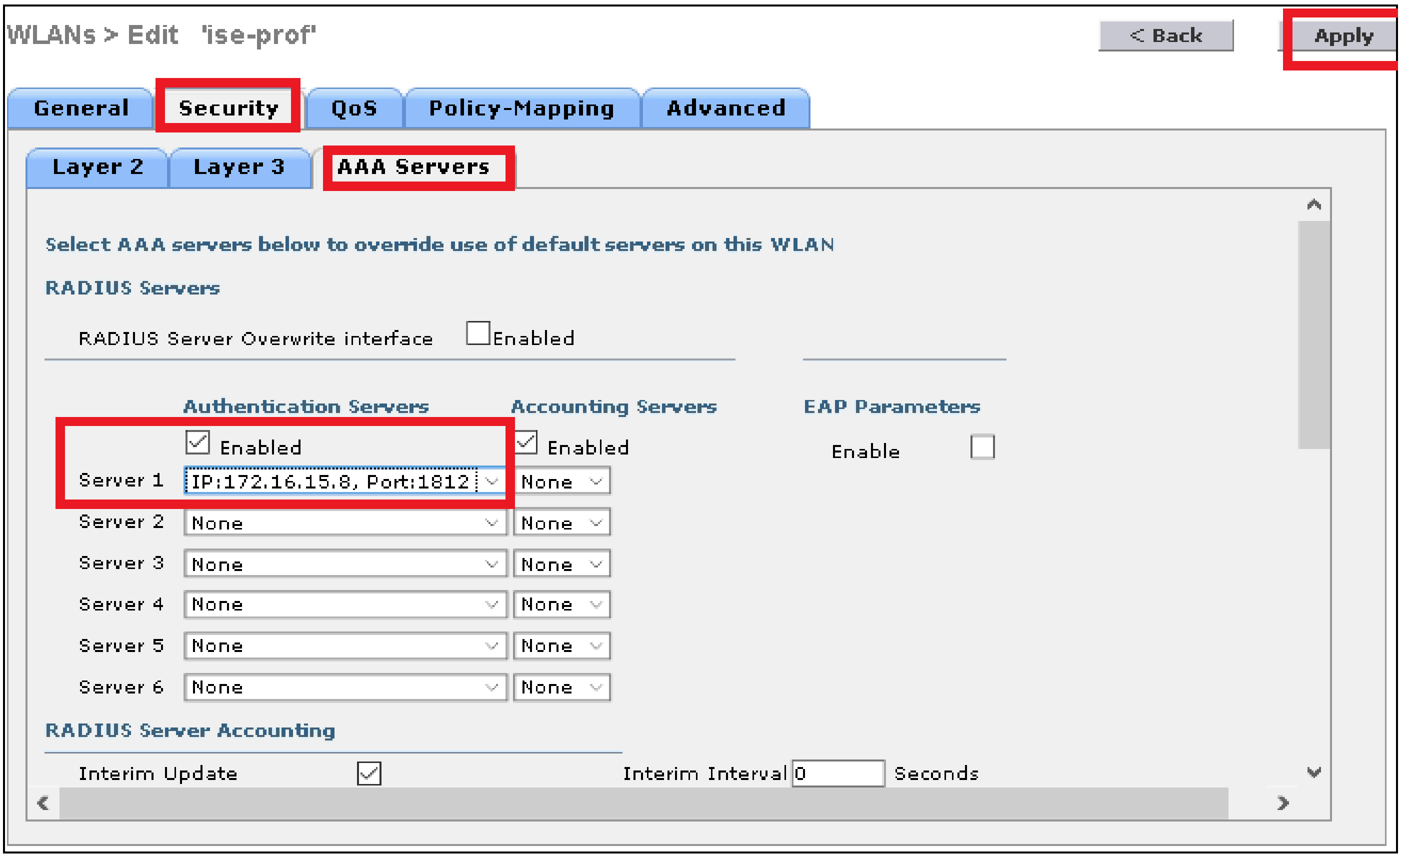
Step 3. Assign the RADIUS server to the WLAN.

CLI:

```
> config wlan radius_server auth add <wlan-id> <radius-index>
```

GUI:

Navigate to **Security > AAA Servers** and choose the desired RADIUS server, then hit **Apply** as shown in the image.



WLANs > Edit 'ise-prof'

Select AAA servers below to override use of default servers on this WLAN

RADIUS Servers

RADIUS Server Overwrite interface □Enabled

	Authentication Servers	Accounting Servers	EAP Parameters	
	☑ Enabled	☑ Enabled	Enable	□
Server 1	IP:172.16.15.8, Port:1812	None		
Server 2	None	None		
Server 3	None	None		
Server 4	None	None		
Server 5	None	None		
Server 6	None	None		

RADIUS Server Accounting

Interim Update ☑ Interim Interval 0 Seconds

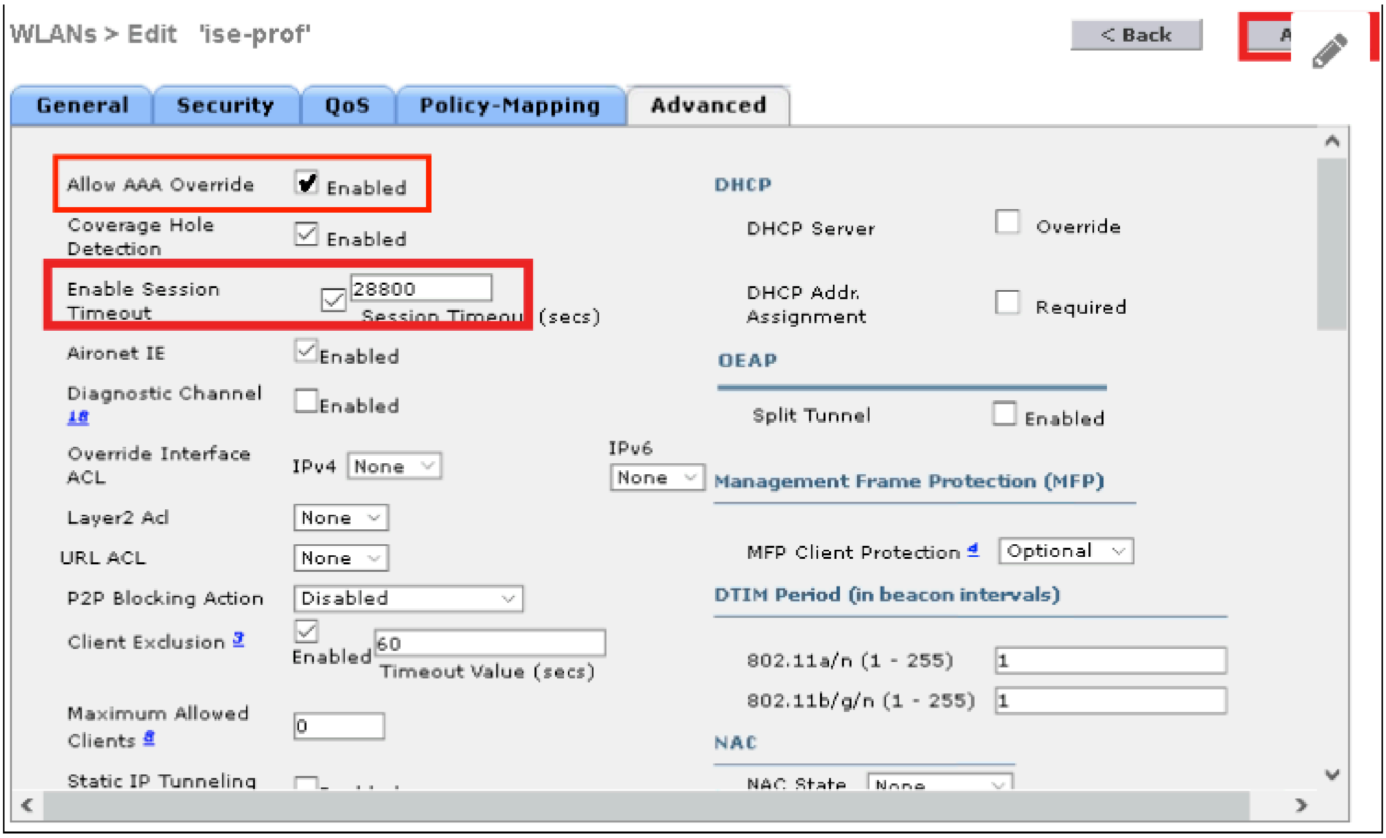
Step 4. Enable **Allow AAA Override** and optionally increase the session timeout

CLI:

```
> config wlan aaa-override enable <wlan-id>
> config wlan session-timeout <wlan-id> <session-timeout-seconds>
```

GUI:

Navigate to **WLANs > WLAN ID > Advanced** and enable **Allow AAA Override**. Optionally specify the Session Timeout as shown in the image.



WLANs > Edit 'ise-prof'

Allow AAA Override ☑ Enabled

Coverage Hole Detection ☑ Enabled

Enable Session Timeout ☑ 28800 Session Timeout (secs)

Aironet IE ☑ Enabled

Diagnostic Channel [18] ☐ Enabled

Override Interface ACL IPv4 None IPv6 None

Layer2 Acl None

URL ACL None

P2P Blocking Action Disabled

Client Exclusion [2] ☑ Enabled 60 Timeout Value (secs)

Maximum Allowed Clients [8] 0

Static IP Tunneling ☐

DHCP

DHCP Server ☐ Override

DHCP Addr. Assignment ☐ Required

OEAP

Split Tunnel ☐ Enabled

Management Frame Protection (MFP)

MFP Client Protection [4] Optional

DTIM Period (in beacon intervals)

802.11a/n (1 - 255) 1

802.11b/g/n (1 - 255) 1

NAC

NAC State None

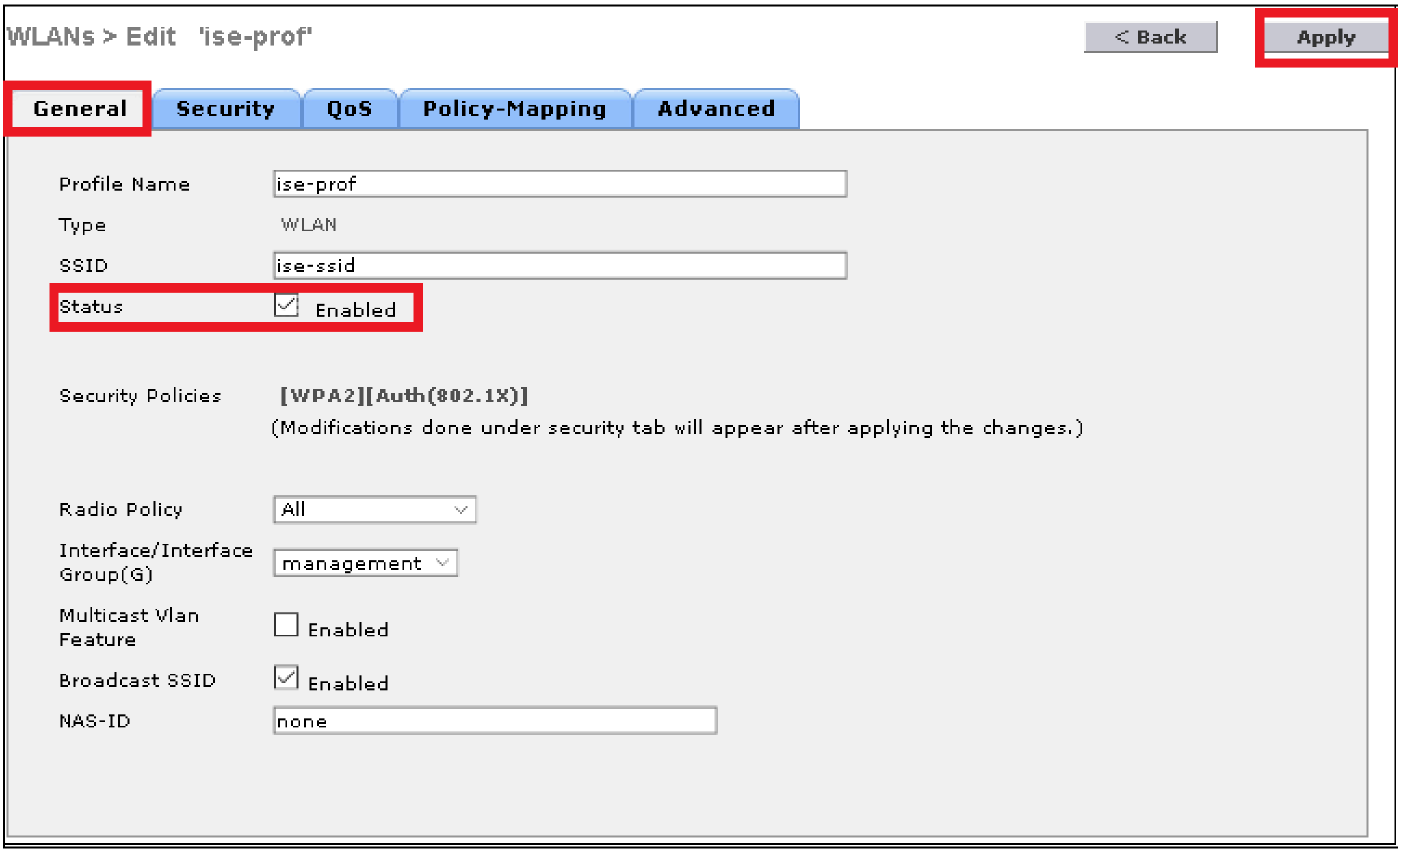
Step 5. Enable the WLAN.

CLI:

```
> config wlan enable <wlan-id>
```

GUI:

Navigate to **WLANs > WLAN ID > General** and enable the SSID as shown in the image.



WLANs > Edit 'ise-prof'

< Back | Apply

General | Security | QoS | Policy-Mapping | Advanced

Profile Name: ise-prof

Type: WLAN

SSID: ise-ssid

Status: ☑ Enabled

Security Policies: [WPA2][Auth(802.1X)]

(Modifications done under security tab will appear after applying the changes.)

Radio Policy: All

Interface/Interface Group(G): management

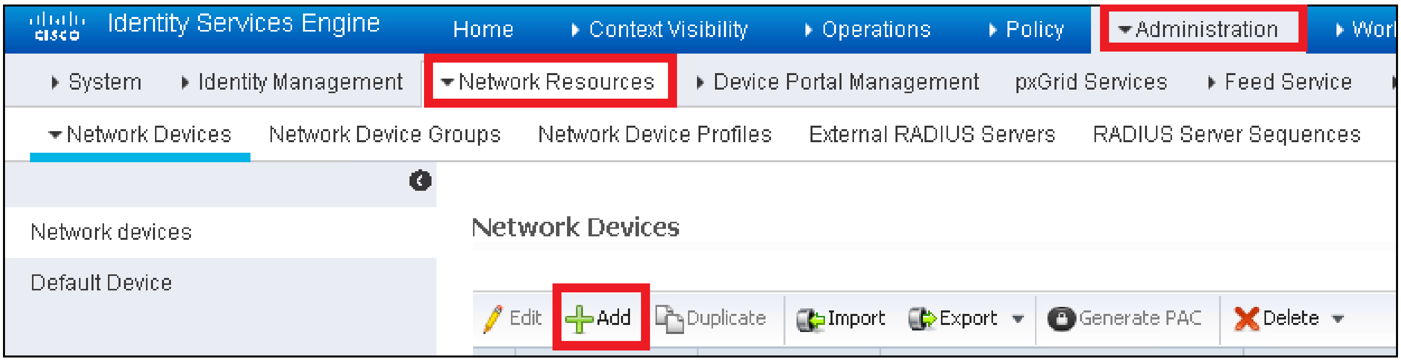
Multicast Vlan Feature: □ Enabled

Broadcast SSID: ☑ Enabled

NAS-ID: none

Declare WLC on ISE

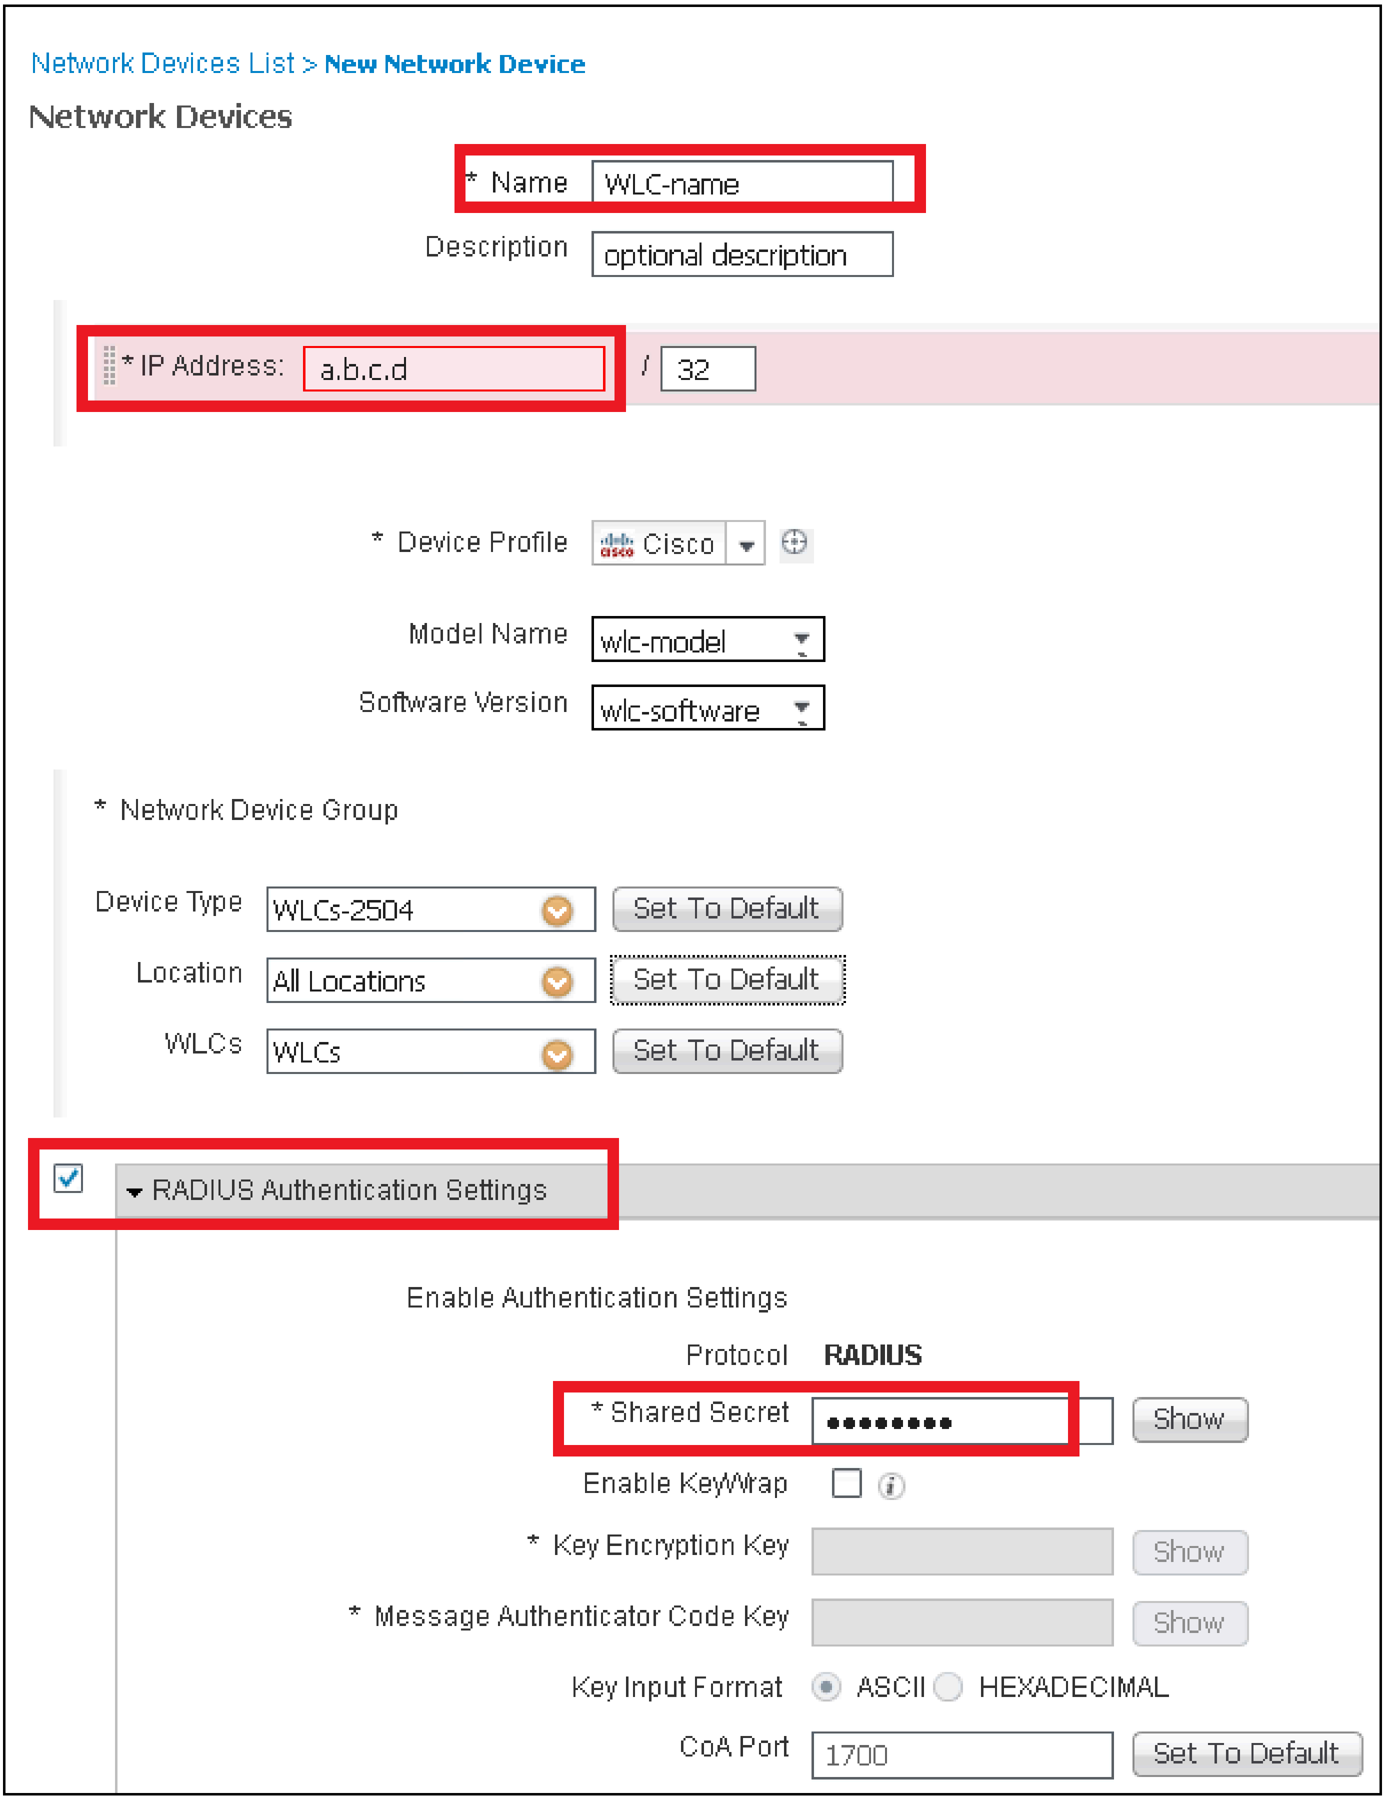
Step 1. Open ISE console and navigate to **Administration** > **Network Resources** > **Network Devices** > **Add** as shown in the image.



Step 2. Enter the values.

Optionally, it can be a specified Model name, software version, description and assign Network Device groups based on device types, location or WLCs.

a.b.c.d correspond to the WLC interface that sends the authentication requested. By default, it is the management interface as shown in the image.



Network Devices List > **New Network Device**

Network Devices

* Name: WLC-name

Description: optional description

* IP Address: a.b.c.d / 32

* Device Profile: Cisco

Model Name: wlc-model

Software Version: wlc-software

* Network Device Group

Device Type: WLCs-2504

Location: All Locations

WLCs: WLCs

☑ RADIUS Authentication Settings

Enable Authentication Settings

Protocol: **RADIUS**

* Shared Secret: ●●●●●●●●●

Enable KeyWrap: □

* Key Encryption Key:

* Message Authenticator Code Key:

Key Input Format: ● ASCII ○ HEXADECIMAL

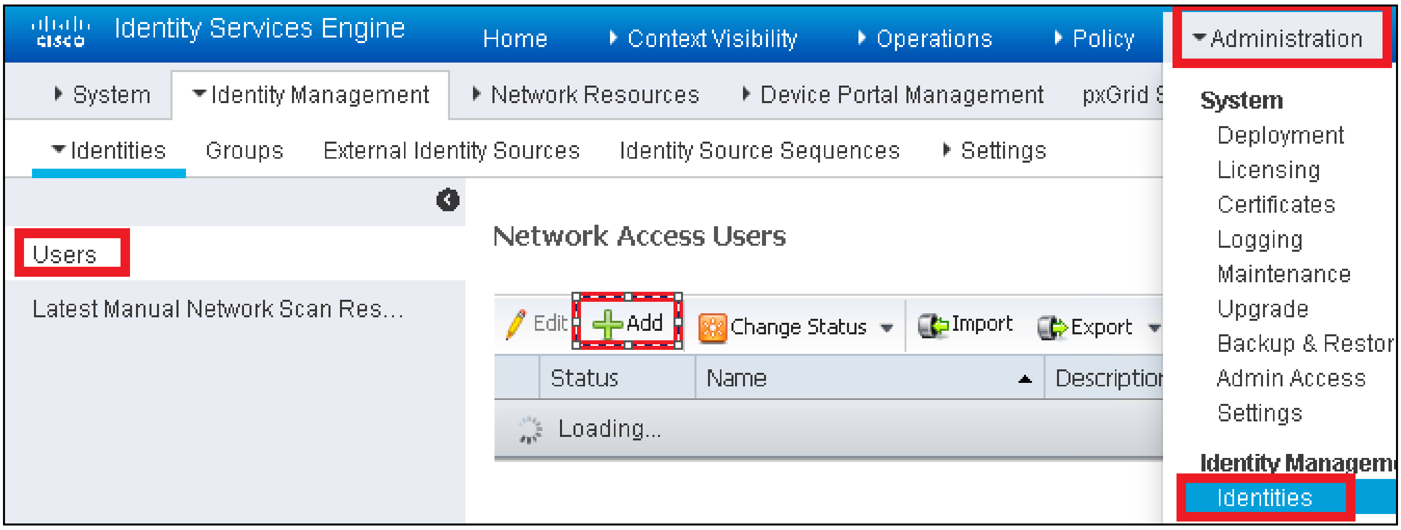
CoA Port: 1700

For more information about Network Device Groups:

ISE - Network Device Groups

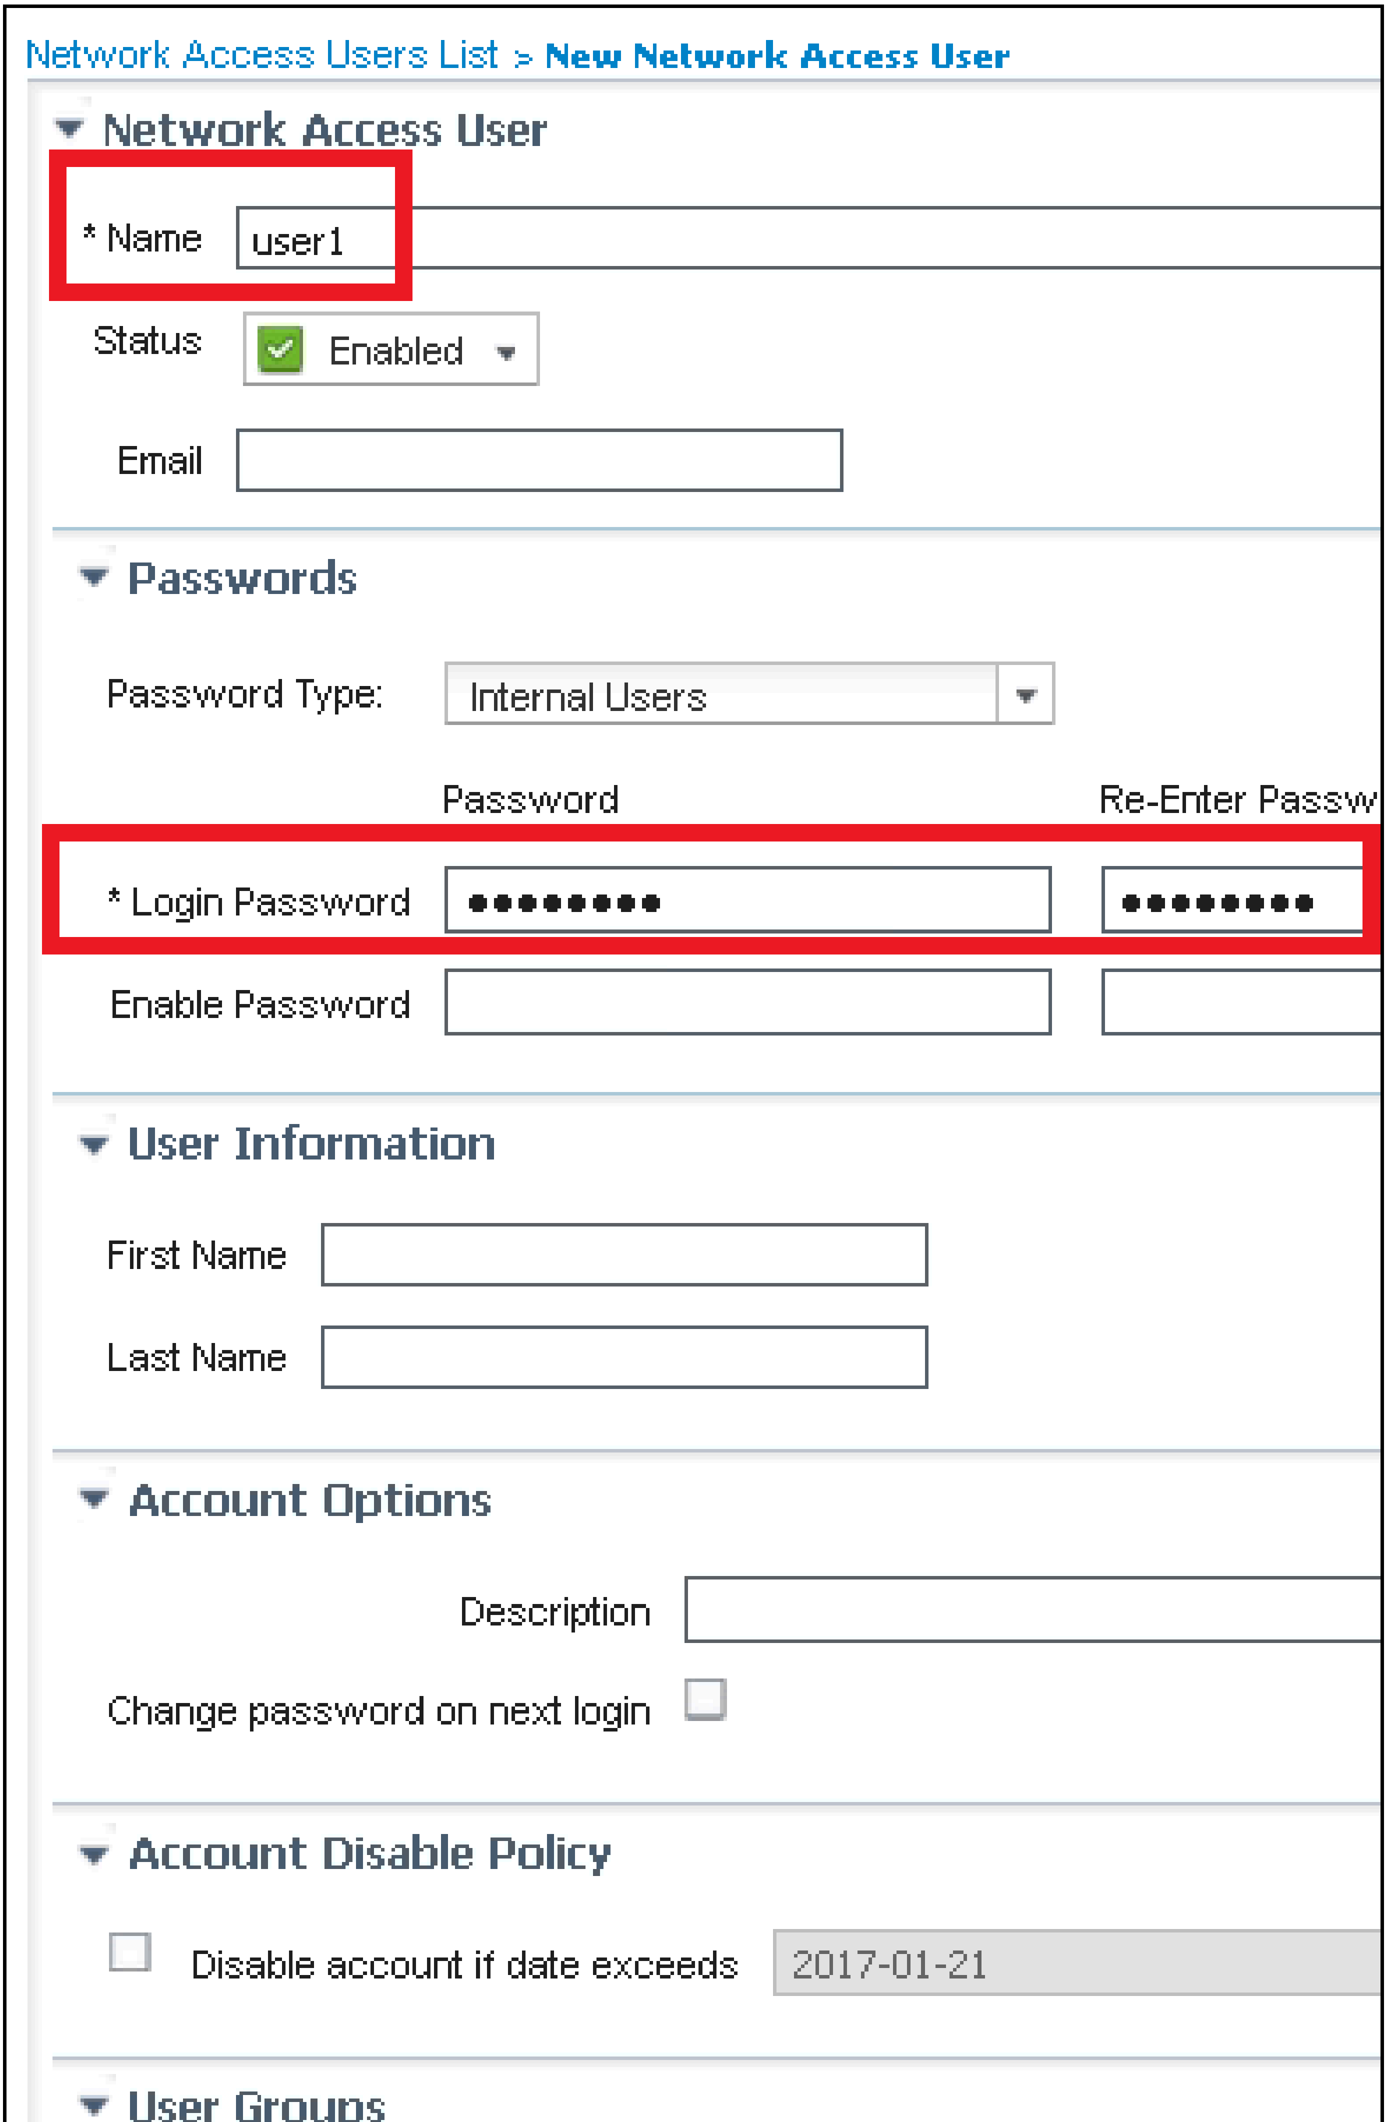
Create New User on ISE

Step 1. Navigate to **Administration** > **Identity Management** > **Identities** > **Users** > **Add** as shown in the image.



Step 2. Enter the information.

In this example, this user belongs to a group called ALL_ACCOUNTS, but it can be adjusted as needed, as shown in the image.



Network Access Users List > **New Network Access User**

Network Access User

* Name user1

Status ✓ Enabled

Email

Passwords

Password Type: Internal Users

	Password	Re-Enter Passw
* Login Password	●●●●●●●●●	●●●●●●●●●
Enable Password		

User Information

First Name

Last Name

Account Options

Description

Change password on next login □

Account Disable Policy

□ Disable account if date exceeds 2017-01-21

User Groups

2. Bypass the validation of the RADIUS server, and trust any RADIUS server used to perform the authentication (not recommended, as it can become a security issue).

The configuration for these options are explained on End device configuration - Create the WLAN Profile - Step 7.

End Device Configuration - Install ISE Self-Signed Certificate

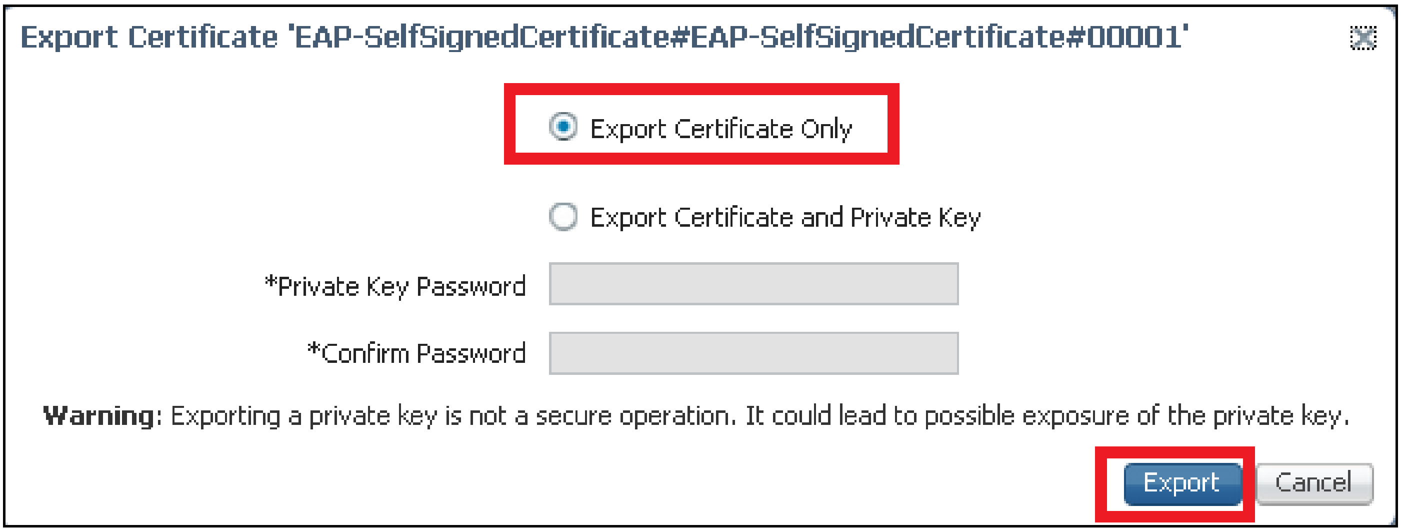
Step 1. Export self-signed certificate.

Log in to ISE and navigate to **Administration** > **System** > **Certificates** > **System Certificates**.

Then choose the certificate used for **EAP Authentication** and click **Export** as shown in the image.

	Friendly Name	Used By	Portal group tag
[redacted]			
☑	EAP-SelfSignedCertificate#EAP-SelfSignedCertificate#00001	EAP Authentication	EA

Save the certificate in the needed location. That certificate must be installed on the windows machine as shown in the image.



Export Certificate 'EAP-SelfSignedCertificate#EAP-SelfSignedCertificate#00001'

● Export Certificate Only

○ Export Certificate and Private Key

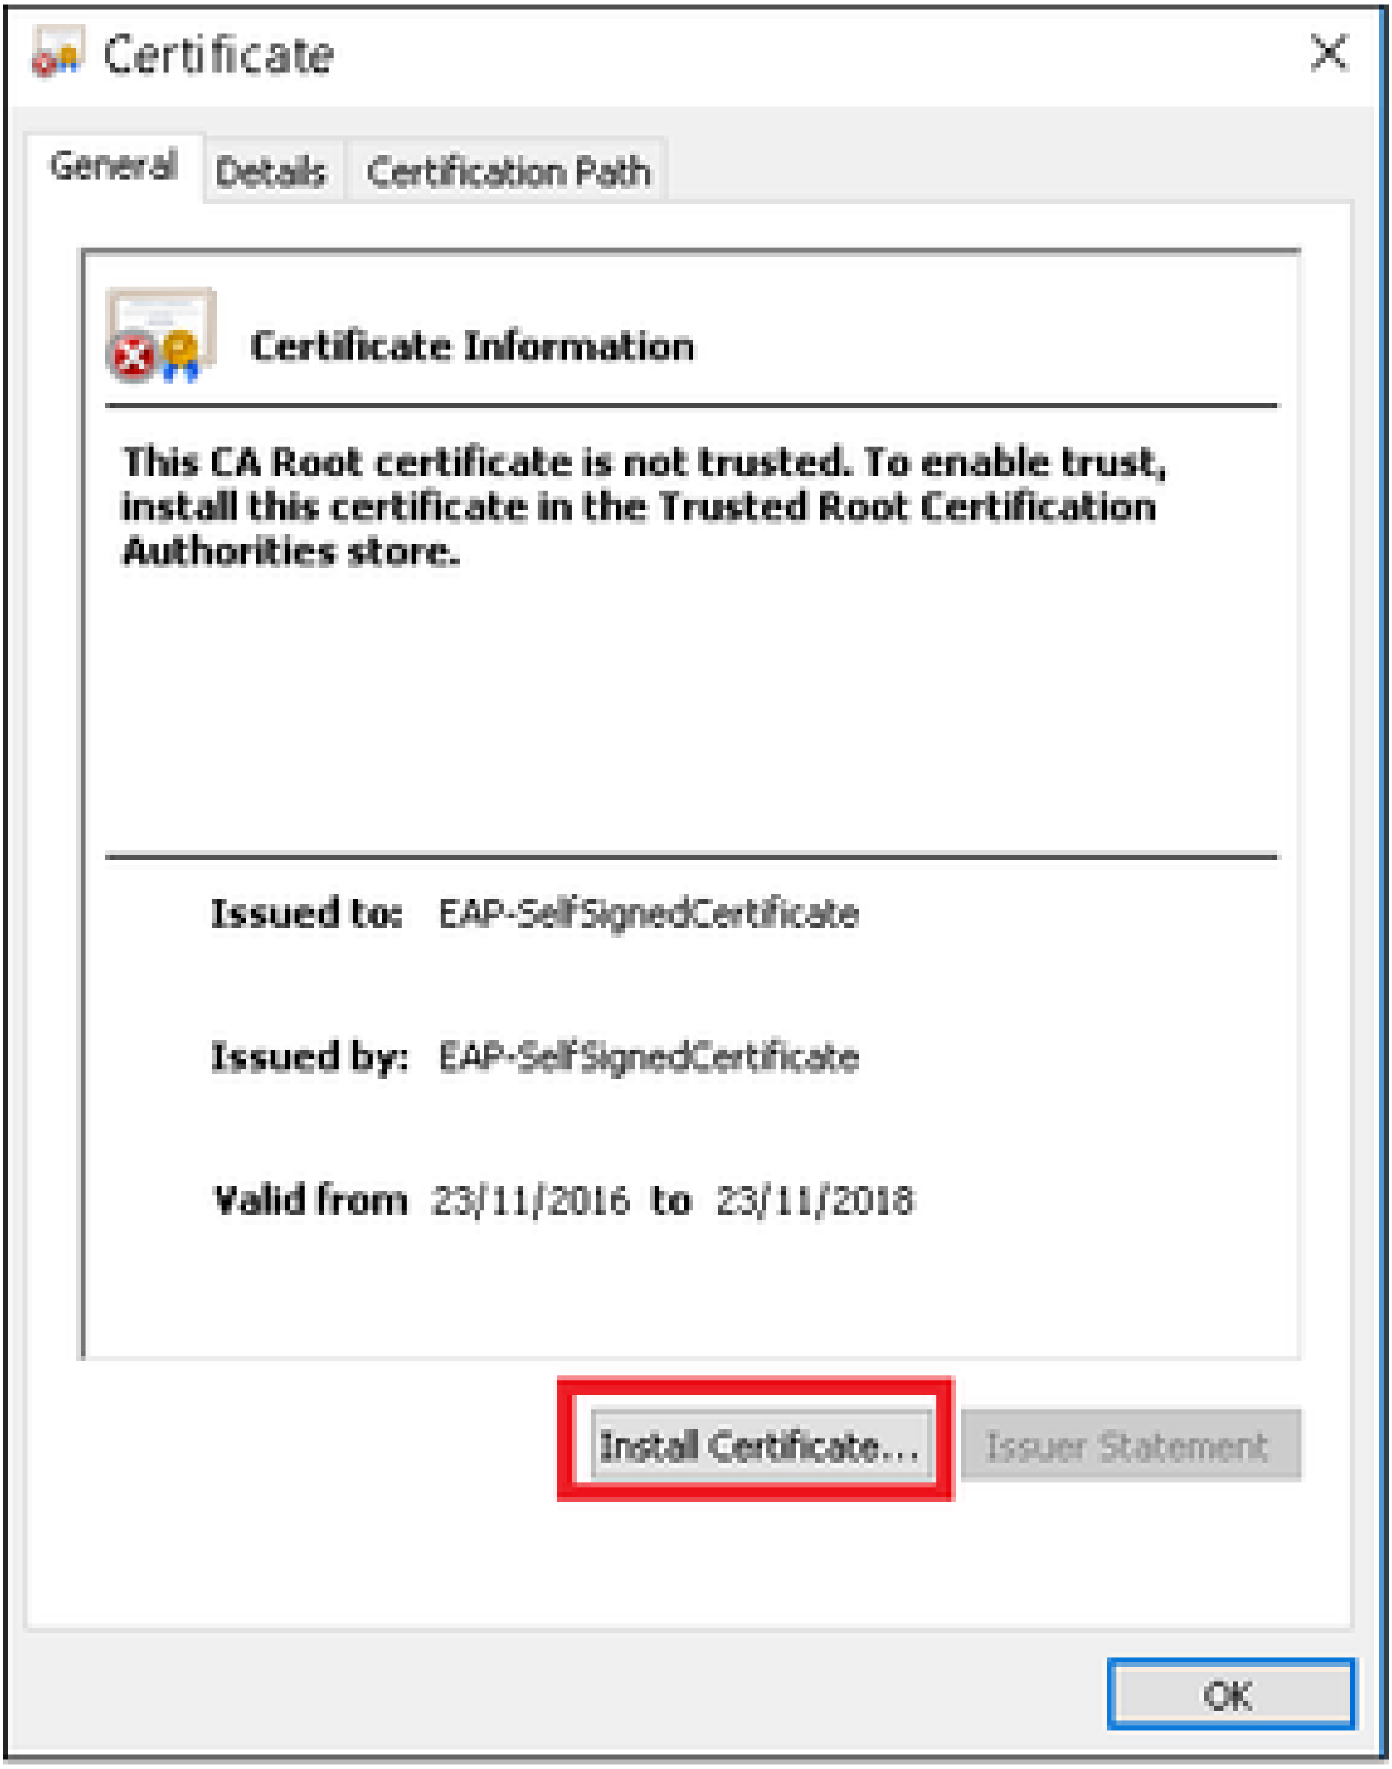
*Private Key Password

*Confirm Password

Warning: Exporting a private key is not a secure operation. It could lead to possible exposure of the private key.

Step 2. Install the certificate in the windows machine.

Copy the certificate exported from ISE into the windows machine, change the extension of the file from .pem to .crt, and after that double click in order to install it as shown in the image.



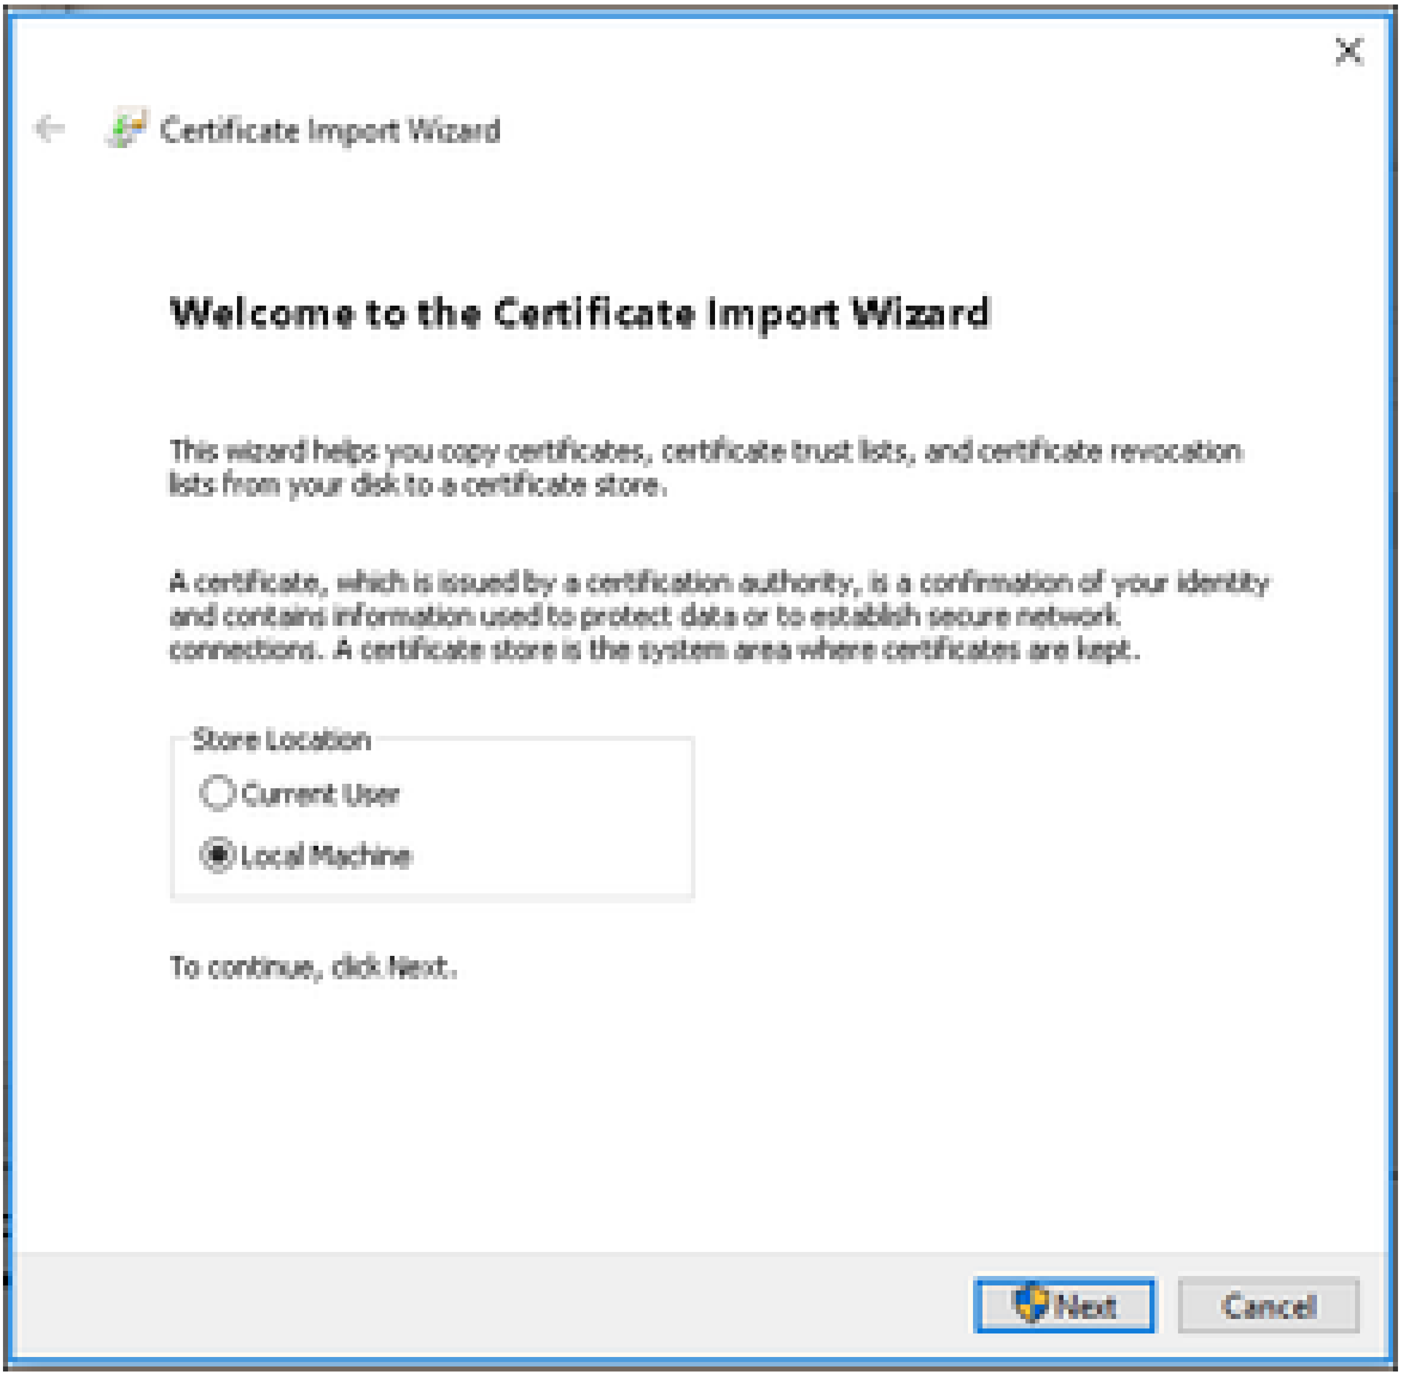
This CA Root certificate is not trusted. To enable trust, install this certificate in the Trusted Root Certification Authorities store.

Issued to: EAP-SelfSignedCertificate

Issued by: EAP-SelfSignedCertificate

Valid from 23/11/2016 **to** 23/11/2018

Step 3. Select install it in **Local Machine** and click **Next** as shown in the image.



Welcome to the Certificate Import Wizard

This wizard helps you copy certificates, certificate trust lists, and certificate revocation lists from your disk to a certificate store.

A certificate, which is issued by a certification authority, is a confirmation of your identity and contains information used to protect data or to establish secure network connections. A certificate store is the system area where certificates are kept.

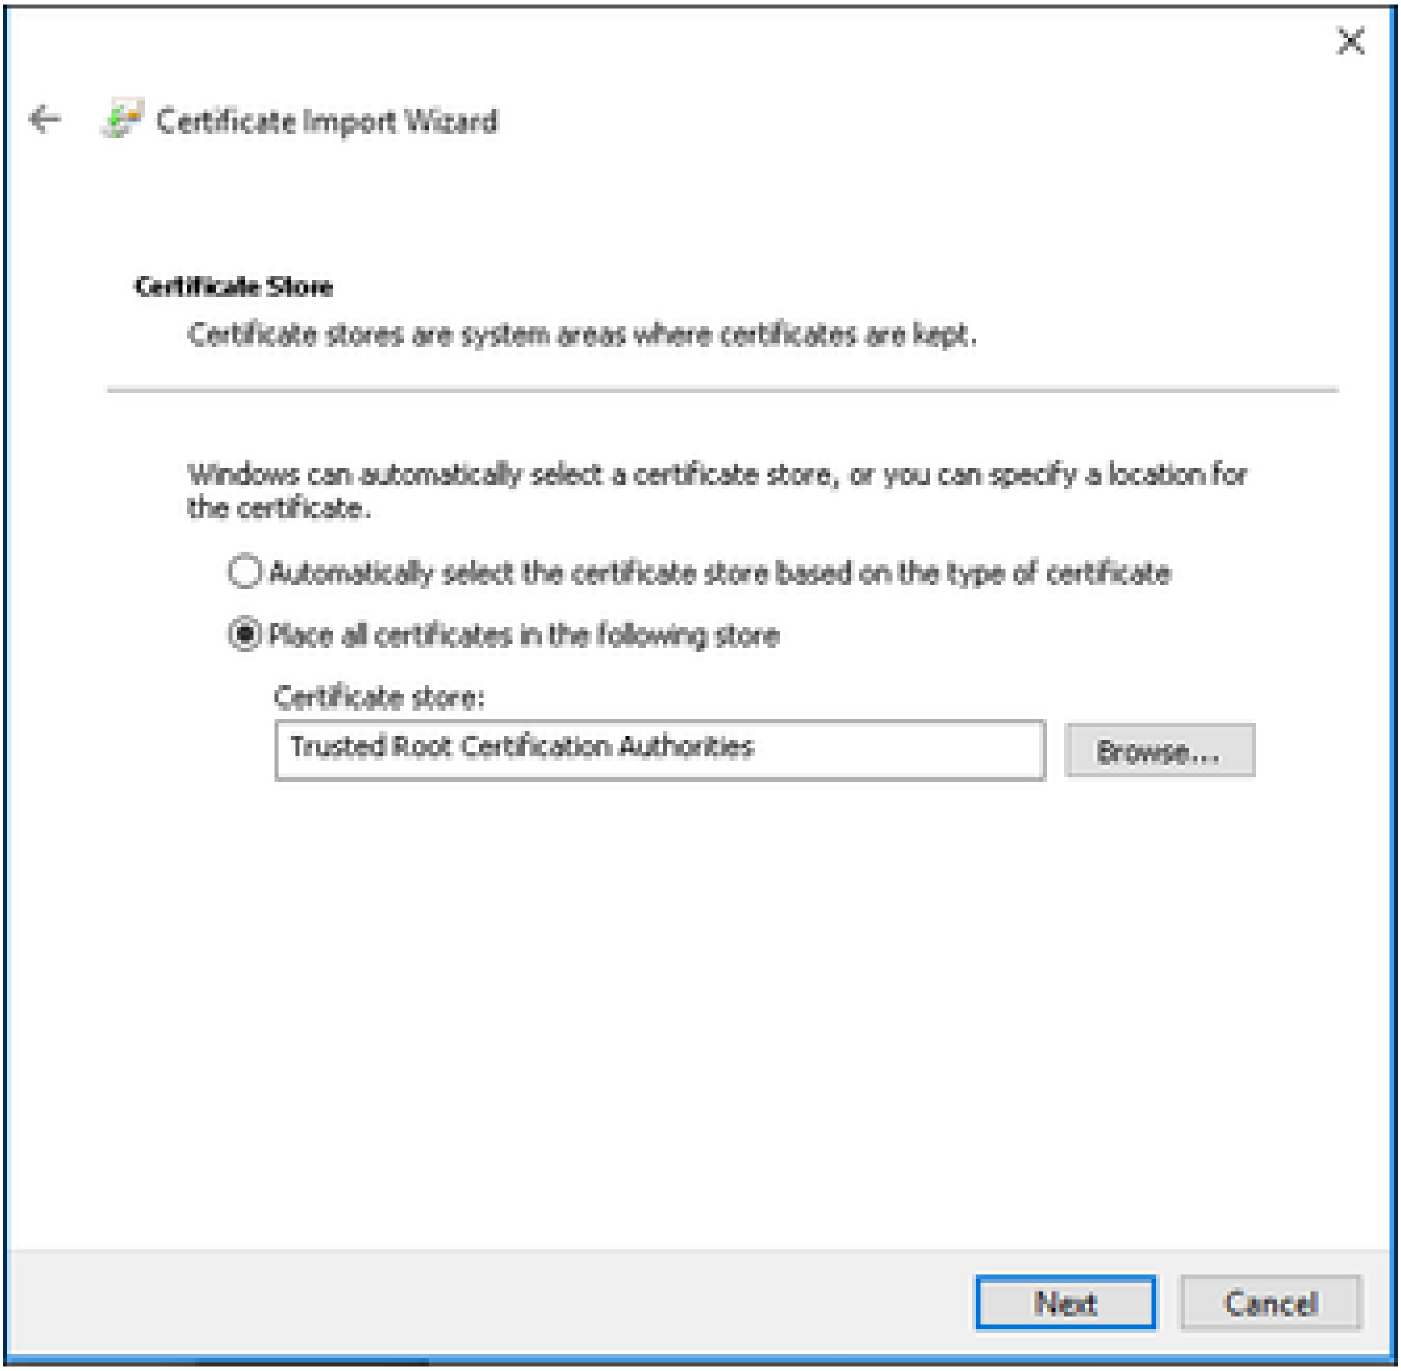
Store Location

○ Current User

● Local Machine

To continue, click Next.

Step 4. Select **Place all certificates in this store**, then browse and select **Trusted Root Certification Authorities.** After that, click **Next** as shown in the image.



Certificate Import Wizard

Certificate Store

Certificate stores are system areas where certificates are kept.

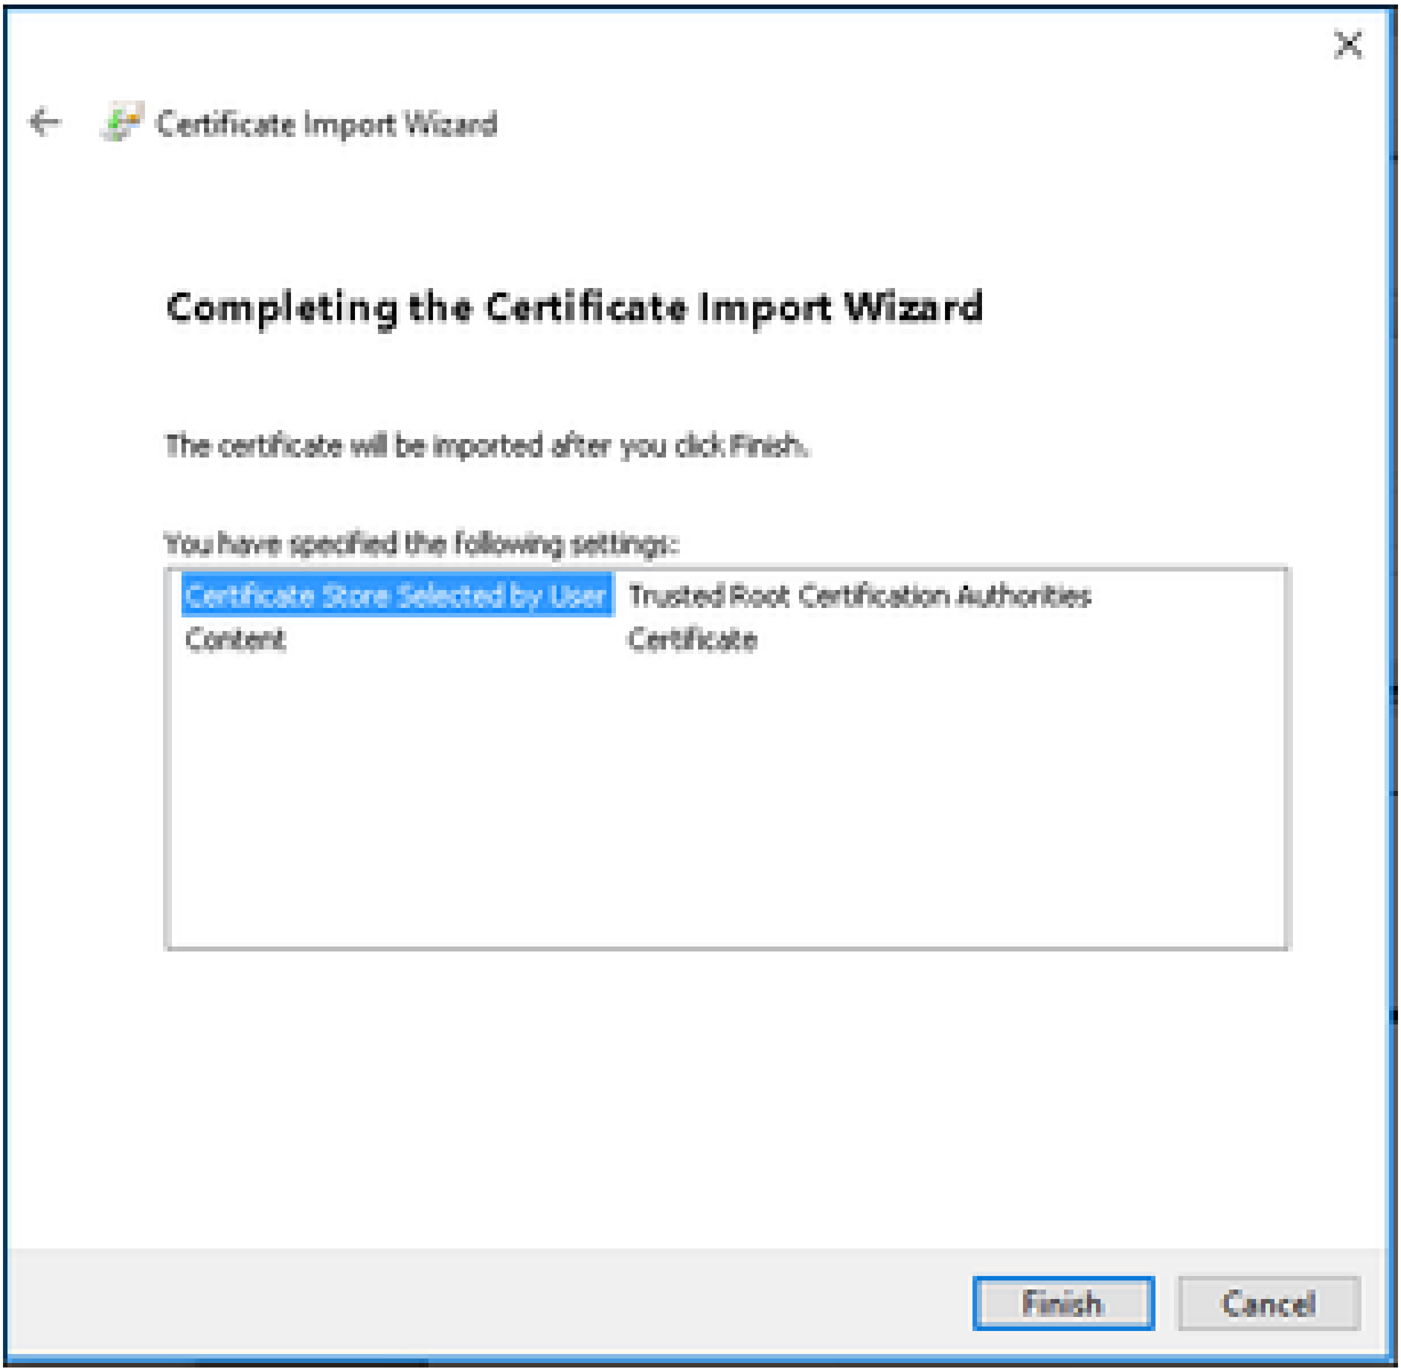
Windows can automatically select a certificate store, or you can specify a location for the certificate.

○ Automatically select the certificate store based on the type of certificate

● Place all certificates in the following store

Certificate store: Trusted Root Certification Authorities

Step 5. Then, click **Finish** as shown in the image.



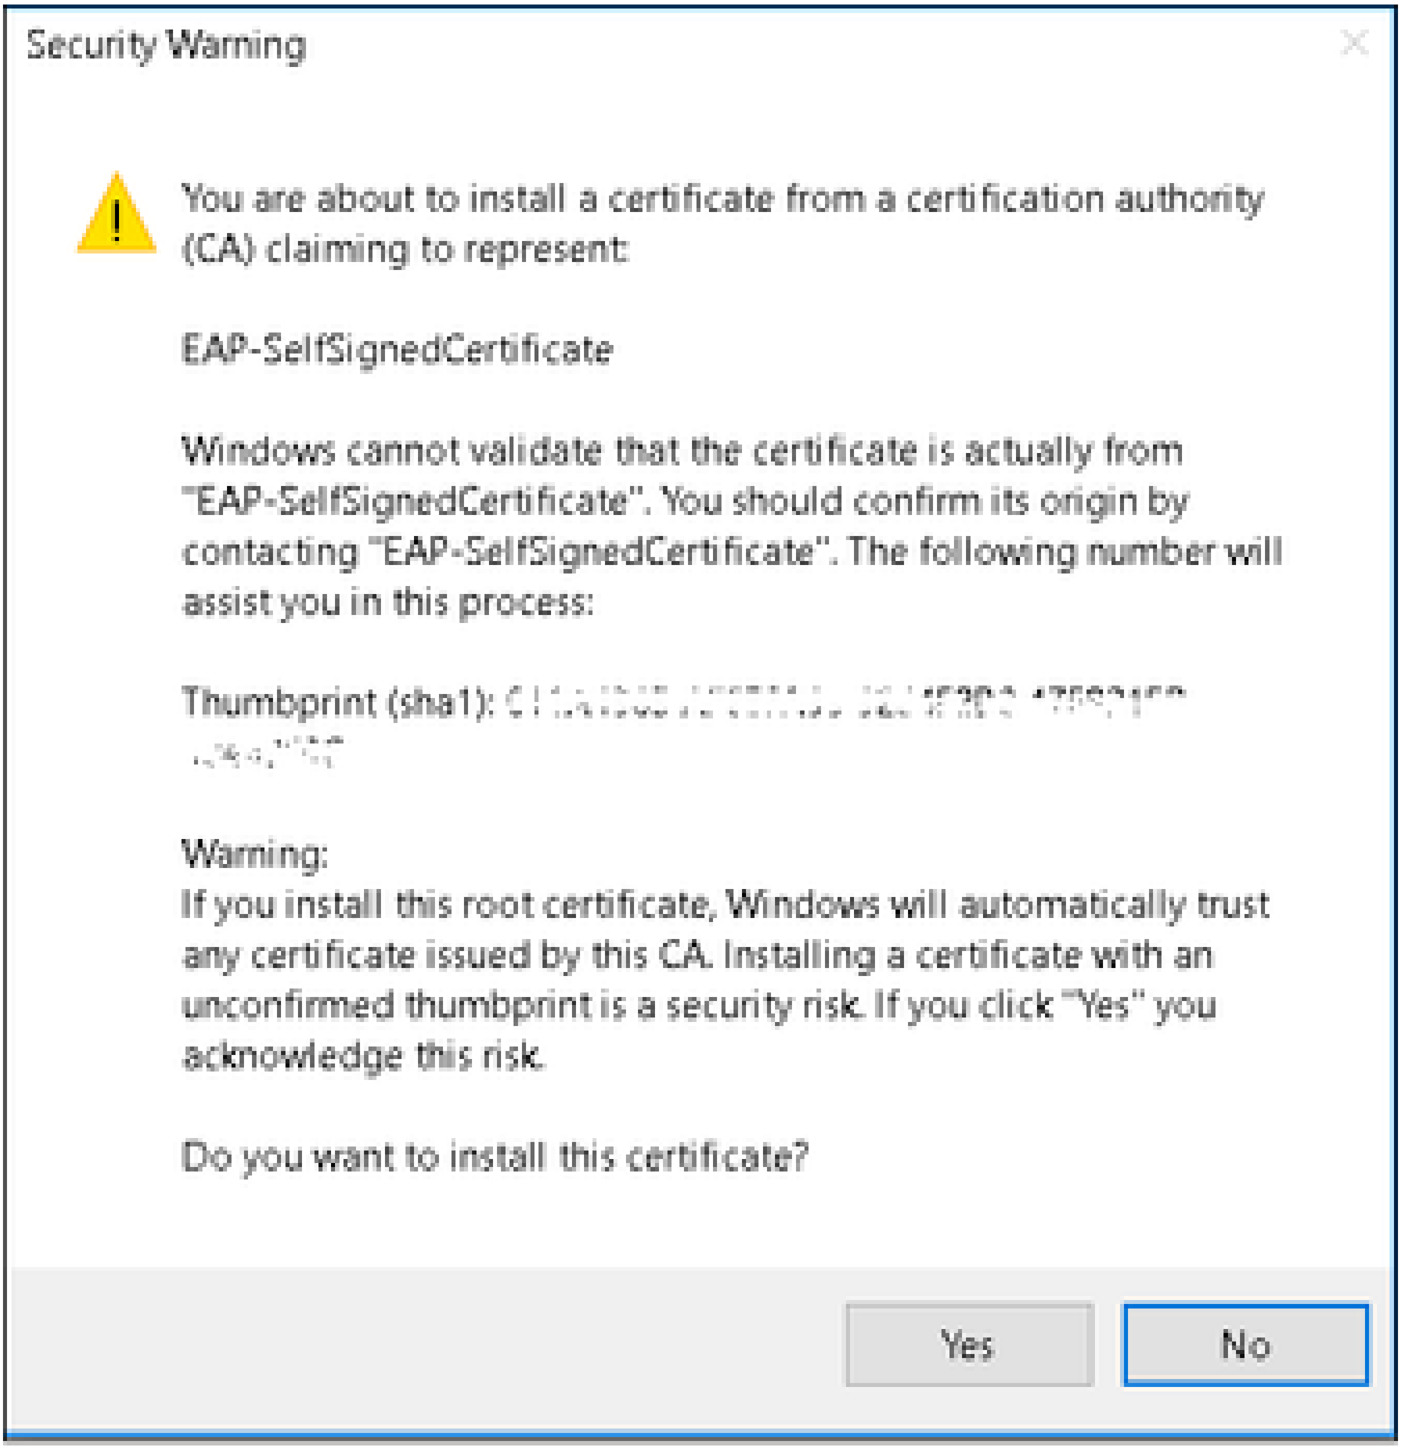
Completing the Certificate Import Wizard

The certificate will be imported after you click Finish.

You have specified the following settings:

Certificate Store Selected by User	Trusted Root Certification Authorities
Content	Certificate

Step 6. Confirm the installation of the certificate. Click **Yes** as shown in the image.



Security Warning

You are about to install a certificate from a certification authority (CA) claiming to represent:

EAP-SelfSignedCertificate

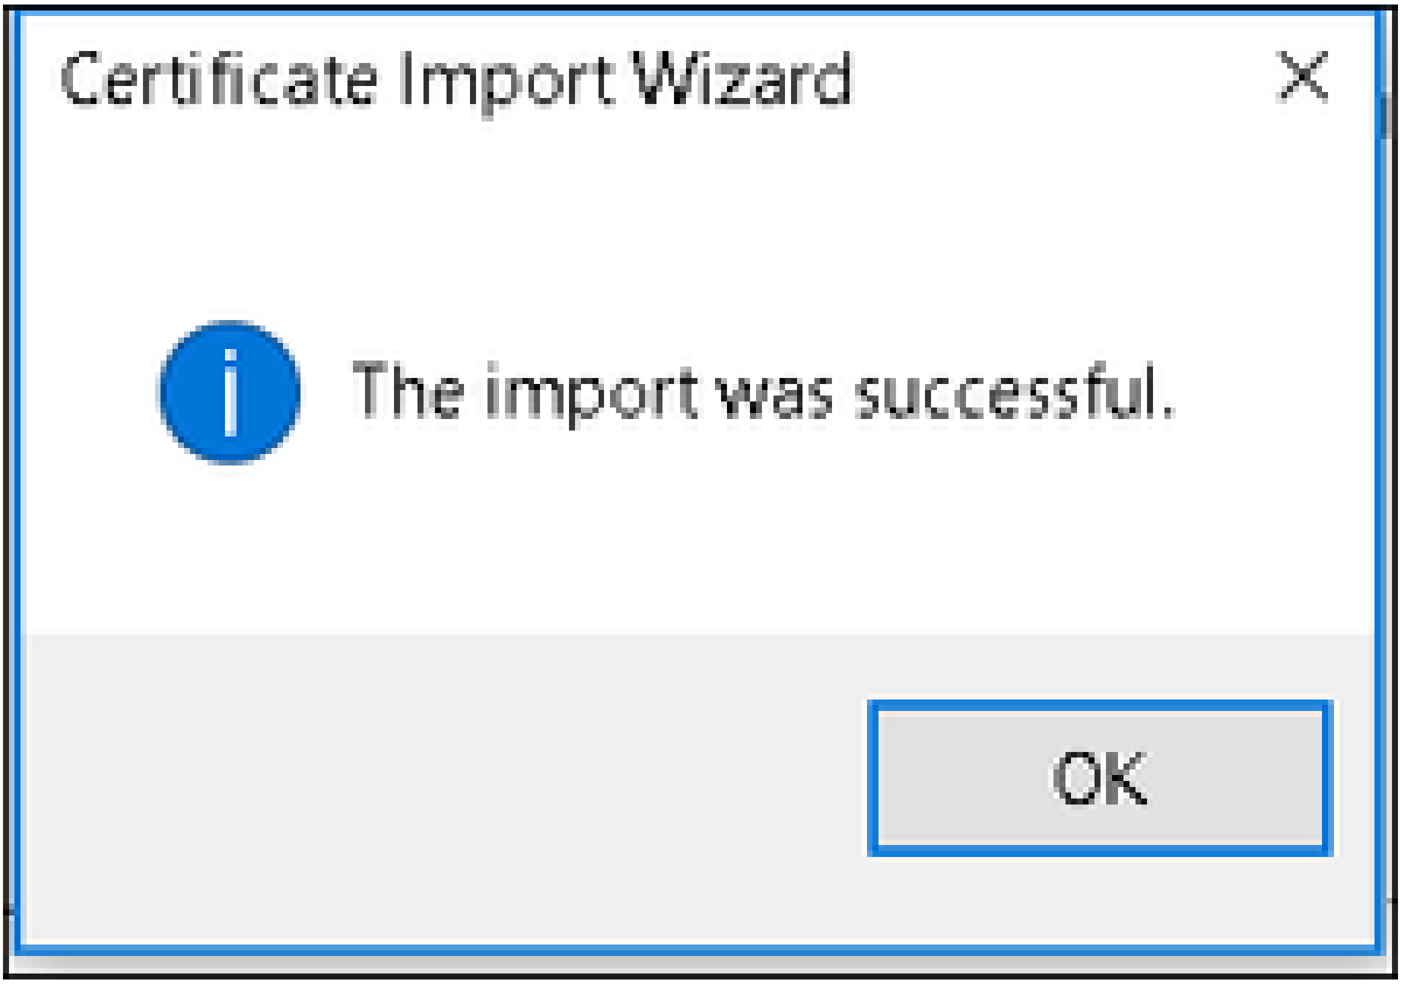
Windows cannot validate that the certificate is actually from "EAP-SelfSignedCertificate". You should confirm its origin by contacting "EAP-SelfSignedCertificate". The following number will assist you in this process:

Thumbprint (sha1): [redacted]

Warning:
If you install this root certificate, Windows will automatically trust any certificate issued by this CA. Installing a certificate with an unconfirmed thumbprint is a security risk. If you click "Yes" you acknowledge this risk.

Do you want to install this certificate?

Step 7. Finally, click **OK** as shown in the image.

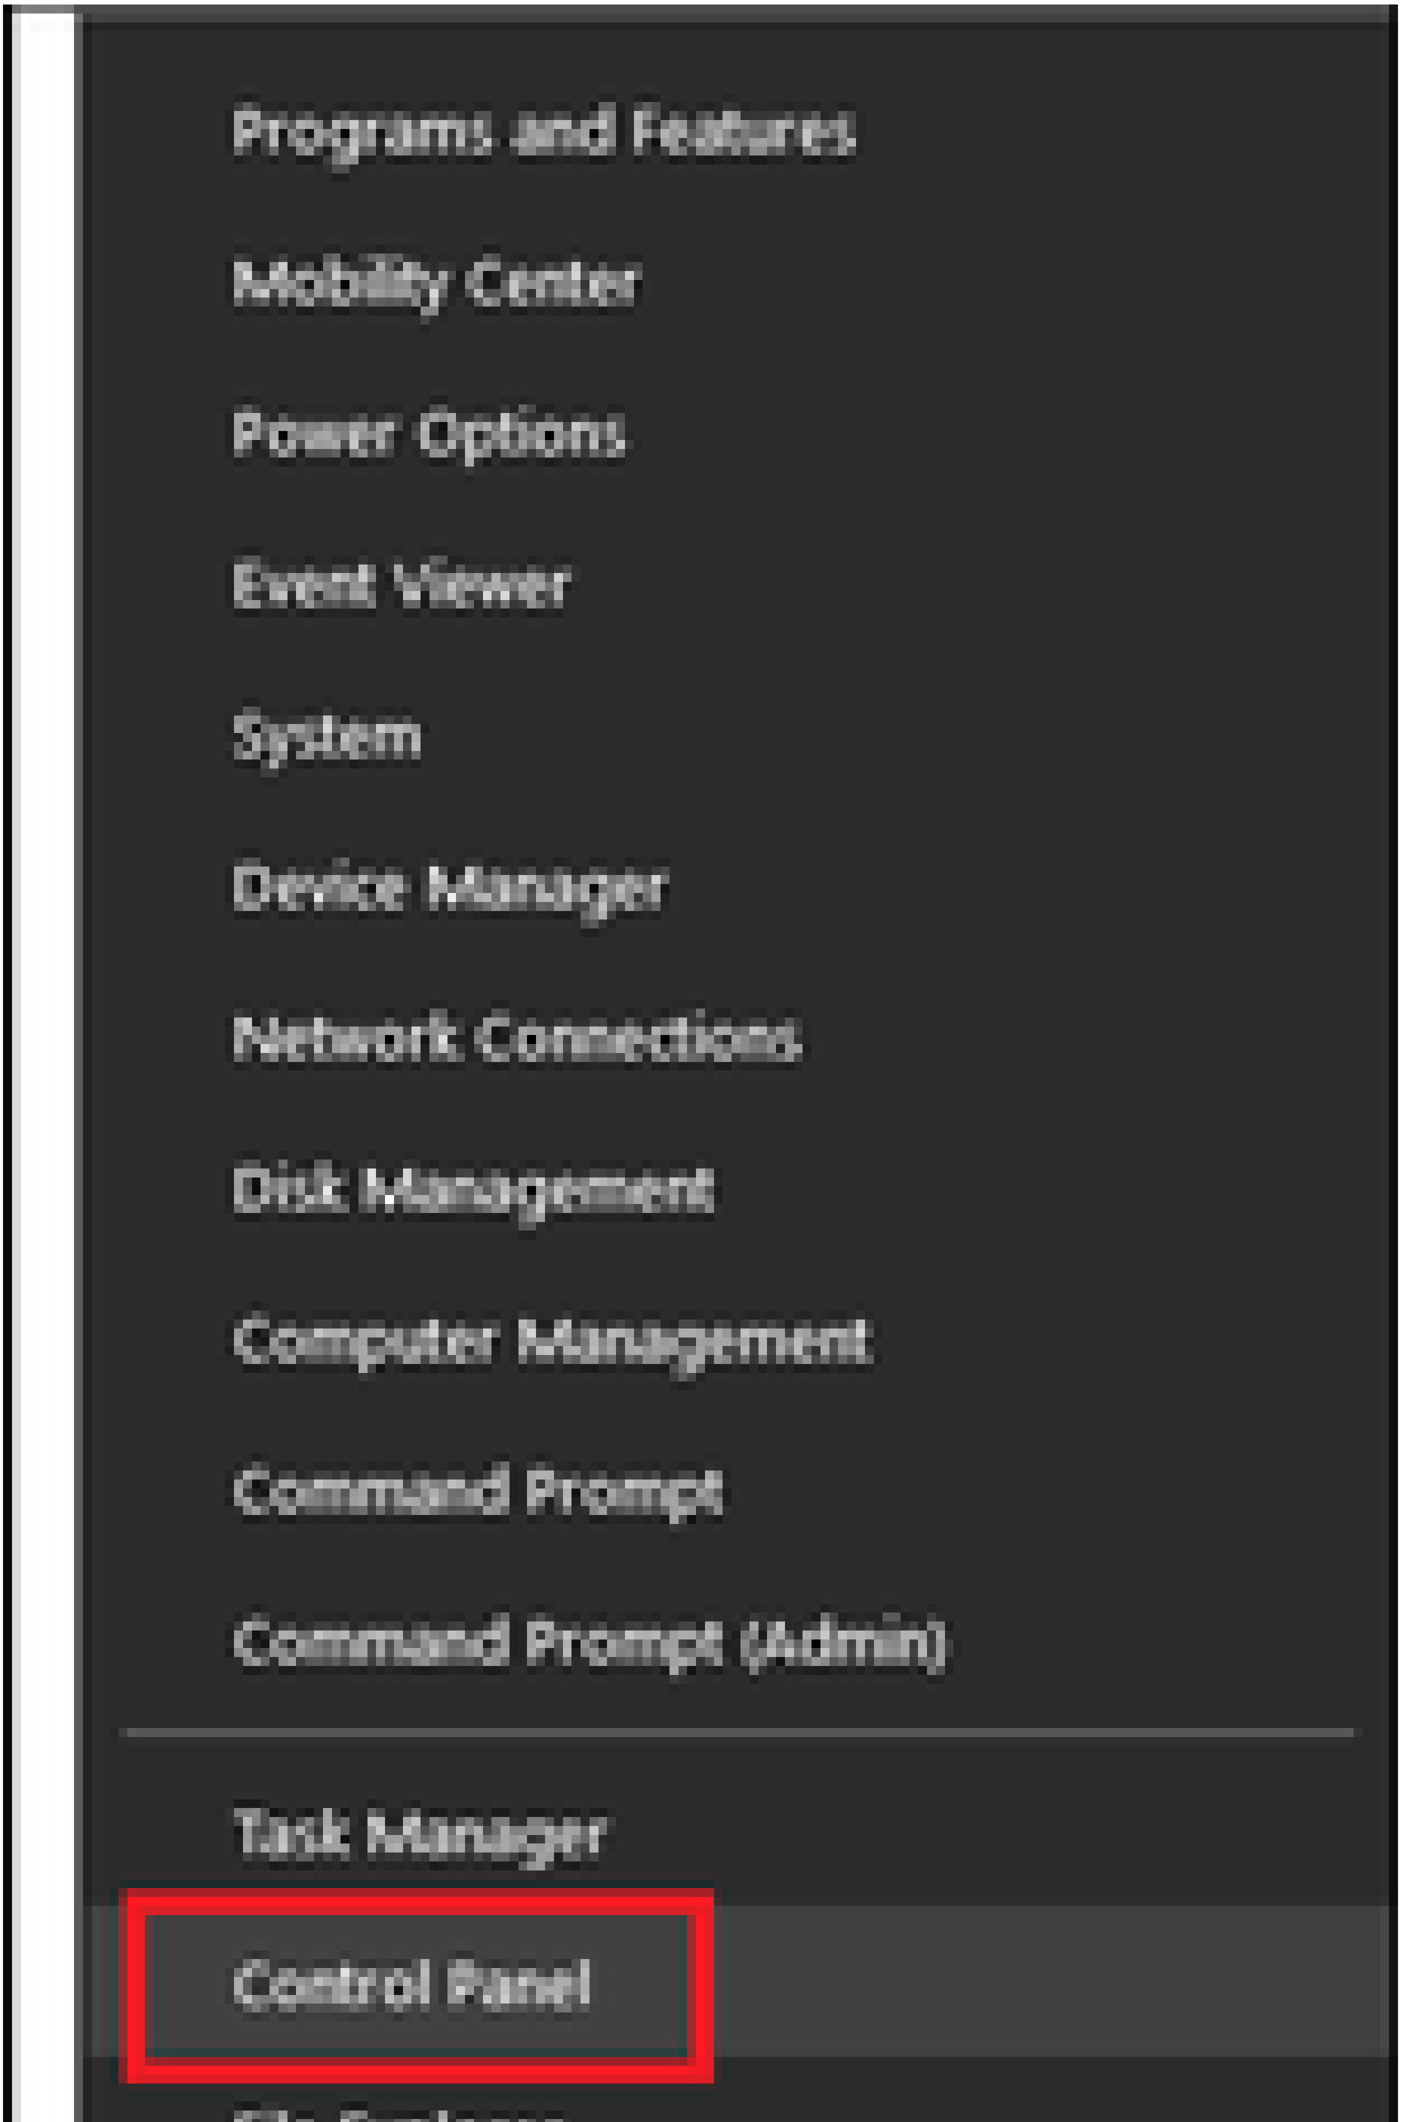


Certificate Import Wizard

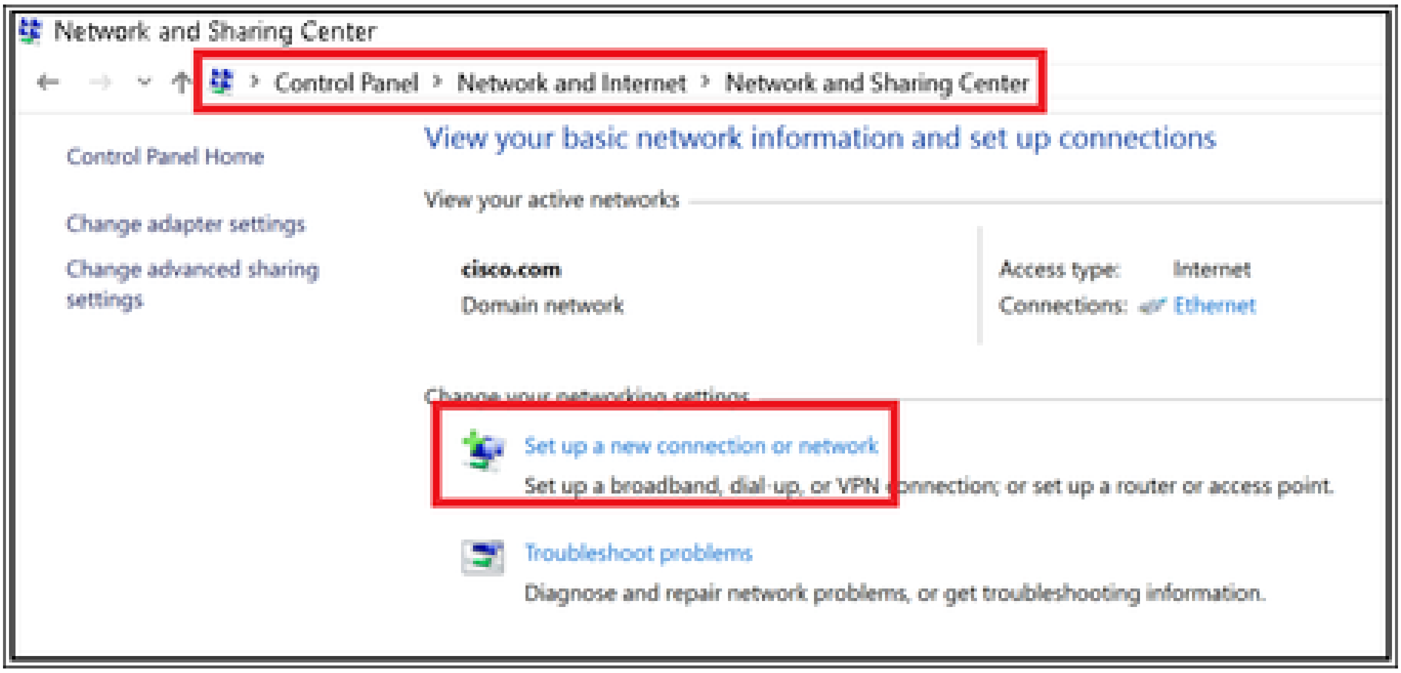
The import was successful.

End Device Configuration - Create the WLAN Profile

Step 1. Right click on **Start** icon and select **Control Panel** as shown in the image.



Programs and Features
Mobility Center
Power Options
Event Viewer
System
Device Manager
Network Connections
Disk Management
Computer Management
Command Prompt
Command Prompt (Admin)
Task Manager
Control Panel



Network and Sharing Center

Control Panel > Network and Internet > Network and Sharing Center

View your basic network information and set up connections

View your active networks

cisco.com
Domain network

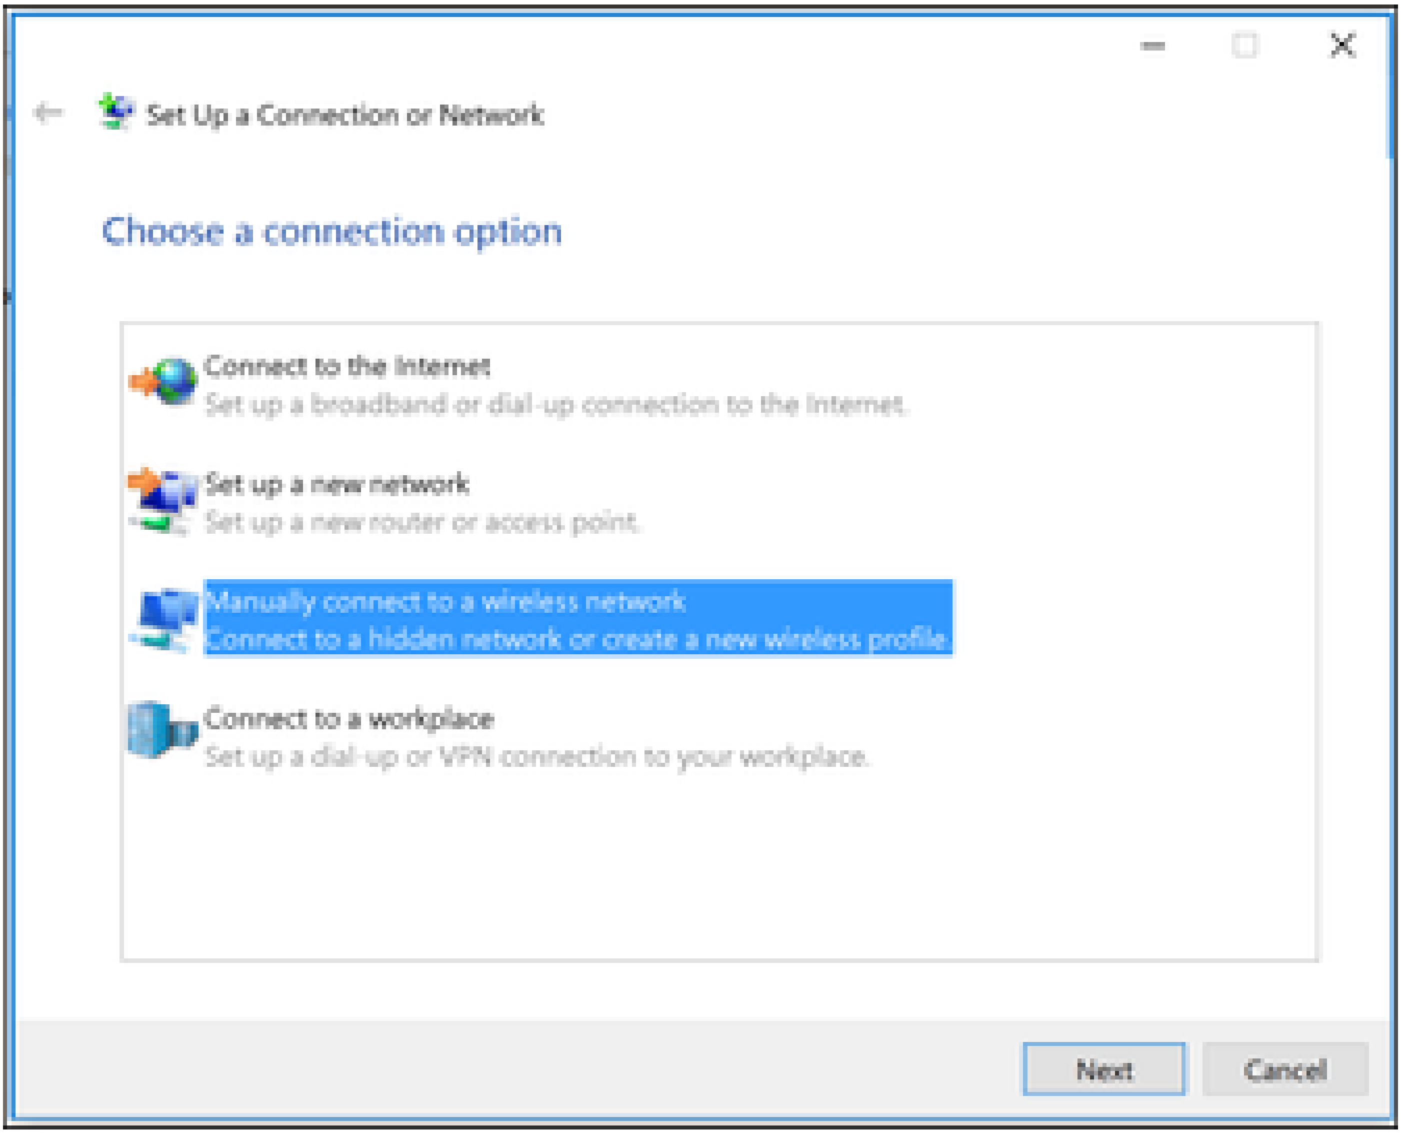
Access type: Internet
Connections: Ethernet

Change your networking settings

Set up a new connection or network
Set up a broadband, dial-up, or VPN connection; or set up a router or access point.

Troubleshoot problems
Diagnose and repair network problems, or get troubleshooting information.

Step 3. Select **Manually connect to a wireless network**, and click **Next** as shown in the image.



Set Up a Connection or Network

Choose a connection option

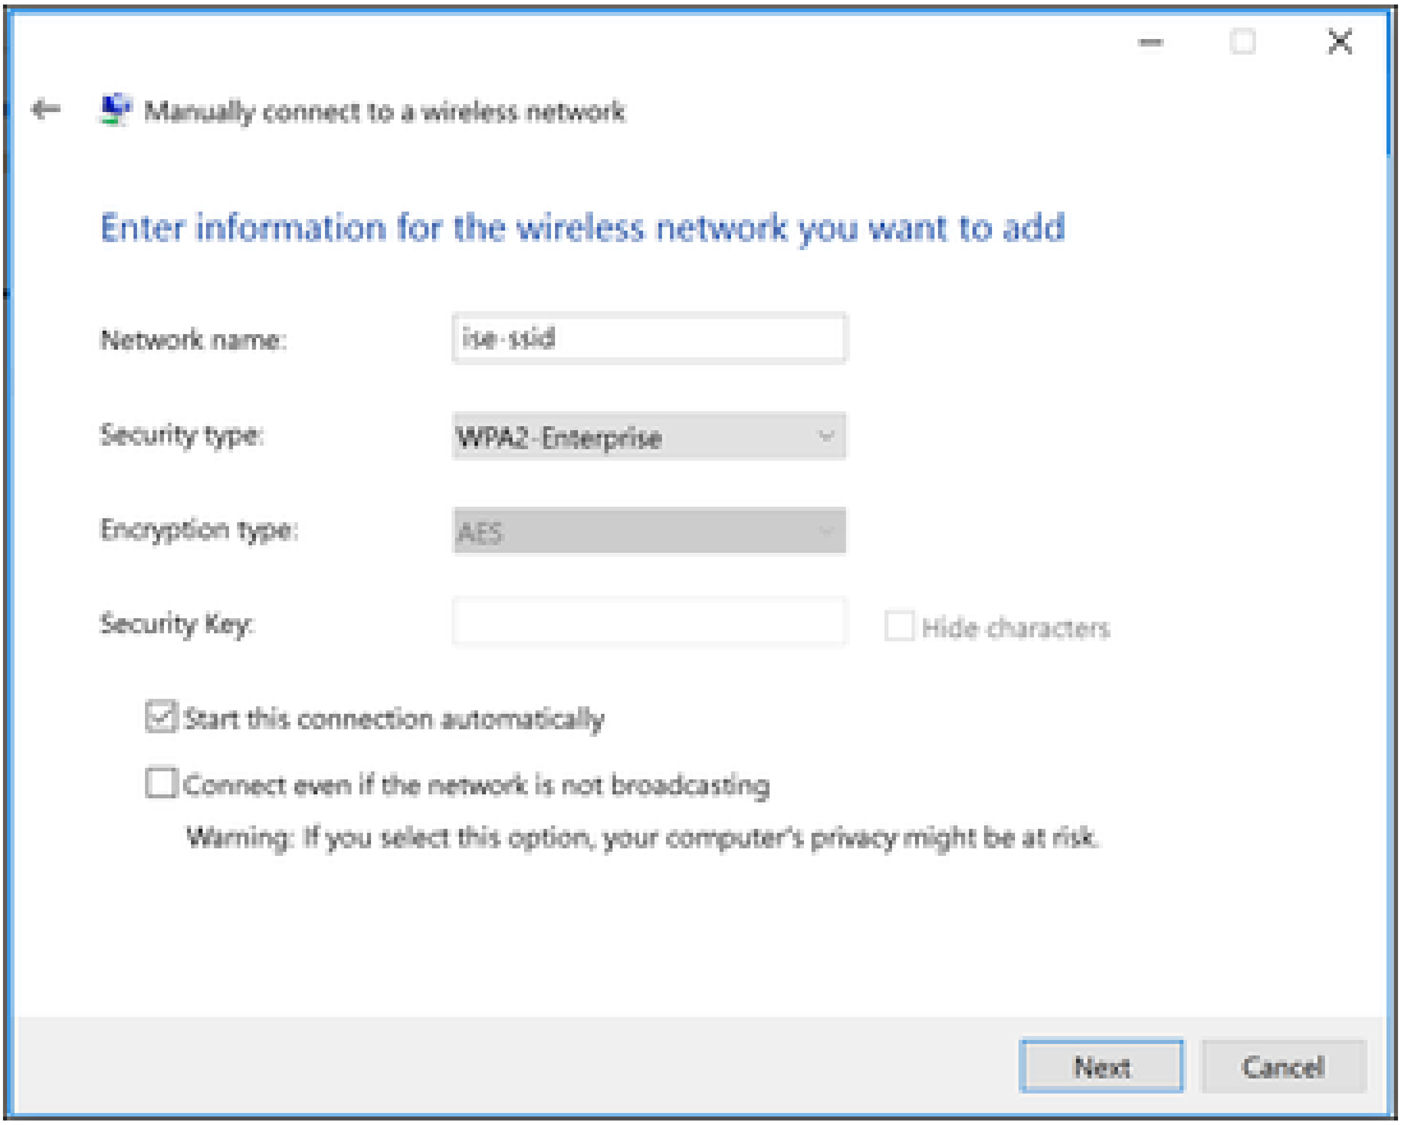
Connect to the Internet
Set up a broadband or dial-up connection to the Internet.

Set up a new network
Set up a new router or access point.

Manually connect to a wireless network
Connect to a hidden network or create a new wireless profile.

Connect to a workplace
Set up a dial-up or VPN connection to your workplace.

Step 4. Enter the information with the name of the SSID and security type WPA2-Enterprise and click **Next** as shown in the image.



Manually connect to a wireless network

Enter information for the wireless network you want to add

Network name: ise-ssid

Security type: WPA2-Enterprise

Encryption type: AES

Security Key:

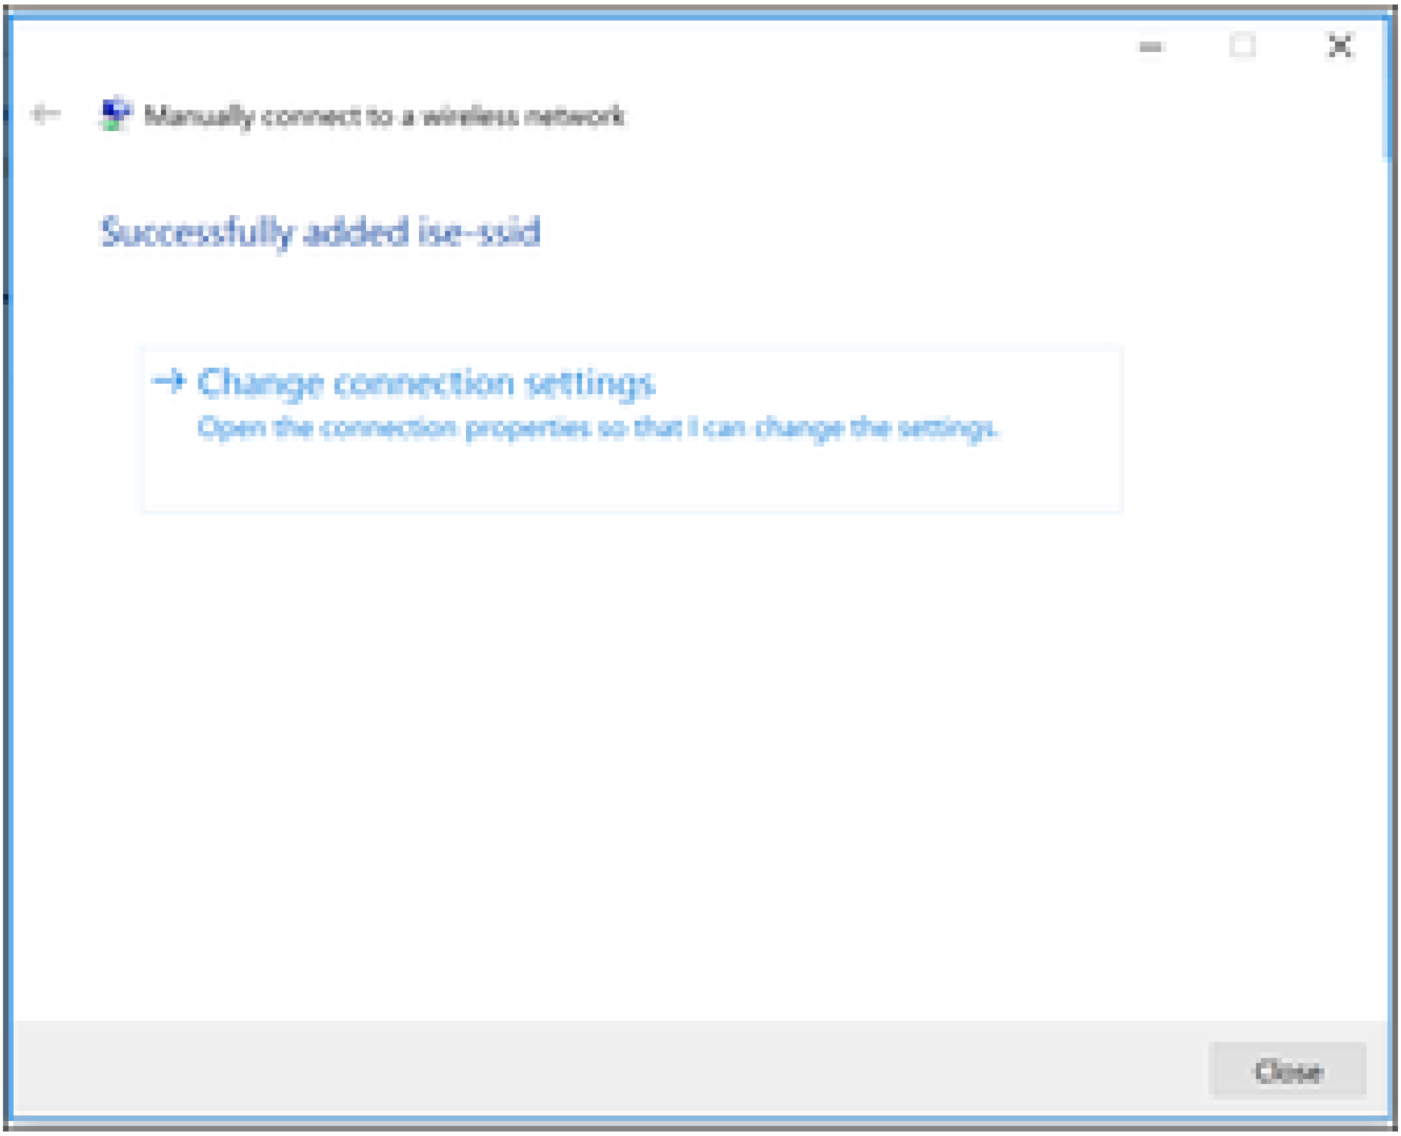
□ Hide characters

☑ Start this connection automatically

□ Connect even if the network is not broadcasting

Warning: If you select this option, your computer's privacy might be at risk.

Step 5. Select **Change connection settings** in order to customize the configuration of the WLAN profile as shown in the image.

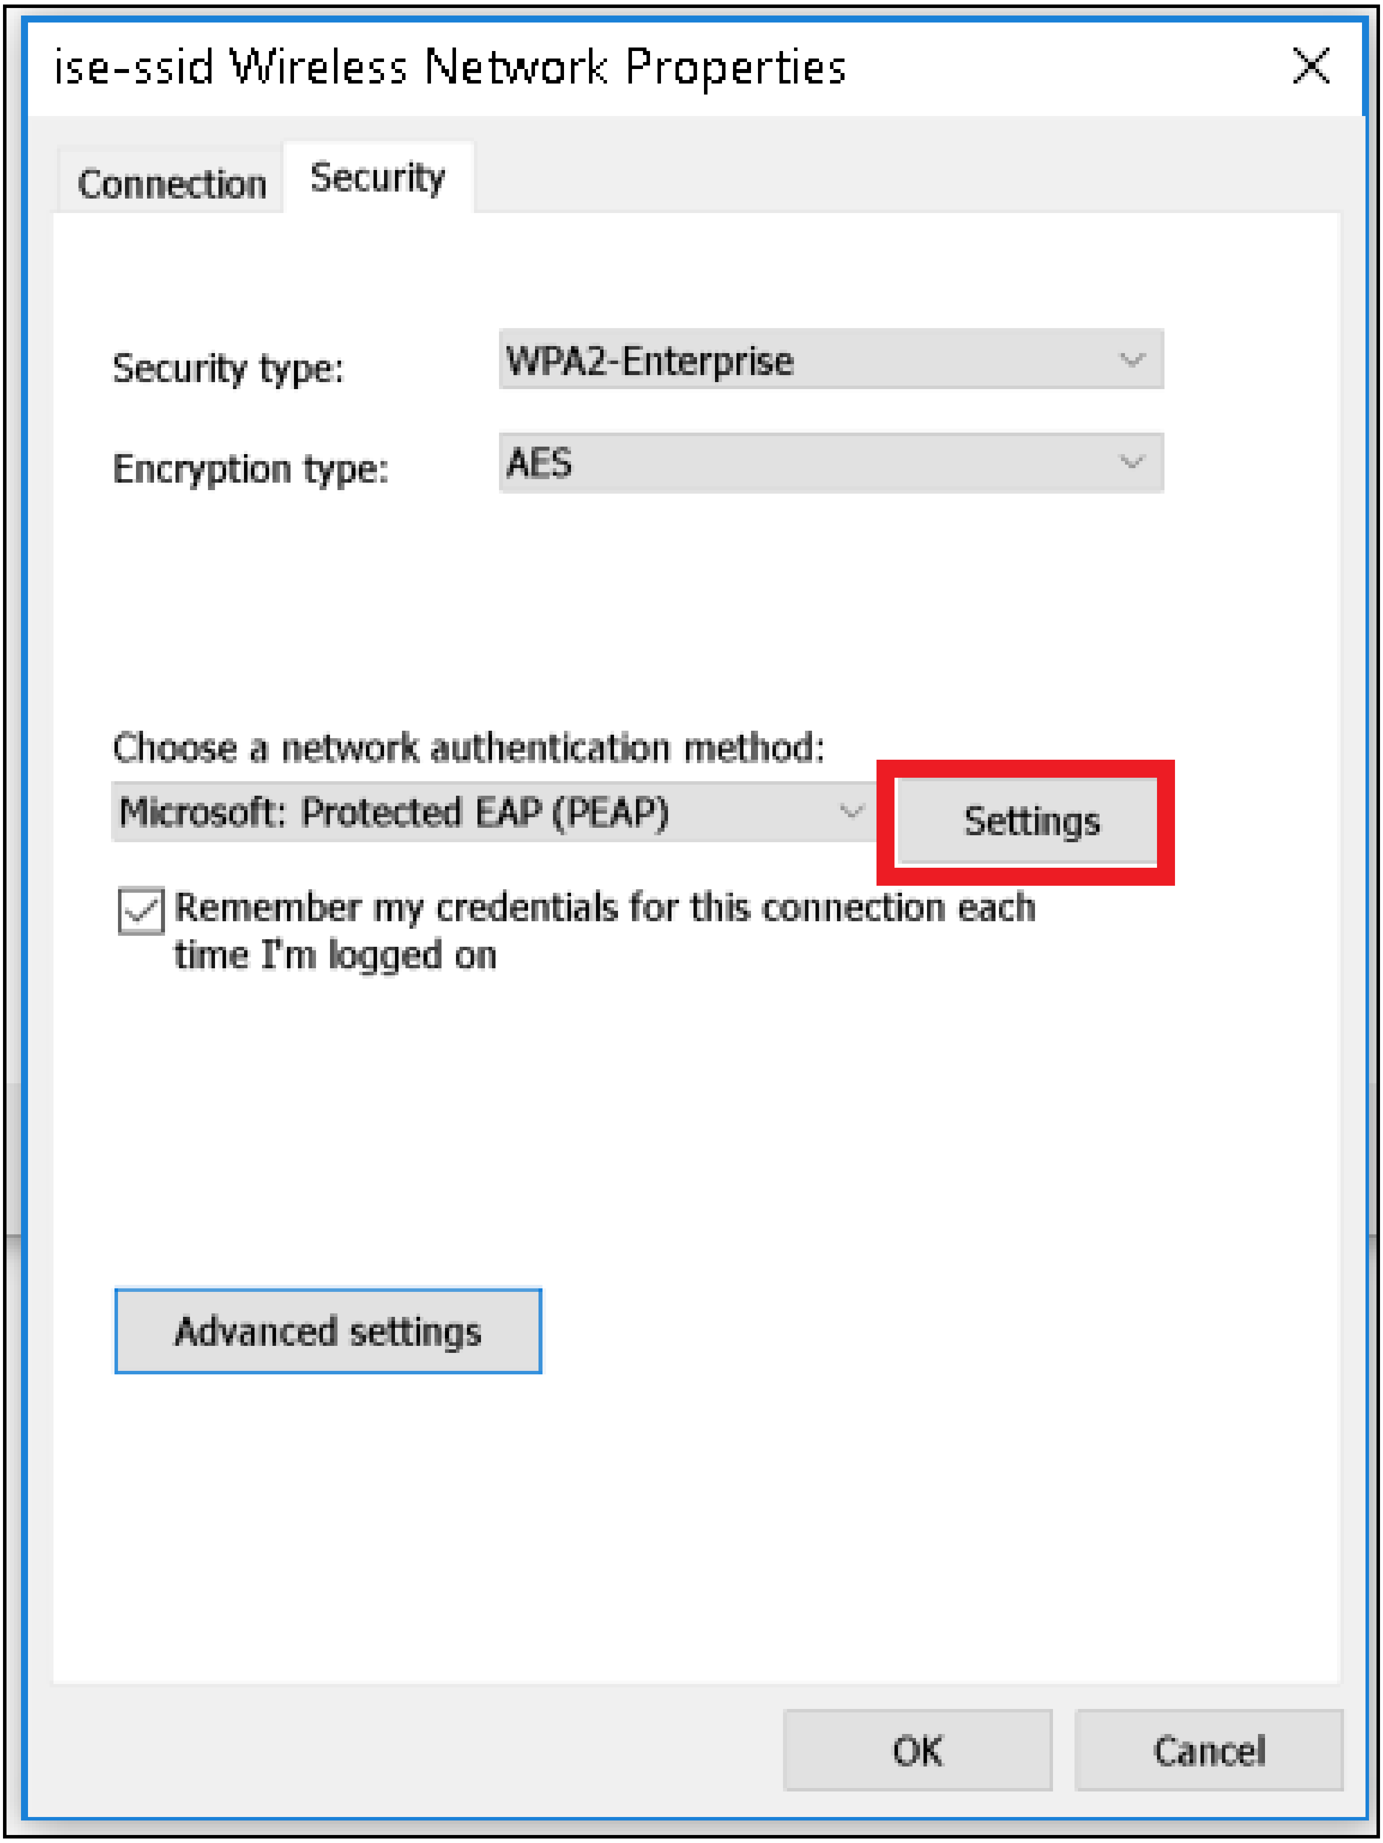


Manually connect to a wireless network

Successfully added ise-ssid

→ Change connection settings
Open the connection properties so that I can change the settings.

Step 6. Navigate to **Security** tab and click **Settings** as shown in the image.



ise-ssid Wireless Network Properties

Connection | Security

Security type: WPA2-Enterprise

Encryption type: AES

Choose a network authentication method:

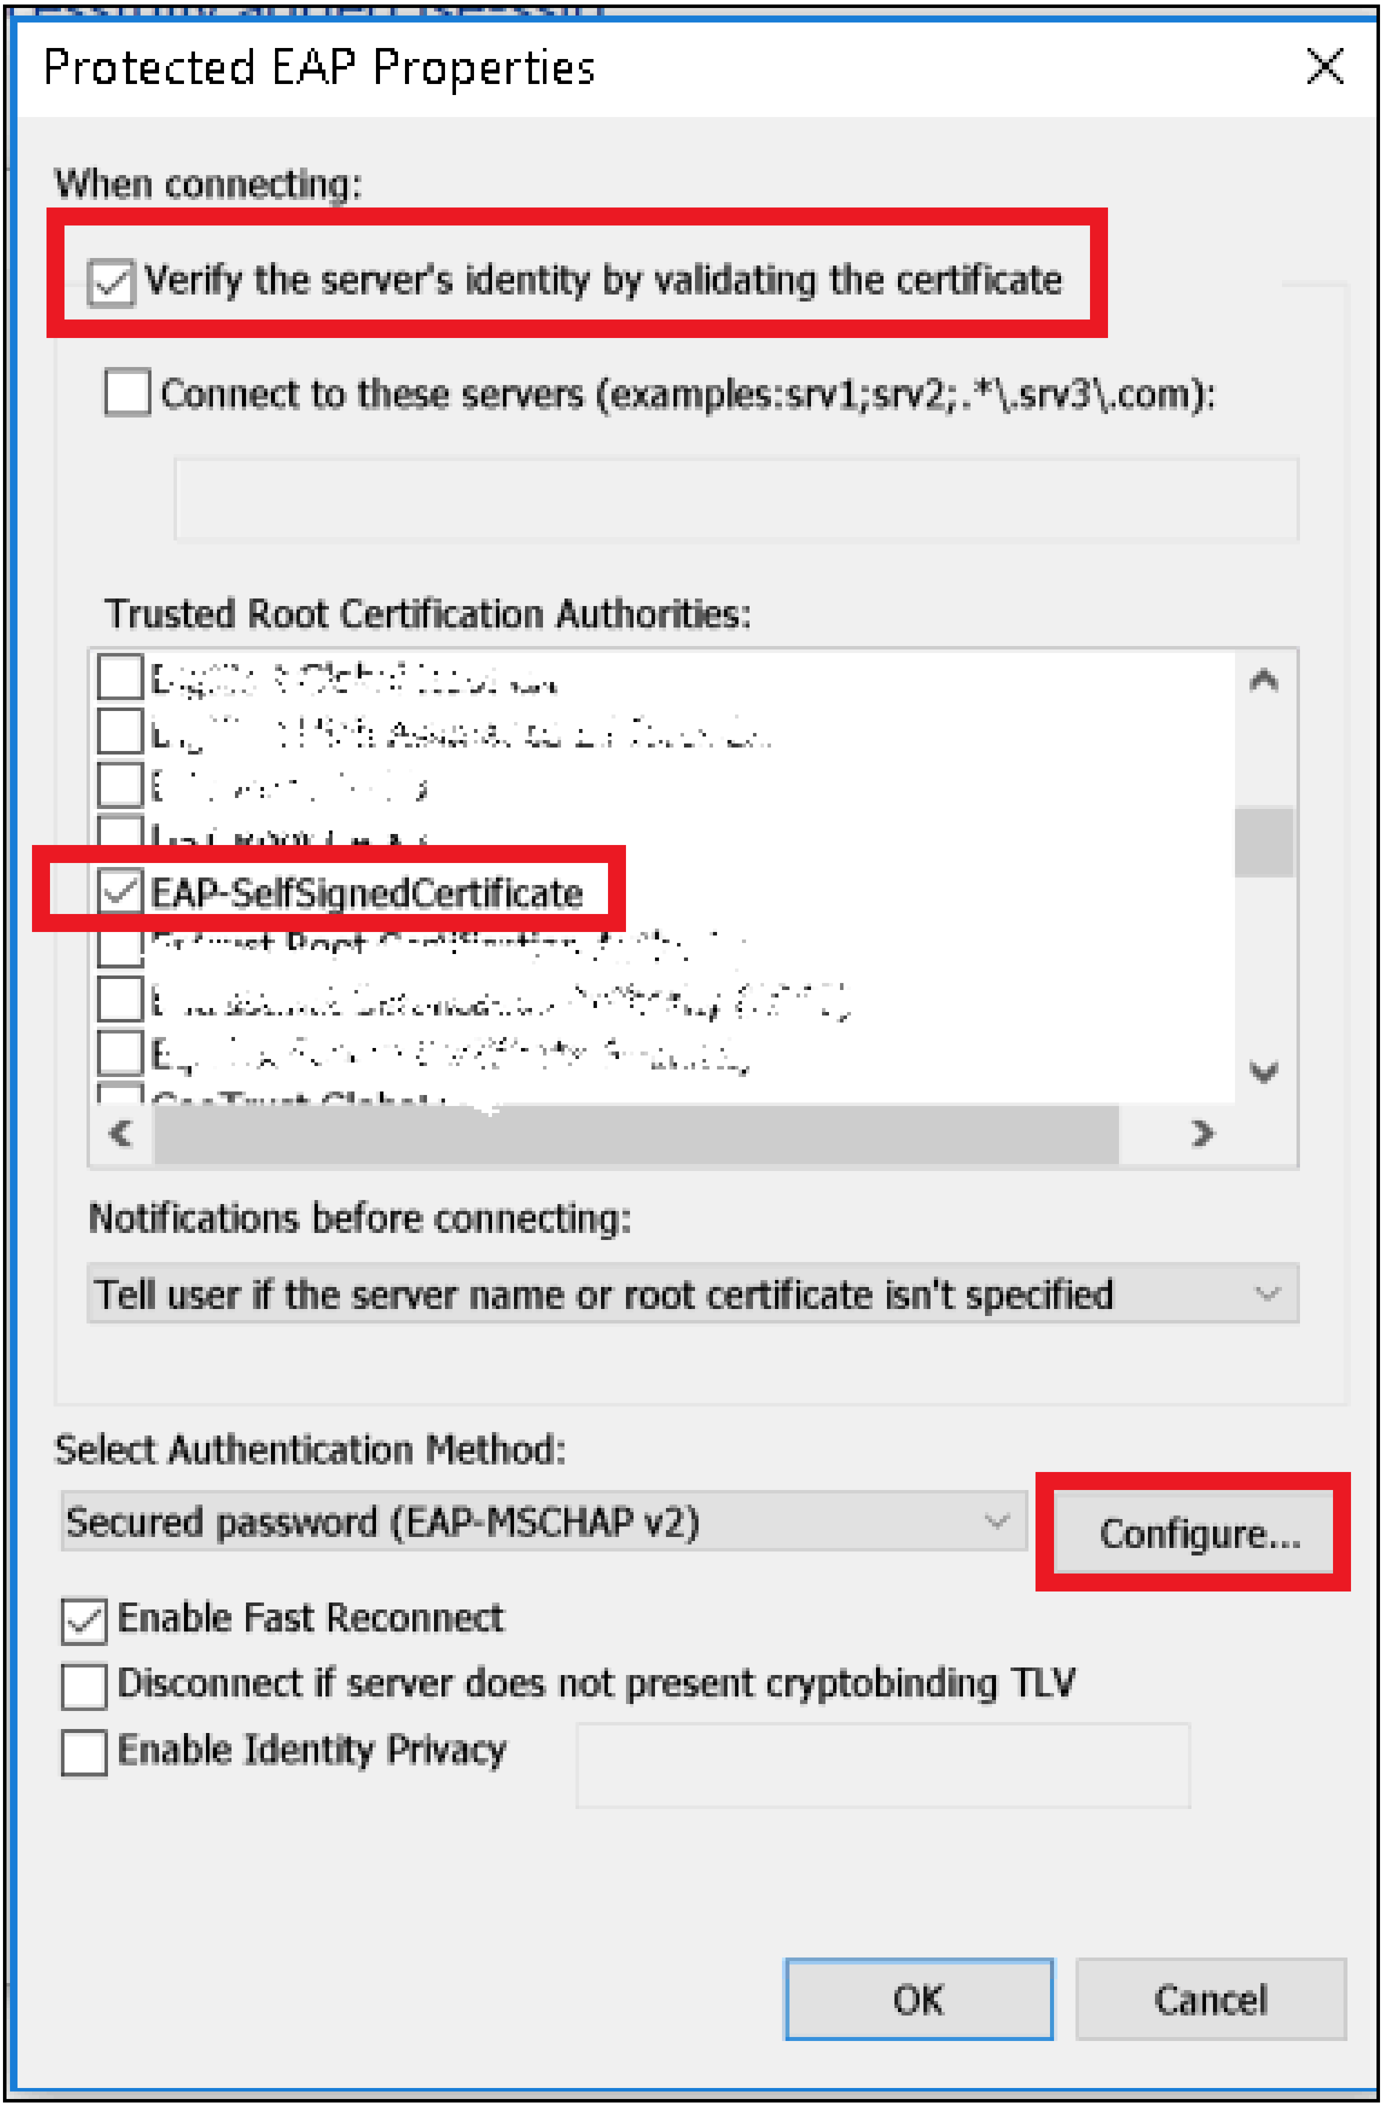
Microsoft: Protected EAP (PEAP)

☑ Remember my credentials for this connection each time I'm logged on

Step 7. Select if RADIUS server is validated or not.

If yes, enable **Verify the server identity by validating the certificate** and from **Trusted Root Certification Authorities:** list select the self-signed certificate of ISE.

After that select **Configure** and disable **Automatically use my Windows logon name and password...**, then click **OK** as shown in the images.



Protected EAP Properties

When connecting:

☑ Verify the server's identity by validating the certificate

□ Connect to these servers (examples:srv1;srv2;.*\.srv3\.com):

Trusted Root Certification Authorities:

□ [illegible]
□ [illegible]
□ [illegible]
□ [illegible]
☑ EAP-SelfSignedCertificate
□ [illegible]
□ [illegible]
□ [illegible]
□ [illegible]

Notifications before connecting:

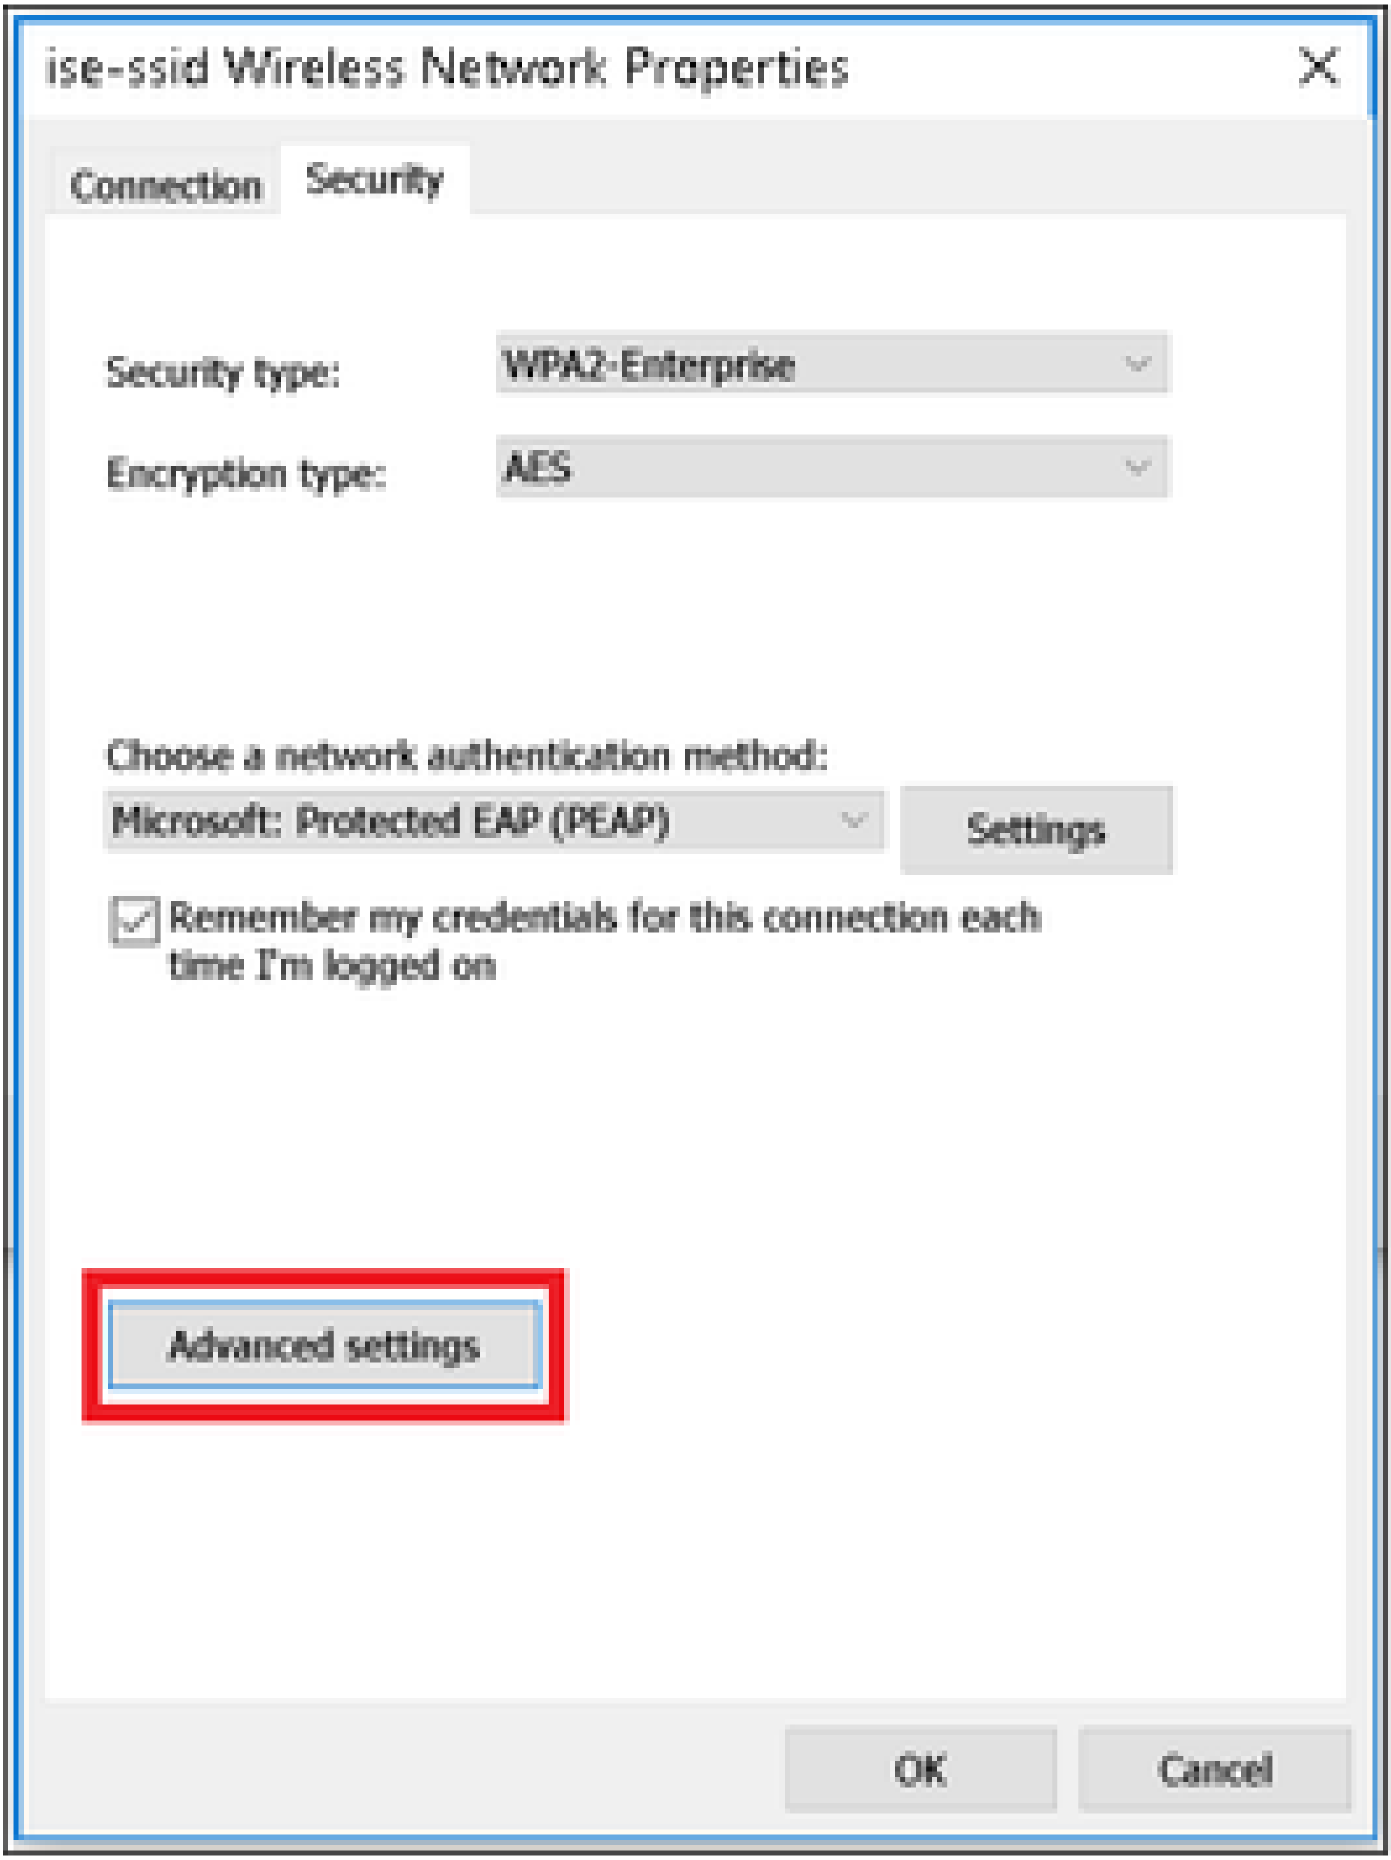
Tell user if the server name or root certificate isn't specified

Select Authentication Method:

Secured password (EAP-MSCHAP v2)

☑ Enable Fast Reconnect
□ Disconnect if server does not present cryptobinding TLV
□ Enable Identity Privacy

Once back to **Security** tab, select **Advanced settings**, specify authentication mode as User authentication, and **save** the credentials that were configured on ISE in order to authenticate the user as shown in the images.



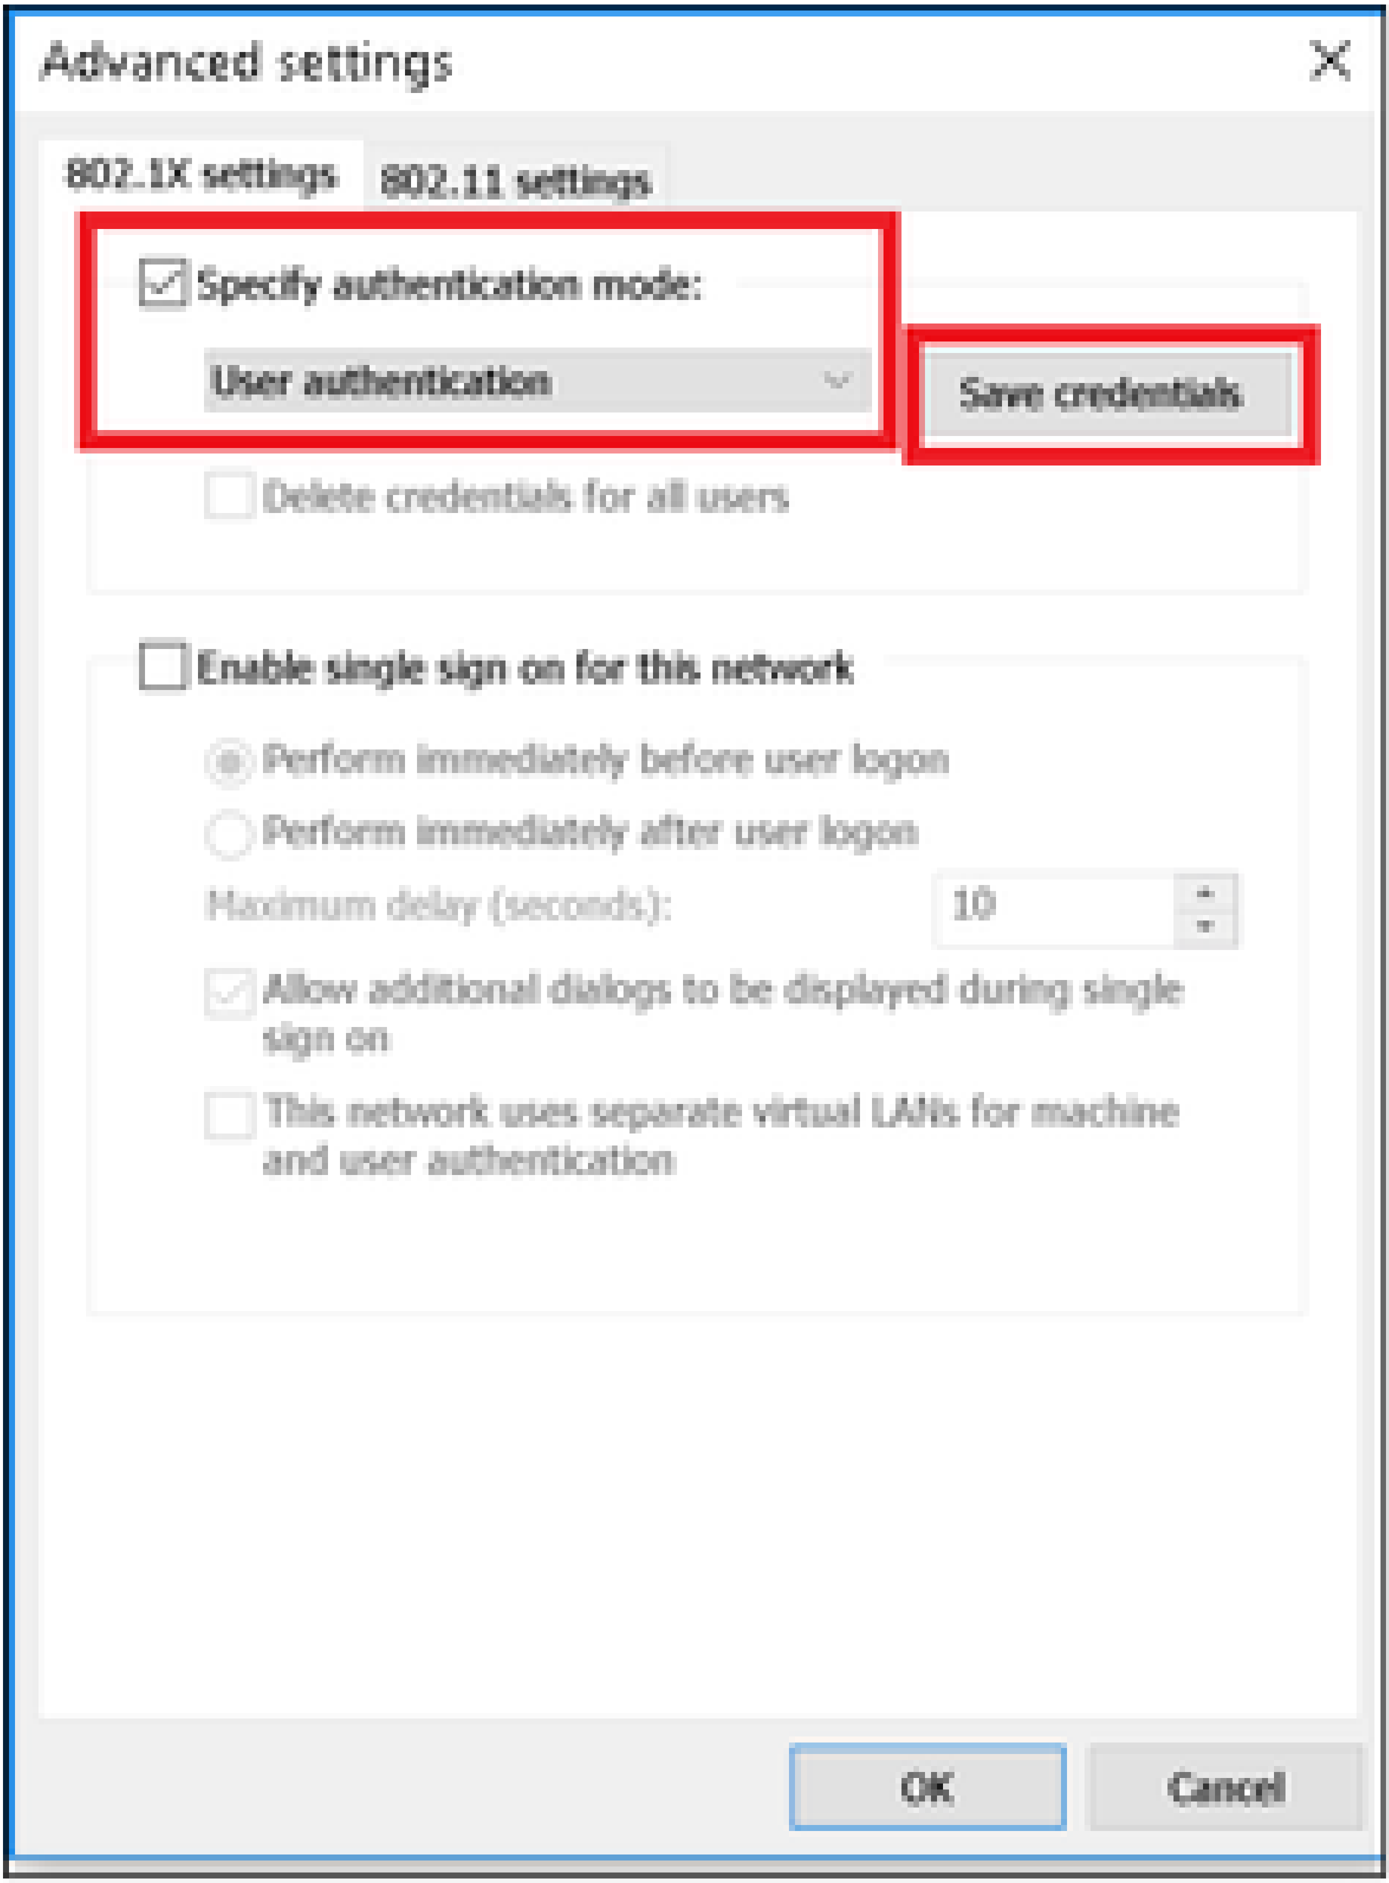
ise-ssid Wireless Network Properties

Security type: WPA2-Enterprise

Encryption type: AES

Choose a network authentication method:
Microsoft: Protected EAP (PEAP)

☑ Remember my credentials for this connection each time I'm logged on



Advanced settings

802.1X settings | 802.11 settings

☑ Specify authentication mode:

User authentication

□ Delete credentials for all users

□ Enable single sign on for this network

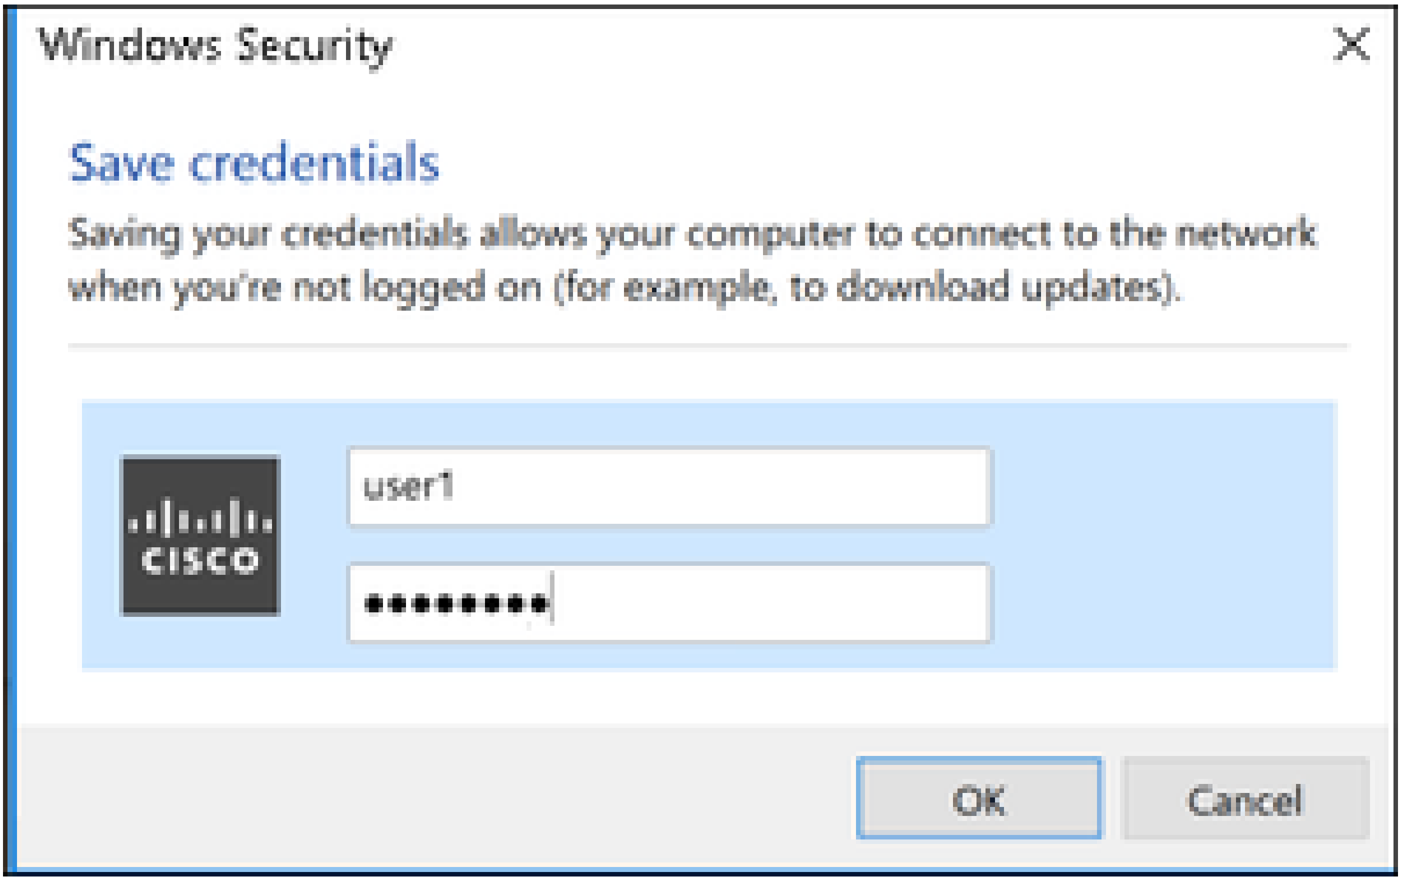
● Perform immediately before user logon

○ Perform immediately after user logon

Maximum delay (seconds): 10

☑ Allow additional dialogs to be displayed during single sign on

□ This network uses separate virtual LANs for machine and user authentication



Windows Security

Save credentials

Saving your credentials allows your computer to connect to the network when you're not logged on (for example, to download updates).

user1

••••••••

Verify

Use this section in order to confirm that your configuration works properly.

The authentication flow can be verified from WLC or from ISE perspective.

Authentication Process on WLC

Run the next commands in order to monitor the authentication process for a specific user:

```
> debug client <mac-add-client>
> debug dot1x event enable
> debug dot1x aaa enable
```

Example of a successful authentication (some output has been omitted):

<#root>
