Introduction

This document describes how to configure central web authentication on the Converged Access Wireless LAN Controller (WLC) and also between the Converged Access WLC and Unified Access WLC (5760 and also between 5760 and 5508).

Prerequisites

Requirements

Cisco recommends that you have knowledge of these topics:

- Basic knowledge of Cisco WLC 5508, 5760, 3850
- Basic knowledge of Identity Services Engine (ISE)
- Basic knowledge of Wireless Mobility
- Basic knowledge of guest anchoring

Components Used

The information in this document is based on these software and hardware versions:

- WLC 5760 that runs Cisco IOS® XE Release 3.3.3
- WLC 5508 that runs Cisco Aironet OS Release 7.6
- Switch 3850 that runs Cisco IOS XE Release 3.3.3
- Cisco ISE that runs Release 1.2

Configure

 **Note:** Use the [Command Lookup Tool](#) ([registered](#) customers only) in order to obtain more information on the commands used in this section.

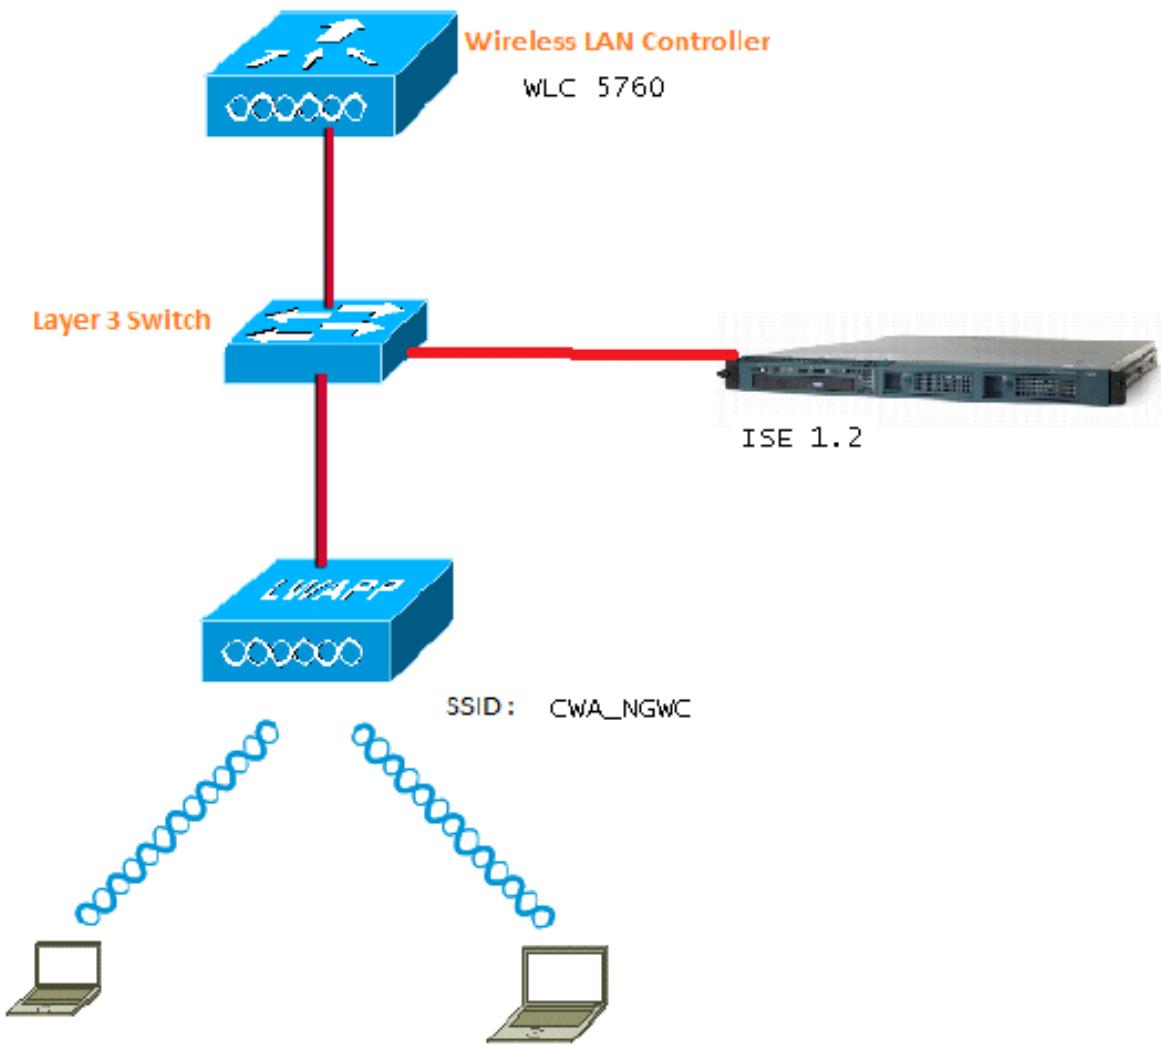

The flow includes these steps:

1. The user associates to the web authentication Service Set Identifier (SSID), which is in fact open+macfiltering and no Layer 3 security.
2. The user opens the browser.
3. The WLC redirects to the guest portal.
4. The user authenticates on the portal.
5. The ISE sends a RADIUS Change of Authorization (CoA - UDP Port 1700) in order to indicate to the controller that the user is valid, and eventually pushes RADIUS attributes such as the Access Control List (ACL).
6. The user is prompted to retry the original URL.

Cisco uses three different deployment setups that cover all the different scenarios to accomplish Central Web Authentication (CWA).

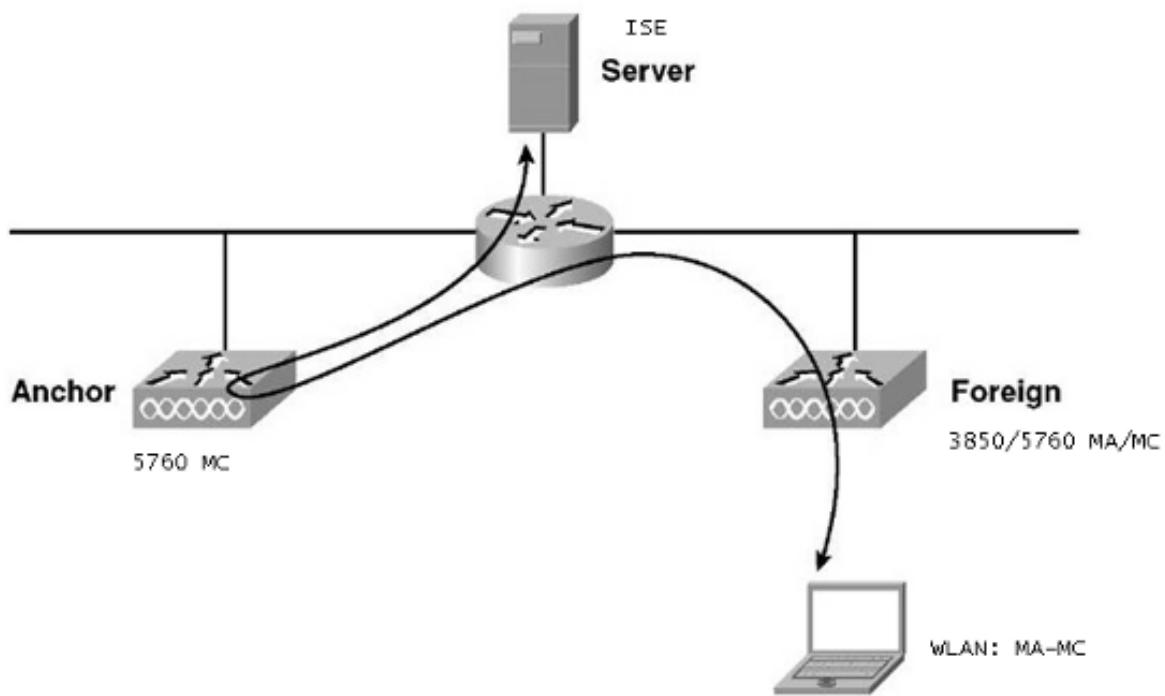

Topology 1

The 5760 WLC acts as a standalone WLC and the Access Points terminate on the same 5760 WLC. The clients are connected to Wireless LAN (WLAN) and are authenticated to the ISE.

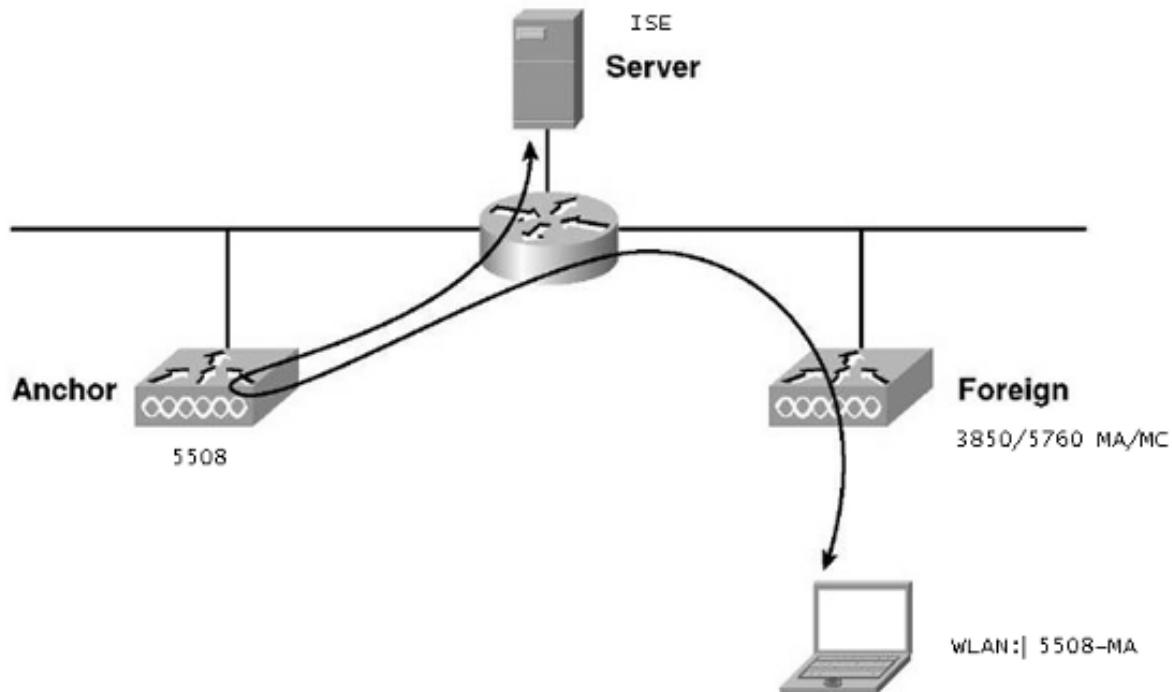

Topology 2

Guest anchoring between the Converged Access WLC with one that acts as a Mobility Controller and the other that acts as a Mobility Agent. The Mobility Agent is the Foreign WLC and the Mobility Controller is the Anchor.

Topology 3

Guest anchoring between the Cisco Unified WLC 5508 and Converged Access WLC 5760/3850 with one that acts as a Mobility Controller and the other that acts as a Mobility Agent. The Mobility Agent/Mobility Controller is the Foreign WLC and the 5508 Mobility Controller is the Anchor.

Note: There are a lot of deployments where the Anchor is the Mobility Controller and the Foreign WLC is the Mobility Agent which obtains the license from another Mobility Controller. In this case, the Foreign WLC has only one Anchor and that Anchor is the one that pushes the policies. Double anchoring is not supported and does not work since it is not expected to work that way.

Example

The WLC 5508 acts as the Anchor and the WLC 5760 acts as the Mobility Controller for a 3850 Switch which acts as a Mobility Agent. For the Anchor Foreign WLAN, the WLC 5508 will be the Anchor for the 3850 Foreign WLAN. There is no need to configure that WLAN on the WLC 5760 at all. If you point the 3850 Switch to the 5760 Anchor, and then from this WLC 5760 to the WLC 5508 as a double anchor, it will not work since this becomes double anchoring and the policies are on the 5508 Anchor.

If you have a setup that includes a WLC 5508 as the Anchor, a WLC 5760 as the Mobility Controller, and a 3850 Switch as the Mobility Agent and Foreign WLC, then at any point of time the Anchor for the 3850 Switch will either be the WLC 5760 or the WLC 5508. It cannot be both the at the same time and the double anchor does not work.

Topology 1 Configuration Example

See [Topology 1](#) for the network diagram and explanation.

The configuration is a two step process:

1. Configuration on the ISE.
2. Configuration on the WLC.

The WLC 5760 acts as a standalone WLC and the users get authenticated to the ISE.

Configuration on the ISE

1. Choose **ISE GUI > Administration > Network Resource > Network Devices List > Add** in order to add the WLC on the ISE as the Authentication, Authorization, and Accounting (AAA) client. Ensure you enter the same shared secret on the WLC that is added on the RADIUS server.

Note: While you deploy Anchor-Foreign, you just need to add the Foreign WLC. There is no need to add the Anchor WLC on the ISE as an AAA client. The same ISE configuration is used for all the other deployment scenarios in this document.

Network Devices

* Name	<input type="text" value="Surbg_5760"/>
Description	<input type="text"/>
* IP Address: <input type="text" value="10.105.135.178"/> / <input type="text" value="32"/>	
Model Name <input type="text"/>	
Software Version <input type="text"/>	
* Network Device Group	
Location	<input type="text" value="All Locations"/> <input type="button" value="Set To Default"/>
Device Type	<input type="text" value="All Device Types"/> <input type="button" value="Set To Default"/>
<input checked="" type="checkbox"/> ▼ Authentication Settings	
Enable Authentication Settings	
Protocol	RADIUS
* Shared Secret	<input type="text" value="*****"/> <input type="button" value="Show"/>
Enable KeyWrap	<input type="checkbox"/> <input type="button" value="i"/>
* Key Encryption Key	<input type="text"/> <input type="button" value="Show"/>
* Message Authenticator Code Key	<input type="text"/> <input type="button" value="Show"/>
Key Input Format <input type="radio"/> ASCII <input type="radio"/> HEXADECIMAL	
<input type="checkbox"/> ► SNMP Settings	
<input type="checkbox"/> ► Advanced TrustSec Settings	
<input type="button" value="Save"/> <input type="button" value="Reset"/>	

2. From the ISE GUI, choose **Policy > Authentication > MAB > Edit** in order to create the authentication policy. The authentication policy accepts the MAC address of the client, which points to Internal End points.

Choose these selections in the Options list:

- From the If authentication failed drop-down list, choose **Reject**.
- From the If user not found drop-down list, choose **Continue**.
- From the If process failed drop-down list, choose **Drop**.

When you configure with these options, the client that fails MAC authorization proceeds with the

guest portal.

Define the Authentication Policy by selecting the protocols that ISE should use to communicate with the network devices, and the identity sources that it should use for authentication.

Policy Type Simple Rule-Based

Allow Protocols : Default Network Access and

Internal Endpoints

Identity Source Internal Endpoints

Options

If authentication failed Reject

If user not found Continue

If process failed Drop

Note: For authentications using PEAP, LEAP, EAP-FAST or RADIUS MSCHAP it is not possible to continue processing when authentication fails or user is not found. If continue option is selected in these cases, requests will be rejected.

3. From the ISE GUI, choose **Policy > Authorization > Results > Authorization Profiles > Add**. Fill in the details and click **Save** in order to create the Authorization profile.

This profile helps the clients to get redirected to the Redirect URL after the MAC authentication,

Authorization Profile

Name: CWA

Access Type: ACCESS_ACCEPT

Web Redirection (CWA, DRW, MDM, NSR, CP)

Centralized Web Auth: ACL: REDIRECT

Static IP/Host name: 10.106.73.69

Select an item

Attributes Details

Access Type: ACCESS_ACCEPT
cisco-av-pair = url-redirect=ac=REDIRECT
cisco-av-pair = url-redirect=https://10.106.73.69/port/guestportal/gateway/sessionId=SessionId/value&action=owa

where the clients enter the Guest Username/password.

4. From the ISE GUI, choose **Policy > Authorization > Results > Authorization Profiles > Add** in order to create another Authorization profile to permit access to the users with the correct credentials.

The screenshot shows the Cisco Identity Services Engine (ISE) interface. The top navigation bar includes links for Home, Operations, Policy, Administration, Authentication, Authorization, Profiling, Posture, Client Provisioning, and Security Group Access. The main content area is titled "Authorization Profiles > PermitAccess". A message indicates that "This is a reserved authorization profile and cannot be edited". The "Authorization Profile" section shows the name "PermitAccess", a description "Default Profile with access type as Access-Accept", and an access type set to "ACCESS_ACCEPT". Below this are sections for "Common Tasks" and "Advanced Attributes Settings". Under "Attributes Details", it states "Access Type = ACCESS_ACCEPT". At the bottom are "Save" and "Reset" buttons.

5. Create the Authorization policies.

The Authorization policy 'Guest_Wireless' pushes the Redirect URL and Redirect ACL to the client session. The profile pushed here is the CWA as shown previously.

The Authorization policy 'Guest_Wireless-Success' gives full access to a guest user who is successfully authenticated via the guest portal. After the user is successfully authenticated on the guest portal, dynamic authorization is sent by the WLC. This reauthenticates the client session with the attribute 'Network Access:UseCase EQUALS Guest Flow'.

The final Authorization policies look like:

<input checked="" type="checkbox"/>	Guest_Wireless_Success	If Guest AND Network Access:UseCase EQUALS Guest Flow	then PermitAccess	Edit
<input checked="" type="checkbox"/>	Guest_Wireless	If Wireless_MAB	then OWA	Edit

Save Reset

6. Optional: In this case default multiportal configurations are used. Based on the requirements, the same can be changed in the GUI.

From the ISE GUI, choose **Administration > Web Portal management > Multi Portal**

Configurations > DefaultGuestPortal.

The screenshot shows the Cisco Identity Services Engine (ISE) web interface. The top navigation bar includes links for Home, Operations, Policy, Administration, and a user dropdown. Below the navigation is a secondary menu with System, Identity Management, Network Resources, Web Portal Management (which is selected), and Feed Service. The main content area has tabs for Sponsor Group Policy, Sponsor Groups, and Settings (which is selected). A left sidebar titled 'Settings' contains categories: General, Sponsor, My Devices, Guest (selected), Language Template, and Multi-Portal Configurations. Under Multi-Portal Configurations, items include CWA, DefaultGuestPortal (selected), DRW, Portal Policy, Password Policy, and Time Profiles. The right panel displays the 'Multi-Portal Configuration List > DefaultGuestPortal' page. It features a 'Multi-Portal' tab and sub-tabs for General, Operations (selected), Customization, and Authentication. The 'Guest Portal Policy Configuration' section asks if guest users should agree to an acceptable use policy, with 'Every Login' selected. Other configuration options include enabling self-provisioning, mobile portals, password changes, and self-service, with 'Enable Mobile Portal' checked.

Multi-Portal Configuration List > DefaultGuestPortal

Multi-Portal

General Operations Customization Authentication

Guest Portal Policy Configuration

Guest users should agree to an acceptable use policy

Not Used
 First Login
 Every Login

Enable Self-Provisioning Flow
 Enable Mobile Portal
 Allow guest users to change password
 Require guest users to change password at expiration and first login
 Guest users should download the posture client
 Guest users should be allowed to do self service
 Send self-registration credentials to whitelisted email domains

The Guest_Portal_sequence is created that allows the Internal, Guest, and AD users.

 Treat as if the user was not found and proceed to the next store in the sequence

Save Reset

7. From the ISE GUI, choose **Guest > Multi-Portal Configurations > DefaultGuestPortal**. From the Identity Store Sequence drop-down list, choose **Guest_Portal_Sequence**.

Configuration on the WLC

1. Define the ISE Radius server on the WLC 5760.
2. Configure the RADIUS server, server group, and method list with the CLI.

```
<#root>
```

```
dot1x system-auth-control
```

```
radius server ISE
```

```
address ipv4 10.106.73.69 auth-port 1645 acct-port 1646
```

```
timeout 10
```

```
retransmit 3
```

```
key Cisco123
```

```
aaa group server radius ISE
```

```
server name ISE

deadtime 10

aaa authentication dot1x ISE group ISE

aaa authorization network ISE group ISE

aaa authorization network MACFILTER group ISE

aaa accounting identity ISE start-stop group ISE

!

aaa server radius dynamic-author

client 10.106.73.69 server-key Cisco123

auth-type any

3. Configure the WLAN with the CLI.
<#root>

wlan CWA_NGWC 10 CWA_NGWC

aaa-override

accounting-list ISE

client vlan VLAN0012
```

```
no exclusionlist

mac-filtering MACFILTER

nac

no security wpa

no security wpa akm dot1x

no security wpa wpa2

no security wpa wpa2 ciphers aes
```

```
security dot1x authentication-list ISE
```

```
session-timeout 1800
```

```
no shutdown
```

4. Configure the Redirect ACLs with the CLI.

This is the url-redirect-acl that ISE returns as an AAA override along with the redirect URL for the guest portal redirection. It is a direct ACL which is used currently on the Unified architecture. This is a 'punt' ACL which is sort of a reverse ACL that you would normally use for Unified architecture. You need to block access to DHCP, the DHCP server, DNS, the DNS server, and the ISE server. Only allow www, 443, and 8443 as needed. This ISE guest portal uses port 8443 and the redirection still works with the ACL shown here. Here ICMP is enabled, but based on the security rules you can either deny or permit.

```
<#root>

ip access-list extended REDIRECT

deny icmp any any
```

```
deny udp any any eq bootps
```

```
deny udp any any eq bootpc
```

```
deny udp any any eq domain
```

```
deny ip any host 10.106.73.69
```

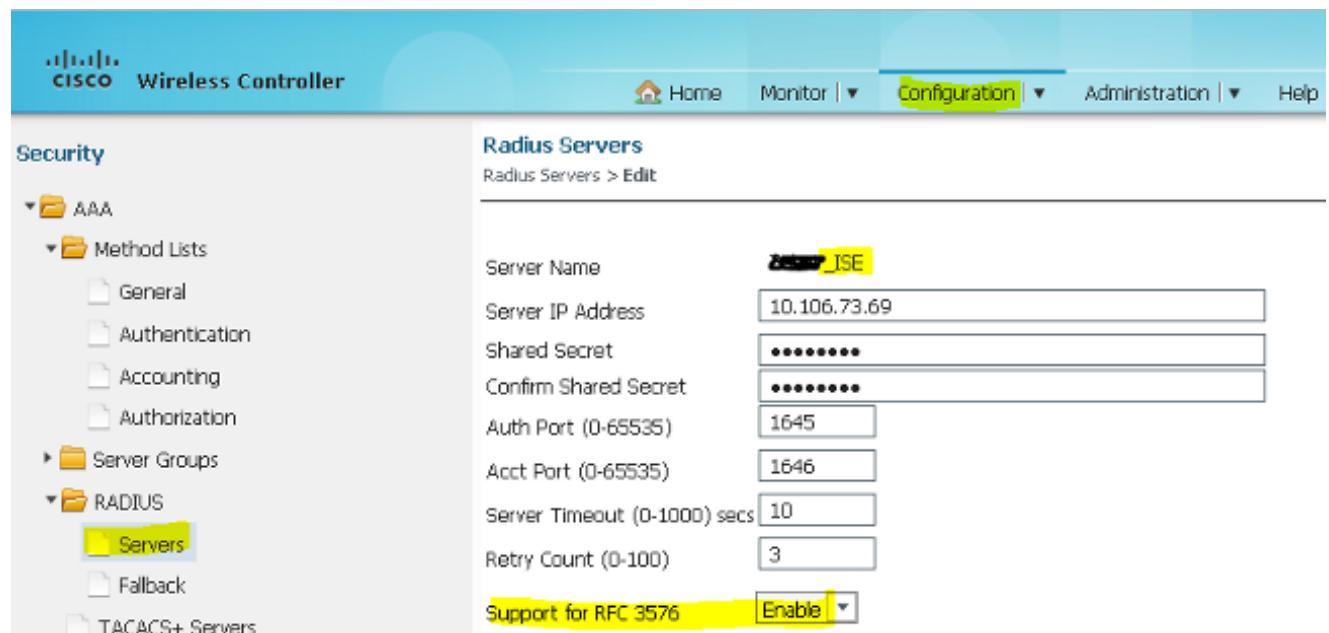

```
permit tcp any any eq www
```

```
permit tcp any any eq 443
```

⚠ Caution: When you enable HTTPS, it might cause some high CPU issues due to scalability. Do not enable this unless it is recommended by the Cisco design team.

5. From the Wireless Controller GUI, choose **AAA > RADIUS > Servers**. Configure the RADIUS Server, server group, and Method List in the GUI.

Fill all the parameters and ensure the Shared Secret configured here matches the one configured on the ISE for this device. From the Support for RFC 3576 drop-down list, choose **Enable**.

The screenshot shows the Cisco Wireless Controller interface. The top navigation bar includes Home, Monitor, Configuration (which is highlighted), Administration, and Help. The left sidebar under Security shows AAA, Method Lists (with General, Authentication, Accounting, Authorization), Server Groups (with RADIUS selected), RADIUS (with Servers selected), Fallback, and TACACS+ Servers. The main content area is titled "Radius Servers" and "Radius Servers > Edit". It displays the following configuration for a server named "ISE":

Server Name	ISE
Server IP Address	10.106.73.69
Shared Secret	*****
Confirm Shared Secret	*****
Auth Port (0-65535)	1645
Acct Port (0-65535)	1646
Server Timeout (0-1000) secs	10
Retry Count (0-100)	3
Support for RFC 3576	Enable

6. From the Wireless Controller GUI, choose **AAA > Server Groups > Radius**. Add the previously created RADIUS server onto the server groups.

Radius Server Groups
Radius Server Groups > Edit

Group Name: **ISE**

MAC-delimiter: **none**

MAC-filtering: **none**

Dead-time (0-1440) in minutes: **10**

Group Type: **Radius**

Available Servers

- Microsoft_NPS
- ISE

Assigned Servers

- ISE**

- From the Wireless Controller GUI, choose **AAA > Method Lists > General**. Check the **Dot1x System Auth Control** check box. If you disable this option, AAA does not work.

General

Dot1x System Auth Control

Local Authentication: **Method List**

- From the Wireless Controller GUI, choose **AAA > Method Lists > Authentication**. Create an Authentication method list for Type dot1X. The Group Type is group. Map it to the ISE.

Authentication
Authentication > Edit

Method List Name: **ISE**

Type: **dot1x**

Group Type: **group**

Fallback to local: **Disabled**

Available Server Groups

- ACS
- ISE
- Microsoft_NPS
- victor

Assigned Server Groups

- ISE**

- From the Wireless Controller GUI, choose **AAA > Method Lists > Accounting**. Create an Accounting method list for Type identity. Map it to the ISE.

The screenshot shows the Cisco Wireless Controller GUI. The left sidebar under 'Security' has 'AAA' expanded, with 'Method Lists' selected. 'Accounting' is highlighted in yellow. The main panel title is 'Accounting' with the subtitle 'Accounting > Edit'. It shows a 'Method List Name' field with 'ISE' and a 'Type' field set to 'identity'. Below these are two lists: 'Available Server Groups' containing 'ACS', 'ISE', 'Microsoft_NPS', and 'victor', and 'Assigned Server Groups' containing 'ISE'. Navigation tabs at the top include Home, Monitor, Configuration (which is selected), Administration, and Help.

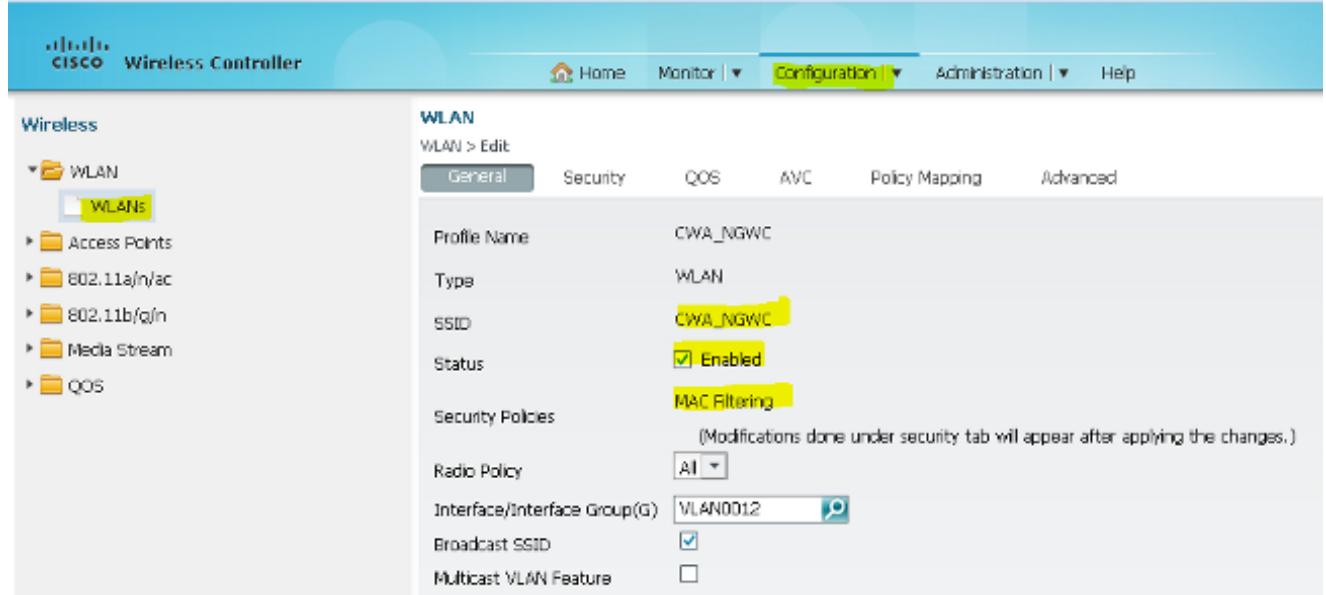

10. From the Wireless Controller GUI, choose **AAA > Method Lists > Authorization**. Create a Authorization method list for Type network. Map it to the ISE.

The screenshot shows the Cisco Wireless Controller GUI. The left sidebar under 'Security' has 'AAA' expanded, with 'Authorization' selected. 'Authorization' is highlighted in yellow. The main panel title is 'Authorization' with the subtitle 'Authorization > Edit'. It shows a 'Method List Name' field with 'ISE', a 'Type' field set to 'network', and a 'Group Type' field set to 'group'. Below these are two lists: 'Available Server Groups' containing 'ACS', 'ISE', 'Microsoft_NPS', and 'victor', and 'Assigned Server Groups' containing 'ISE'. Navigation tabs at the top include Home, Monitor, Configuration (which is selected), Administration, and Help.

11. Optional, since there is MAC on failure support as well. Create an Authorization method list MACFILTER for Type network. Map it to the ISE.

The screenshot shows the Cisco Wireless Controller GUI. The left sidebar under 'Security' has 'AAA' expanded, with 'Authorization' selected. 'Authorization' is highlighted in yellow. The main panel title is 'Authorization' with the subtitle 'Authorization > Edit'. It shows a 'Method List Name' field with 'MACFILTER', a 'Type' field set to 'network', and a 'Group Type' field set to 'group'. Below these are two lists: 'Available Server Groups' containing 'ACS', 'ISE', 'Microsoft_NPS', and 'victor', and 'Assigned Server Groups' containing 'ISE'. Navigation tabs at the top include Home, Monitor, Configuration (which is selected), Administration, and Help.

12. From the Wireless Controller GUI, choose **WLAN > WLANs**. Create a new configuration with the parameters shown here.

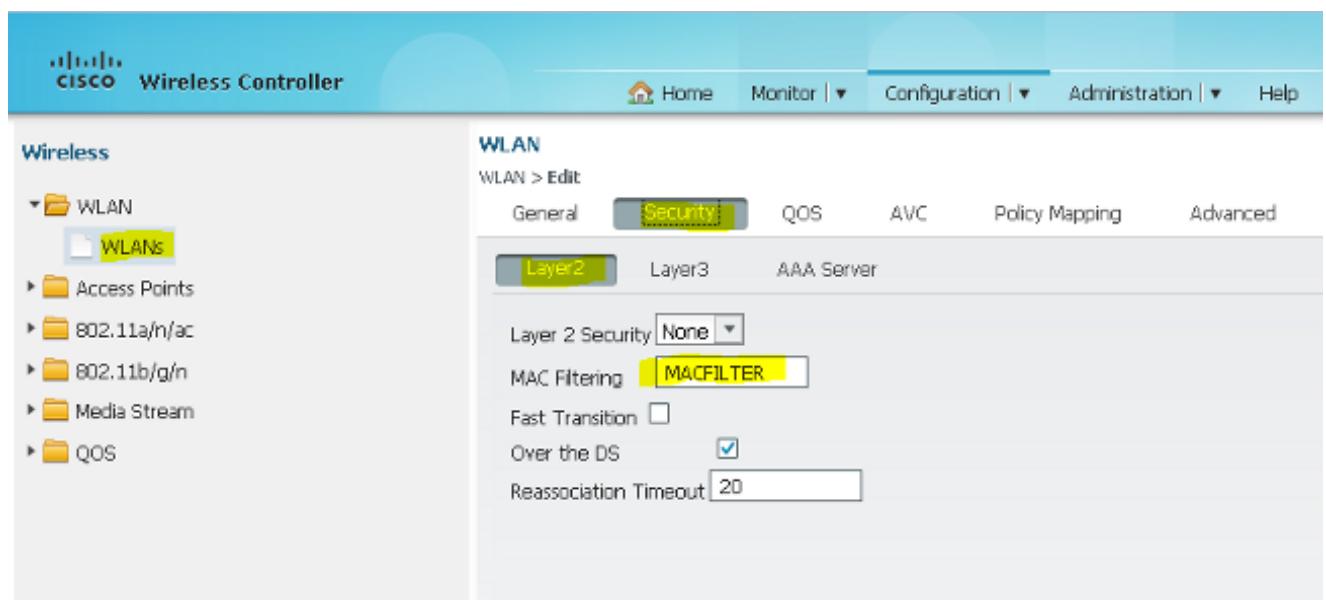

The screenshot shows the Cisco Wireless Controller interface. On the left, a navigation tree under 'Wireless' includes 'WLAN' (selected), 'Access Points', '802.11a/n/ac', '802.11b/g/n', 'Media Stream', and 'QoS'. The main panel is titled 'WLAN' and shows 'WLAN > Edit' for profile 'CWA_NGWC'. The 'General' tab is selected. The configuration includes:

- Profile Name: CWA_NGWC
- Type: WLAN
- SSID: CWA_NGWC
- Status: Enabled (checkbox checked)
- Security Policies: MAC Filtering (highlighted)
- Radio Policy: AI
- Interface/Interface Group(G): VLAN0012 (with a search icon)
- Broadcast SSID: checked
- Multicast VLAN Feature: unchecked

A note at the bottom states: '(Modifications done under security tab will appear after applying the changes.)'

13. Choose **Security > Layer2**. In the MAC Filtering field, enter **MACFILTER**.

The screenshot shows the same Cisco Wireless Controller interface. The 'Security' tab is now selected in the 'WLAN > Edit' panel. The configuration includes:

- Layer 2 Security: None
- MAC Filtering: MACFILTER (highlighted)
- Fast Transition: unchecked
- Over the DS: checked
- Reassociation Timeout: 20

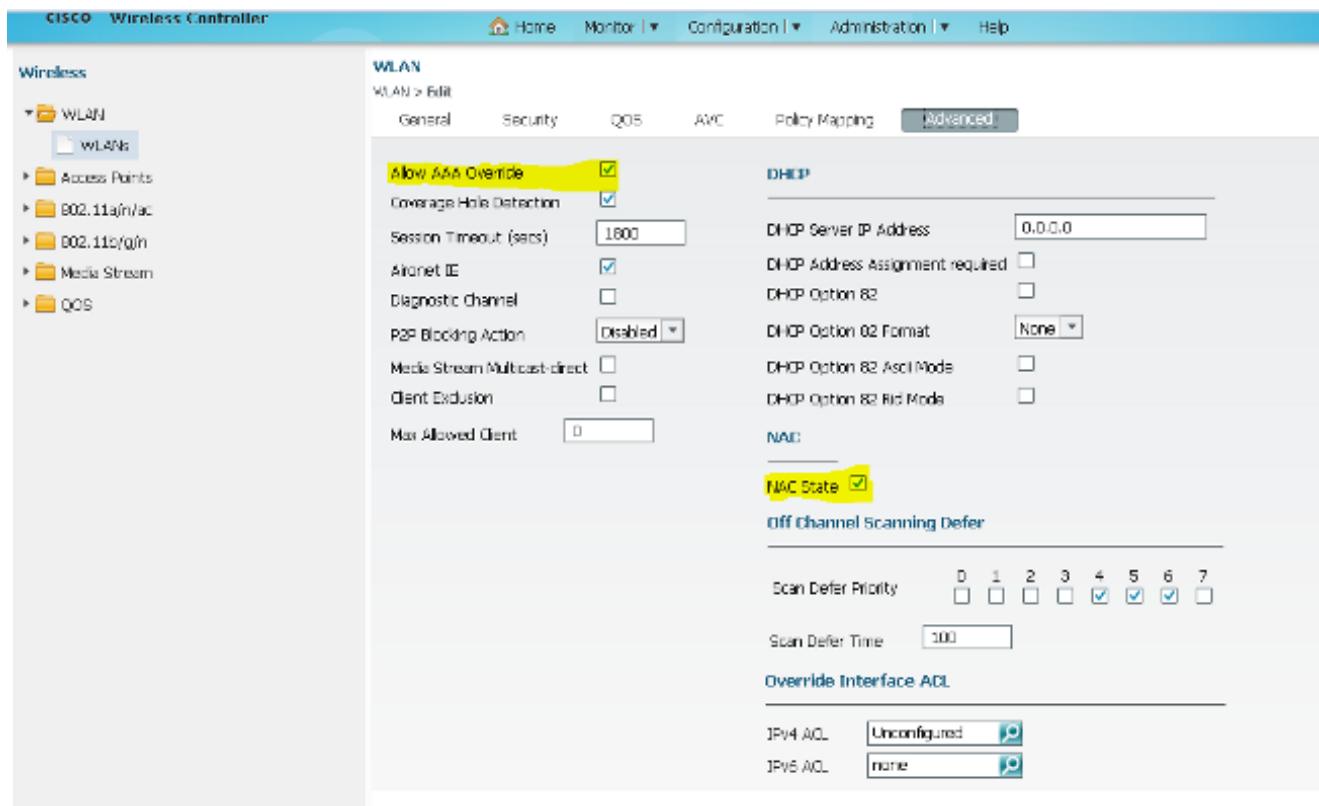

14. It is not necessary to configure Layer3.

The screenshot shows the Cisco Wireless Controller interface. On the left, there's a navigation tree under 'Wireless' with items like WLAN, Access Points, 802.11a/n/ac, 802.11b/g/n, Media Stream, and QoS. The 'WLAN' item is expanded, and 'WLANS' is selected. On the right, the 'WLAN > Edit' screen is displayed. The top navigation bar has tabs for Home, Monitor, Configuration (which is selected), Administration, and Help. Below the tabs are sub-tabs: General, Security (selected), QoS, AVC, Policy Mapping, and Advanced. Under the 'Security' tab, the 'Layer3' sub-tab is selected. The configuration area includes fields for Web Policy (checkboxes), Conditional Web Redirect (checkboxes), Webauth Authentication List (set to 'Disabled'), Webauth Parameter Map (set to 'Unconfigured'), Webauth On-mac-filter Failure (checkbox), Preauthentication IPv4 ACL (set to 'Unconfigured'), and Preauthentication IPv6 ACL (set to 'none').

15. Choose **Security > AAA Server**. From the Authentication Method drop-down list, choose **ISE**. From the Accounting Method drop-down list, choose **ISE**.

This screenshot is similar to the previous one but shows the 'AAA Server' sub-tab under the 'Security' tab being selected. The 'Layer3' sub-tab is also highlighted. The configuration fields for Authentication Method and Accounting Method both show 'ISE' selected. The other fields remain the same as in the first screenshot.

16. Choose **Advanced**. Check the **Allow AAA Override** check box. Check the **NAC State** check box.

17. Configure Redirect ACLs on the WLC in the GUI.

Access Control Lists
ACLs > ACL detail

Details :

Name: **REDIRECT**

<input type="checkbox"/>	40	permit	tcp	any	any	-	eq 443	-	

Topology 2 Configuration Example

See [Topology 2](#) for the network diagram and explanation.

This configuration is also a two step process.

Configuration on the ISE

Configuration on the ISE is the same as for the Topology 1 configuration.

There is no need to add the Anchor Controller on the ISE. You just need to add the Foreign WLC on the ISE, define the RADIUS server on the Foreign WLC, and map the Authorization policy under the WLAN. On the Anchor you just need to enable MAC filtering.

In this configuration example, there are two WLC 5760s that act as an Anchor Foreign. In case you want to use the WLC 5760 as an Anchor and the 3850 Switch as the Anchor Foreign, which is the Mobility Agent, to another Mobility Controller then the same configuration is correct. However, there is no need to configure the WLAN on the second Mobility Controller to which the 3850 Switch gets the licenses from. You just need to point the 3850 Switch to the WLC 5760 which acts as the Anchor.

Configuration on the WLC

1. On the Foreign, configure the ISE server with the AAA Method list for AAA and map the WLAN to a MAC filter authorization.

 **Note:** Configure the redirect ACL on both the Anchor and Foreign and also MAC filtering.

```
<#root>

dot1x system-auth-control

radius server ISE

address ipv4 10.106.73.69 auth-port 1645 acct-port 1646

timeout 10

retransmit 3

```

```
nac
```

```
no security wpa
```

```
no security wpa akm dot1x
```

```
no security wpa wpa2
```

```
no security wpa wpa2 ciphers aes

security dot1x authentication-list ISE

session-timeout 1800

no shutdown
```

2. Configure Redirect ACLs with the CLI.

This is the url-redirect-acl that ISE returns as an AAA override along with the redirect URL for the guest portal redirection. It is a direct ACL which is used currently on the Unified architecture. This is a 'punt' ACL which is sort of a reverse ACL that you would normally use for Unified architecture. You need to block access to DHCP, the DHCP server, DNS, the DNS server, and the ISE server. Only allow www, 443, and 8443 as needed. This ISE guest portal uses port 8443 and the redirection still works with the ACL shown here. Here ICMP is enabled, but based on the security rules you can either deny or permit.

```
<#root>

ip access-list extended REDIRECT

deny icmp any any

deny udp any any eq bootps

deny udp any any eq bootpc

deny udp any any eq domain

deny ip any host 10.106.73.69

permit tcp any any eq www

permit tcp any any eq 443
```

⚠ Caution: When you enable HTTPS, it might cause some high CPU issues due to scalability. Do not enable this unless it is recommended by the Cisco design team.

3. Configure Mobility on the Anchor.

```
<#root>
```

```
wireless mobility group member ip 10.105.135.244 public-ip 10.105.135.244 group surbg
```

>Note: If you configure the same with the 3850 Switch as the Foreign, then ensure you define the Switch peer group on the Mobility Controller and vice-versa on the Mobility Controller. Then configure the above CWA configurations on the 3850 Switch.

4. Configuration on the Anchor.

On the Anchor, there is no need to configure any ISE configurations. You just need the WLAN configuration.

```
<#root>
```

```
wlan MA-MC 6 MA-MC
```

```
aaa-override
```

```
client vlan VLAN0012
```

```
mac-filtering MACFILTER
```

```
mobility anchor
```

```
nac
```

```
nbsp;no security wpa
```

```
no security wpa akm dot1x
```

```
no security wpa wpa2
```

```
no security wpa wpa2 ciphers aes
```

```
session-timeout 1800
```

```
no shutdown
```

5. Configure Mobility on the Anchor.

Define the other WLC as the Mobility member on this WLC.

```
<#root>
```

```
wireless mobility group member ip 10.105.135.178 public-ip 10.105.135.178 group surbg
```

6. Configure Redirect ACLs with the CLI.

This is the url-redirect-acl that ISE returns as an AAA override along with the redirect URL for the guest portal redirection. It is a direct ACL which is used currently on the Unified architecture. This is a 'punt' ACL which is sort of a reverse ACL that you would normally use for Unified architecture. You need to block access to DHCP, the DHCP server, DNS, the DNS server, and the ISE server. Only allow www, 443, and 8443 as needed. This ISE guest portal uses port 8443 and the redirection still works with the ACL shown here. Here ICMP is enabled, but based on the security rules you can either deny or permit.

```
<#root>
```

```
ip access-list extended REDIRECT
```

```
deny icmp any any
```

```
deny udp any any eq bootps
```

```
deny udp any any eq bootpc
```

```
deny udp any any eq domain
```

```
deny ip any host 10.106.73.69
```

```
permit tcp any any eq www
```

```
permit tcp any any eq 443
```

Caution: When you enable HTTPS, it might cause some high CPU issues due to scalability. Do not enable this unless it is recommended by the Cisco design team.

Topology 3 Configuration Example

See [Topology 3](#) for the network diagram and explanation.

This is also a two step process.

Configuration on the ISE

Configuration on the ISE is the same as for the Topology 1 Configuration.

There is no need to add the Anchor Controller on the ISE. You just need to add the Foreign WLC on the ISE, define the RADIUS server on the Foreign WLC, and map the Authorization policy under the WLAN. On the Anchor you just need to enable MAC filtering.

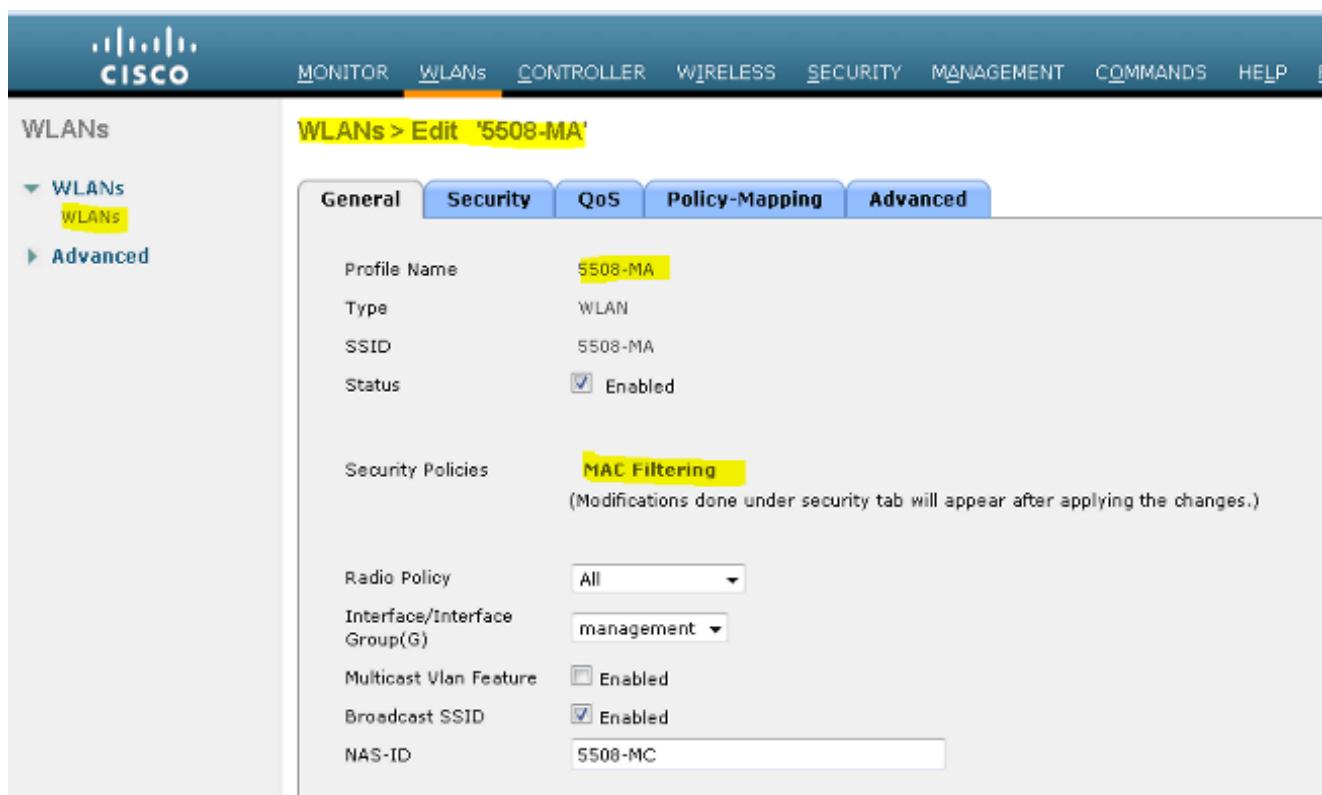

In this example, there is a WLC 5508 that acts as an Anchor and a WLC 5760 that acts as a Foreign WLC. If you want to use a WLC 5508 as an Anchor and a 3850 Switch and Foreign WLC, which is a Mobility Agent, to another Mobility Controller then the same configuration is correct. However, there is no need to configure the WLAN on the second Mobility Controller to which the 3850 Switch gets the licenses from. You just need to point the 3850 Switch to the 5508 WLC which acts as the Anchor.

Configuration on the WLC

1. On the Foreign WLC, configure the ISE server with the AAA Method list for AAA and map the WLAN to a MAC filter authorization. This is not needed on the Anchor.

 **Note:** Configure Redirect ACL on both the Anchor and Foreign WLC and also MAC filtering.

2. From the WLC 5508 GUI, choose **WLANS > New** in order to configure the Anchor 5508. Fill in the details in order to enable MAC filtering.

3. It is not necessary to configure Layer 2 options.

The screenshot shows the Cisco AireOS Web Interface. The top navigation bar includes MONITOR, WLANs (highlighted in orange), CONTROLLER, WIRELESS, SECURITY, and MANAGEMENT. The left sidebar under 'WLANs' has 'WLANS' expanded, showing 'WLANS' and 'Advanced'. The main content area is titled 'WLANs > Edit '5508-MA''. It features tabs for General, Security, QoS, Policy-Mapping, and Advanced, with sub-tabs for Layer 2, Layer 3, and AAA Servers. Under Layer 2, the 'Layer 2 Security' dropdown is set to 'None'. The 'MAC Filtering' checkbox is checked. A 'Fast Transition' section contains a checkbox which is unchecked.

4. It is not necessary to configure Layer 3 options.

This screenshot is similar to the previous one, showing the 'Edit '5508-MA'' configuration page. The 'Layer 3' tab is selected under the Layer 3 sub-tab. The 'Layer 3 Security' dropdown is also set to 'None'.

5. AAA servers should be disabled in the Anchor AireOS WLC in order for the CoA to be processed by the foreign NGWC. AAA servers can only be enabled in the Anchor WLC if there is no RADIUS servers configured under: Security > AAA > RADIUS > Authentication

The screenshot shows the Cisco Wireless LAN Controller (WLC) interface. The top navigation bar includes links like IMP Bookmarks, Cisco Live Australia 2013, Cisco Live 2014, SURBG Device Access, and Study. Below the navigation is a blue header bar with tabs: MONITOR, WLANs (highlighted), CONTROLLER, WIRELESS, SECURITY, MANAGEMENT, and COMMANDS. On the left, a sidebar menu has 'WLANs' expanded, showing 'WLANS' and 'Advanced'. The main content area is titled 'WLANs > Edit '5508-MA''. A tab bar at the top of the content area includes General, Security, QoS, Policy-Mapping, Advanced, Layer 2, Layer 3, and AAA Servers (highlighted). The 'AAA Servers' tab contains a section titled 'Select AAA servers below to override use of default servers on this WLAN'. It includes a 'Radius Servers' section with a checkbox for 'Radius Server Overwrite interface' which is unchecked. Below this is a table for 'Authentication Servers' and 'Accounting Servers', both with 'Enabled' checkboxes checked. The table lists six servers, each with dropdown menus for Authentication and Accounting. At the bottom of the table is a 'Pending Changes' link.

- Choose **WLANs > WLANs > Edit > Advanced**. Check the **Allow AAA Override** check box. From the NAC State drop-down list, choose **Radius NAC**.

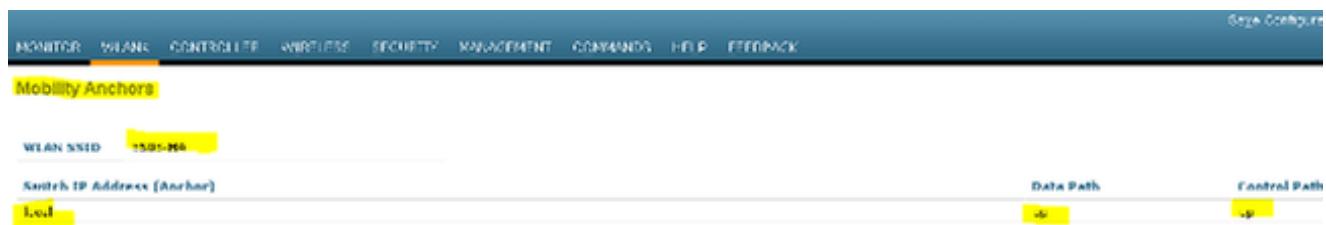

This screenshot shows the 'Advanced' tab of the 'WLANs > Edit '5508-MA'' configuration page. The 'Allow AAA Override' checkbox is checked. Other visible settings include 'Coverage Hole Detection' (Enabled), 'Enable Session Timeout' (1800 seconds), 'Aironet IE' (Enabled), 'Diagnostic Channel' (Disabled), 'Override Interface ACL' (None), 'Layer2 Ad' (None), 'P2P Blocking Action' (Disabled), 'Client Exclusion' (Enabled, timeout 60 seconds), 'Maximum Allowed Clients' (0), 'Static IP Tunneling' (Enabled), 'Wi-Fi Direct Clients Policy' (Disabled), and 'Maximum Allowed Clients Per AP Radio' (200). On the right side, there are sections for 'DHCP' (DHCP Server, Override), 'EAP' (Split Tunnel (Printers), Enabled), 'Management Frame Protection (MFP)' (MFP Client Protection, Optional), 'DTIM Period (in beacon intervals)' (802.11a/n (1 - 255), 1; 802.11b/g/n (1 - 255), 1), 'NAC' (NAC State, Radius NAC), and 'Load Balancing and Band Select'.

- Add this as the Anchor for the WLAN.

This screenshot shows a table of WLAN configurations. The first row has 'WLAN' and '5500-004' selected. The second row has 'WLAN' and '5500-005' selected. The columns include 'Name', 'SSID', 'Profile', 'Status', 'MAC Filtering', and a 'More' button. A context menu is open over the second row, with 'Modify wireless' highlighted. Other options in the menu include Remove, Modify wireless, 802.11s, Foreign Map, Service Advertisement, and Hotspot 2.0.

Name	SSID	Profile	Status	MAC Filtering	More
5500-004	5500-004	5500-MA	Enabled	Disabled	More
5500-005	5500-005	5500-MA	Enabled	Disabled	Modify wireless

8. After it is pointed to local, it should look this with Control and Data Path UP/UP.

9. Create the Redirect ACL on the WLC. This denies DHCP and DNS. It allows HTTP/HTTPs.

The screenshot shows the 'Access Control Lists > Edit' screen. Under the 'General' tab, the 'Access List Name' is set to 'REDIRECT'. The 'Deny Counters' field shows a value of 0. Below this, there's a table listing the rules of the ACL:

Seq	Action	Source IP/Mask	Destination IP/Mask	Protocol	Source Port	Dest Port	DSCP	Direction	Number of Hits
1	Permit	0.0.0.0 / 0.0.0.0	0.0.0.0 / 0.0.0.0	UDP	Any	DNS	Any	Any	0
2	Permit	0.0.0.0 / 0.0.0.0	0.0.0.0 / 0.0.0.0	UDP	DNS	Any	Any	Any	0
3	Permit	0.0.0.0 / 0.0.0.0	10.106.73.69 / 255.255.255.255	Any	Any	Any	Any	Any	0
4	Permit	10.106.73.69 / 255.255.255.255	0.0.0.0 / 0.0.0.0	Any	Any	Any	Any	Any	0

This is how it looks after the ACL is created.

The screenshot shows the 'Security > Access Control Lists' screen. On the left, there's a sidebar with navigation links: AAA, Local EAP, Priority Order, Certificate, and Access Control Lists (which is currently selected). Under 'Access Control Lists', there are three sub-links: Access Control Lists (highlighted with a yellow box), CPU Access Control Lists, FlexConnect ACLs, and Layer2 ACLs. The main panel displays the 'Access Control Lists' configuration. It includes an 'Enable Counters' checkbox and a table for defining counters:

Name	Type
ACL_Provisioning_Redirect	IPv4
REDIRECT	IPv4

10. Define the ISE RADIUS server on the WLC 5760.

11. Configure the RADIUS Server, Server group, and Method List with the CLI.

<#root>

```
dot1x system-auth-control
```

```
radius server ISE
```

```
address ipv4 10.106.73.69 auth-port 1645 acct-port 1646

timeout 10

retransmit 3

key Cisco123

aaa group server radius ISE

server name ISE

deadtime 10

aaa authentication dot1x ISE group ISE

aaa authorization network ISE group ISE

aaa authorization network MACFILTER group ISE

aaa accounting identity ISE start-stop group ISE

!

aaa server radius dynamic-author

client 10.106.73.69 server-key Cisco123

auth-type any
```

12. Configure the WLAN from the CLI.
<#root>

```
wlan 5508-MA 15 5508-MA
```

```
aaa-override
```

```
accounting-list ISE
```

```
client vlan VLAN0012
```

```
mac-filtering MACFILTER
```

```
mobility anchor 10.105.135.151
```

```
nac
```

```
no security wpa
```

```
no security wpa akm dot1x
```

```
no security wpa wpa2
```

```
no security wpa wpa2 ciphers aes
```

```
security dot1x authentication-list ISE
```

```
session-timeout 1800
```

```
shutdown
```

13. Define the other WLC as the Mobility member on this WLC.

```
<#root>
```

```
wireless mobility group member ip 10.105.135.151 public-ip 10.105.135.151 group Mobile-1
```

 **Note:** If you configure the same with the WLC 3850 as the Foreign, then ensure you define the Switch peer group on the Mobility Controller and vice-versa on the Mobility Controller. Then configure the previous CWA configurations on the WLC 3850.

14. Configure Redirect ACLs with the CLI.

This is the url-redirect-acl that ISE returns as an AAA override along with the redirect URL for the guest portal redirection. It is a direct ACL which is used currently on the Unified architecture. This is a 'punt' ACL which is sort of a reverse ACL that you would normally use for Unified architecture. You need to block access to DHCP, the DHCP server, DNS, the DNS server, and the ISE server. Only allow www, 443, and 8443 as needed. This ISE guest portal uses port 8443 and the redirection still works with the ACL shown here. Here ICMP is enabled, but based on the security rules you can either deny or permit.

```
<#root>

ip access-list extended REDIRECT

deny icmp any any

deny udp any any eq bootps

deny udp any any eq bootpc

deny udp any any eq domain

deny ip any host 10.106.73.69

permit tcp any any eq www

permit tcp any any eq 443
```

 **Caution:** When you enable HTTPS, it might cause some high CPU issues due to scalability. Do not enable this unless it is recommended by the Cisco design team.

Verify

Use this section to confirm that your configuration works properly.

The [Output Interpreter Tool](#) ([registered](#) customers only) supports certain **show** commands. Use the Output Interpreter Tool in order to view an analysis of **show** command output.

Connect the client to the configured SSID. Once you receive the IP address and when the client goes to the Web auth Required state, open the browser. Enter your client credentials in the portal.

After successful authentication, check the **Accept terms and conditions** check box. Click **Accept**.

A screenshot of a web browser showing the Cisco Guest Portal Acceptable Use Policy screen. The title "Acceptable Use Policy" is at the top. Below it is a text area containing the policy terms. At the bottom, there is a checkbox labeled "Accept terms and conditions" followed by "Accept" and "Decline" buttons.

Please accept the policy:

1. You are responsible for
- maintaining the confidentiality of the password and
- all activities that occur under your username and password.

2. Cisco Systems offers the Service for activities such as the active use of e-mail, instant messaging, browsing the World Wide Web and accessing corporate intranets. High volume data transfers, especially sustained high volume data transfers, are not permitted. Hosting a web server or any other server by use of our Service is prohibited. Trying to access someone else's account, sending unsolicited bulk e-mail, collection of other people's personal data without their knowledge and interference with other network users are all prohibited.

3. Cisco Systems reserves the right to suspend the Service if
- Cisco Systems reasonably believes that your use of the Service is unreasonably excessive or
- you are using the Service for criminal or illegal activities.

Accept terms and conditions

Accept **Decline**

You will receive a confirmation message and will now be able to browse to the Internet.

You can now type in the original URL in the browser's address bar.

On the ISE, the client flow looks like this:

2014-05-09 06:28:19.334	<input checked="" type="checkbox"/>		shubair	00:17:7C:2F:B6:9A	Unknown	Surbg_5760	PermitAccess	Authorize-Only succeeded	0af987b2536c7a1700000117	
2014-05-09 06:28:19.298	<input checked="" type="checkbox"/>			00:17:7C:2F:B6:9A		Surbg_5760		Dynamic Authorization succeeded	0af987b2536c7a1700000117	
2014-05-09 06:28:19.274	<input checked="" type="checkbox"/>		shubair	00:17:7C:2F:B6:9A				Guest Authentication Passed	0af987b2536c7a1700000117	
2014-05-09 06:19:00.822	<input checked="" type="checkbox"/>			00:17:7C:2F:B6:9A	00:17:7C:2F:B6:9A	Unknown	Surbg_5760	CWA	Authentication succeeded	0af987b2536c7a1700000117

Troubleshoot

This section provides information you can use to troubleshoot your configuration.

The [Output Interpreter Tool](#) (registered customers only) supports certain **show** commands. Use the Output Interpreter Tool in order to view an analysis of **show** command output.

Note: Refer to [Important Information on Debug Commands](#) before you use **debug** commands.

On the Converged Access WLC, it is recommended to run traces instead of debugs. On the Aironet OS 5508 WLC you just need to enter **debug client <client mac>** and **debug web-auth redirect enable mac <client mac>**.

```
set trace group-wireless-client level debug
set trace group-wireless-secure level debug

set trace group-wireless-client filter mac 0017.7c2f.b69a
set trace group-wireless-secure filter mac 0017.7c2f.b69a
```

Some known defects on the Cisco IOS-XE and the Aironet OS are included in Cisco bug ID [CSCun38344](#).

This is how the successful CWA flow looks like on the traces:

```
