## Introduction

This document describes how to configure and troubleshoot Enhanced Open with Transition Mode on Catalyst 9800 Wireless LAN Controller (9800 WLC).

## Prerequisites

### Requirements

Cisco recommends that you have knowledge of these topics:

- Cisco Wireless Lan Controllers (WLC) 9800.
- Cisco Access Points (APs) that support Wi-Fi 6E.
- IEEE Standard 802.11ax.
- Wireshark.

### Components Used

The information in this document is based on these software and hardware versions:

- WLC 9800-CL with IOS® XE 17.9.3.
- APs C9130, C9136, CW9162, CW9164 and CW9166.
- Wi-Fi 6 Clients:
  - iPhone SE3rd gen on IOS 16
  - MacBook on Mac OS 12.
- Wi-Fi 6E Clients:

- Lenovo X1 Carbon Gen11 with Intel AX211 Wi-Fi 6 and 6E Adapter with driver version 22.200.2(1).
- Netgear A8000 Wi-Fi 6 and 6E Adapter with driver v1(0.0.108);
- Mobile Phone Pixel 6a with Android 13;
- Mobile Phone Samsung S23 with Android 13.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

## Background Information

The Enhanced Open is a certification provided by WiFi alliance as part of the WPA3 wireless security standard. It uses Opportunistic Wireless Encryption (OWE) on Open (unauthenticated) networks to prevent passive sniffing and prevent simple attacks as compared to a public PSK wireless network.

With Enhanced Open, clients and the WLC (in case of Central Authentication) or the AP (in case of FlexConnect Local Authentication) perform a Diffie-Hellman key exchange during the association process and use the pairwise master key secret (PMK) with the 4-way handshake.

## OWE

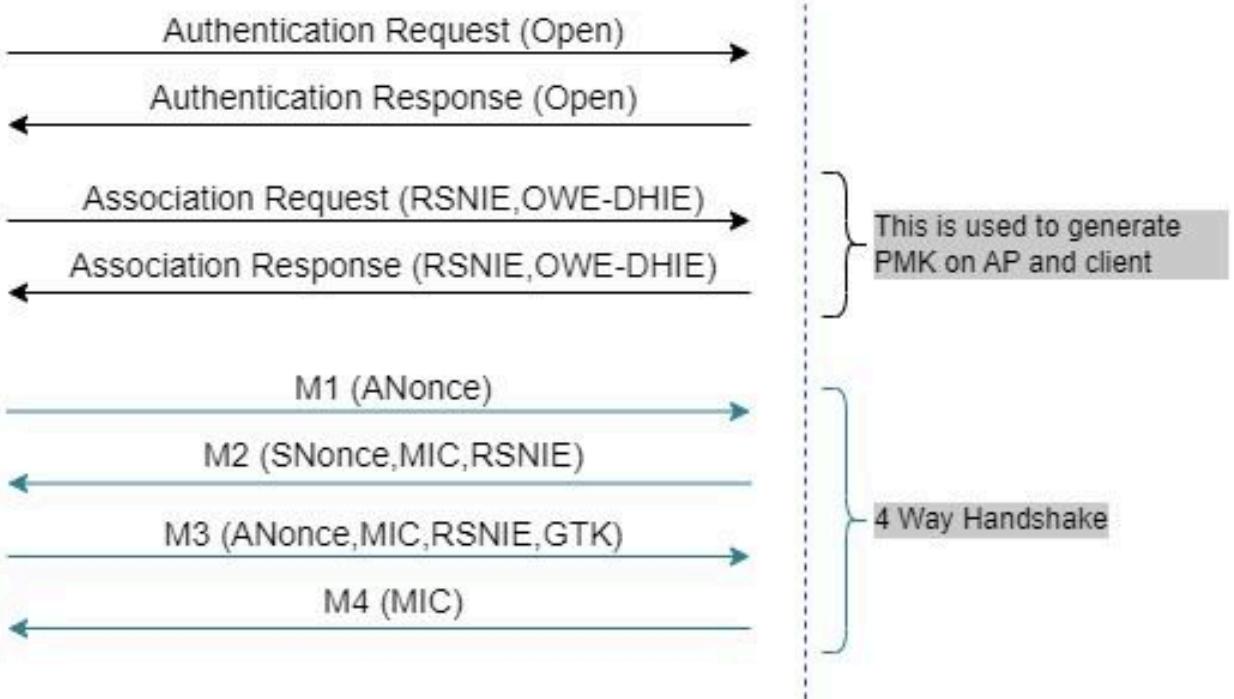

Opportunistic Wireless Encryption (OWE) is an extension to IEEE 802.11 that provides encryption of the wireless medium ([IETF RFC 8110](#)). The purpose of OWE based authentication is avoid open unsecured wireless connectivity between the AP's and clients. The OWE uses the Diffie-Hellman algorithms based Cryptography to setup the wireless encryption. With OWE, the client and AP perform a Diffie-Hellman key exchange during the access procedure and use the resulting pairwise master key (PMK) secret with the 4-way handshake. The use of OWE enhances wireless network security for deployments where Open or shared PSK based networks are deployed.

**STA**

**AP**

*OWE frame exchange*

## Transition Mode

Typically enterprise networks only have one unencrypted guest SSID and prefer to have both older clients that do not support enhanced open and newer clients with enhanced open to co-exist. Transition Mode is introduced specifically to cater to this scenario.

This requires configuration of two SSIDs - one hidden SSID to support OWE and a second SSID that is Open and is broadcasted.

The Opportunistic Wireless Encryption (OWE) transition mode enables OWE and non-OWE STAs to connect to the same SSID simultaneously. When all the OWE STAs see an SSID in OWE transition mode, they connect with the OWE.

Both the open WLAN and the OWE WLAN transmit beacon frames. Beacon and probe response frames from the OWE WLAN include the Wi-Fi Alliance vendor IE to encapsulate the BSSID and SSID of the open WLAN, and similarly, the open WLAN also includes for OWE WLAN.

An OWE STA shall only display to the user in the list of available networks the SSID of the Open BSS of an OWE AP operating in OWE Transition Mode, and shall suppress the display of the OWE BSS SSID of that OWE AP.

## Guidelines and Restrictions:

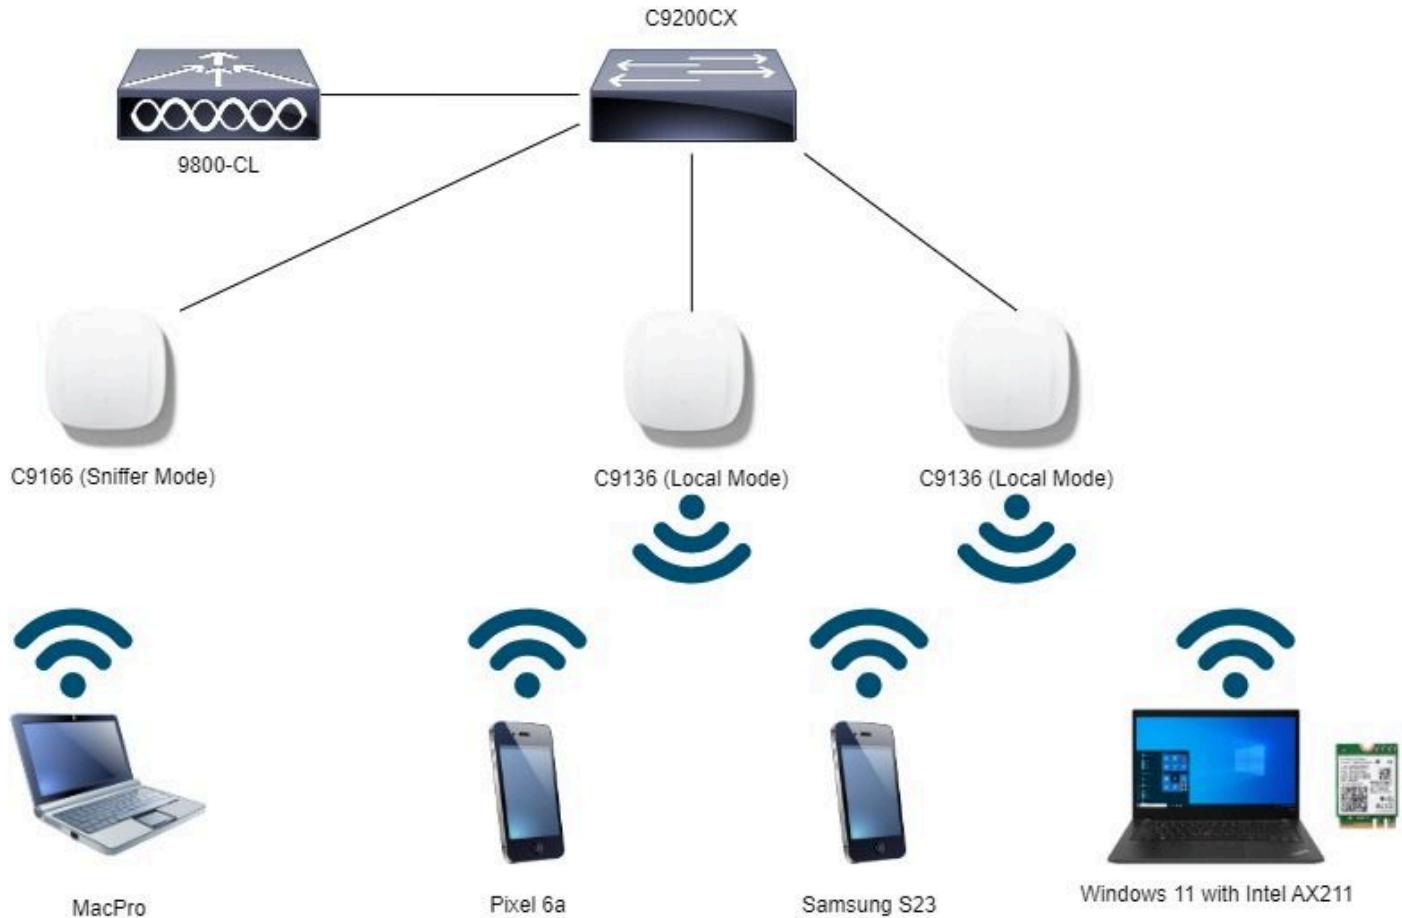

- Enhanced open requires WPA3 only Policy. WPA3 is not supported in Cisco Wave 1 (Cisco IOS®-)

- based) APs.
- Protected Management Frame (PMF) must be set to Required. This is set by default with WPA3 only Layer 2 Security.
  - Enhanced Open only works on end clients that run the newer versions that support Enhanced Open.

## Configure

Typical use case where the administrator wants to configure Enhanced Open but still allow for older clients to be able to connect to the guest SSID.

### Network Diagram

*Network Topology*

### Configuration steps for GUI:

Create first SSID, hereby called “OWE\_Transition”. In this example WLAN ID 3, and ensure it is hidden with the option “Broadcast SSID” disabled:

Step 1 Choose **Configuration > Tags & Profiles > WLANS** to open the WLANS page.

Step 2 Click **Add** to add new WLAN > add WLAN name "OWE\_Transition" > change **Status** to **Enable** > ensure **Broadcast SSID** is **Disabled**.

*OWE Transition Enhanced Open SSID hidden*

**Step 3** Choose the **Security > Layer 2** tab > Select **WPA3**.

**Step 4** Set Protected Management Frame (**PMF**) to **Required**.

**Step 5** Under **WPA Parameters** > Check the WPA3 Policy. Select **AES(CCMP128)** Encryption and **OWE** Auth Key Management.

**Step 6** Add WLAN ID 4 (open WLAN) to "**Transition Mode WLAN ID**" box.

**Step 7** Click **Apply to Device**.

*OWE Transition Mode - OWE SSID*

Create second SSID, call it “open” in this example WLAN ID 4, and ensure you enable “Broadcast SSID”:

**Step 1** Choose **Configuration > Tags & Profiles > WLANs** to open the WLANs page.

**Step 2** Click **Add** to add new WLAN > add WLAN name "open" > change **Status** to **Enable** > ensure

## Broadcast SSID is Enabled.

The screenshot shows the Cisco Catalyst 9800-CL Wireless Controller interface. On the left, the navigation menu includes Dashboard, Monitoring, Configuration (selected), Administration, Licensing, and Troubleshooting. The main panel displays 'Configuration > Tags & Profiles > WLANs'. A table lists five WLAN profiles: Mac-Filter (ID 1), dot1x (ID 2), OWE\_Transition (ID 3), open (ID 4, selected), and wifi6e\_test (ID 5). To the right, the 'Edit WLAN' dialog is open for profile 'open'. The 'General' tab shows 'Profile Name' as 'open', 'SSID\*' as 'open', 'WLAN ID\*' as '4', and 'Status' as 'ENABLED'. The 'Broadcast SSID' checkbox is also checked and highlighted with a red box. Other tabs include Security, Advanced, Add To Policy Tags, Radio Policy, and Show slot configuration.

OWE Transition Open SSID

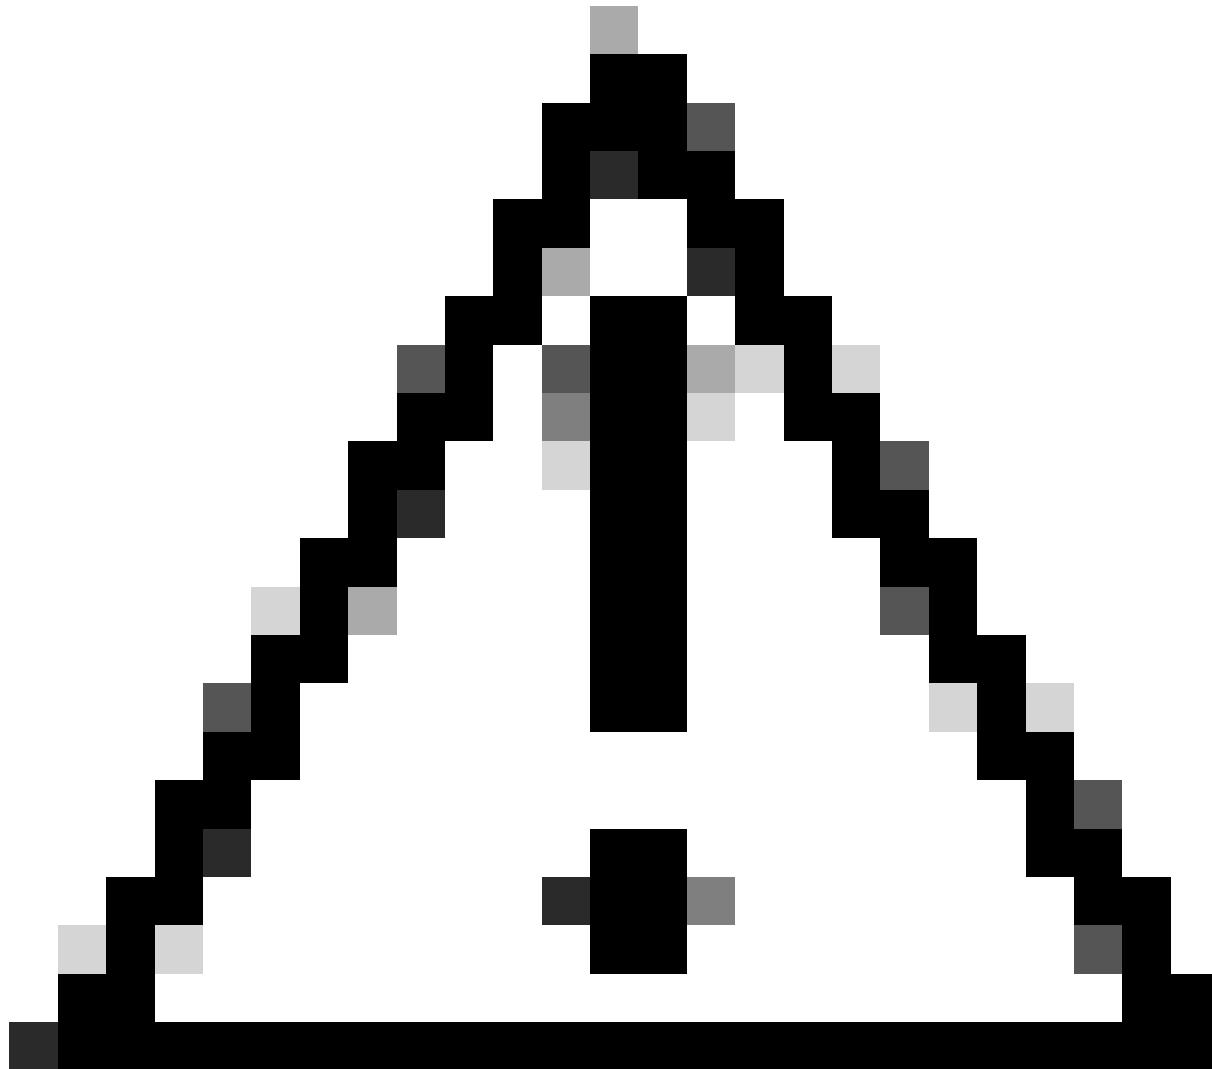

Step 3 Choose the **Security > Layer 2** tab > Choose **None**.

Step 4 Add WLAN ID 4 (OWE\_Transition) to "Transition Mode WLAN ID" box.

Step 5 Click **Apply to Device**.

The screenshot shows the Cisco Catalyst 9800-CL Wireless Controller interface. The navigation menu and WLAN list are identical to the previous screenshot. The 'Edit WLAN' dialog is now on the 'Security' tab. The 'Layer2' tab is selected, showing 'OWE Transition Mode' checked and 'Transition Mode WLAN ID\*' set to '3'. Other options like WPA + WPA2, WPA2 + WPA3, WPA3, and Static WEP are available but not selected. The 'None' radio button is selected. Other tabs include Layer3, AAA, MAC Filtering, Lobby Admin Access, Protected Management Frame, and Fast Transition.

OWE Transition Mode Open WLAN Security

**Caution:** In case you had a previous open WLAN using the same SSID of the OWE WLAN, Windows clients will append “2” to the SSID name. To overcome this, navigate to “Network & Internet > Wi-Fi > Manage known networks” and delete the old connection.

This screenshot shows the final result: one WLAN is secured and configured for WPA3+OWE+WPA3 named "OWE\_Transition" and the other is a fully open SSID named "open". Only the fully open SSID called “open” has its SSID broadcasted in the beacons while "OWE\_Transition" is hidden.

Screenshot of the Cisco Catalyst 9800-CL Wireless Controller interface showing the configuration of WLANs. The "Selected WLANs" table lists the following entries:

ID	SSID	Security
1	MacFilter	[open] MAC Filtering, [Web Auth]
2	dot1x	[WPA2][802.1x][AES]
3	OWE_Transition	[WPA3][OWE][AES]
4	open	[open]
5	wifi6E_test	[WPA3][OWE][AES]

The rows for "OWE\_Transition" and "open" are highlighted with a red box.

OWE Transition Mode WLANs

Step 6 Map the **WLANS** created to the desired **Policy Profiles** into the **Policy Tag** and apply it to the APs.

The screenshot shows the 'Edit Policy Tag' dialog box. At the top, there is a warning message: '⚠ Changes may result in loss of connectivity for some clients that are associated to APs with this Policy Tag.' Below this, the 'Name\*' field is set to 'Wifi6E\_TestPolicy'. The 'Description' field has the placeholder 'Enter Description'. Under the heading 'WLAN-POLICY Maps: 2', there are two entries in a table:

WLAN Profile	Policy Profile
<input type="checkbox"/> OWE_Transition	CentralSwPolicyProfile
<input type="checkbox"/> open	CentralSwPolicyProfile

At the bottom of the table, there are navigation buttons (back, forward, page number 1, page size 10, dropdown), and a message '1 - 2 of 2 items'.

Policy Tag

## Configure for CLI:

### Enhanced Open SSID:

```
Device# conf t
Device(config)# wlan OWE_Transition 3 OWE_Transition
Device(config)# no broadcast-ssid
Device(config)# no security ft adaptive
Device(config)# no security wpa wpa2
Device(config)# no security wpa akm dot1x
Device(config)# security wpa akm owe
Device(config)# security wpa transition-mode-wlan-id 4
Device(config)# security wpa wpa3
Device(config)# security pmf mandatory
Device(config)# no shutdown
```

### Open SSID:

```
Device# conf t
Device(config)# wlan open 4 open
Device(config)# no security ft adaptive
Device(config)# no security wpa
Device(config)# no security wpa wpa2
Device(config)# no security wpa wpa2 ciphers aes
```

```
Device(config)# no security wpa akm dot1x
Device(config)# security wpa transition-mode-wlan-id 3
Device(config)# no shutdown
```

#### Policy Profile:

```
Device(config)# wireless tag policy Wifi6E_TestPolicy
Device(config-policy-tag)# wlan open policy CentralSwPolicyProfile
Device(config-policy-tag)# wlan OWE_Transition policy CentralSwPolicyProfile
```

## Verify

This is the verification section.

Verify the WLANs configuration on CLI:

```
<#root>

Device#show wlan id 3
WLAN Profile Name : OWE_Transition
=====
Identifier : 3

Description :

Network Name (SSID) : OWE_Transition

Status : Enabled

Broadcast SSID : Disabled

[...]
Security

802.11 Authentication : Open System

Static WEP Keys : Disabled

Wi-Fi Protected Access (WPA/WPA2/WPA3) : Enabled

WPA (SSN IE) : Disabled
WPA2 (RSN IE) : Disabled

WPA3 (WPA3 IE) : Enabled

AES Cipher : Enabled

CCMP256 Cipher : Disabled
GCMP128 Cipher : Disabled
GCMP256 Cipher : Disabled
```

Auth Key Management  
802.1x : Disabled  
PSK : Disabled  
CCKM : Disabled  
FT dot1x : Disabled  
FT PSK : Disabled  
FT SAE : Disabled  
Dot1x-SHA256 : Disabled  
PSK-SHA256 : Disabled  
SAE : Disabled

**OWE : Enabled**

SUITEB-1X : Disabled  
SUITEB192-1X : Disabled  
SAE PWE Method : Hash to Element, Hunting and Pecking(H2E-HNP)

**Transition Disable : Disabled**

CCKM TSF Tolerance (msecs) : 1000

**OWE Transition Mode : Enabled**

**OWE Transition Mode WLAN ID : 4**

OSEN : Disabled  
FT Support : Disabled  
FT Reassociation Timeout (secs) : 20  
FT Over-The-DS mode : Disabled

**PMF Support : Required**

PMF Association Comeback Timeout (secs): 1  
PMF SA Query Time (msecs) : 200  
[...]  
#show wlan id 4  
WLAN Profile Name : open  
=====

**Identifier : 4**

Description :

**Network Name (SSID) : open**

**Status : Enabled**

**Broadcast SSID : Enabled**

[...]  
Security  
802.11 Authentication : Open System  
Static WEP Keys : Disabled

**Wi-Fi Protected Access (WPA/WPA2/WPA3) : Disabled**

```
OWE Transition Mode : Enabled
```

```
OWE Transition Mode WLAN ID : 3
```

```

```

```
PMF Support : Disabled
```

```
PMF Association Comeback Timeout (secs): 1  
PMF SA Query Time (msecs) : 200  
[...]
```

In the WLC you can go to the AP Configuration and verify that both WLANs are active on the AP:

The screenshot shows the Cisco Catalyst 9800-CL Wireless Controller interface. The top navigation bar includes the Cisco logo, the device name "Cisco Catalyst 9800-CL Wireless Controller", and the software version "17.9.3". Below this, the path "Configuration > Wireless > Access Points" is visible. A search bar labeled "Search Menu Items" is present. On the left, a sidebar lists "Dashboard", "Monitoring", "Configuration" (which is selected and highlighted in blue), "Administration", "Licensing", and "Troubleshooting". The main content area is titled "AP Operational Configuration Viewer". It displays a hierarchical structure under "WLANS and Policies": "Wifi6E\_TestPolicy". This policy has two entries: "WLAN : open" and "WLAN : OWE\_Transition". Both entries show "Policy : CentralSwPolicyPro..." and "VLAN ID : default". The "Security" field for the first entry is "Open", and for the second it is "WPA3".

OWE Transition Mode AP Operational Configuration Viewer

When enabled, the AP only beacons with Open SSID but carry an OWE Transition Mode Information Element (IE). When a client capable of enhanced open connects to this SSID, it automatically uses OWE to encrypt all traffic post association.

Here is what you can observe over the air (OTA):

OWE Transition Open SSID Beacon

The beacon send with SSID "open" contains the OWE Transition Mode IE with the enhanced open SSID details inside, like BSSID and SSID name "OWE\_Transition".

There are also beacons OTA with the SSID hidden and if we filter by bssid, the frames are sent to the BSSID **00:df:1d:dd:7d:3e** which is the BSSID inside the OWE Transition Mode IE:

*OWE Beacon*

You can see that also the OWE hidden beacon contains the OWE Transition Mode IE with the open ssid BSSID and SSID name "open".

These screenshots show an Android phone that supports Enhanced Open: it only displays the open SSID with no lock icon (a lock icon would make the user believe it requires a password to connect), but once connected the security shows Enhanced Open security is used.

User Defined (Private) Network Drop Unicast : Disabled
Encrypted Traffic Analytics : No
```

Protected Management Frame - 802.11w : Yes

EAP Type : Not Applicable

And we can observe the same in the WLC GUI:

The screenshot shows the Cisco Catalyst 9800-CL Wireless Controller interface. On the left is a navigation sidebar with icons for Dashboard, Monitoring, Configuration, Administration, Licensing, and Troubleshooting. The main area has a title bar "Cisco Catalyst 9800-CL Wireless Controller" and a sub-menu "Monitoring > Wireless > Clients". Below this is a table titled "Clients" showing two entries:

Client MAC Address	IPv4 Address	IPv6 Address
0429.2ec9.e371	192.168.1.160	fe80::6a20:34e8:ab1b:6332
286b.3598.580f	192.168.1.159	2001:8a0:fb91:1c00:d0cb:dd1b:71e4:f29d

To the right is a detailed view of the selected client (286b.3598.580f). The "General" tab is active, showing the following properties:

MAC Address	286b.3598.580f
Client MAC Type	Universally Administered Address
Client DUID	NA
IPv4 Address	192.168.1.159
IPv6 Address	2001:8a0:fb91:1c00:d0cb:dd1b:71e4:f29d fe80::ac5b:e1e1:67ba:c353 2001:8a0:fb91:1c00:edb2:8d62:d379:c53b
User Name	N/A
Policy Profile	CentralSwPolicyProfile
Flex Profile	N/A
Wireless LAN Id	3
WLAN Profile Name	OWE_Transition
Wireless LAN Network Name (SSID)	OWE_Transition
RSSID	00:00:00:00:00:00

This screenshot shows the same interface as above, but the "Security Information" tab is active for the selected client. The table now includes columns for AP Properties and Security Information.

Client Properties	AP Properties	Security Information	Client Statistics	QC
Client State Servers		None		
Client ACLs		None		
Client Entry Create Time		424 seconds		
Policy Type		WPA3		
Encryption Cipher		CCMP (AES)		
Authentication Key Management		OWE		
EAP Type		Not Applicable		
Session Timeout		1800		

For clients that do not support Enhanced Open, they only see and connect to the open SSID, with no encryption.

As illustrated here, these are clients that do not support Enhanced Open (respectively an iPhone on IOS 15 and a MacBook on Mac OS 12) and only see the open guest SSID and do not use encryption.

```

## Troubleshoot

1. Ensure that client supports OWE, as not all clients support it. Check the client vendor documentation, for example Apple documented the support for their devices [here](#).
2. Some older clients possibly do not even accept the Open ssid beacons due to the presence of the OWE Transition Mode IE and not present the SSID in the networks in range. If your client cannot see the Open SSID, remove the Transition VLAN (set to 0) from the WLAN configuration and check if it sees the WLAN then.
3. If clients see open SSID, support OWE, but they still connect without WPA3, then verify if the transition VLAN id is correct and being broadcasted in the beacons of both WLANs. You can use AP in sniffer mode to capture OTA traffic. Please execute these steps to configure an AP in sniffer mode: [APs Catalyst 91xx in Sniffer Mode](#).
  - The beacon is sent with SSID "open" contains the OWE Transition Mode IE with the enhanced

open SSID details inside, like BSSID and SSID name "OWE\_Transition":

*OWE Transition Open SSID Beacon*

- There are also beacons OTA with the SSID hidden and if we filter by bssid, the frames are sent to the BSSID **00:df:1d:dd:7d:3e** which is the BSSID inside the OWE Transition Mode IE:

OWE Beacon

You can see that also the OWE hidden beacon contains the OWE Transition Mode IE with the open ssid BSSID and SSID name "open".

- You can as well see AKM info and verify that MFP is advertised as Required and Capable:

OWE Beacon AKM

4. Collect RadioActive traces based on client mac address and you see similar logs as this:

2023/06/23 15:08:58.567933 {wncd\_x\_R0-0}{1}: [client-keymgmt] [14854]: (note): MAC: xxxx.xxxx.xxxx EAP Key management successful.  
AKM:OWE Cipher:CCMP WPA Version: WPA3

2023/06/23 15:10:06.971651 {wnced\_x\_R0-0}{1}: [client-orch-state] [14854]: (note): MAC: xxxx.xxxx.xxxx Client state transition: S\_CO\_IP\_LEARN\_IN\_PROGRESS -> S\_CO\_RUN
