cable-modem upstream preamble qpsk	Enables the QPSK modulation scheme in the upstream direction from the cable interface to the CMTS.
cable-modem voip best-effort	Allows voice traffic to be transmitted on the upstream using a best-effort QoS.

interface integrated-cable

To configure integrated cable interface on a cable interface line card, use the **interface integrated-cable** command in global configuration mode.

Cisco uBR10012 Universal Broadband Router

interface integrated-cable *slot/subslot/port:rf-channel*

Cisco uBR7225VXR and Cisco uBR7246VXR Universal Broadband Router

interface integrated-cable *slot/subslot/port:rf-channel*

Cisco cBR Series Converged Broadband Routers

interface integrated-cable *slot/subslot/port:rf-channel*

Syntax Description	
<i>slot</i>	Identifies the chassis slot where the cable interface line card resides. <ul style="list-style-type: none"> • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco cBR Series Converged Broadband Routers— The valid range is from 0 to 3 and 6 to 9.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. For Cisco cBR Series Converged Broadband Routers, the valid subslot is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4. • Cisco cBR Series Converged Broadband Routers— The valid range is from 0 to 7.
<i>rf-channel</i>	RF channel number. The valid range is from 0 to 162.

Command Default None

Command Modes Global configuration (config)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
	IOS-XE 3.18.0SP	This command was modified on the Cisco cBR Series Converged Broadband Routers. The <i>rf-channel</i> range is 0 to 162 now.

Usage Guidelines The **interface integrated-cable** command is used to configure the following line cards:

- [Configuring the Cisco uBR-MC20X20V Cable Interface Line Card](#)
- [Configuring the Cisco uBR-MC88V Cable Interface Line Card](#)

The **interface integrated-cable** command is supported on Cisco cBR Converged Broadband Routers and also on Cisco uBR-MC88V and Cisco UBR-MC20X20V line cards.

Examples

The following example shows how to configure a integrated cable interface in slot 7, subslot 0, and port 0 on a Cisco UBR-MC20X20V cable interface line card:

```
Router# configure terminal
Router(config)# interface integrated-cable 7/0/0:1
```

Related Commands

Command	Description
show interface integrated-cable	Displays the current configuration and status for an integrated channel.

interface modular-cable

To configure a modular cable interface, use the **interface modular-cable** command in global configuration mode.

Cisco IOS Releases 2.3(21)BC, 12.3(23)BC, and 12.2(33)SCA

interface modular-cable*slot/subslot/bay:nb-channel-number*

Cisco IOS Release 12.2(33)SCB

interface modular-cable*slot/subslot/bay:nb-channel-number*

Cisco IOS Release 12.2(33)SCE

interface modular-cable*slot/subslot/bay:nb-channel-number*

Syntax Description	
<i>slot</i>	<p>Identifies the chassis slot where the Cisco Cable line card, or Cisco Wideband Shared Port Adaptor (SPA) is located.</p> <ul style="list-style-type: none"> For the Cisco Cable line cards, the valid range is from 5 to 8. For the Cisco Wideband SPA, the valid values are: <ul style="list-style-type: none"> <i>slot</i>—1 or 3 (for SIP-600) <i>slot</i>—1 (for Wideband SIP) <p>Note In Cisco IOS Release 12.2(33)SCE, support for configuring modular-cable interface on the Cisco uBR-MC3GX60V cable line card is introduced.</p>
<i>subslot</i>	<p>Identifies the subslot where the Cisco Cable line card is located.</p> <ul style="list-style-type: none"> For the Cisco Cable line cards, the valid value is 0 or 1. <p>Note In Cisco IOS Release 12.2(33)SCE, support for configuring modular-cable interface on the Cisco uBR-MC3GX60V cable line card is introduced.</p>
<i>bay</i>	<p>Identifies the bay where the Cisco Wideband SPA is located.</p> <p>The valid range is from 0 to 3.</p>
<i>port</i>	<p>Identifies the port on the Cisco Cable line card, or the Cisco Wideband SPA in the specified <i>slot/subslot</i> or <i>slot/bay</i>.</p> <ul style="list-style-type: none"> For the Cisco UBR-MC20X20V cable interface line card, the valid range for is from 0 to 5. For the Cisco uBR-MC3GX60V cable interface line card, the valid range is from 0 to 2. For the Cisco Wideband SPA, the valid value is 0.
<i>nb-channel-number</i>	Identifies the narrowband channel number.
<i>interface-number</i>	Identifies the modular-cable interface number. The valid range is from 0 to 23.

Command Default None

Command Modes

Global configuration (config)

Command History

Release	Modification
12.3(21)BC	This command was introduced.
12.3(23)BC	This command was integrated into Cisco IOS Release 12.3(23)BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCB	This command was modified to change the addressing format for the modular cable interface from <i>slot/subslot/bay:nb-channel-number</i> to <i>slot/bay/port:nb-channel-number</i> .
12.2(33)SCE	Support for configuring modular-cable interface on the Cisco uBR-MC3GX60V cable line card was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to configure a modular cable interface in slot 1, bay 3, and channel 23 on a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface modular-cable 1/3/0:23
```

The following example shows how to configure a modular cable interface in slot 5, subslot 1, and port 2 on a Cisco uBR-MC3GX60V cable line card.

```
Router# configure terminal
Router(config)# interface modular-cable 5/1/2:0
```

Related Commands

Command	Description
cable attribute-mask	Specifies an attribute mask value for a modular cable interface.
interface wideband-cable	Specifies a wideband cable interface.
interface cable	Specifies a cable interface.

interface port-channel

To create an EtherChannel interface on the Cisco Cable Modem Termination System (CMTS), use the **interface port-channel** command in global configuration mode. To remove this EtherChannel port from the Cisco CMTS, use the **no** form of this command.

```
interface port-channel n
no interface port-channel n
```

Syntax Description	<i>number</i> Identifying port channel number for this interface (EtherChannel port). The range is 1 to 64.
---------------------------	---

Command Default By default, EtherChannel groups and ports are not defined, and they are disabled.

Command Modes Global configuration (config)

Command History	Release	Modification
	12.2(11)BC3	This command was introduced on the Cisco uBR7246VXR router.
	12.2(9a)BC	This command was introduced on the Cisco uBR10012 router.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The first EtherChannel interface configured becomes the bundle primary for all EtherChannel interfaces in the group. That is, the MAC address of the first EtherChannel interface is the MAC address for all EtherChannel interfaces in the group. If the first EtherChannel interface is later removed, the second EtherChannel interface to be configured becomes the bundled primary by default.

Repeat this configuration on every EtherChannel port to be bundled into:

- FastEtherChannel (FEC) or GigabitEtherChannel (GEC) group on the Cisco uBR10012 and Cisco uBR7200 series routers.
- Ten Gigabit EtherChannel (Ten GEC) group on the Cisco cBR series routers.

This configuration must be present on all EtherChannel interfaces before the EtherChannel group can be configured.

Examples

The following example configures the port to have an EtherChannel port number of 1 within its EtherChannel group. The EtherChannel group is defined with the **channel-group** command.

```
Router(config-if)# interface port-channel 1
```

Related Commands	Command	Description
	channel-group	Assigns an EtherChannel port to an EtherChannel group.

Command	Description
show interface port-channel	Displays the EtherChannel interfaces and channel identifiers, with their mode and operational status.

interface virtualportgroup

To configure a VirtualPortGroup interface, use the **interface** command in the global configuration mode. To delete the VirtualPortGroup created, use the **no** form of the command.

```
interface virtualportgroup number
no interface virtualportgroup number
```

Syntax Description	<i>number</i> Specifies the Virtual Port Group number. Valid range is 0 to 31.
---------------------------	--

Command Default	None.
------------------------	-------

Command Modes	Global configuration mode (config)
----------------------	------------------------------------

Command History	Release	Modification
	Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines	This command is used to configure a VirtualPortGroup interface. If a VirtualPortGroup interface is configured, you will need to assign a primary IP address to it. You can also configure a secondary IP address on the VirtualPortGroup interface, similar to a gigabit Ethernet interface IP address configuration. You can assign only one secondary IP address.
-------------------------	---

The following example shows how to configure a VirtualPortGroup interface:

```
Router#configure terminal
Router(config)#interface VirtualPortGroup0
Router(config-if)#ip address 1.23.2.1 255.255.255.0
Router(config-if)#ip address 1.23.2.2 255.255.255.0 secondary
Router(config-if)#end
```

Related Commands	Command	Description
	mgmt-intf	Define a cable video management interface.
	show run interface VirtualPortGroup	Displays the VirtualPortGroup interface configuration.
	show run include mgmt-intf	Displays the cable video management interface configuration.
	show interfaces VirtualPortGroup	Displays the VirtualPortGroup interface state.

interface wideband-cable

To configure a wideband cable interface, use the **interface wideband-cable** command in global configuration mode.

Command History

Release	Modification
12.3(21)BC	This command was introduced.
12.3(23)BC	This command was integrated into Cisco IOS Release 12.3(23)BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCB	This command was modified to change the addressing format for the wideband cable interface from <i>slot/subslot/bay:wideband-channel</i> to <i>slot/bay/port:wideband-channel</i> .
12.2(33)SCD	This command was modified. Support was added for Cisco uBR7225VXR and Cisco uBR7246VXR routers.
12.2(33)SCE	Support was added for Cisco uBR-MC3GX60V cable interface line card on the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command was integrated into Cisco IOS-XE Release 3.15.0S. Support for the Cisco cBR Series Converged Broadband Routers was added.
IOS-XE 3.18.0SP	This command was modified on Cisco cBR Series Converged Broadband Routers. The <i>wideband-channel</i> range is 0 to 162 now.

Examples

The following example shows how to configure a wideband cable interface in slot 1, bay 3, and port 0 on a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface wideband-cable 1/3/0:0
```

The following example shows how to configure a wideband cable interface in slot 5, subslot 1, and port 2 on a Cisco uBR-MC3GX60V cable line card.

```
Router# configure terminal
Router(config)# interface wideband-cable 5/1/2:0
```

The following example shows how to configure a wideband cable interface in slot 1, and port 0 on a Cisco uBR7225VXR or Cisco uBR7246VXR router:

```
Router# configure terminal
Router(config)# interface wideband-cable 1/0:0
```

Related Commands

Command	Description
cable downstream attribute-mask	Specifies an attribute mask value for a wideband cable interface.
cable rf-channels	Associates RF channels on the router with a wideband interface and allocate bandwidth.
cable bundle	Specifies bundle number for bundling of cable interfaces.
interface modular-cable	Specifies a modular cable interface.
interface cable	Specifies a cable interface.

interleaver-depth (QAM profile)

To set the interleaver-depth for a specific QAM profile, use the **interleaver-depth** command in QAM profile configuration mode.

interleaver-depth {**I12-J17** | **I128-J1** | **I128-J2** | **I128-J3** | **I128-J4** | **I128-J5** | **I128-J6** | **I128-J7** | **I128-J8** | **I16-J8** | **I32-J4** | **I64-J2** | **I8-J16**}

Syntax Description	
I12-J17	INTERLEAVER-I-12-J-17 for Annex A or C
I128-J1	INTERLEAVER-I-128-J-1 for Annex B
I128-J2	INTERLEAVER-I-128-J-2 for Annex B
I128-J3	INTERLEAVER-I-128-J-3 for Annex B
I128-J4	INTERLEAVER-I-128-J-4 for Annex B
I128-J5	INTERLEAVER-I-128-J-5 for Annex B
I128-J6	INTERLEAVER-I-128-J-6 for Annex B
I128-J7	INTERLEAVER-I-128-J-7 for Annex B
I128-J8	INTERLEAVER-I-128-J-8 for Annex B
I16-J8	INTERLEAVER-I-16-J-8 for Annex B
I32-J4	INTERLEAVER-I-32-J-4 for Annex B
I64-J2	INTERLEAVER-I-64-J-2 for Annex B
I8-J16	INTERLEAVER-I-8-J-16 for Annex B

Command Default None

Command Modes QAM profile configuration (config-qam-prof)

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco eBR Series Converged Broadband Routers.

Usage Guidelines Use this command to set the interleaver-depth for a specific QAM profile.

Examples The following example shows how to set the interleaver-depth for a specific QAM profile:

```
Router# configure terminal
```

interleaver-depth (QAM profile)

```
Router(config)# cable downstream qam-profile 4
Router(config-qam-prof)# interleaver-depth I12-J17
```

Related Commands

Command	Description
cable downstream qam-profile	Set the QAM profile for the cable interface line card.
annex	Set the MPEG framing format.
modulation	Set the QAM modulation format.
spectrum-inversion	Set the spectrum-inversion on or off.
symbol-rate	Set the symbol rate.

interleaver-depth (OFDM channel profile)

To specify the channel interleaver-depth, use the **interleaver-depth** command in OFDM channel profile configuration mode. To undo the interleaver-depth assignment, use **no** form of this command.

interleaver-depth *value*

no interleaver-depth

Syntax Description

<i>value</i>	1 to 16 for 25 KHz spacing, 1 to 32 for 50 KHz spacing.
--------------	---

Command Default

16

Command Modes

OFDM channel profile configuration (config-ofdm-chan-prof)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to specify the channel interleaver-depth.

Examples

The following example shows how to specify the channel interleaver-depth:

```
Router# configure terminal
Router(config)# cable downstream ofdm-chan-profile 21
Router(config-ofdm-chan-prof)# interleaver-depth 3
```

Related Commands

Command	Description
cable downstream ofdm-chan-profile	Define the OFDM channel profile on the OFDM channel.
cyclic-prefix	Specify the channel cyclic-prefix.
description (OFDM channel profile)	Specify a user defined description for the profile.
pilot-scaling	Specify the value used to calculate the number of continuous pilots.
profile-control	Specify default modulation or profile as the channel control profile.
profile-data	Specify default modulation or profile as the channel data profile.
profile-ncp	Specify default modulation or profile as the channel ncp profile.
roll-off	Specify the channel roll-off value.
subcarrier-spacing	Specify the spacing for specific subcarriers configured in this profile.

interval

To set the duration of time the CMTS waits before checking the load on an interface, use the **interval** command in the load balancing group configuration mode. To reset the duration of time, use the **no** form of this command.

interval *seconds*
no interval

Syntax Description

<i>seconds</i>	The polling interval for the CMTS to determine the current load on each cable interface. The valid range is from 1 to 1000. The default value is 10 seconds in Cisco IOS Release 12.2(33)SCE and earlier. The default value is 30 seconds in Cisco IOS Release 12.2(33)SCE1 and later.
----------------	--

Command Default

None

Command Modes

Load balancing group configuration (config-lb-group)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
12.2(33)SCE1	This command was modified. The default value for this command was changed from 10 seconds to 30 seconds.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to set the duration of time that the CMTS waits before checking the load on the interface, using the **interval** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# interval
50
Router(config-lb-group)#
```

Related Commands

Command	Description
cable load-balance docsis-group	Configures a DOCSIS load balancing group on the CMTS.
show cable load-balance docsis-group	Displays real time configuration, statistical, and operational information for load balancing operations on the router.

ip (virtual-arpd)

To configure the virtual advanced return path demodulator (ARPD) source IP address, use the **ip** command in OOB virtual ARPD configuration mode. To void the virtual ARPD source IP configuration, use the **no** form of this command.

ip *ip subnet_mask* [*vrf*]

no ip *ip*

Syntax Description		
	<i>ip</i>	Specifies the virtual ARPD source IP address.
	<i>subnet_mask</i>	Specifies the virtual ARPD source subnet mask.

Command Default None

Command Modes OOB Virtual ARPD configuration (config-oob-varpd)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use this command to configure the virtual ARPD source IP address.

Examples The following example shows how to configure the virtual ARPD source IP address:

```
Router# configure terminal
Router(config)# cable oob
Router(config-oob)# virtual-arpd 1
Router(config-oob-varpd)# ip 225.225.225.225 255.255.255.0
```

Related Commands	Command	Description
	virtual-arpd	Defines a virtual ARPD configuration.
	nc	Configures the network controller for virtual ARPD.
	source-id	Configures the source ID for virtual ARPD.

ip (virtual-om)

To configure the virtual OOB modulator (OM) source IP address, use the **ip** command in OOB virtual OM configuration mode. To void the virtual OM source IP configuration, use the **no** form of this command.

ip *ip subnet_mask* [**vrf**]

no ip *ip*

Syntax Description		
	<i>ip</i>	Specifies the virtual OM source IP address.
	<i>subnet_mask</i>	Specifies the virtual OM source subnet mask.

Command Default None

Command Modes OOB Virtual OM configuration (config-oob-vom)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use this command to configure the virtual OM source IP address.

Examples The following example shows how to configure the virtual OM source IP address:

```
Router# configure terminal
Router(config)# cable oob
Router(config-oob)# virtual-om 1
Router(config-oob-vom)# ip 225.225.225.225 255.255.255.0
```

Related Commands	Command	Description
	virtual-om	Defines a virtual OM configuration.
	join-group	Joins multicast group address.

ip address

To specify the IP address range for multicast pool, use the **ip address** command in multicast pool configuration mode. To void the IP address configuration, use the **no** form of this command.

ip address *ip mask*

no ip address

Syntax Description	<i>ip mask</i> Specifies the IP address and subnet mask for the DEPI multicast pool.
---------------------------	--

Command Default	None
------------------------	------

Command Modes	Multicast pool configuration (config-multicast-pool)
----------------------	--

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use this command to specify the IP address range for multicast pool.

The following example shows how to specify the IP address range for multicast pool:

```
Router# configure terminal
Router(config)# cable depi multicast pool 1
Router(config-multicast-pool)# ip address 225.225.225.0 255.255.255.0
```

Related Commands	Command	Description
	cable depi multicast pool	Configures the DEPI multicast pool.

ip address docsis

To specify that the cable access router should use the DHCP protocol, as required by the DOCSIS specification, to assign an IP address for its cable interface, use the **ip address docsis** command in cable interface configuration mode. To disable the use of DHCP, use the **no** form of this command.

Cisco uBR905, uBR924, uBR925 cable access routers, Cisco CVA122 Cable Voice Adapter
ip address docsis
no ip address docsis

Syntax Description There are no key words or arguments for this command.

Command Default The cable access router uses the DHCP protocol, as required by the DOCSIS specification, to assign an IP address to its cable interface during system power-on.

Command Modes Interface configuration (cable interface only)

Command History

Release	Modification
12.1(3)XL	This command was introduced for the Cisco uBR905 cable access router.
12.1(4)T	Support was added for the Cisco uBR924 cable access router.
12.1(3)XL	Support was added for the Cisco uBR905 cable access router.
12.1(5)XU1	Support was added for the Cisco CVA122 Cable Voice Adapter.
12.2(2)XA	Support was added for the Cisco uBR925 cable access router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **ip address docsis** command configures the cable access router so that it obtains its IP address from a DHCP server at system power-on, which is a requirement for DOCSIS operation. This is the default mode of operation. If the configuration for the cable interface does not include any form of **ip address** command, the cable access router defaults to configuring the cable interface with the **ip address docsis** command.

Configuring the cable interface with any other form of the **ip address** command or with the **no ip address docsis** command prevents the cable access router from operating in DOCSIS networks. This mode of operation should be used only in lab or test networks.

Note Earlier Cisco IOS software releases for the cable access routers used either the **ip address negotiated** or the **ip address dhcp** command to specify that the cable interface should obtain its IP address from a DHCP server. These commands should no longer be used to configure the router's cable interface.

Examples

The following example shows how to configure the cable access router so that it obtains the IP address for its cable interface from a DHCP server:

```
Router(config)# interface cable-modem 0
Router(config-if)# ip address docsis
Router(config-if)# exit
Router(config)#
```

Related Commands

Command	Description
cable-modem dhcp-proxy	Specifies that a DHCP server should provide the IP address for the router's Ethernet interface or for a NAT address pool.
ip http dhcp	Specifies the use of the DHCP protocol to obtain an IP address for any interface except the cable interface at system power-on.
ip http negotiated	Specifies that a serial interface should use the PPP/PCP to obtain an IP address at system power-on

ip-address (controller)

To set the IP address of the Wideband SPA FPGA, use the **ip-address (controller)** command in controller configuration mode. To remove the IP address of the Wideband SPA FPGA, use the **no** form of this command.

ip-address *ip-address*
no ip-address *ip-address*

Syntax Description

<i>ip-address</i>	IP address for the Wideband SPA FPGA.
-------------------	---------------------------------------

Command Default

No IP address is set for the Wideband SPA FPGA.

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to set the IP address for the Wideband SPA FPGA. This address is used as the source IP address for packets that the Wideband SPA transmits to the EQAM device.

Examples

The following example shows how to set the IP address of the Wideband SPA FPGA. The SPA is located in slot 1, subslot 0, bay 0.

```
Router(config)# controller modular-cable 1/0/0
Router(config-controller)# ip-address 192.168.200.6
```

Related Commands

Command	Description
annex modulation	Sets the annex and modulation for the Wideband SPA.
cable rf-channel	Associates an RF channel on a Wideband SPA with a wideband channel.
controller modular-cable	Enters controller configuration mode to configure the Wideband SPA controller.
modular-host subslot	Specifies the modular-host line card.
rf-channel frequency	Sets the frequency for each RF channel.
rf-channel ip-address mac-address udp-port	Sets the IP address, MAC address and UDP port for each RF channel.

Command	Description
rf-channel network delay	Specifies the CIN delay for each RF channel.
rf-channel description	Specifies the description for each RF channel.
rf-channel cable downstream channel-id	Assigns a downstream channel ID to an RF channel.

ip dhcp ping packet 0

To instruct the DHCP server to assign an IP address from its pool without first sending an ICMP ping to test whether a client is already currently using that IP address, use the **ip dhcp ping packet 0** command in global configuration mode. Use the no form of this command to remove this configuration.

ip dhcp ping packet 0

no ip dhcp ping packet 0

Syntax Description

This command has no additional keywords or arguments.

Command Default

By default, the DHCP server pings a pool address twice before assigning a particular address to a requesting client. If the ping is unanswered, the DHCP server assumes that the address is not in use and assigns the address to the requesting client.

Command Modes

Global configuration

Command History

Release	Modification
12.1 EC	Command support introduced on the Cisco CMTS.

Usage Guidelines

Disabling the ping option can speed up address assignment when a large number of modems are trying to connect at the same time. However, disabling the ping option can also result in duplicate IP addresses being assigned if users assign unauthorized static IP addresses to their CPE devices.

For additional information about DHCP configuration on the Cisco CMTS, refer to the following documents on Cisco.com:

- *Filtering Cable DHCP Lease Queries on the Cisco CMTS*
- *DHCP and Time-of-Day Services on the Cisco CMTS*

Examples

The following example of the show version command illustrates configuration of this feature on the Cisco CMTS:

```
version 12.1
no service pad
! provides nice timestamps on all log messages
service timestamps debug datetime msec localtime
service timestamps log uptime
! turn service password-encryption on to encrypt passwords
no service password-encryption
! provides additional space for longer configuration file
service compress-config
! supports a large number of modems / hosts attaching quickly
service udp-small-servers max-servers no-limit
!
hostname Router
!
boot system disk0:
!
```

```

no cable qos permission create
no cable qos permission update
cable qos permission modems
! permits cable modems to obtain Time of Day (TOD) from uBR7100
cable time-server
!
! High performance DOCSIS config file, additional options may be added
! 10 Mbit/sec download, 128 Kbit/sec upload speed, 10 Kbit/sec guaranteed upstream
! NOTE: cable upstream 0 admission-control 150 will prevent modems from
! connecting after 150% of guaranteed-bandwidth has been allocated to
! registered modems. This can be used for peek load balancing.
! max-burst 1600 prevents a modem with concatenation turned on from consuming
! too much wire time, and interfering with VoIP traffic.
! cpe max 8 limits the modem to 8 hosts connected before the CMTS refuses
! additional host MAC addresses.
! Timestamp option makes the config file only valid for a short period of time.
!
cable config-file platinum.cm
  service-class 1 max-upstream 128
  service-class 1 guaranteed-upstream 10
  service-class 1 max-downstream 10000
  service-class 1 max-burst 1600
  cpe max 8
  timestamp
!
! Medium performance DOCSIS config file, additional options may be added
! 5 Mbit/sec download, 128 Kbit/sec upload speed
!
cable config-file gold.cm
  service-class 1 max-upstream 64
  service-class 1 max-downstream 5000
  service-class 1 max-burst 1600
  cpe max 3
  timestamp
!
! Low performance DOCSIS config file, additional options may be added
! 1 Mbit/sec download, 64 Kbit/sec upload speed
!
cable config-file silver.cm
  service-class 1 max-upstream 64
  service-class 1 max-downstream 1000
  service-class 1 max-burst 1600
  cpe max 1
  timestamp
!
! No Access DOCSIS config file, used to correctly shut down an unused cable modem
! 1 kbit/sec download, 1 Kbit/sec upload speed, with USB/ethernet port shut down.
!

! Prevents issuance of IP address that is already in use.
ip dhcp ping packets 0
```

Related Commands

Command	Description
cable dhcp-giaddr policy	Sets the DHCP <i>giaddr</i> field of DHCP request packets to the primary address for cable modems and the secondary address for CPE devices, allowing the use of separate address pools for the different clients.
cable dhcp-parse option	Enables the parsing of certain DHCP options.
cable helper-address	Enables load-balancing of DHCP requests from cable modems and CPE devices by specifying different DHCP servers according to the cable interface or subinterface.
ip dhcp ping packet 0	Instructs the DHCP server to assign an IP address from its pool without first sending an ICMP ping to test whether a client is already currently using that IP address.
ip dhcp relay information option	Configures the DHCP server to validate the relay agent information option in forwarded BOOTREPLY messages.
ip dhcp smart-relay	Enables the DHCP relay agent on the CMTS to automatically switch a cable modem or CPE device to a secondary DHCP server or address pool if the primary DHCP server does not respond to three successive requests.

ip dhcp pool

To create a DHCP address pool and enter DHCP pool configuration file mode, use the **ip dhcp pool** command in global configuration mode. To remove a configured DHCP pool, use the **no** form of this command.

Syntax Description

Provide a name for the DHCP address pool

<i>name</i>	The <i>name</i> can be either an arbitrary string, such as <i>service</i> , or a number, such as 1 .
-------------	---

Command Default

DHCP pool names are not configured by default.

Command Modes

Global configuration

Command History

Release	Modification
12.1 EC	Command support introduced on the Cisco CMTS.

Usage Guidelines

Disabling the ping option can speed up address assignment when a large number of modems are trying to connect at the same time. However, disabling the ping option can also result in duplicate IP addresses being assigned if users assign unauthorized static IP addresses to their CPE devices.

For additional information about DHCP configuration on the Cisco CMTS, refer to the following documents on Cisco.com:

- https://www.cisco.com/c/en/us/td/docs/cable/cmts/config_guide/b_cbr_docsis_full_book_xe16_12/b_cbr_docsis_full_book_xe16_12_chapter_0111001.pdf Filtering Cable DHCP Lease Queries on the Cisco CMTS.
- http://www.cisco.com/en/US/docs/ios/cable/configuration/guide/cmts_services.html *DHCP and Time-of-Day Services on the Cisco CMTS*

Examples

The following example configures a DHCP pool with the name indicated, and enables additional configuration in the DHCP pool configuration mode:

```
Router# configure terminal
Router(config)# ip dhcp pool local
Router(dhcp-config)#
```

The following examples illustrate additional configurations that are typical for a DHCP pool configured when starting with the **ip dhcp pool** command, or with additional DHCP configuration commands.

```
ip dhcp pool cm-platinum
network 10.128.4.0 255.255.255.0
bootfile platinum.cm
next-server 10.128.4.1

Related Commands

Command	Description
cable dhcp-giaddr policy	Sets the DHCP <i>giaddr</i> field of DHCP request packets to the primary address for cable modems and the secondary address for CPE devices, allowing the use of separate address pools for the different clients.
cable dhcp-parse option	Enables the parsing of certain DHCP options.
cable helper-address	Enables load-balancing of DHCP requests from cable modems and CPE devices by specifying different DHCP servers according to the cable interface or subinterface.
ip dhcp ping packet 0	Instructs the DHCP server to assign an IP address from its pool without first sending an ICMP ping to test whether a client is already currently using that IP address.

Command	Description
ip dhcp relay information option	Configures the DHCP server to validate the relay agent information option in forwarded BOOTREPLY messages.
ip dhcp smart-relay	Enables the DHCP relay agent on the CMTS to automatically switch a cable modem or CPE device to a secondary DHCP server or address pool if the primary DHCP server does not respond to three successive requests.

ipdr associate

To associate the Collector with a session, use the **ipdr associate** command in global configuration mode. To remove the association, use the **no** form of this command.

ipdr associate *session_id collector_name priority*
no ipdr associate *session_id collector_name*

Syntax Description

<i>session_id</i>	The unique IPDR session ID.
<i>collector_name</i>	The collector name. The name should not contain extra spaces.
<i>priority</i>	The priority value between the session and the collector. The value range is 1 to 10. A value of 1 indicates that the highest priority.

Command Default

An association with the session will not be created.

Command Modes

Global configuration mode

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command allows the user to associate the Collector with a session. Once the Collector is configured, the Exporter sends data to the Collector. IPDR supports redundant collector and consistent streaming continues when a collector is down or not functioning.

The no form of the command will only remove the association for the stopped session.

Note The collector and the session should be configured before running this command.

Examples

The following example configures a Collector.

```
Router# configure terminal
Router(config)#ipdr associate 1 federal 1
```

Related Commands

Command	Description
ipdr collector	Configures the IPDR Collector details.
show ipdr collector	Displays the collector information, message statistics and event for all the sessions that are associated with the collector.

Command	Description
ipdr session	Adds a session to the IPDR Exporter.

ipdr authorization

To enable the Internet Protocol Detail Record (IPDR) authorization, use **ipdr authorization** command in global configuration mode. To remove the configuration, use the **no** form of this command.

ipdr authorization
no ipdr authorization

Syntax Description This command has no arguments or keywords.

Command Default This IPDR authorization will be disabled by default.

Command Modes Global configuration (config)

Release	Modification
12.2(33)SCI2	This command was introduced.

Usage Guidelines The IPDR authorization is disabled by default. Use the **ipdr authorization** command to enable IPDR authorization. You can include it in the start-up configuration file as well. Whether IPDR authorization is enabled or not, any Collector coming from the bundle side will always be rejected.

Examples The following example shows how to enable IPDR authorization:

```
Router#configure terminal
Router(config)#ipdr authorization
IPDR authorization is enabled.
Router(config)#
```

Command	Description
ipdr collector	Configures the Internet Protocol Detail Record (IPDR) Collector details.

ipdr collector

To configure the Internet Protocol Detail Record (IPDR) Collector details, use the **ipdr collector** command in global configuration mode. To remove the Collector, use the **no** form of this command.

```
ipdr collector collector_name ip_addr [port]
no ipdr collector collector_name
```

Cisco IOS Release 12.2(33)SCI2

```
ipdr collector collector_name ip_addr [port] [nat-address ip_addr [port] ]
no ipdr collector collector_name
```

Syntax Description

<i>collector_name</i>	The collector name. The name should not contain extra spaces.
<i>ip_addr</i>	The collector IP address.
<i>port</i>	(Optional) The collector port value. The default port number will be considered if the value is not entered.
nat-address <i>ip_addr</i>	(Optional) The collector's Network Address Translation (NAT) in IP header.

Command Default

A Collector will not be configured.

Command Modes

Global configuration mode

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
12.2(33)SCI2	This command was integrated into Cisco IOS Release 12.2(33)SCI2. The nat-address keyword was added.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command allows the user to configure an IPDR Collector and authenticate the IPDR protocol. Once the Collector is configured, the Exporter sends data to the Collector. User must provide the collector name and the IP address. Port number is used when an exporter creates an active connection.

The no form of the command will remove a specific IPDR Collector. If the collector is associated with an active session, you should stop the session before using the no command.

Examples

The following example configures a Collector.

```
Router# configure terminal
Router(config)#ipdr collector federal 192.0.2.0
```

Related Commands

Command	Description
show ipdr collector	Displays the collector information, message statistics and event for all the sessions that are associated with the collector.
ipdr session	Adds a session to the IPDR Exporter.

ipdr exporter ack-timeout

To set IPDR Exporter acknowledged records timeout value, use the **ipdr exporter ack-timeout** command in global configuration mode. To disable the acknowledged records timeout value, use the **no** form of this command.

ipdr exporter ack-timeout *time_interval*
no ipdr exporter ack-timeout

Syntax Description	<i>time_interval</i>	Acknowledged records timeout count. The valid range is from 5 to 60 seconds. The default value is 60.
---------------------------	----------------------	---

Command Default This command is enabled when the IPDR Exporter is running.

Command Modes Global configuration (config)

Command History	Release	Modification
	12.3(33)SCG	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command allows you to set acknowledged records timeout value for a session.

Note Restart the IPDR Exporter for the timer values to take effect.

Examples

The following example shows how to configure the acknowledged records timeout value on the Cisco CMTS router:

```
Router# configure terminal
Router(config)# ipdr exporter ack-timeout 60
Router(config)# ipdr exporter start
```

Related Commands	Command	Description
	show ipdr exporter	Displays information about the IPDR Exporter state on the Cisco CMTS router.

ipdr exporter connection active

To enable the IPDR exporter to start connection, use the **ipdr exporter connection-active** command in global configuration mode. To enable collectors to start connection, use the **no** form of this command. It does not support to change connection type when the exporter is started. Stop exporter then change to another type.

ipdr exporter connection-active [*source-interface interface*]
no ipdr exporter connection-active

Syntax Description **source-interface** Specifies the interface on which the connection is established.

Command Default By default, the IPDR exporter process will not be started.

Command Modes Global configuration mode

Command History	Release	Modification
	IOS XE Gibraltar 16.12.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command allows the IPDR exporter to start connection.

The **no** form of the command will change the IPDR Exporter connection mode to default.

Examples

The following example allows the IPDR Exporter to start connection on the TenGigabitEthernet port 4/1/0 of the CMTS.

```
Router# configure terminal
Router(config)#ipdr exporter connection-active source-interface TenGigabitEthernet4/1/0
```

Related Commands	Command	Description
	show ipdr exporter	Displays information about the IPDR Exporter state.
	show ipdr collector	Displays the collector information, message statistics and event for all the sessions that are associated with the collector.
	ipdr collector	Configures the Internet Protocol Detail Record (IPDR) Collector details.

ipdr exporter keepalive

To set the keepalive timer value on the IPDR exporter, use the **ipdr exporter keepalive** command in global configuration mode. To disable the keepalive timer value, use the **no** form of this command.

```
ipdr exporter keepalive time_interval
no ipdr exporter keepalive
```

Syntax Description	<i>time_interval</i> Keepalive timer count. The valid range is from 5 to 300 seconds. The default value is 300.
---------------------------	---

Command Default This command is enabled when the IPDR Exporter is running.

Command Modes Global configuration (config)

Command History	Release	Modification
	12.3(33)SCG	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command allows you to set the keepalive timeout value for a session.

Note Restart the IPDR Exporter for the keepalive timer values to take effect.

Examples

The following example shows how to configure the keepalive value on the Cisco CMTS router:

```
Router# configure terminal
Router(config)
)# ipdr exporter keepalive 300
Router(config)# ipdr exporter start
```

Related Commands	Command	Description
	show ipdr exporter	Displays information about the IPDR Exporter state on the Cisco CMTS.

ipdr exporter max-unacked

To set the maximum number of unacknowledged records on the IPDR exporter, on the Cisco CMTS, use the **ipdr exporter max unacked** command in global configuration mode. To reset the maximum number of unacknowledged records, use the **no** form of this command.

ipdr exporter max-unacked *records*
no ipdr exporter max-unacked

Syntax Description

<i>records</i>	Number of unacknowledged records. The valid range is from 5 to 200 records. The default value is 200.
----------------	---

Command Default

This command is enabled when IPDR Exporter is running.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.3(33)SCG	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command allows you to set the maximum number of unacknowledged records for a session.

Note Restart the IPDR Exporter for the number of records to take effect.

Examples

The following example shows how to configure the number of unacknowledged records configured on the Cisco CMTS router:

```
Router# configure terminal
Router(config)
)# ipdr exporter max-unacked 200
Router(config)# ipdr exporter start
```

Related Commands

Command	Description
show ipdr exporter	Displays information about the IPDR Exporter state on the Cisco CMTS router.

ipdr exporter start

To enable the CMTS application, to start the Internet Protocol Detail Record (IPDR) Exporter process to connect the exporter and the collector, use the **ipdr exporter start** command in global configuration mode. To terminate the connection between the exporter and collector, use the **no** form of this command.

ipdr exporter start [ipv6]
no ipdr exporter start

Syntax Description **ipv6** Configure IPDR in IPv6 mode.

Command Default By default, the IPDR exporter process will not be started.

Command Modes Global configuration mode

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
	IOS XE Gibraltar 16.12.1	This command was updated to include ipv6 keyword.

Usage Guidelines This command allows the user to explicitly start the IPDR Exporter and connect to the collector. As a default behavior, the command will initiate all the sessions configured in the Exporter to a "Start" state.

The **no** form of the command will stop the IPDR Exporter process. The command will also clear the connection with the collector while retaining other configurations.

Examples

The following example starts the IPDR Exporter process on the CMTS.

```
Router# configure terminal
Router(config)#ipdr exporter start
```

Related Commands	Command	Description
	show ipdr exporter	Displays information about the IPDR Exporter state.
	show ipdr collector	Displays the collector information, message statistics and event for all the sessions that are associated with the collector.
	ipdr collector	Configures the Internet Protocol Detail Record (IPDR) Collector details.

ipdr session

To start or stop a specific session, use the **ipdr session** command in the privileged EXEC mode.

ipdr session *session_id* {**start** | **stop**}

Syntax Description

<i>session_id</i>	The unique IPDR session ID.
start	The keyword to start the session.
stop	The keyword to stop the session.

Command Default

No sessions are started.

Command Modes

Privileged EXEC mode

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command allows the user to start or stop a specific session. This command can be executed only when the IPDR exporter is started.

Note The user has to stop the session before configuring any tasks if the session is active.

Examples

The following example enables the user to start a session.

```
Router# configure terminal
Router(config)#ipdr session 1 start
```

Related Commands

Command	Description
ipdr exporter start	Starts the IPDR Exporter and connects to the collector.
show ipdr exporter	Displays information about the IPDR Exporter state.
ipdr associate	Associates the Collector with a session.

ipdr session (global configuration)

To enable the CMTS application to add a session to the Internet Protocol Detail Record (IPDR) exporter, use the **ipdr session** command in global configuration mode. To remove the session, use the **no** form of this command.

```
ipdr session session_id session_name session_descr
no ipdr session session_id
```

Syntax Description

<i>session_id</i>	The unique IPDR session ID.
<i>session_name</i>	The session name. The name should not contain extra spaces.
<i>session_descr</i>	The description of the session.

Command Default

No sessions are added to the IPDR exporter. It depends on the status of the IPDR exporter. After configuring one session, if the status of exporter is started, then the session is started automatically.

Command Modes

Global configuration mode

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command allows the user to add a session to the IPDR exporter. User should provide session ID, session name and session description for every session.

The **no** form of the command will remove a specific session. Once a session is removed, the template and other information associated with the session is also lost.

Note You can not update template details or other details when a session already created.

Examples

The following example adds a session to the Exporter.

```
Router# configure terminal
Router(config)#ipdr session 1 test no_descr
```

Related Commands

Command	Description
ipdr exporter start	Starts the IPDR exporter and connects to the collector.
show ipdr exporter	Displays information about the IPDR exporter state.

Command	Description
ipdr associate	Associates the IPDR collector with a session.

ipdr template

To add an Internet Protocol Detail Record (IPDR) template to the IPDR session on the Cisco CMTS, use the **ipdr template** command in global configuration mode. To remove the template, use the **no** form of this command.

ipdr template *session_id* *template_name*
no ipdr template *session_id* *template_name*

Syntax Description

<i>session_id</i>	Unique IPDR Session ID.
<i>template_name</i>	Template name.

Command Default

The IPDR template is not added to the IPDR session.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
12.2(33)SCG	A new template SERVICE-FLOW is added to the event-based and ad-hoc session types.
12.2(33)SCH5	A new template is defined for CM-STATUS and the old template is renamed as CM-STATUS-2008.
12.2(33)SCI1	This command is integrated from Cisco IOS Release 12.2(33)SCH5.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command allows the user to add an IPDR template to the desired session (based on session ID) on the Cisco CMTS.

Note You can only add the system-supported templates. The list can be viewed by entering “?” at the command prompt.

Examples

The following example displays the **show running-config** command output of the configured IPDR sessions and types:

```
Router(config)# do show running-config | i ipdr
ipdr session 1 test test
ipdr session 2 event2 event2
ipdr session 3 ad-hoc3 ad-hoc3
ipdr type 1 time-interval 15
ipdr type 2 event
```

```
ipdr type 3 event
```

The following example shows the templates available in a timer-interval session.

```
Router# ipdr template 1 ?
CM-STATUS      DOCSIS-CMTS-CM-REG-STATUS-TYPE template
CM-US          DOCSIS-CMTS-CM-US-STATS-TYPE template
DIAGLOG-DETAIL DOCSIS-DIAG-LOG-DETAIL-TYPE template
SAMIS-TYPE1    DOCSIS-SAMIS-TYPE-1 template
SAMIS-TYPE2    DOCSIS-SAMIS-TYPE-2 template
SPECTRUM       DOCSIS-SPECTRUM-MEASUREMENT-TYPE template
TEST           Template for test
```

The following example shows how to add the SAMIS_TYPE1 template in a timer-interval session.

```
Router(config)# ipdr template 1 SAMIS-TYPE1
```

The following example shows how to view the templates available in an event-based session.

```
Router(config)# ipdr template 2 ?
CM-STATUS      DOCSIS-CMTS-CM-REG-STATUS-TYPE template
CPE-TYPE       DOCSIS-CPE-TYPE template
DIAGLOG-DETAIL DOCSIS-DIAG-LOG-DETAIL-TYPE template
DIAGLOG-EVENT  DOCSIS-DIAG-LOG-EVENT-TYPE template
DS-UTIL        DOCSIS-CMTS-DS-UTIL-STATS-TYPE template
SAMIS          OSSI2.0 SAMIS template
SERVICE-FLOW  SERVICE-FLOW-TYPE template
TEST           Template for test
TOPOLOGY       DOCSIS-CMTS-TOPOLOGY-TYPE template
US-UTIL        DOCSIS-CMTS-US-UTIL-STATS-TYPE template
```

The following example shows how to view the templates available in an ad-hoc session.

```
Router(config)# ipdr template 3 ?
CM-STATUS      DOCSIS-CMTS-CM-REG-STATUS-TYPE template
CPE-TYPE       DOCSIS-CPE-TYPE template
DIAGLOG-DETAIL DOCSIS-DIAG-LOG-DETAIL-TYPE template
DIAGLOG-EVENT  DOCSIS-DIAG-LOG-EVENT-TYPE template
DS-UTIL        DOCSIS-CMTS-DS-UTIL-STATS-TYPE template
SAMIS          OSSI2.0 SAMIS template
SERVICE-FLOW  SERVICE-FLOW-TYPE template
TEST           Template for test
TOPOLOGY       DOCSIS-CMTS-TOPOLOGY-TYPE template
US-UTIL        DOCSIS-CMTS-US-UTIL-STATS-TYPE template
```

The following example shows the templates available in a timer-interval session for Cisco IOS Release 12.2(33)SCH5:

```
Router(config)# ipdr template 1 ?

CM-STATUS      DOCSIS-CMTS-CM-REG-STATUS-TYPE template
CM-STATUS-2008 DOCSIS-CMTS-CM-REG-STATUS-TYPE-2008 template
CPE-TYPE       DOCSIS-CPE-TYPE template
DIAGLOG-DETAIL DOCSIS-DIAG-LOG-DETAIL-TYPE template
DIAGLOG-EVENT  DOCSIS-DIAG-LOG-EVENT-TYPE template
DS-UTIL        DOCSIS-CMTS-DS-UTIL-STATS-TYPE template
SAMIS          OSSI2.0 SAMIS template
```

```
SERVICE-FLOW    SERVICE-FLOW-TYPE template
TEST            Template for test
TOPOLOGY        DOCSIS-CMTS-TOPOLOGY-TYPE template
US-UTIL         DOCSIS-CMTS-US-UTIL-STATS-TYPE template
```

Related Commands

Command	Description
ipdr exporter start	Starts the IPDR Exporter on the Cisco CMTS and connects to the collector.
show ipdr exporter	Displays information about the IPDR Exporter state on the Cisco CMTS.
ipdr session	Adds a session to the IPDR Exporter on the Cisco CMTS.

ipdr type

To configure the IPDR session type, use the **ipdr type** command in global configuration mode. The IPDR session types that can be defined using this command are event type, time-interval type, and the ad hoc type.

Use the **no** form of the command to reset the session type to the default "event" type.

```
ipdr type session_id [{ad-hoc | event | time-interval value}]
no ipdr type session_id
```

Syntax Description

<i>session id</i>	IPDR session ID. Range is from 1 to 255.
ad-hoc	The ad hoc session type.
event	The event session type.
time-interval <i>value</i>	The time-interval session type. Interval range is from 15 to 1440 minutes.

Command Default

The IPDR session type is not defined.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(33)SCD2	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command allows the user to define the specific IPDR session type.

Note Once the IPDR session type is configured, the templates supported by this IPDR type are automatically associated with it.

Examples

The following example shows how to configure the IPDR "time-interval" session type for a time interval of 15 minutes.

```
Router> enable
Router# configure terminal
Router(config)# ipdr type 1 time-interval 15
```

Related Commands

Command	Description
cable ipdr cm-us-status interval	Displays a cable modem's upstream channel status information.

Command	Description
cable ipdr docs-spectrum interval	Sets the interval between different spectrum measurements' data for a CMTS.
cable ipdr diaglog interval	Sets the time interval between different diagnostic logs' data for a CMTS.
cable ipdr cm-status interval	Displays the CMTS and cable modem registration status information.

Related Commands

To configure IPv6 segment routing (SRv6), use the **ipv6 address** command in the global configuration mode.

ipv6 address {*ipv6_address_prefixprefix_length*} **segment-routing**
no ipv6 address {*ipv6_address_prefixprefix_length*} **segment-routing**

<i>ipv6_address_prefix</i>	IPv6 prefix associated with a particular SAV group, specified in the X:X:X:X::X format.
<i>prefix_length</i>	Length of the IPv6 prefix. The valid range is from 0 to 128

Command Default

None.

Command Modes

Global configuration mode (config)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command is used to configure IPv6 Segment Routing. You can also configure multiple IPv6 addresses for SRv6 under the same interface. An IPv6 address with a prefix SID can also be associated with SRv6. to define a local prefix as an SID, use the following commands:

```
ipv6-sr prefix-sid
```

Use the **no ipv6-sr prefix-sid** command to disable the local prefix SID.

The following example shows how to configure IPv6 segment routing.

```
Router#config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#inter Ether0/0
Router(config-if)#ipv6 address 2001::0DB8/32 segment-routing
Router(config-if-sr-ipv6)#ipv6-sr prefix-sid
Router(config-if-sr-ipv6)#exit
Router(config-if)#exit
Router(config)#exit
```

The following example shows how to configure multiple IPv6 addresses for SRv6 under the same interface.

```
Router#config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#inter Ether 0/0
Router(config-if)# ipv6 address 110::110/64 segment-routing
Router(config-if)# ipv6 address 111::111/64 segment-routing
Router(config-if-sr-ipv6)#ipv6-sr prefix-sid
Router(config-if-sr-ipv6)#end
```

Related Commands

Command	Description
ipv6-sr prefix-sid	Defines a local prefix as an SID.

issu linecard abortversion

To roll back the current image version on a single line card or multiple line cards to the previous version, use the **issu linecard abortversion** command in the privileged EXEC mode.

Note This command is used to roll back the versions on redundant line cards only.

```
issu linecard abortversion {alllc slot/subslot} [forced]
```

Syntax Description

all	All redundant line cards.
<i>lc_slot</i>	The line card slot number.
<i>subslot</i>	The line card sub slot number.
forced	(Optional) The ISSU would ignore potential service outage and line card incompatibility errors and proceed with abortversion instead of stopping and error handling.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command allows the user to roll back to prior image on working or primary line card on a single or multiple line cards to the previous versions.

Note The **issu linecard reloadversion** command is used to reload a line card with the original version of images.

The following example rolls back the specific redundant line card's image version.

```
Router# configure terminal
Router(config)#issu linecard abortversion
```

Related Commands

Command	Description
issu linecard acceptversion	Accepts the new image version on the working line card.
issu linecard loadversion	Loads a specific image version on the primary line card.

Command	Description
issu linecard prepareversion	Determines if the image version on the line card has to be upgraded or downgraded to the route processor's image version.
issu linecard reloadversion	Reloads the new loaded image on a working or a primary line card.
issu linecard runversion	Runs the new loaded image on a working or a primary line card.
issu linecard changeversion	Starts the upgrade or downgrade activity of the image version for a single line card or multiple line cards.

issu linecard acceptversion

To accept the new image version on the working line card, use the **issu linecard acceptversion** command in the privileged EXEC mode.

issu linecard acceptversion *lc slot* [/subslot]

Syntax Description	
<i>lc_slot</i>	The line card slot number.
<i>subslot</i>	The line card sub slot number.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command allows the user to accept the new image version on the working line card. The command also indicates the completion of changing the image version for the specific line card and allows the ISSU of the next line card in the queue.

Examples The following example indicates a command accepting the image version on the slot 7 of the line card.

```
Router# configure terminal
Router(config)#issu linecard acceptversion 7/0
```

Related Commands	Command	Description
	issu linecard abortversion	Rolls back to the prior image on working/primary line card.
	issu linecard loadversion	Loads a specific image version on the primary line card.
	issu linecard prepareversion	Determines if the image version on the line card has to be upgraded or downgraded to the route processor's image version.
	issu linecard reloadversion	Reloads the new loaded image on a working or a primary line card.
	issu linecard runversion	Runs the new loaded image on a working or a primary line card.
	issu linecard changeversion	Starts the upgrade or downgrade activity of the image version for a single line card or multiple line cards.

issu linecard changeversion

To start the upgrade or downgrade activity of the image version for a single working line card or multiple working line cards, use the **issu linecard changeversion** command in the privileged EXEC mode.

Note Effective with Cisco IOS Release 12.2(33)SCH2, the **issu linecard changeversion** command is used to check and upgrade the line card images automatically during the RP-only ISSU process.

issu linecard changeversion { **all** | **stop***slot_1* [/*subslot_1*]} . . . [*slot_n* [/*subslot_n*]] [**forced**]

Syntax Description

all	All redundant line cards.
<i>slot_1</i>	The slot number for the first line card.
<i>subslot_1</i>	The sub slot number for the first line card.
<i>slot_n</i>	The slot number for the n th line card.
<i>subslot_n</i>	The sub slot number for the n th line card.
forced	(Optional) The ISSU would ignore potential service outage and line card incompatibility errors and proceed with changeversion instead of stopping and error handling.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command allows the user to start the upgrade or downgrade activity of the image version for a single line card or multiple line cards. Here the line cards are of the primary or working type only.

Using the all option, you can change the image version of all the redundant line cards instead of specifying explicitly each of the line card.

Using the stop option, you can stop the version change process for a line card.

Examples

The following example displays the command and uses the all option.

```
Router# configure terminal
Router(config)#issu linecard changeversion all
```

The following example displays the command and uses the slot value of 6.

```
Router# configure terminal
Router(config)#issu linecard changeversion 6/0
```

Related Commands	Command	Description
	issu linecard abortversion	Rolls back to the prior image on working/primary line card.
	issu linecard acceptversion	Accepts the new image version on the working line card.
	issu linecard loadversion	Loads a specific image version on the primary line card.
	issu linecard prepareversion	Determines if the image version on the line card has to be upgraded or downgraded to the route processor's image version.
	issu linecard reloadversion	Reloads the new loaded image on a working or a primary line card.
	issu linecard runversion	Runs the new loaded image on a working or a primary line card.

issu linecard loadversion

To load a specific image version on the primary line card, use the **issu linecard loadversion** command in the privileged EXEC mode.

issu linecard loadversion *slot* [/subslot]

Syntax Description

<i>slot</i>	The line card slot number.
<i>subslot</i>	The line card sub slot number.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command allows the user to load a specific image version on the working line card.

Examples

The following example shows the command that loads the image version on a line card with the slot number 7.

```
Router# configure terminal
Router(config)#issu linecard loadversion 7/0
```

Related Commands

Command	Description
issu linecard abortversion	Rolls back to the prior image on working/primary line card.
issu linecard acceptversion	Accepts the new image version on the working line card.
issu linecard prepareversion	Determines if the image version on the line card has to be upgraded or downgraded to the route processor's image version.
issu linecard reloadversion	Reloads the new loaded image on a working or a primary line card.
issu linecard runversion	Runs the new loaded image on a working or a primary line card.
issu linecard changeversion	Starts the upgrade or downgrade activity of the image version for a single line card or multiple line cards.

issu linecard prepareversion

To determine if the image version on the line card has to be upgraded or downgraded to the route processor's image version, use the **issu linecard prepareversion** command in the privileged EXEC mode.

issu linecard prepareversion *lc_slot* [/subslot] [**forced**]

Syntax Description	
<i>lc_slot</i>	The line card slot number.
<i>subslot</i>	The line card sub slot number.
forced	(Optional) The ISSU would ignore potential service outage and line card incompatibility errors and proceed with prepareversion instead of stopping and error handling.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command allows the user to check if the image version on the line card has to be upgraded or downgraded to the route processor's image version.

This command also checks if the line card has a valid redundancy configuration. If the line card does not have a valid configuration, then the user has to reload the line card using the **issu linecard reloadversion** command.

Examples

The following example shows the command executed for a line card with a slot value of 7.

```
Router# configure terminal
Router(config)#issu linecard prepareversion 7/0
```

Related Commands	Command	Description
	issu linecard abortversion	Rolls back to the prior image on working/primary line card.
	issu linecard acceptversion	Accepts the new image version on the working line card.
	issu linecard loadversion	Loads a specific image version on the primary line card.
	issu linecard reloadversion	Reloads the new loaded image on a working or a primary line card.
	issu linecard runversion	Runs the new loaded image on a working or a primary line card.

Command	Description
issu linecard changeversion	Starts the upgrade or downgrade activity of the image version for a single line card or multiple line cards.

issu linecard process stop

Note Effective with Cisco IOS Release 12.2(33)SCG and later, `issu linecard process stop` is no longer supported on the Cisco CMTS router.

To stop the automatic line card ISSU process, use the `issu linecard process stop` command in privileged EXEC mode.

issu linecard process stop

Syntax Description This command has no arguments or keywords.

Command Default This command is enabled by default.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	12.2(33)SCG	This command is obsolete.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use the `issu linecard process stop` command to interrupt the automatic ISSU process continuing to the next line card.

Associated Features:

The `issu linecard process stop` command is associated with following features:

[Cisco IOS In Service Software Upgrade Process](#)

Example

The following example shows how to stop the ISSU process:

```
Router> enable
Router# issu linecard process stop
```

Related Commands	Command	Description
	<code>issu linecard abortversion</code>	Rolls back to the prior image on working/primary line card.
	<code>issu linecard acceptversion</code>	Accepts the new image version on the working line card.
	<code>issu linecard loadversion</code>	Loads a specific image version on the primary line card.

Command	Description
issu linecard prepareversion	Determines if the image version on the line card has to be upgraded or downgraded to the route processor's image version.
issu linecard reloadversion	Reloads the new loaded image on a working or a primary line card.
issu linecard runversion	Runs the new loaded image on a working or a primary line card.
issu linecard changeversion	Starts the upgrade or downgrade activity of the image version for a single line card or multiple line cards.

issu linecard reloadversion

To reload the new loaded image on a working or a primary line card, use the **issu linecard reloadversion** command in the privileged EXEC mode.

issu linecard prepareversion {**original** | **target**} {**all**[*slot_1* [*subslot_1*]... [*slot_n* [/*subslot_n*]]}

Syntax Description	original	The original image version.
	all	All redundant line cards.
	<i>slot_1</i>	The slot number for the first line card.
	<i>subslot_1</i>	The sub slot number for the first line card.
	<i>slot_n</i>	The slot number for the n th line card.
	<i>subslot_n</i>	The sub slot number for the n th line card.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command allows the user to reload the new loaded image on a working or a primary line card.

This command can be used for the following line card conditions.

- Line cards that are not configured with redundancy, and do not support Minimal Disruptive Restart (MDR.)
- Line cards which are capable of line card redundancy which were rolled back due to an unsuccessful **changeversion** command.

Examples

The following example shows the command executed with the original keyword.

```
Router# configure terminal
Router(config)#issu linecard reloadversion original 8/0
```

The following example shows the command executed with the target keyword.

```
Router# configure terminal
Router(config)#issu linecard reloadversion target 8/0
```

Related Commands

Command	Description
issu linecard abortversion	Rolls back to the prior image on working or primary line card.
issu linecard acceptversion	Accepts the new image version on the working line card.

	issu linecard changeversion	Starts the upgrade or downgrade activity of the image version for a single linecard or multiple line cards.

jitter

To set session jitter, use the **jitter** command in cable video configuration mode. To disable session jitter, use the **no jitter** form of this command.

jitter {sdv | vod | broadcast | gaming | table-based} *value*
no jitter {sdv | vod | broadcast | gaming | table-based} *value*

Command Default

None.

Command Modes

Cable video configuration (config-video)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to set session jitter:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# jitter gaming 5
```

Related Commands

Command	Description
show cable video jitter	Displays the session jitter information.

join-group

To join multicast group address, use the **join-group** command in OOB virtual OM configuration mode. To void the virtual OM configuration, use the **no** form of this command.

join-group *ip* **source-ip** *ip* **out-group** *ip*

no join-group *ip* **source-ip** *ip* **out-group** *ip*

Syntax Description

join-group <i>ip</i>	Specifies the group IP address.
source-ip <i>ip</i>	Specifies the SSM source IP address.
out-group <i>ip</i>	Specifies the local OM group IP address.

Command Default

None

Command Modes

OOB Virtual OM configuration (config-oob-vom)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to join multicast group address.

Examples

The following example shows how to join multicast group address:

```
Router# configure terminal
Router(config)# cable oob
Router(config-oob)# virtual-om 1
Router(config-oob-vom)# join-group 235.1.1.1 source-ip 2.3.4.5 out-group 239.2.2.2
```

Related Commands

Command	Description
virtual-om	Defines a virtual OM configuration.
ip	Configures the virtual OM source IP address.

keepalive

To set the default ONID number, use the **default-onid** command in the video configuration mode.

default-onid *number*

Syntax Description	<i>number</i> The ONID number. By default, the system ONID is 0, which is commonly used in North America. If the default value of the ONID is used, the TSID must be unique. If you change the ONID, the TSID-ONID pair must be unique. The ONID must be in the range of 0 to 65535.				
Command Default	None.				
Command Modes	Video configuration mode (config-video)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS-XE Release 3.18.0S</td> <td>This command was introduced on the Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
Release	Modification				
Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.				
Usage Guidelines	<p>This command is used to change the default system ONID.</p> <p>The following example shows how to change the default ONID number:</p> <pre>configure terminal cable video default-onid 1580</pre>				

lACP fast-switchover

To enable Link Aggregation Control Protocol (LACP) 1:1 link redundancy, use the **lACP fast-switchover** command in interface configuration mode. To disable LACP 1:1 link redundancy, use the **no** form of this command.

lACP fast-switchover
no lACP fast-switchover

Syntax Description This command has no arguments or keywords.

Command Default LACP 1:1 link redundancy is disabled by default.

Command Modes Interface configuration (config-if)

Command History	Release	Modification
	Cisco IOS 12.2(33)SCJ	This command was introduced.

Usage Guidelines Prior to entering the **lACP fast-switchover** command, you must ensure the following:

- The port channel protocol type is LACP.
- The **lACP max-bundle 1** command has been entered on the port channel. The **lACP fast-switchover** command will not affect the **lACP max-bundle** command.

When you enable LACP 1:1 link redundancy, based on the system priority and port priority, the port with the higher system priority chooses the link as the active link and the other link as the standby link. When the active link fails, the standby link is selected as the new active link without taking down the port channel. When the original active link recovers, it reverts to its active link status. During this change-over, the port channel is also up.

Note We recommend that you configure two ports only (one active and one hot-standby) in the bundle for optimum performance.

Examples

This example shows how to enable LACP 1:1 link redundancy:

```
Router(config-if)# lACP fast-switchover
```

Related Commands	Command	Description
	lACP max-bundle	Assigns and configures an EtherChannel interface to an EtherChannel group.
	show etherchannel	Displays the EtherChannel information for a channel.

lACP max-bundle

To define the maximum number of active bundled Link Aggregation Control Protocol (LACP) ports allowed in a port channel, use the **lACP max-bundle** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

lACP max-bundle *max-bundles number*
no lACP max-bundle

Syntax Description

<i>max-bundles</i>	Maximum threshold of active member links allowed in the LACP bundle. The range from is 1 to 8. The maximum threshold value must be greater than or equal to the minimum threshold value.
--------------------	--

Command Default

A maximum number of active bundled ports is not configured.

Command Modes

Interface configuration (config-if)

Command History

Release	Modification
Cisco IOS 12.2(33)SCJ	Support for this command was introduced.

Usage Guidelines

The value specified in the *max-bundles* argument determines the number of active links that are bundled in the port channel. The remaining links are in hot-standby mode.

Examples

This example shows how to set 3 ports to bundle in port channel 2:

```
Router(config)# interface port-channel 2
Router(config-if)# lACP max-bundle 3
Router(config-if)#
```

Related Commands

Command	Description
interface port-channel	Creates a port-channel virtual interface and puts the CLI in interface configuration mode.
ip address	Sets a primary or secondary IP address on an interface.
show etherchannel	Displays the EtherChannel information for a channel.
show interfaces port-channel	Displays traffic that is seen by a specific port channel.

lACP min-bundle

To define the minimum number of active bundled LACP ports allowed in a port channel, use the **lACP min-bundle** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

lACP min-bundle *min-bundle*
no lACP min-bundle

Syntax Description	<i>min-bundle</i>	Minimum threshold of active member links allowed in the LACP bundle. The range is from 1 to 8. The default is 1.
---------------------------	-------------------	--

Command Default The port-channel operational state will be “Down” only when there are no active links in the channel. If there are one or more active links, the port-channel state will be “Up.”

Command Modes Interface configuration (config-if)

Command History	Release	Modification
	Cisco IOS 12.2(33)SCJ	This command was introduced.

Usage Guidelines Use the **lACP min-bundle** command to configure the minimum number of active links allowed in an LACP bundle. When the number of active links falls below this minimum threshold, the port channel shuts down.

Examples This example shows how to set the minimum number of active links to five ports:

```
Device(config-if)# lACP min-bundle 5
```

Related Commands	Command	Description
	interface port-channel	Creates a port-channel virtual interface and enters interface configuration mode.
	ip address	Sets a primary or secondary IP address on an interface.
	show etherchannel	Displays the EtherChannel information for a channel.
	show interfaces port-channel	Displays traffic that is seen by a specific port channel.

lACP port-priority

To set the LACP priority for a physical interface, use the **lACP port-priority** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

lACP port-priority *priority*

no lACP port-priority

Syntax Description	<i>priority</i> Integer that indicates the priority for the physical interface. The range is from 0 to 65535. The default is 32768.
---------------------------	---

Command Default The default port priority is set.

Command Modes Interface configuration (config-if)

Command History	Release	Modification
	Cisco IOS 12.2(33)SCJ	This command was introduced.

Usage Guidelines You may assign a port priority to each port on a device running Link Aggregation Control Protocol (LACP). You can specify the port priority by using the **lACP port-priority** command at the command-line interface (CLI) or use the default port priority (32768) that is carried as part of the LACP protocol data unit (PDU) exchanged with the partner. Port priority is used to decide which ports should be put in standby mode when a hardware limitation or the **lACP max-bundle** command configuration prevents all compatible ports from aggregating. Priority is supported only on port channels with LACP-enabled physical interfaces.

Note A high priority number means a low priority.

Port priority together with port number form a port identifier.

To verify the configured port priority, issue the **show lACP** command.

Examples

This example shows how to set a priority of 23700 for an interface:

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 0/0
Device(config-if)# lACP port-priority 23700
Device(config-if)#
```

Related Commands	Command	Description
	channel-group	Assigns and configures an EtherChannel interface to an EtherChannel group.
	debug lACP	Enables debugging of LACP activities.

Command	Description
lACP max-bundle	Defines the maximum number of active bundled LACP ports allowed in a port channel.
lACP system-priority	Sets the priority of the system.
show lACP	Displays information about LACP activity on the device.

lACP system-priority

To set the priority for a system, use the **lACP system-priority** command in global configuration mode. To return to the default setting, use the **no** form of this command.

lACP system-priority *priority*

no lACP system-priority

Syntax Description	<i>priority</i> Integer that indicates the LACP priority for the system. The range is from 0 to 65535. The default is 32768.
---------------------------	--

Command Default The default system priority is set.

Command Modes Global configuration (config)

Command History	Release	Modification
	Cisco IOS 12.2(33)SCJ	This command was introduced.

Usage Guidelines You can assign a system priority to each device running Link Aggregation Control Protocol (LACP). You can specify the system priority by using the **lACP system-priority** command at the command-line interface (CLI) or use the default system priority (32768) that is carried as part of the LACP protocol data unit (PDU) exchanged with the partner. System priority is used with the MAC address of the device to form the system ID and also is used during negotiation with other systems. Priority is supported only on port channels with LACP-enabled physical interfaces.

Note A high priority number means a low priority.

To verify the configured system priority, issue the **show lACP** command.

Examples

The following example shows how to set a system priority of 25500 for a device:

```
Router> enable
Router# configure terminal
Router(config)# lACP system-priority 25500
```

Related Commands	Command	Description
	channel-group	Assigns and configures an EtherChannel interface to an EtherChannel group.
	debug lACP	Enables debugging of LACP activities.
	lACP port-priority	Sets the priority of a port.
	show lACP	Displays information about LACP activity on the device.

lane start-freq

To set the start frequency for a specific lane, use the **lane start-freq** command from frequency profile configuration mode.

```
lane lane_id start-freq start-freq
```

Syntax Description

<i>lane_id</i>	Specifies the ID of the lane that the start frequency to be set.
<i>start-freq</i>	Configures the start frequency for the lane.

Command Default

None

Command Modes

Frequency profile configuration (config-freq-prof)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to set the start frequency for a specific lane.

Examples

The following example shows how to set start frequency for a specific lane:

```
Router# Configure terminal
Router(config)# cable downstream freq-profile 4
Router(config-freq-prof)# lane 1 start-freq 45000000
```

Related Commands

Command	Description
cable downstream freq-profile	Set the start frequency for a specific lane.

lc-control-plane-timeout

To set the interval of monitoring cable line card control plane process restart, use the **lc-control-plane-timeout** *time* command in the process restart configuration mode.

```
lc-control-plane-timeout time
```

Syntax Description

<i>time</i>	Cable line card control plane process restart monitoring interval in seconds.
-------------	---

Command Default

None

Command Modes

Process restart configuration (config-process-restart)

Command History

Release	Modification
IOS-XE 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command sets the interval of monitoring cable line card control plane process restart.

The following example shows how to set the interval of monitoring cable line card control plane process restart.

```
Router# configure terminal
Router(config)# process-restart
Router(config-process-restart)# lc-control-plane-timeout 200
```

Related Commands

Command	Description
lc-us-scheduler-timeout	Sets the interval of monitoring cable line card upstream scheduler process restart.
restart-retry	Sets the retrying times for process restart.

lc-us-scheduler-timeout

To set the interval of monitoring cable line card upstream scheduler process restart, use the **lc-us-scheduler-timeout** *time* command in the process restart configuration mode.

```
lc-us-scheduler-timeout time
```

Syntax Description	<i>time</i> Cable line card upstream scheduler process restart monitoring interval in seconds.
---------------------------	--

Command Default	None
------------------------	------

Command Modes	Process restart configuration (config-process-restart)
----------------------	--

Command History	Release	Modification
	IOS-XE 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command sets the interval of monitoring cable line card upstream scheduler process restart.

The following example shows how to set the interval of monitoring cable line card upstream scheduler process restart.

```
Router# configure terminal
Router(config)# process-restart
Router(config-process-restart)# lc-us-scheduler-timeout 200
```

Related Commands	Command	Description
	lc-control-plane-timeout	Sets the interval of monitoring cable line card control plane process restart.
	restart-retry	Sets the retrying times for process restart.

lcha-preferred

To select the LCHA when it is possible, use the **lc-control-plane-timeout** command in the process restart configuration mode. To disable this function, use the **no** form of this command.

```
lcha-preferred
```

```
no lcha-preferred
```

Command Default None

Command Modes Process restart configuration (config-process-restart)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command selects the LCHA when it is possible.
 The following example shows how to select the LCHA when it is possible.

```
Router# configure terminal
Router(config)# process-restart
Router(config-process-restart)# lcha-preferred
```

Related Commands	Command	Description
	disable-auto-restart	Disables the automatic process restart.

license feature evaluation disable

To disable an evaluation license for Cisco uBR-MC3GX60V and Cisco UBR-MC20X20V cable interface line cards on the Cisco uBR10012 router, use the **license feature evaluation disable** command in global configuration mode.

license feature evaluation disable {**DS_license** | **US_license** | **all** } **subslot** *slot/subslot*

Syntax Description	Parameter	Description
	disable	Disables an evaluation license for a cable interface line card.
	DS_License	Disables a downstream evaluation license for a cable interface line card.
	US_License	Disables an upstream evaluation license for a cable interface line card.
	all	Disables both downstream and upstream evaluation licenses for a cable interface line card.
	subslot <i>slot/subslot</i>	<ul style="list-style-type: none"> <i>slot</i>—Slot where the line card resides. The valid range is from 5 to 8. <i>subslot</i>—Secondary slot number of the cable interface line card. The valid value is 0 or 1.

Command Default A cable interface line card evaluation license is disabled by default.

Command Modes Global configuration (config)

Command History	Release	Modification
	12.2(33)SCE	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Evaluation licenses are temporary and used to evaluate a feature set on a new line card. Ensure that an equivalent permanent license is installed on the Cisco CMTS before the evaluation license expires to avoid any service disruptions.

Examples

The following example shows how to disable both downstream and upstream evaluation licenses for a cable interface line card on the Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# license feature evaluation disable all subslot 5/0
```

The following example shows how to disable a downstream evaluation license for a cable interface line card on the Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# license feature evaluation disable DS_License subslot 6/0
```

The following example shows how to disable an upstream evaluation license for a cable interface line card on the Cisco uBR10012 router:

```
Router# configure terminal  
Router(config)# license feature evaluation disable US_License subslot 6/1
```

Related Commands

Command	Description
license feature evaluation enable	Enables an evaluation license for Cisco uBR-MC3GX60V and Cisco UBR-MC20X20V cable interface line cards.

license feature evaluation enable

To enable an evaluation license for Cisco uBR-MC3GX60V and Cisco UBR-MC20X20V cable interface line cards on the Cisco uBR10012 router, use the **license feature evaluation enable** command in global configuration mode.

license feature evaluation enable {**DS_License** | **US_License** | **all**} **subslot** *slot/subslot*

Syntax Description	enable	Enables an evaluation license for a cable interface line card.
	DS_License	Enables a downstream evaluation license for a cable interface line card.
	US_License	Enables an upstream evaluation license for a cable interface line card.
	all	Enables both downstream and upstream evaluation licenses for a cable interface line card.
	subslot <i>slot/subslot</i>	<ul style="list-style-type: none"> <i>slot</i>—Slot where the cable interface line card resides. The valid range is from 5 to 8. <i>subslot</i>—Secondary slot number of the cable interface line card. The valid value is 0 or 1.

Command Default A cable interface line card evaluation license is not enabled by default.

Command Modes Global configuration (config)

Command History	Release	Modification
	12.2(33)SCE	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Evaluation licenses are temporary and used to evaluate a feature set on a new cable interface line card. Ensure that an equivalent permanent license is installed on the Cisco CMTS router before the evaluation license expires to avoid any service disruptions.

Examples The following example shows how to enable both downstream and upstream evaluation licenses for a cable interface line card on the Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# license feature evaluation enable all subslot 5/0
```

The following example shows how to enable a downstream evaluation license for a cable interface line card on the Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# license feature evaluation enable DS_License subslot 6/0
```

The following example shows how to enable an upstream evaluation license for a cable interface line card on the Cisco uBR10012 router:

```
Router# configure terminal  
Router(config)# license feature evaluation enable US_License subslot 6/1
```

Related Commands

Command	Description
license feature evaluation disable	Disables an evaluation license for Cisco uBR-MC3GX60V and Cisco UBR-MC20X20V cable interface line cards.

linecard

To define the encryption type of a linecard, use the **linecard** command in the encryption configuration mode. To remove the configuration, use the **no** form of this command.

linecard *slot / bay*

ca-system {**pme scrambler** *dvs042* | **powerkey scrambler** *des* | **powerkey scrambler** *dvb-csa* | **dvb scrambler** *dvb-csa* | **dualcrypt scrambler** *dvb-csa*}

no linecard *slot / bay*

ca-system {**pme scrambler** *dvs042* | **powerkey scrambler** *des* | **powerkey scrambler** *dvb-csa* | **dvb scrambler** *dvb-csa* | **dualcrypt scrambler** *dvb-csa*}

Syntax Description

<i>slot / bay</i>	<ul style="list-style-type: none"> • <i>slot</i>—Specifies the slot number. The valid range is from 0 to 9. • <i>bay</i>—Specifies the bay number. The valid value is 0.
ca-system	<p>Specifies the encryption type of the virtual carrier group.</p> <ul style="list-style-type: none"> • <i>pme</i>—Sets to privacy mode encryption. • <i>powerkey</i>—Sets to powerkey encryption. • <i>dvb</i>—Sets to DVB encryption. • <i>dualcrypt</i>—Sets to Dualcrypt encryption.
pme scrambler <i>dvs042</i>	Specifies the scrambler algorithm for privacy mode encryption.
powerkey scrambler <i>des dvb-csa</i>	Specifies the scrambler algorithm for powerkey encryption.
dvb scrambler <i>dvb-csa</i>	Specifies the scrambler algorithm for DVB encryption.
dualcrypt scrambler <i>dvb-csa</i>	Specifies the scrambler algorithm for DualCrypt encryption.

Command Default

None.

Command Modes

Encryption configuration (config-video-encrypt)

Command History

Release	Modification
IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.
Cisco IOS XE Everest 16.5.1	This command was updated to support DualCrypt encryption on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command defines the encryption type of a linecard.

Examples

The following example shows how to configure the encryption for the linecard:

```

Router# configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#linecard 7/0 ca-system powerkey scrambler des

```

The following example shows how to configure the Dualcrypt encryption mode:

```

Router(config)#cable video
Router(config-video)#mgmt-intf VirtualPortGroup 0
Router(config-video)#encryption
Router(config-video-encrypt)#linecard 8/0 ca-system dualcrypt scrambler dvb-csa

```

Related Commands

Command	Description
encrypt	Enables encryption on a virtual carrier group.
rf-channel	Specifies the virtual RF channels in a virtual carrier group.
virtual-edge-input-ip	Configures a virtual edge input.
virtual-carrier-group	Defines a virtual carrier group.

linecard-group (redundancy)

To configure the redundancy group, use the **linecard-group** command in redundancy configuration mode. To remove the configuration, use the **no** form of this command.

linecard-group *group-id* **internal-switch**
no linecard-group *group-id* **internal-switch**

Syntax Description		
	<i>group-id</i>	The line card group identifier. The valid value is 0 on the Cisco cBR-8 Router.
	internal-switch	Sets the redundancy type to internal switch.

Command Default None.

Command Modes Redundancy configuration (config-red)

Command History	Release	Modification
	IOS-XE Release 3.16.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Line card group members must be removed before removing the redundancy group configuration.

Examples

The following example shows how to configure the redundancy group:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# redundancy
Router(config-red)# linecard-group 0 internal-switch
Router(config-red-lc)#
```

Related Commands	Command	Description
	class	Configures redundancy class on the line card.
	description	Adds a description to the line card group.
	member slot	Adds a slot to the line card redundancy group.
	redundancy	Configures line card redundancy.
	show redundancy linecard	Displays information about a redundant line card or a line card group.

listening-port

To configure the listening TCP port, use the **listening-port** command in the DVB scrambling EIS configuration mode. To void the listening TCP port configuration, use the **no** form of this command.

listening-port *port*
no listening-port *port*

<i>port</i>	Specifies the listening TCP port.
-------------	-----------------------------------

Command Default None

Command Modes DVB scrambling EIS configuration mode (config-video-encrypt-dvb-eis)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to configure the listening TCP port:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#eis EIS-1 id 1
Router(config-video-encrypt-dvb-eis)#listening-port 8890
```

Related Commands

Command	Description
cp-overrule	Overrules and specifies the crypto period duration.
overwrite-scg	Enables Scrambling Control Group (SCG) overwrite.
eis	Enters the Event Information Scheduler configuration mode.

logging cmts ipc-cable

To enable debug logging for the cable inter-processor communication (IPC) software, use the **logging cmts ipc-cable** command from the global configuration mode. To disable logging of these messages, use the **no** form of the command.

Note Use this command for debugging purpose only.

logging cmts ipc-cable log-level

[{alerts critical debugging emergencies errors informational notifications warnings}]

no logging cmts ipc-cable log-level

[{alerts critical debugging emergencies errors informational notifications warnings}]

Syntax Description

log-level	Configures the log severity level. Logs with severity equal to or higher than the specified log-level are logged in log buffer.
<i>level=emergencies</i>	Emergency severity level indicates system is unusable. The default severity level for emergencies syslog messages is 0.
<i>level=alerts</i>	Alerts severity level indicates that immediate action is needed. The default severity level for alerts syslog messages is 1.
<i>level=critical</i>	Critical severity level indicates the critical condition of the system. The default severity level for critical syslog messages is 2.
<i>level=errors</i>	Errors severity level indicates the error conditions. The default severity level for errors syslog messages is 3.
<i>level=warnings</i>	Warning severity level warns the network administrator. The default severity level for warnings syslog messages is 4.
<i>level=notifications</i>	Notification severity level indicates normal but significant condition of the system. The default severity level for notification syslog messages is 5.
<i>level=informational</i>	Informational severity level provides additional information about the system. The default severity level for informational syslog messages is 6.
<i>level=debugging</i>	Debugging severity level provides debugging messages. The default severity level for debugging syslog messages is 7.

Command Default

By default, the log-level is set to 'errors'.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(33)SCF	This command was introduced.

Usage Guidelines

Each cable IPC debug log has a severity level. The **logging cmts ipc-cable** command allows you to selectively enable cable IPC debug logs based on the log severities. Each debug log has a debug-enable flag that is set by the **debug cmts ipc-cable** command in Privileged EXEC mode. A debug log is recorded only if its severity is equal to or higher than the configured log-level, and if its debug enable flag is set.

Examples

The following example shows how to enable all the cable IPC debug logs:

```
Router(config)# logging cmts ipc-cable log-level debugging
```

The following example shows how to disable debug logging for the cable IPC:

```
Router(config)# no logging cmts ipc-cable log-level debugging
```

Related Commands

Command	Description
debug cmts ipc-cable	Sets the debug-enable flag for the cable IPC debug logs.
show cmts ipc-cable	Displays statistics of all IPC messages on a Cisco CMTS router.

logging cmts sea

To enable the logging of syslog messages to System Event Archive (SEA), use the **logging cmts sea** command from global configuration mode. To disable logging of syslog messages to SEA, use the **no** form of the command.

logging cmts sea

no logging cmts sea

Syntax Description

syslog-level <i>level</i>	(Optional) Configures the level of syslog messages inclusive of and above the specified level which will be stored in the SEA log file.
Possible values for level are: <i>level=emergencies</i>	Emergency security level indicates system is unusable. The default severity level for emergency syslog messages is 0.
<i>level=alerts</i>	Alerts severity level indicates that immediate action is needed. The default severity level for alerts syslog messages is 1.
<i>level=critical</i>	Critical severity level indicates the critical condition of the system. The default severity level for critical syslog messages is 2.
<i>level=errors</i>	Errors severity level indicates the error conditions. The default severity level for errors syslog messages is 3.
<i>level=warnings</i>	Warning severity level warns the network administrator. The severity level for warning syslog messages is 4.
<i>level=notifications</i>	Notification severity level indicates normal but significant condition of the system. By default severity level for syslog messages is configured as 'normal'. The default severity level for notification syslog messages is 5.
<i>level=informational</i>	Informational severity level provides additional information about the system. The default severity level for informational syslog messages is 6.
<i>level=debugging</i>	Debugging severity level provides debugging messages. The default severity level for debugging syslog messages is 7.

Command Default

By default, storing of syslog messages to SEA log file is enabled, with the severity-level of syslog messages being set to 'notification'.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use the **logging cmts sea** command is used to enable the logging of syslog messages to SEA log file. To change the severity-level of syslog messages inclusive of and above the level to be stored in SEA log file, specify the command **logging cmts sea [syslog-level level]**.

Examples

The following example shows how to enable logging of syslog messages to SEA log file on the Cisco uBR10012 router:

```
Router(config)# logging cmts sea
```

The following example shows how to disable logging of syslog messages to SEA log file on the Cisco uBR10012 router:

```
Router(config)# no logging cmts sea
```

The following example shows how to change the severity-level of syslog messages inclusive of and above the level being stored in the SEA log file:

```
Router(config)# logging cmts sea syslog-level warning
```

Related Commands

Command	Description
clear logging system	Clears the event records stored in the SEA.
copy logging system	Copies the archived system events to another location.
logging system	Enables or disables the SEA logging system.

logical-edge-device

To define a logical edge device, use the **logical-edge-device** command in video configuration mode. To delete a logical edge device, use the **no** form of this command.

```
logical-edge-device name [id id]
no logical-edge-device name [id id]
```

Syntax Description	logical-edge-device name	Specifies the logical edge device name.
	id id	Specifies the logical edge device identifier.

Command Default None.

Command Modes Video configuration (config-video)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command defines a logical edge device.

Examples The following example shows how to define a logical edge device:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# logical-edge-device vod id 1
```

Related Commands	Command	Description
	protocol	Specifies the protocol used in the logical edge device.
	show cable video logical-edge-device	Displays the logical edge device information.

load-interval

To change the length of time for which data is used to compute load statistics, use the **load-interval** command in MAC domain profile configuration mode, wideband-cable interface profile configuration mode, or downstream profile configuration mode. To void the configuration, use the **no** form of this command.

load-interval *seconds*
no low-latency *seconds*

Command Default None.

Command Modes MAC domain profile configuration (config-profile-md)

Wideband-cable interface profile configuration (config-profile-wb)

Downstream profile configuration (config-profile-ds)

Command History	Release	Modification
	Cisco IOS XE Fuji 16.7.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
	Cisco IOS XE Gibraltar 16.10.1c	This command was modified to support downstream profile configuration mode on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to set load interval:

```
Router# configure terminal
Router(config)# cable profile mac-domain MD
Router(config-profile-md)# load-interval 30
```

low-latency

To set low latency VCG, use the **low-latency** command in virtual carrier group configuration mode. To disable low latency VCG, use the **no** form of this command.

low-latency
no low-latency

Command Default

None.

Command Modes

Virtual carrier group configuration (config-video-vcg)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to set low latency VCG:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# virtual-carrier-group vod id 1
Router(config-video-vcg)# low-latency
```

Related Commands

Command	Description
show cable video low-latency linecard	Displays the linecard low latency information

mac-addr-filter

To configure MAC filtering, use the **mac-addr-filter** command in the interface configuration mode. To disable MAC filtering, use the **no** form of this command.

mac-addr-filter
no mac-addr-filter

Command Default None

Command Modes Interface configuration (config-if)

Command History	Release	Modification
	IOS-XE 3.18.1SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to configure the MAC filtering for a backhaul interface:

```
Router# configure terminal
Router(config)# interface tenGigabitEthernet 4/1/0
Router(config-if)#mac-addr-filter
Router(config-if)#end
```

Related Commands	Command	Description
	show platform software iomd	Verifies the MAC filtering status.

mac-address

To define the MAC address for a logical edge device, use the **mac-address** command in the logical edge device protocol configuration mode. To reset to default configuration, use the **no** form of this command.

mac-address *mac-address*
no mac-address *mac-address*

Syntax Description

<i>mac-address</i>	Specifies the MAC address for a logical edge device.
--------------------	--

Command Default

None

Command Modes

Logical edge device protocol configuration (config-video-led-protocol)

Command History

Release	Modification
IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Each logical edge device requires a unique MAC address. MAC address is required only when you configure the logical edge device with GQI protocol.

Tip Use the following command to get the chassis MAC address:

show diag all eeprom detail | include MAC

```
Chassis MAC Address : 54a2.120e.3000
MAC Address block size : 1024
```

Increment the least significant digit of the Chassis MAC address to give a unique identifier (mac-address) for each logical edge device. Example: 54a2.120e.3001.

The MAC address for a logical edge device should be unique with respect to the GQI server and it should not relate to a real MAC address.

Examples

The following example shows how to define the MAC address for a logical edge device:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)#logical-edge-device vod id 1
Router#(config-video-led)protocol gqi
Router#(config-video-led-protocol)mac-address 0800.270e.25b8
```

Related Commands

Command	Description
logical-edge-device	Defines a logical edge device.

Command	Description
protocol	Specifies the protocol used in the logical edge device.
mgmt-ip	Defines the local management IP address for a logical edge device.
server	Defines the server IP address of the session resource manager.
vcg	Specifies the virtual carrier group assigned to the logical edge device.
virtual-edge-input-ip	Defines a virtual edge input.
show cable video logical-edge-device	Displays the logical edge device information.
show cable video gqi connections	Displays the GQI connection information of the logical edge device with the Session Resource Manager.
show diag all eeprom detail include MAC	Displays the chassis MAC address information.

mgmt-intf virtualportgroup

To configure the cable video management interface, use the **mgmt-intf virtualportgroup** command in the video configuration mode. To delete the management interface created, use the **no** form of the command.

```
mgmt-intf virtualportgroup number
no mgmt-intf virtualportgroup number
```

Syntax Description	VirtualPortGroup <i>number</i> Defines the specified Virtual Port Group as the management interface. Valid range is 0 to 31.				
Command Default	None.				
Command Modes	Video configuration mode (config-video)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS-XE Release 3.18.0S</td> <td>This command was introduced on the Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
Release	Modification				
Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.				

Usage Guidelines This command is used to configure the cable video management interface.

The following example shows how to change the default ONID number:

```
Router#configure terminal
Router (config)#cable video
Router (config-video)#mgmt-intf VirtualPortGroup0
```

Related Commands	Command	Description
	interface virtualportgroup	Defines a VirtualPortGroup interface.
	show run interface virtualportgroup	Displays the VirtualPortGroup interface configuration.
	show run include mgmt-intf	Displays the cable video management interface configuration.
	show interfaces virtualportgroup	Displays the VirtualPortGroup interface state.

main-cpu

To enter main-CPU redundancy configuration mode, so that you can configure the synchronization of the active and standby Performance Routing Engine (PRE1) modules or Supervisor cards, use the **main-cpu** command in redundancy configuration mode.

main-cpu

Syntax Description

This command has no keywords or arguments.

Command Default

No default behavior or values

Command Modes

Redundancy configuration (config-r)

Cisco RF Gateway 10

Redundancy configuration (config-red)

Command History

Release	Modification
12.2(4)XF	This command was introduced for the Cisco uBR10012 router.
12.2(11)BC3	Support for the switchover timeout command was added.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(44)SQ	This command was integrated into Cisco IOS Release 12.2(44)SQ. Support for the Cisco RF Gateway 10 was added.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

When you enter main-CPU redundancy configuration mode, the prompt changes to the following:

```
Router(config-r-mc)#
```

After you enter main-CPU redundancy configuration mode, you can use the **auto-sync** command to specify which files are synchronized between the active and standby PRE1 modules or Supervisor cards. In Cisco IOS Release 12.2(11)BC3 and later releases, you can also use the **switchover timeout** command to specify the amount of time that the standby PRE1 module should wait when it first detects that the active PRE1 module is not active and when it initiates a switchover and becomes the active PRE1 module.

To leave main-CPU redundancy configuration mode and to return to redundancy configuration mode, use the **exit** command.

Examples

The following example shows how to enter main-CPU redundancy mode and the commands that are available there:

```

Router# config t

Router(config)# redundancy

Router(config-r)# main-cpu

Router(config-r-mc)# ?

Main Cpu redundancy configuration commands:
  auto-sync   Sync elements
  exit        Exit from main-cpu configuration mode
  no          Negate a command or set its defaults
  switchover  Configuration of switchover
Router(config-r-mc)#

```

Cisco RF Gateway 10

The following example shows how to enter main-CPU redundancy mode, and its associated commands:

```

Router# configure terminal

Router(config)# redundancy

Router(config-red)# main-cpu

Router(config-r-mc)# ?

Main CPU redundancy configuration commands:
  auto-sync   Sync elements
  default     Set a command to its defaults
  exit        Exit from main-cpu configuration mode
  no          Negate a command or set its defaults

```

Related Commands

Command	Description
associate slot	Logically associate slots for APS processor redundancy
auto-sync	Configures which files are synchronized between the active and standby PRE1 modules or Supervisor cards.
redundancy	Enters redundancy configuration mode.
switchover timeout	Configures the switchover timeout period of the PRE1 module.

maintenance-mode

To configure the PRE1 modules on the router for maintenance mode, use the **maintenance-mode** command in redundancy configuration mode. To return to normal operations, use the **no** form of this command.

maintenance-mode
no maintenance-mode

Syntax Description This command has no keywords or arguments.

Command Default Normal operations (**no maintenance-mode**)

Command Modes Redundancy configuration

Command History

Release	Modification
12.2(4)XF	This command was introduced for the Cisco uBR10012 router.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

When the Cisco uBR10012 router is configured with redundant PRE1 modules, the active PRE1 module automatically synchronizes the configuration, network state information, and other information with the standby PRE1 module, so that if a switchover occurs, the standby module can restore normal operations quickly. You can use the **maintenance-mode** command to disable this automatic synchronization of the PRE1 modules, and to disable the reporting of any faults on the standby module to the active module.

Note The **maintenance-mode** command disables the ability of the Cisco uBR10012 router to switchover PRE1 modules and should be used only while upgrading the router or troubleshooting network problems.

Examples

The following example shows how to disable the automatic PRE1 module synchronization on the Cisco uBR10012 router and enter maintenance mode:

```
Router# config t
Router(config)# redundancy
Router(config-r)# maintenance-mode
Router(config-r)# exit
Router(config)#
```

The following example shows how to leave maintenance mode and return to normal operations, which includes the automatic synchronization of the PRE1 modules:

```
Router# config t
Router(config)# redundancy
```

```
Router(config-r)# no maintenance-mode
Router(config-r)# exit
Router(config)#
```

Related Commands

Command	Description
auto-sync	Configures which files are synchronized between the active and standby PRE1 modules.
redundancy	Enters redundancy configuration mode.

match

To configure the matching option for the DHCP IPv4 profile, use the **match** command in DHCP IPv4 profile configuration mode. To void the configuration, use the **no** form of this command.

match option { **43 suboption** *type* | **hex** *value* || **60 hex** *value* }
no match option { **43 suboption** *type* | **hex** *value* || **60 hex** *value* }

Syntax Description

option	Specifies the matching option.
suboption <i>type</i>	Specifies the suboption for the option 43.
hex <i>value</i>	Specifies the HEX pattern

Command Default

None.

Command Modes

DHCP IPv4 profile configuration (config-dhcpv4-profile)

Release	Modification
IOS XE Fuji 16.8.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to configure the matching option:

```
Router# configure terminal
Router(config)# cable dhcp ipv4 profile DEVICE1
Router(config-dhcpv4-profile)# match option 43 suboption 100 hex 123456
Router(config-dhcpv4-profile)# match option 60 hex *efef*
```

Related Commands

Command	Description
cable dhcp ipv4 profile	Enters the IPv4 DHCP profile configuration mode.

match rule

To configure the match rule, rule priority and related action in the selected cable multicast authorization profile, use the **match rule** command in interface configuration mode. To disable a cable multicast authorization profile match, use the **no** form of this command.

match rule [*ipv4|ipv6*] [*source-prefix*] [*group-prefix*] **priority** [*priority-value*] [*permit|deny*]
no match rule [*ipv4|ipv6*] [*source-prefix*] [*group-prefix*] **priority** [*priority-value*] [*permit|deny*]

Syntax Description		
match rule [<i>ipv4 / ipv6</i>]	Specifies the matching source rule.	Though CLI allows IPv6 to be configured, only IPv4 is supported in the CMTS.
<i>source-prefix</i>	(Optional) Specifies the matching source address prefix.	Example: 223.1.1.1/16
<i>group-prefix</i>	(Optional) Specifies the matching group address prefix.	Example: 223.1.1.1/16
priority [<i>priority-value</i>]	Specifies the priority of the cable multicast authorization profile.	Priority value range is: 0-255.
<i>permit</i>	The argument <i>permit</i> allows specified packets to be forwarded.	
<i>deny</i>	The argument <i>deny</i> allows to specified packets to be rejected.	

Command Default Cable multicast authorization is disabled.

Command Modes Interface configuration—cable interface only (config-mauth)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command specifies the cable multicast authorization profile match to be used.

Examples The following example shows how to use the selected multicast authorization profile match:

```
Router(config-mauth)# match rule rule1
```

Related Commands

Command	Description
cable multicast authorization enable default-action	This command enables the cable multicast authorization features. If the multicast authorization feature is disabled, all defined authorization profiles are ineffective.
cable multicast authorization profile-name	Defines the cable multicast authorization profile.
show cable multicast authorization	Displays the list of defined multicast authorization profiles and all CMs associated with corresponding profiles.

max-carrier

To specify the maximum number of carriers, use the max-carrier command in the controller sub configuration mode.

max-carrier *value*

Syntax Description	<i>value</i> Value for the maximum number of carriers. Valid range is from 0 to 128.				
Command Default	The default value is 128.				
Command Modes	Controller sub configuration mode (config-controller).				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>IOS-XE 3.15.0S</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	IOS-XE 3.15.0S	This command was introduced.
Release	Modification				
IOS-XE 3.15.0S	This command was introduced.				
Usage Guidelines	This command is used to specify the maximum number of carriers on an RF port.				

```
router#configure terminal
router (config)#controller Integrated-Cable 3/0/0
router (config-controller)#max-carrier 96
router (config-controller)#end
router #show controllers Integrated-Cable 3/0/0 rf-port
```

```
Admin: UP MaxCarrier: 96 BasePower: 32 dBmV Mode: normal
```

max-comp-time

To configure the maximum time needed by ECMG to compute an ECM, use the **max-comp-time** command in the DVB scrambling ECMG overrule configuration mode. To void the maximum time configuration, use the **no** form of this command.

max-comp-time *time*

no max-comp-time

max-comp-time <i>time</i>	Specifies the maximum computing time in millisecond.
----------------------------------	--

Command Default

None

Command Modes

DVB scrambling ECMG overrule configuration mode (config-video-encrypt-dvb-ecmg-overrule)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command specifies the maximum time needed by ECMG to compute an ECM in milliseconds. The valid range is from 0 to 60000.

The following is an example of how to configure the maximum computing time:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dwb
Router(config-video-encrypt-dwb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dwb-ecmg)#overrule
Router(config-video-encrypt-dwb-ecmg-overrule)#max-comp-time 10000
```

Related Commands

Command	Description
overrule	Enters DVB scrambling configuration mode.
ac-start-delay	Specifies the time between start of first CP after a change in AC and start of ECM broadcast.
ac-stop-delay	Specifies the time between end of last CP preceding a change in AC and end of ECM broadcast.
max-streams	Specifies the maximum number of simultaneous open streams supported by the ECMG on a channel.
min-cp-duration	Specifies the minimum crypto period.

Command	Description
rep-period	Specifies the time between two ECM packets at the output.
start-delay	Specifies the delay between the start of CP and ECM broadcast.
stop-delay	Specifies the delay between the end of CP and ECM broadcast.
trans-start-delay	Specifies the transition start delay.
trans-stop-delay	Specifies the transition stop delay.

max-ofdm-spectrum

To specify the maximum spectrum used by all the OFDM channels on the given port, use the **max-ofdm-spectrum** command in controller configuration mode. To undo the maximum spectrum assignment, use **no** form of this command.

max-ofdm-spectrum *value*

no max-ofdm-spectrum

Syntax Description

<i>value</i>	Maximum OFDM spectrum value (Hz), in 1 MHz increments. Valid range is from 24000000 to 1170000000.
--------------	--

Command Default

None.

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to specify the maximum spectrum used by all the OFDM channels on the given port.

Examples

The following example shows how to specify the maximum spectrum used by all the OFDM channels on the given port:

```
Router# configure terminal
Router(config)# controller integrated-cable 3/0/0
Router(config-controller)# max-ofdm-spectrum 24000000
```

max-streams

To configure the maximum number of simultaneous open streams supported by the ECMG on a channel, use the **max-streams** command in the DVB scrambling ECMG override configuration mode. To void the maximum number configuration, use the **no** form of this command.

max-streams *number*
no max-streams

max-streams <i>number</i>	Specifies the maximum number of simultaneous open streams supported by the ECMG on a channel.
----------------------------------	---

Command Default

None

Command Modes

DVB scrambling ECMG override configuration mode (config-video-encrypt-dvb-ecmg-override)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command specifies the maximum number of simultaneous open streams supported by the ECMG on a channel. The valid range is from 0 to 30000.

The following is an example of how to configure the maximum number of simultaneous open streams supported by the ECMG on a channel:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dvb-ecmg)#override
Router(config-video-encrypt-dvb-ecmg-override)#max-streams 10000
```

Related Commands

Command	Description
override	Enters DVB scrambling configuration mode.
ac-start-delay	Specifies the time between start of first CP after a change in AC and start of ECM broadcast.
ac-stop-delay	Specifies the time between end of last CP preceding a change in AC and end of ECM broadcast.
max-comp-time	Specifies the maximum time needed by ECMG to compute an ECM.
min-cp-duration	Specifies the minimum crypto period.

Command	Description
rep-period	Specifies the time between two ECM packets at the output.
start-delay	Specifies the delay between the start of CP and ECM broadcast.
stop-delay	Specifies the delay between the end of CP and ECM broadcast.
trans-start-delay	Specifies the transition start delay.
trans-stop-delay	Specifies the transition stop delay.

member slot

To add a line card as a primary or secondary card in a redundancy group, use the **member slot** command in line card redundancy configuration sub-mode. To remove the configuration, use the **no** form of this command.

```
member slot slot { primary | secondary }
no member slot slot { primary | secondary }
```

Syntax Description	slot	Slot number of the line card. The range is from 0 to 3 and 6 to 9 on the Cisco cBR-8 router.
	primary	Specifies the primary slot of the line card group.
	secondary	Specifies the secondary slot of the line card group.

Command Default None.

Command Modes Line card redundancy configuration (config-red-lc)

Command History	Release	Modification
	IOS-XE Release 3.16.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines We can only add the secondary card (protect card) after which there should be at least one primary member in the group. You can add a single secondary card for multiple primary cards.

Note You cannot remove the last primary member if there is secondary member in redundancy group. You should remove the secondary member first in such case. If the primary card is in Standby role, you must revert back to it before removing.

When a line card is added as secondary card, the line card will be reloaded automatically. On the Cisco cBR-8 router, slot 3 and 6 cannot be configured as secondary card. Only the line card with CBR-RF-PROT-PIC installed could be set as secondary card. In addition, only the line card with CBR-RF-PIC installed could be set as primary card.

The CBR-RF-PROT-PIC can only send RF signals to lower slot (with larger slot number). So the slot number of the secondary card must be the smallest one in the line card redundancy group.

It is recommended to install the PROT-PIC in slot 0 and make line card 0 as secondary. The RF signal can only be relayed from upper slot to lower slot by CBR-RF-PIC. So, do not install any RF blank PICs between the secondary and primary cards.

Examples

The following example shows how to add the line card as a primary card in the redundancy group:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# redundancy
Router(config-red)# linecard-group 0 internal-switch
```

```
Router(config-red-lc)# member slot 1 primary
```

The following example shows how to add the line card as a primary card in the redundancy group:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# redundancy
Router(config-red)# linecard-group 0 internal-switch
Router(config-red-lc)# member slot 0 secondary
```

Related Commands

Command	Description
class	Configures redundancy class on the line card.
description	Adds a description to the line card group.
linecard-group internal-switch	Creates a line card group for the line card.
redundancy	Configures line card redundancy.
show redundancy linecard	Displays information about a redundant line card or a line card group.

method

To select the method the CMTS uses to determine the load, use the **method** command in the config-lb-group configuration mode. To reset the method, use the **no** form of this command.

Cisco uBR Series Router

```
method {modems | service-flows | utilization} us-method {modems | service-flows | utilization}
no method
```

Cisco cBR Series Router

```
method {modems | service-flows | utilization} us-method {modems | utilization}
no method
```

Syntax Description		
modems		Specifies the load balancing method for the number of modems on the CMTS.
service-flows		Specifies the load balancing method for the number of service flows on the CMTS.
utilization		Specifies the load balancing method for the interface utilization on the CMTS.
us-method {modems service-flows utilization}		Specifies the load balancing method for upstream (US) channels on modems, service-flows, or utilization. Note service-flows method is not supported in Cisco cBR-8 router.

Command Default No default behavior or values.

Command Modes DOCSIS load balancing group mode (config-lb-group)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The service-flows keyword was removed.

Usage Guidelines The upstream channel uses the same method as the downstream channel. Change the method of the upstream channel using the **method** command.

Examples The following example shows how to select the method the CMTS uses to determine the load, using the **method** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# method modems us-method service-flows
```

```
Router (config-lb-group) #
```

Related Commands

Command	Description
cable load-balance docsis-group	Configures a DOCSIS load balancing group on the CMTS.
show cable load-balance docsis-group	Displays real-time configuration, statistical, and operational information for load balancing operations on the router.

mgmt-ip

To define the local management IP address for a logical edge device, use the **mgmt-ip** command in the logical edge device protocol configuration mode. To reset to default configuration, use the **no** form of this command.

Note The **mgmt-ip** address should be in the same subnet as the IP address of interface VirtualPortGroup.

mgmt-ip *ip-address*
no mgmt-ip *ip-address*

Syntax Description	<i>ip-address</i> Specifies the local management IP address.
---------------------------	--

Command Default	None
------------------------	------

Command Modes	Logical edge device protocol configuration (config-video-led-protocol)
----------------------	--

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines	This command defines the local management IP address for a logical edge device.
-------------------------	---

Examples	The following example shows how to define the local management IP address for a logical edge device:
-----------------	--

```
Router# configure terminal
Router(config)# cable video
Router(config-video)#logical-edge-device vod id 1
Router#(config-video-led)protocol gqi
Router#(config-video-led-protocol)mgmt-ip 172.16.0.1
```

Related Commands	Command	Description
	logical-edge-device	Defines a logical edge device.
	protocol	Specifies the protocol used in the logical edge device.
	mac-address	Defines the MAC address for a logical edge device.
	server	Defines the server IP address of the session resource manager.
	vcg	Specifies the virtual carrier group assigned to the logical edge device.
	virtual-edge-input-ip	Defines a virtual edge input.

Command	Description
show cable video logical-edge-device	Displays the logical edge device information.
show cable video gqi connections	Displays the GQI connection information of the logical edge device with the Session Resource Manager.
show diag all eeprom detail include MAC	Displays the chassis MAC address information.

mgmt-ip (DVB)

To configure the management IP for EIS/Broadcast ECMG, use the **mgmt-ip** command in the DVB scrambling configuration mode. To void the management IP configuration, use the **no** form of this command.

mgmt-ip *ip_address*
no mgmt-ip

<i>ip_address</i>	Specifies the management IP for EIS and Broadcast ECMG Connection.
-------------------	--

Command Default

None

Command Modes

DVB scrambling configuration mode (config-video-encrypt-dvb)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to configure the management IP for EIS/Broadcast ECMG:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#mgmt-ip 1.24.2.10
```

Related Commands

Command	Description
dvb	Enters DVB scrambling configuration mode.
strong-pairing-enforce	Switches on the NDS strong pairing enforcement
check-scg-at-prov	Enables Check SCG at provision time.
scramble-video-audio	Scrambles only video and audio pids.
route-ecmg	Configures the route to the ECMG server.
ca-interface	Configures the conditional access interface.
tier-based	Enters the tier-based scrambling configuration mode.
ecmg	Enters the ECM Generator configuration mode.
eis	Enters the Event Information Scheduler configuration mode.

microcode (uBR10012)

To reload the microcode software images on a Parallel eXpress Forwarding (PXF) processor or on all line cards that support downloadable microcode, use the **microcode** command in global configuration mode.

microcode {*pxf filename* | **reload**}

Syntax Description

pxf	Reloads the microcode for the PXF processors on the Performance Routing Engine (PRE1) module.
<i>filename</i>	Specifies the microcode software image for the PXF processors by device name and filename.
reload	Reloads the microcode for all PRE1 modules and other line cards that support downloadable microcode software images.

Command Default

None

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(1)XF1	This command was introduced for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

By default, the Cisco uBR10012 router automatically loads all required microcode on to the PXF processors and other line cards when it loads the Cisco IOS software image. Also, the PRE1 module automatically reloads the microcode on a card when certain faults occur, allowing the card to recover from the fault.

You can reload the microcode on the PRE1 module or on all line cards that support downloadable microcode by using the **microcode** command. Typically, this is not needed and should be done only upon the advice of Cisco TAC or field service engineers.

Tip You can also reload the microcode on the PXF processors or on all cards using the **microcode reload** command in privileged EXEC mode. In particular, use the **microcode reload** command to reload the PXF processors with the default microcode that was loaded along with the Cisco IOS software image.

Examples

The following example shows how to reload the microcode on all PRE processors and line cards that support downloadable microcode:

```
Router# configure terminal
```

```
Router(config)# microcode reload  
Reload microcode? [confirm] yes
```

```
00:49:41: Downloading Microcode: file=system:pxf/ubr10k-ucode.1.2.3,  
version=1.1.0, description=Release Software created Wed 17-Jul-02 16:58  
<<list of interfaces going down or coming up>>
```

```
00:49:42: !!pxf clients started, forwarding code operational!!
Router(config)#
```

The following example shows how to reload the microcode on the PXF processors on the PRE1 module, using a specific image that is stored in the Flash memory:

```
Router# configure terminal
```

```
Router(config)# microcode pxf flash:pxf/ubr10k-ucode.122.1.2.3
```

```
Reload microcode? [confirm] yes
```

```
1d04h: Downloading Microcode: file=flash:pxf/ubr10k-ucode.122.1.2.3, version=122.1.2.3,
description=Release Software created Thu 17-Oct-02 11:33
```

```
<<list of interfaces going down or coming up>>
```

```
1d04h: !!pxf clients started, forwarding code operational!!
```

```
Router(config)#
```

Related Commands

Command	Description
hw-module reset	Resets a particular PRE1 module or a particular line card.
microcode reload	Reloads the microcode software images on one or all line cards that support downloadable microcode.
show pxf microcode	Displays display identifying information for the microcode being used on the PXF processors.

microcode reload (uBR10012)

To reload the microcode software images on one or all line cards that support downloadable microcode, use the **microcode reload** command in privileged EXEC mode.

microcode reload {**all** | **pxf**} *device:* [*filename*]

Syntax Description

all	Reloads the microcode for all Performance Routing Engine (PRE1) modules and other line cards that support downloadable microcode software images.
pxf	Reloads the microcode for the Parallel eXpress Forwarding (PXF) processors on the PRE1 module.
<i>device:</i> [<i>filename</i>]	(Optional) Loads the PXF processors with the microcode software image that has the specific filename on the specific device. If no filename is specified, the first image found on the device is loaded by default.

Command Default

For **microcode reload pxf**, defaults to loading the microcode image that was originally loaded when the Cisco IOS software image was loaded.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(1)XF1	This command was introduced for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

By default, the Cisco uBR10012 router automatically loads all required microcode on to the PXF processors and other line cards when it loads the Cisco IOS software image. Also, the PRE1 module automatically reloads the microcode on a card when certain faults occur, allowing the card to recover from the fault.

You can reload the microcode on the PRE1 module or on all line cards that support downloadable microcode by using the **microcode reload** command. Typically, this is not needed and should be done only upon the advice of Cisco TAC or field service engineers.

Tip You can also reload the microcode on the PXF processors or on all cards using the **microcode** command in global configuration mode.

Examples

The following example shows how to reload the microcode on all PRE processors and line cards that support downloadable microcode:

```
Router# microcode reload all
Reload microcode? [confirm] yes
```

```
00:49:41: Downloading Microcode: file=system:pxf/ubr10k-1-ucode.122.1.0, version=122.1.0,
```

```

description=Release Software created Wed 17-Jul-02 16:58
<<list of interfaces going down or coming up>>
00:49:42: !!pxf clients started, forwarding code operational!!
Router#

```

The following example shows a typical list of devices that you can use when loading microcode for the PXF processors. This list might vary, depending on whether a standby PRE1 module is installed and depending on the version of Cisco IOS software being used.

```

Router# microcode reload pxf ?

Router#

```

The following example shows how to reload the microcode on the PXF processors on the PRE1 module, using a specific image that is stored in the Flash memory:

```

Router# microcode reload pxf flash:pxf/ubr10k-1-ucode.122.1.0.4

Reload microcode? [confirm] yes

3d00h: Downloading Microcode: file=flash:pxf/ubr10k-1-ucode.122.1.0.4, version=122.1.0.4,
description=Release Software created Thu 27-Jun-02 16:05
<<list of interfaces going down or coming up>>
3d00h: !!pxf clients started, forwarding code operational!!
Router#

```

Related Commands

Command	Description
hw-module reset	Resets a particular PRE1 module or a particular line card.
microcode	Reloads the microcode software images on one or all line cards that support downloadable microcode.
show pxf microcode	Displays display identifying information for the microcode being used on the PXF processors.

min-cp-duration

To configure the minimum crypto period, use the **min-cp-duration** command in the DVB scrambling ECMG override configuration mode. To void the minimum crypto period configuration, use the **no** form of this command.

min-cp-duration *time*

no min-cp-duration

min-cp-duration <i>time</i>	Specifies the minimum crypto period in milliseconds.
------------------------------------	--

Command Default

None

Command Modes

DVB scrambling ECMG override configuration mode (config-video-encrypt-dvb-ecmg-override)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command specifies the minimum crypto period in milliseconds. The valid range is from 1000 to 3600000.

The following is an example of how to configure the minimum crypto period in milliseconds:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dwb
Router(config-video-encrypt-dwb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dwb-ecmg)#override
Router(config-video-encrypt-dwb-ecmg-override)#min-cp-duration 10000
```

Related Commands

Command	Description
override	Enters DVB scrambling configuration mode.
ac-start-delay	Specifies the time between start of first CP after a change in AC and start of ECM broadcast.
ac-stop-delay	Specifies the time between end of last CP preceding a change in AC and end of ECM broadcast.
max-comp-time	Specifies the maximum time needed by ECMG to compute an ECM.
max-streams	Specifies the maximum number of simultaneous open streams supported by the ECMG on a channel.

Command	Description
rep-period	Specifies the time between two ECM packets at the output.
start-delay	Specifies the delay between the start of CP and ECM broadcast.
stop-delay	Specifies the delay between the end of CP and ECM broadcast.
trans-start-delay	Specifies the transition start delay.
trans-stop-delay	Specifies the transition stop delay.

mode

To configure the application mode of ECMG, use the **mode** command in the DVB scrambling ECMG configuration mode. To void the ECMG application mode configuration, use the **no** form of this command.

mode {**broadcast** | **tier-based** | **vod linecard** *slot/bay*}
no mode

broadcast	Specifies the ECM application mode broadcast.
tier-based	Specifies the ECM application mode tier-based.
vod	Specifies the ECM application mode VOD.
<i>slot/bay</i>	Specifies the slot and bay of the linecard.

Command Default

None

Command Modes

DVB scrambling ECMG configuration mode (config-video-encrypt-dvb-ecmg)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to configure the application mode of ECMG:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dwb
Router(config-video-encrypt-dwb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dwb-ecmg)#mode vod linecard 7/0
```

Related Commands

Command	Description
ecmg	Enters the ECM Generator configuration mode.
auto-channel-id	Enables automatic channel ID selection.
connection	Configures the ECMG connection.
ecm-pid-source	Configures the source of ECM PID.
ca-system-id	Configures the CA system ID.
type	Configures the ECMG type.
desc-rule	Configures the descriptor rule.

Command	Description
override	Overrules the default settings.

modular-host subslot

To specify the modular-host line card that will be used for DOCSIS 3.0 downstream or downstream channel bonding operations, use the **modular-host subslot** command in controller configuration mode. To remove the modular-host line card used for DOCSIS 3.0 downstream or downstream channel bonding operations, use the **no** form of this command.

modular-host subslot *slot/subslot*
no modular-host subslot *slot/subslot*

Syntax Description

<i>slot/subslot</i>	The location of the modular-host line card.
---------------------	---

Command Default

No modular-host line card is configured for DOCSIS 3.0 downstream or downstream channel bonding operations.

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command specifies the modular-host line card for DOCSIS 3.0 downstream or downstream channel bonding operations. This applies to the cable interface line card (for example, the Cisco uBR10-MC5X20S-D line card) that is used for these operations. The Wideband SPA itself does not support DOCSIS 3.0 downstream channel bonding operations.

Note A maximum of 3 SPA controllers can be hosted on a single cable interface line card.

Examples

The following example shows how to configure the modular-host line card for DOCSIS 3.0 downstream channel bonding operations for the Wideband SPA located in slot/subslot/bay 1/0/0:

```
Router(config)# controller modular-cable 1/0/0
Router(config-controller)# modular-host subslot 7/0
```

Related Commands

Command	Description
annex modulation	Sets the annex and modulation for the Wideband SPA.

Command	Description
cable rf-channel	Associates an RF channel on a Wideband SPA with a wideband channel.
controller modular-cable	Enters controller configuration mode to configure the Wideband SPA controller.
ip-address (controller)	Sets the IP address of the Wideband SPA FPGA.
rf-channel frequency	Sets the frequency for each RF channel.
rf-channel ip-address mac-address udp-port	Sets the IP address, MAC address and UDP port for each RF channel.
rf-channel network delay	Specifies the CIN delay for each RF channel.
rf-channel description	Specifies the description for each RF channel.
rf-channel cable downstream channel-id	Assigns a downstream channel ID to an RF channel.

modulation

To set the QAM modulation format for a specific QAM profile, use the **annex** command in QAM profile configuration mode.

modulation {256 | 64}

Syntax Description

modulation {256 64}	Specifies the QAM modulation format: <ul style="list-style-type: none"> • 256– 256-QAM modulation. • 64– 64-QAM modulation.
------------------------------	---

Command Default

None

Command Modes

QAM profile configuration (config-qam-prof)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to set the QAM modulation format for a specific QAM profile.

Examples

The following example shows how to set the QAM modulation format for a specific QAM profile:

```
Router# configure terminal
Router(config)# cable downstream qam-profile 4
Router(config-qam-prof)# modulation 256
```

Related Commands

Command	Description
cable downstream qam-profile	Set the QAM profile for the cable interface line card.
interleaver-depth	Set the interleaver-depth.
annex	Set the MPEG framing format.
spectrum-inversion	Set the spectrum-inversion on or off.
symbol-rate	Set the symbol rate.

monitoring-basics

To specify the type of monitoring for subscriber traffic management on a Cisco CMTS router, use the **monitoring-basics** command in enforce-rule configuration mode. To disable the selected monitoring, use the **no** form of this command.

```
monitoring-basics {legacy | peak-offpeak} {docsis10 | docsis11}
no monitoring-basics {legacy | peak-offpeak} {docsis10 | docsis11}
```

Syntax Description

legacy	Provides only one threshold and one monitoring duration.
peak-offpeak	Allows the selection of two peak durations within a day.
docsis10	Specifies application of the enforce-rule to DOCSIS 1.0 cable modems.
docsis11	Specifies application of the enforce-rule to DOCSIS 1.1 cable modems.

Command Default

The default for this command is **legacy** and **docsis10**.

Command Modes

Enforce-rule configuration (enforce-rule)

Command History

Release	Modification
12.3(9a)BC	This command was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Legacy monitoring (using the **legacy** keyword) occurs 24 hours a day, with no distinction between peak and offpeak hours. The available monitoring duration is between 10 minutes and 31 days.

Use the **peak-offpeak** keyword to set up monitoring duration and threshold for first peak, second peak, and offpeak monitoring. Each one can be different. After setting up first peak and second peak durations, the remaining hours are treated as offpeak. Monitoring happens during offpeak hours if the offpeak duration and threshold are defined. Monitoring duration is between 60 minutes and 23 hours.

Examples

The following example shows configuration of peak-offpeak monitoring for DOCSIS 1.1 cable modems:

```
Router(enforce-rule)# monitoring-basics peak-offpeak docsis11
```

The following example shows configuration of legacy monitoring for DOCSIS 1.1 on a Cisco cBR Series Converged Broadband Router:

```
Router(enforce-rule)#monitoring-basics legacy docsis11
```

Related Commands

Command	Description
cable qos enforce-rule	Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode.
debug cable subscriber-monitoring	Displays enforce-rule debug messages for subscriber traffic management on the Cisco CMTS routers.
duration	Specifies the time period and sample rate to be used for monitoring subscribers.
peak-time1	Specifies peak and offpeak monitoring times.
qos-profile registered	Specifies the registered QoS profile that should be used for this enforce-rule.
qos-profile enforced	Specifies a QoS profile that should be enforced when users violate the registered QoS profiles.
service-class (enforce-rule)	Identifies a particular service class for cable modem monitoring in an enforce-rule.
show cable qos enforce-rule	Displays the QoS enforce-rules that are currently defined.
show cable subscriber-usage	Displays subscribers who are violating their registered QoS profiles.

monitoring-duration

Note Effective with Cisco IOS Release 12.3(9a)BC, the **monitoring-duration** command is replaced by the **duration** command.

To specify the time period and sample rate to be used for monitoring subscribers, use the **monitoring-duration** command in enforce-rule configuration mode. To reset an enforce-rule to its default values, use the **no** form of this command.

monitoring-duration *minutes* [**sample-rate** *minutes*]
no monitoring-duration

Syntax Description

<i>minutes</i>	Specifies the time (in minutes). The valid range is 10 to 10080, with a default of 360 (6 hours).
sample-rate <i>minutes</i>	(Optional) Rate of sampling, in minutes. The valid range is 1 to 30, with a default value of 15.

Command Default

The **monitoring-duration** value defaults to 360 minutes (6 hours), and the **sample-rate** value defaults to 15 minutes.

Command Modes

Enforce-rule configuration (enforce-rule)

Command History

Release	Modification
12.2(15)BC1	This command was introduced.
12.2(15)BC2	The minimum sample-rate was reduced to 1 minute. Also, the sample-rate is not allowed to be set to a value greater than the monitoring-duration period. If you attempt to do so, the command is ignored and both parameters remain set to their current values.
12.3(9a)BC	This command was replaced by the duration command.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **sample-rate** *minutes* must be less than or equal to the **monitoring-duration** *minutes* period.

When you enable an enforce-rule, the Cisco CMTS router periodically checks the bandwidth being used by subscribers, to determine whether any subscribers are consuming more bandwidth than that specified by their registered QoS profile. The Cisco CMTS router keeps track of the subscribers using a sliding window that begins at each sample-rate interval and continues for the monitoring-duration period.

For example, with the default sample-rate interval of 15 minutes and the default monitoring-duration window of 360 minutes, the Cisco CMTS router samples the bandwidth usage every 15 minutes and determines the total bytes transmitted at the end of each 360-minute period. Each sample-rate interval begins a new sliding window period for which the Cisco CMTS router keeps track of the total bytes transmitted.

Note The **sample-rate** interval must be less than or equal to the **monitoring-duration** period. If you attempt to set the sample-rate interval to a value greater than the monitor-duration period, the command is ignored and the parameters are unchanged.

When you change the configuration of a currently active enforce-rule, that rule begins using the new configuration immediately to manage the cable modems tracked by this enforce-rule.

For more information about the Subscriber Traffic Management feature and to see an illustration of a sample monitoring window, refer to the Subscriber Traffic Management for the Cisco CMTS Routers feature document on Cisco.com.

Examples

The following example shows an enforce-rule being configured for a monitoring-duration period that is 20 minutes in length, with a sampling rate of every 10 minutes:

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
Router(enforce-rule)# monitoring-duration 20 sample-interval 10
```

The following example shows the error message that is displayed when the **sample-rate** interval is configured to be greater than the **monitoring-duration** period. In this situation, the command is ignored and the parameters remain unchanged.

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
Router(enforce-rule)# monitoring-duration 20 sample-interval 30
```

```
Monitoring duration cannot be less than the Sampling interval -- so the values
would remain unchanged
```

Related Commands

Command	Description
activate-rule at-byte-count	Specifies the number of bytes that a subscriber can transmit during the monitoring period on a Cisco CMTS router.
cable qos enforce-rule	Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode.
enabled (enforce-rule)	Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.
penalty-period	Specifies the time period that an enforced QoS profile should be in effect for subscribers that violate their registered QoS profiles.
qos-profile enforced	Specifies a QoS profile that should be enforced when users violate their registered QoS profiles.
qos-profile registered	Specifies the registered QoS profile that should be used for this enforce-rule.

Command	Description
show cable qos enforce-rule	Displays the QoS enforce-rules that are currently defined.
show cable subscriber-usage	Displays subscribers who are violating their registered QoS profiles.

mute

To mute the port, use the **mute** command in the controller sub configuration mode. Use the **no** form of the command to unmute the port.

[no] **mute**

This command has no keywords or arguments.

Command Default Default is no mute.

Command Modes Controller sub configuration mode (config-controller).

Command History	Release	Modification
	Cisco IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command is used to mute the RF channel without changing any channel configuration.

The following example shows how to mute the RF channel:

```
router#configure terminal
router (config)#controller Integrated-Cable 3/0/1
router (config-controller)#rf-chan 15
router (config-rf-chan)#mute
router (config-rf-chan)#exit
router (config-controller)#exit
router (config)#exit
```

Related Commands

Command	Description
shutdown	Disables or enables the interface on a line card.

multicast-label

To create a multicast label used for table-based session configuration when more than one multicast source [S, G] is used as backup for the sessions, use the **multicast-label** command in cable video configuration mode.

multicast-label *label* **group** *group-ip* **source** *source-ip* **source2** *source-ip* **source3** *source-ip* **source4** *source-ip*

Syntax Description

<i>label</i>	Specifies the multicast label name.
group <i>group-ip</i>	Identifies the multicast group for the label.
source <i>source-ip</i> source2 <i>source-ip</i> source3 <i>source-ip</i> source4 <i>source-ip</i>	Specifies the multicast sources for the label.

Command Default

None

Command Modes

Cable video configuration mode (config-video)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to configure a multicast label:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#table-based
Router(config-video-tb)#multicast-label mlabel1 group 236.0.1.1 source 175.10.5.2 source2
175.10.6.20 source3 175.10.7.2
```

Related Commands

Command	Description
cable video	Enters cable video configuration mode.
table-based	Enables table-based session configuration.

multicast-pool

To specify the multicast pool for the downstream controller profile, use the **multicast-pool** command in controller profile configuration mode. To void the multicast pool configuration, use the **no** form of this command.

multicast-pool *id*

no multicast-pool

Syntax Description

Syntax Description *id* Specifies the multicast pool ID.

Command Default

None

Command Modes

Controller profile configuration (config-controller-profile)

Command History

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to specify the multicast pool for the downstream controller profile.

Examples

The following example shows how to specify the multicast pool for the downstream controller profile:

```
Router# configure terminal
Router(config)# cable downstream controller-profile 1
Router(config-controller-profile)# multicast-pool 1
```

Related Commands

Command	Description
cable downstream controller-profile	Configures the downstream controller profile.

multicast-uplink

To set a TenGigabit Ethernet port for multicast traffic, use the **multicast-uplink** command in cable video configuration mode.

multicast-uplink *interface-name* [{**access-list** *access-list-name*}]

<i>interface-name</i>	Specifies the interface for multicast traffic.
access-list <i>access-list-name</i>	Specifies the access list for the multicast uplink.

Command Default None

Command Modes Cable video configuration mode (config-video)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to configure a multicast uplink:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#multicast-uplink TenGigabitEthernet4/1/2
```

The following example shows how to configure a multicast uplink with an access list:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#multicast-uplink Port-channel23 access-list all-multicasts
```

Related Commands

Command	Description
cable video	Enters cable video configuration mode.

name

To specify the name of the CMTS tag, use the **name** command in the cmts-tag configuration mode. To remove the name, use the **no** form of this command.

name *tag-name*

no name *tag-name*

Syntax Description

<i>tag-name</i>	Name of the CMTS tag. The configured name is added to the DOCSIS load balancing group and policies.
-----------------	---

Command Default

No default behavior or values.

Command Modes

CMTS tag mode (cmts-tag)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to give name to a CMTS tag using the **name** command:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable tag 1
Router(cmts-tag)# name cisco
```

Related Commands

Command	Description
cable load-balance docsis-group	To configure a DOCSIS load balancing group on the CMTS.
show cable load-balance docsis-group	To display real-time configuration, statistical and operational information for load balancing operations on the router.
cable tag	To configure a tag for a DOCSIS load balancing group on the CMTS.

nc

To configure the network controller for virtual ARPD, use the **nc** command in OOB virtual ARPD configuration mode. To void the network controller configuration, use the **no** form of this command.

nc *ip udp-port port_number*

no nc *ip udp-port port_number*

Syntax Description	
<i>ip</i>	Specifies the IP address of the network controller.
<i>port_number</i>	Specifies the destination UDP port number.

Command Default None

Command Modes OOB Virtual ARPD configuration (config-oob-varpd)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use this command to configure the network controller for virtual ARPD.

Examples The following example shows how to configure the network controller for virtual ARPD:

```
Router# configure terminal
Router(config)# cable oob
Router(config-oob)# virtual-arpd 1
Router(config-oob-varpd)# nc 225.225.225.225 udp-port 23411
```

Related Commands	Command	Description
	virtual-arpd	Defines a virtual ARPD configuration.
	ip	Configures the virtual ARPD source IP address.
	source-id	Configures the source ID for virtual ARPD.

network

To configure the DHCP address pool with the specified *network-number* and subnet *mask*, which are the DHCP *yiaddr* field and Subnet Mask (DHCP option 1) field, use the **network** command in global configuration mode. To remove this configuration, use the **no** form of this command.

network *network-number* [*mask*]

no network *network-number* [*mask*]

Syntax Description

<i>network-number</i>	The DHCP <i>yiaddr</i> field.
<i>mask</i>	Subnet Mask (DHCP option 1). If you do not specify the <i>mask</i> value, it is supported to 255.255.255.255.

Command Default

DHCP settings are not configured by default.

Command Modes

DHCP configuration

Command History

Release	Modification
Release 12.2(4)BC1	Supported on the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 routers.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command requires that you first use the **dhcp ip dhcp pool name** command in global configuration mode to enter DHCP configuration mode.

Note To create an address pool with a single IP address, use the **host** command instead of **network**.

For additional information about DHCP support on the Cisco CMTS, refer to the following document on Cisco.com:

- *DHCP and ToD Servers on the Cisco CMTS*

Examples

The following example illustrates use of the **network** command with the **ip dhcp pool name** command.

```
Router# configure terminal
Router(config)# ip dhcp pool name platinum
Router(dhcp-config)# network 10.10.10.0 255.255.0.0

Router(dhcp-config)#
```

Related Commands

Command	Description
ip dhcp pool name	Creates a DHCP address pool and enters DHCP pool configuration file mode.

network-delay

To configure the DEPI latency measurement, use the **network-delay dlm** command in core-interface configuration mode. To void the DEPI latency measurement configuration, use the **no** form of this command.

network-delay dlm *interval_in_seconds* [measure-only]

no network-delay dlm

Syntax Description	<i>interval_in_seconds</i> Specifies the sampling interval in seconds.
---------------------------	--

Command Default	None
------------------------	------

Command Modes	Core-interface configuration (config-rpd-core)
----------------------	--

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines	Use this command to configure the DEPI latency measurement.
-------------------------	---

The following example shows how to configure the DEPI latency measurement:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# core-interface tengigabitethernet 3/0/1
Router(config-rpd-core)# network-delay dlm 100
```

Related Commands	Command	Description
	core-interface	Configures the core-interface of the RPD.

nls

To enable Network Layer signaling (NLS) functionality, use the **nls** command in global configuration mode. To disable NLS functionality, use the **no** form of this command.

nls [authentication]
no nls [authentication]

Syntax Description	authentication (Optional) Enables NLS protocol security authentication.
---------------------------	--

Command Default Disabled.

Command Modes Global configuration

Command History	Release	Modification
	12.3(21a)BC3	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines It is recommended that NLS message authentication is enabled all the time.

Examples The following example shows nls enabled on a router:

```
router (config)# nls
```

Related Commands	Command	Description
	cpd	Enables the CPD feature.
	nls ag-id auth-key	Configures an Authorization Group Identifier (AG ID) for CMTS.
	nls resp-timeout	Configures NLS response timeout.

nls ag-id auth-key

To configure an Authorization Group Identifier (AG ID) for CMTS, use the **nls ag-id auth-key** command in global configuration mode. To disable the AG ID, use the **no** form of this command.

```
nls ag-id ag-id number auth-key auth-key char
no nls ag-id auth-key
```

Syntax Description

<i>ag-id number</i>	Authorization Group Identifier. The valid range is 1- 4294967295.
<i>auth-key char</i>	Authentication key provisioned on CMTS. The valid range is 20-64 characters.

Command Default

Disabled

Command Modes

Global configuration

Command History

Release	Modification
12.3(21a)BC3	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows configuring the AG ID:

```
Router(config) # nls ag-id 345 auth-key aabbccddeeeeddcbbaa
```

Related Commands

Command	Description
cpd	Enables CPD.
nls	Enables Network Layer signaling (NLS) functionality.
nls resp-timeout	Configures NLS response timeout.

nls resp-timeout

To configure the NLS response timeout, use the **nls resp-timeout** command in global configuration mode. To disable CPD, use the **no** form of this command.

nls resp-timeout *timeout number*
no nls resp-timeout *timeout number*

Syntax Description	<i>timeout number</i>	Controls the time CTMS will wait before getting a response for an NLS information request. The valid range is 1-60 seconds. Upon a response timeout, the CPD message is dropped.
---------------------------	-----------------------	--

Command Default The default timeout is 1 second.

Command Modes Global configuration

Command History	Release	Modification
	12.3(21a)BC3	This command was introduced.
	IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples The following example shows configuring the NLS response timeout:

```
Router(config)#nls rssp-timeout 35
```

Related Commands	Command	Description
	cpd	Enables CPD.
	nls	Enables Network Layer signalling (NLS) functionality.
	nls ag-id auth-key	Configures an Authorization Group Identifier (AG ID) for CMTS.

ofdm-freq-excl-band

To specify the range of frequencies on this port that are excluded from all OFDM channels, use the **ofdm-freq-excl-band** command in controller configuration mode. To undo the frequency range assignment, use **no** form of this command.

ofdm-freq-excl-band start-frequency *frequency* **width** *value*

no ofdm-freq-excl-band start-frequency *frequency* **width** *value*

Syntax Description

<i>frequency</i>	Frequency of the left edge of the exclusion band in Hz.
<i>value</i>	Width of the exclusion band in Hz. Valid range is from 1000000 to 1110000000.

Command Default

None.

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to specify the range of frequencies on this port that are excluded from all OFDM channels.

Examples

The following example shows how to specify the range of frequencies on this port that are excluded from all OFDM channels:

```
Router# configure terminal
Router(config)# controller integrated-cable 3/0/0
Router(config-controller)# ofdm-freq-excl-band start-frequency 10800000 width 1000000
```

ofdm channel-profile

To configure the OFDM RF channel, use the **ofdm channel-profile** command in RF-channel configuration mode. To undo the configuration, use **no** form of this command.

ofdm channel-profile *id***start-frequency** *frequency* [**width** *value*] [**plc** *plc-spectrum-start-freq*]

no ofdm channel-profile *id***start-frequency** *frequency* [**width** *value*] [**plc** *plc-spectrum-start-freq*]

Syntax Description

ofdm channel-profile <i>id</i>	OFDM RF channel profile.
start-frequency <i>frequency</i>	OFDM RF channel start frequency in Hz.
width <i>value</i>	Channel width in Hz.
plc <i>plc-spectrum-start-freq</i>	PLC spectrum start frequency in Hz.

Command Default

None.

Command Modes

RF-channel configuration (config-rf-chan)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to configure the OFDM RF channel.

Examples

The following example shows how to configure the OFDM RF channel:

```
Router# configure terminal
Router(config)# controller integrated-cable 3/0/0
Router(config-controller)# rf-chan 158
Router(config-rf-chan)# ofdm channel-profile 0 start-frequency 627000000 width 192000000
plc 720000000
```

onid

To override the default ONID, use the **onid** command in the service distribution group configuration mode. To revert back to the default ONID, use the **no** form of the command.

onid *number*

Syntax Description

number Defines the new ONID value. By default, the system ONID is 0, which is commonly used in North America.

Command Default

None.

Command Modes

Service distribution group configuration mode (config-video-sdg)

Command History

Release	Modification
Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command is used to override the default ONID value. If you perform this configuration, all channels associated with the configured SDG will have the new ONID value.

The following example shows how to override the default ONID value:

```
router#configure terminal
router(config)#cable video
router(config-video)#service-distribution-group sdg id 1
router(config-video-sdg)#onid 100
```

Related Commands

Command	Description
service-distribution-group	Defines a service distribution group.
rf-port integrated-cable	Defines the physical slot/bay/port to be used in a video service.
psi-interval	Override the default PSI value.
show cable video service-distribution-group	Displays the SDG configuration.

oui

To configure the Organizational Unique Identifier (OUI) of the CM for the CMTS tag, use the **oui** command in the cmts-tag configuration mode. To remove the configured OUI from the CMTS tag, use the **no** form of this command.

```
[exclude] oui oui-of-CM
no oui oui-of-CM
```

Syntax Description

exclude	(Optional) Configures the tag to exclude the specified OUI.
<i>oui-of-CM</i>	MAC address prefix of the vendor.

Command Default

None

Command Modes

CMTS tag mode (cmts-tag)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to configure the OUI for the CMTS tag using the **oui** command:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable tag 1
Router(cmts-tag)# oui 00.1a.c3
```

Related Commands

Command	Description
cable load-balance docsis-group	To configure a DOCSIS load balancing group on the CMTS.
show cable load-balance docsis-group	To display real-time configuration, statistical and operational information for load balancing operations on the router.
cable tag	To configure a tag for a DOCSIS load balancing group on the CMTS.

output-rate

Note Starting with Cisco IOS Release 12.2(33)SCG, the **output-rate** command is not supported on the Cisco uBR10012 router.

To specify a custom-defined output line rate to a WAN interface instead of the default output line rate, use the **output-rate** command in interface configuration mode. Use the **no** form of this command to use the default output line rate.

output-rate *rate*
no output-rate

Syntax Description

<i>rate</i>	Output rate to the WAN interface, in kilobits per second. Valid values range from 1 to 1,000,000.
-------------	---

Command Default

Gigabit Ethernet output line rate is 1,000,000 kbps.

Command Modes

Interface configuration (config-if)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
12.2(33)SCG	Support for this command was removed for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command specifies a custom-defined output line rate for the WAN interface.

Starting with Cisco IOS Release 12.2(33)SCG, the **output-rate** command is not supported and the value 10,000 is used for the output line rate on a Cisco uBR10012 router.

Examples

The following example shows how to specify a custom-defined output line rate for the WAN interface:

```
Router# configure terminal
Router(config)
)# interface gigabitethernet 1/0/0
Router(config-if)
)# output-rate 100
```

Related Commands

Command	Description
show running-config interface gigabitethernet	Displays the configuration settings for the specified Gigabit Ethernet interface.

Command	Description
show interfaces gigabitethernet	Displays the status and configuration settings for Gigabit Ethernet interfaces.

override

To override the Type/Length/Value (TLV) or SNMP when assigning a restricted load balancing group (RLBG) to CM, use the **override** command in the cmts-tag configuration mode. To reenable the TLV or SNMP when assigning a RLBG to CM, use the **no** form of this command.

override

no override

Command Default

TLV or SNMP are effective when assigning a RLBG to CM.

Command Modes

CMTS tag mode (cmts-tag)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to override the TLV or SNMP when assigning a RLBG using the **override** command:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable tag 1
Router(cmts-tag)# override
```

Related Commands

Command	Description
cable load-balance docsis-group	Configures a DOCSIS load balancing group on the CMTS.
show cable load-balance docsis-group	Displays real-time configuration, statistical, and operational information for load balancing operations on the router.
cable tag	Configures a tag for a DOCSIS load balancing group on the CMTS.

override

To override the default settings, use the **override** command in the DVB scrambling ECMG configuration mode. To void the override configuration, use the **no** form of this command.

override
no override

Command Default

None

Command Modes

DVB scrambling ECMG configuration mode (config-video-encrypt-dvb-ecmg)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to override the default settings:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dwb
Router(config-video-encrypt-dvb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dvb-ecmg)#override
Router(config-video-encrypt-dvb-ecmg-override)#
```

Related Commands

Command	Description
ecmg	Enters the ECM Generator configuration mode.
ac-start-delay	Specifies the time between start of first CP after a change in AC and start of ECM broadcast.
ac-stop-delay	Specifies the time between end of last CP preceding a change in AC and end of ECM broadcast.
max-comp-time	Specifies the maximum time needed by ECMG to compute an ECM.
max-streams	Specifies the maximum number of simultaneous open streams supported by the ECMG on a channel.
min-cp-duration	Specifies the minimum crypto period.
rep-period	Specifies the time between two ECM packets at the output.
start-delay	Specifies the delay between the start of CP and ECM broadcast.

Command	Description
stop-delay	Specifies the delay between the end of CP and ECM broadcast.
trans-start-delay	Specifies the transition start delay.
trans-stop-delay	Specifies the transition stop delay.

overwrite-scg

To enable Scrambling Control Group (SCG) overwrite, use the **overwrite-scg** command in the DVB scrambling EIS configuration mode. To disable the SCG overwrite, use the **no** form of this command.

overwrite-scg
no overwrite-scg

Command Default

None

Command Modes

DVB scrambling EIS configuration mode (config-video-encrypt-dvb-eis)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to enable Scrambling Control Group (SCG) overwrite:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dwb
Router(config-video-encrypt-dvb)#eis EIS-1 id 1
Router(config-video-encrypt-dvb-eis)#overwrite-scg
```

Related Commands

Command	Description
eis	Enters the Event Information Scheduler configuration mode.
listening-port	Configures the listening TCP port.
cp-overrule	Overrules and specifies the crypto period duration.

packetcable

To enable PacketCable operations on the Cisco CMTS, use the **packetcable** command in global configuration mode. To disable PacketCable operations, use the **no** form of this command.

packetcable
no packetcable

Syntax Description This command has no keywords or arguments.

Command Default PacketCable operation is disabled.

Command Modes Global Configuration (config)

Command History

Release	Modification
12.2(8)BC2	This command was introduced for the Cisco uBR7200 series universal broadband router.
12.2(11)BC1	Support was added for automatically creating a random Element ID when PacketCable operations are enabled.
12.2(15)BC1	Support was added for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command enables PacketCable operations on all cable interfaces and takes effect immediately. If you do not need to change any parameters from their default values, this is the only command needed to enable PacketCable operations.

In Cisco IOS Release 12.2(11)BC1 and later releases, this command also automatically creates a random Element ID for the CMTS that is in the range of 0 and 99,999. To ensure that this Element ID is unique across the entire PacketCable domain, you should use the **packetcable element-id** command.

Note PacketCable operations can be configured together with HCCP N+1 redundancy, but the PacketCable states are not synchronized between the Working and Protect interfaces. If a switchover occurs, existing voice calls continue, but when the user hangs up, PacketCable event messages are not generated because the Protect interface is not aware of the previous call states. However, new voice calls can be made and proceed in the normal fashion.

Channel Width Limitations

The 200,000 Hz channel width cannot be used on upstreams that support PacketCable voice calls, or on any upstreams that use Unsolicited Grant Service (UGS) or UGS with Activity Detection (UGS-AD) service flows. Using this small a channel width with voice and other UGS/UGS-AD service flows results in calls being rejected because of “DSA MULTIPLE ERRORS”.

Examples

The following example shows PacketCable operation being enabled:

```
Router# configure terminal
Router(config)# packetcable
Router(config)#
```

The following example shows PacketCable operation being disabled (default):

```
Router# configure terminal
Router(config)# no packetcable
Router(config)#
```

Related Commands

Command	Description
clear packetcable gate counter commit	Resets the counters that track the total number of committed gates.
packetcable authorize vanilla-docsis-mta	Allows Unsolicited Grant Service (UGS) service flows without a proper PacketCable gate ID when PacketCable operations are enabled on the Cisco CMTS.
packetcable element-id	Configures the PacketCable Event Message Element ID.
packetcable gate maxcount	Changes the maximum number of PacketCable gate IDs in the gate database on the Cisco CMTS.
packetcable timer	Changes the value of the different PacketCable DQoS timers.
show packetcable gate	Displays information about one or more gates in the gate database.
show packetcable gate counter commit	Displays the total number of committed gates since system reset or since the counter was last cleared.
show packetcable global	Displays the current PacketCable configuration.

packetcable authorize vanilla-docsis-mta

To allow Unsolicited Grant Service (UGS) service flows without a proper PacketCable gate ID when PacketCable operations are enabled on the Cisco CMTS, use the **packetcable authorize vanilla-docsis-mta** command in global configuration mode. To prevent CMs from requesting non-PacketCable UGS service flows when PacketCable operations are enabled, use the **no** form of this command.

packetcable authorize vanilla-docsis-mta
no packetcable authorize vanilla-docsis-mta

Syntax Description

This command has no keywords or arguments.

Command Default

Non-PacketCable UGS service flows are not allowed when PacketCable operations are enabled.

Command Modes

Global Configuration (config)

Command History

Release	Modification
12.2(11)BC2	This command was introduced for the Cisco uBR7200 series universal broadband router.
12.2(15)BC1	Support was added for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

By default, when PacketCable operations are enabled (using the **packetcable** ccommand), CMs must follow the PacketCable protocol when requesting UGS service flows. This prevents DOCSIS CMs that do not support PacketCable operations from using DOCSIS-style UGS service flows.

If you have a mixed network that contains both PacketCable and non-PacketCable DOCSIS CMs, you can allow DOCSIS CMs to request UGS service flows by using the **packetcable authorize vanilla-docsis-mta** command. If, however, your CMTS is providing PacketCable services, use the **no packetcable authorize vanilla-docsis-mta** command to disable DOCSIS-style service flows. This is the default configuration when PacketCable operations are enabled, and it requires that CMs must provide a validly authorized gate ID before being granted a UGS service flow.

Examples

The following example shows PacketCable operation being enabled, while still allowing DOCSIS-style UGS service flows:

```
Router# configure terminal
Router(config)# packetcable
Router(config)# packetcable authorize vanilla-docsis-mta
```

The **show packetcable global** command has also been enhanced to display whether non-PacketCable DOCSIS-style UGS service flows are allowed.

The following is a sample output on the Cisco uBR10012 router:

```
Router# show packetcable global
Packet Cable Global configuration:
```

```

Enabled      : Yes
Element ID: 12456
Max Gates   : 1048576
Allow non-PacketCable UGS
Default Timer value -
  T0        : 30000 msec
  T1        : 300000 msec
  T2        : 2000 msec
  T5        : 500 msec
Router#

```

The following is a sample output on a Cisco cBR series router:

```

Router# show packetcable global
Packet Cable Global configuration:
Packetcable DQOS Enabled      : Yes
Packetcable Multimedia Enabled : No
Element ID: 88330
Max Gates   : 512000
Allow non-PacketCable UGS
Default Multimedia Timer value -
  T1          : 200000 msec
  Persistent gate : 0 hour
  Volume Limit   : STOPPED
Default DQoS Timer value -
  T0          : 30000 msec
  T1          : 300000 msec
Client Accept Timer: Disabled
Client Accept Timer Expired: 0
Packetcable DQOS Gate Send SubscriberID Enabled: No
Router#

```

Related Commands

Command	Description
clear packetcable gate counter commit	Resets the counters that track the total number of committed gates.
packetcable	Enables PacketCable operations on the Cisco CMTS.
packetcable element-id	Configures the PacketCable Event Message Element ID.
packetcable gate maxcount	Changes the maximum number of PacketCable gate IDs in the gate database on the Cisco CMTS.
packetcable timer	Changes the value of the different PacketCable DQoS timers.
show packetcable gate	Displays information about one or more gates in the gate database.
show packetcable gate counter commit	Displays the total number of committed gates since system reset or since the counter was last cleared.
show packetcable global	Displays the current PacketCable configuration.

packetcable element-id

To configure the PacketCable Event Message Element ID on the Cisco CMTS, use the **packetcable element-id** command in global configuration mode. To reset the counter to its default value, use the **no** form of this command.

packetcable element-id *n*
no packetcable element-id

Syntax Description

<i>n</i>	PacketCable Event Message Element ID for the Cisco CMTS. The valid range is 0 through 99999, with a default that is a random number in that range.
----------	--

Command Default

A random value between 0 and 99,999.

Command Modes

Global Configuration (config)

Command History

Release	Modification
12.2(11)BC1	This command was introduced for the Cisco uBR7200 series universal broadband router.
12.2(15)BC1	Support was added for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The PacketCable Event Message specification (PKT-SP-EM-I03-011221) requires that each trusted PacketCable network element that generates an Event Message MUST identify itself with a static Element ID that is unique across an entire PacketCable domain. This command allows you to configure the CMTS with an Element ID that is unique for your particular network. If you do not manually configure this parameter with the **packetcable element-id** command, it defaults to a random value between 0 and 99,999 when PacketCable operations is enabled.

The CMTS includes the Element ID in its Event Messages, along with its timezone information. You can display the current value using the **show packetcable global** command.

Examples

The following example shows the Event Message Element ID for this particular CMTS being set to 12456:

```
Router# configure terminal
Router(config)# packetcable element-id 12456
Pktcbl: Configured element ID 12456
Router(config)#
```

Related Commands

Command	Description
packetcable	Enables PacketCable operations on the Cisco CMTS.

Command	Description
packetcable authorize vanilla-docsis-mta	Allows Unsolicited Grant Service (UGS) service flows without a proper PacketCable gate ID when PacketCable operations are enabled on the Cisco CMTS.
packetcable gate maxcount	Changes the maximum number of PacketCable gate IDs in the gate database on the Cisco CMTS.
packetcable timer	Changes the value of the different PacketCable DQoS timers.
show packetcable global	Displays the current PacketCable configuration, including the Element ID.

packetcable gate maxcount

To change the maximum number of PacketCable gate IDs in the gate database on the Cisco CMTS, use the **packetcable gate maxcount** command in global configuration mode. To reset the counter to its default value, use the **no** form of this command.

packetcable gate maxcount *n*
no packetcable gate maxcount

Syntax Description

<i>n</i>	Maximum number of gate IDs to be allocated in the gate database on the CMTS. The valid range on the Cisco uBR10012 and Cisco uBR7200 series routers is 512 through 2097152, with a default value of 2097152 (8 * 512 * 512), which is sufficient to support 8 cable interface line cards. The valid range on the Cisco cBR series routers is 1 to 512000 and the default is 512000.
----------	---

Command Default

2097152 gate IDs on the Cisco uBR10012 and Cisco uBR7200 series routers.
 512000 gate IDs on the Cisco cBR series routers.

Command Modes

Global Configuration (config)

Command History

Release	Modification
12.2(8)BC2	This command was introduced for the Cisco uBR7200 series universal broadband router.
12.2(11)BC2	The maximum number of possible gates and the default number of gates were doubled from 1,048,576 to 2,097,152 to accommodate a maximum of eight cable interface line cards (where each cable interface line card can use a maximum of 512*512, or 262,144, gates).
12.2(15)BC1	Support was added for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command configures the number of gate IDs that the Cisco CMTS can store in its gate database. Because each PacketCable gate ID typically refers to both an upstream gate and a downstream gate, multiply this number by 2 to get the maximum number of gates that can be created on the Cisco CMTS.

Note Each cable interface line card on the Cisco uBR10012 and Cisco uBR7200 series routers supports a maximum of 512*512 (262,144) PacketCable gates, so ensure that you set the maximum number of gates to accommodate all installed cable interface line cards.

Examples

The following example shows the maximum number of gate IDs being set to 524288 on the Cisco uBR10012 router, which is sufficient for two cable interface line cards:

```
Router# configure terminal
Router(config)# packetcable gate maxcount 524288
```

The following example shows the maximum number of gate IDs being set to 10 on a Cisco cBR series router:

```
Router# configure terminal
Router(config)# packetcable gate maxcount 10
```

Related Commands

Command	Description
packetcable	Enables PacketCable operations on the Cisco CMTS.

show packetcable global	Displays the current PacketCable configuration.

packetcable gate send-subscriberID

To include subscriber identification in GATE-OPEN and GATE-CLOSE gate control messages, use the **packetcable gate send-subscriberID** command in global configuration mode. To remove subscriber identification information from the gate control messages, use the **no** form of this command.

packetcable gate send-subscriberID
no packetcable gate send-subscriberID

Syntax Description This command has no arguments or keywords.

Command Default No subscriber identification information is provided in the GATE-OPEN and GATE-CLOSE gate control messages.

Command Modes Global configuration (config)

Release	Modification
12.3(23)BC1	This command was introduced.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples The following example enables gate control subscriber identification information using the **packetcable gate send-subscriberID** command:

```
Router(config)# packetcable gate send-subscriberID
```

Command	Description
packetcable	Enables PacketCable operation.
show packetcable gate	Displays information about one or more gates in the gate database.
show packetcable global	Displays the current PacketCable configuration.

packetcable multimedia

To enable the Cisco CMTS router to start or stop responding to PCMM COPS messages received from the PCMM Policy Server, use the **packetcable multimedia** command in the Global Configuration (config) mode.

packetcable multimedia**no packet cable multimedia**

To configure the SessionClassID that the Cisco CMTS router applies to high priority PCMM calls, use the **packetcable multimedia high-priority** command in the Global Configuration (config) mode.

packetcable multimedia high-priority *priority***Syntax Description**

high-priority To configure the SessionClassID for high priority calls.

priority SessionClassID of the high priority (911) calls.

Command Default

The default SessionClassID of high priority (911) calls is 15.

Command Modes

Global Configuration (config)

Command History

Release	Modification
IOS-XE 3.15.0S	The packetcable multimedia command was implemented on the Cisco cBR Series Converged Broadband Routers.
Cisco IOS XE Amsterdam 17.3.1x	The packetcable multimedia high-priority command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Enable packetcable multimedia before you use **packetcable multimedia high-priority** *priority*.

packetcable timer

To change the value of the different PacketCable Dynamic Quality of Service (DQoS) timers, use the **packetcable timer** command in global configuration mode. To reset a timer to its default value, use the **no** form of this command.

```
packetcable timer {T0 timer-value | T1 timer-value | multimedia T1 timer-value}
no packetcable timer {T0 timer-value | T1 timer-value | multimedia T1 timer-value}
```

Syntax Description

T0 <i>timer-value</i>	Sets the T0 timer in milliseconds. The valid range is from 1 to 1,000,000,000 milliseconds, with a default value of 30000 milliseconds (30 seconds).
T1 <i>timer-value</i>	Sets the T1 timer in milliseconds. The valid range is from 1 to 1,000,000,000 milliseconds, with a default value of 200000 milliseconds (200 seconds).
multimedia T1 <i>timer-value</i>	Sets the PacketCable multimedia T1 timer in milliseconds. The valid range is 1 to 1,000,000,000 milliseconds, with a default value of 200000 milliseconds (200 seconds).

Command Default

None

Command Modes

Global Configuration (config)

Command History

Release	Modification
12.2(8)BC2	This command was introduced for the Cisco uBR7200 series universal broadband router.
12.2(11)BC2	The T2 and T5 timers were removed to conform to the requirements of the PacketCable DQoS Engineering Change Notice (ECN) 02148.
12.2(15)BC1	Support was added for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command sets the following timers, which are defined in the *PacketCable™ Dynamic Quality-of-Service Specification* (PKT-SP-DQOS-I03-020116):

- T0 specifies the amount of time that a gate ID can remain allocated without any specified gate parameters. The timer begins counting when a gate is allocated with a Gate-Alloc command. The timer stops when a Gate-Set command marks the gate as Authorized. If the timer expires without a Gate-Set command being received, the gate is deleted.
- T1 specifies the amount of time that an authorization for a gate can remain valid. It begins counting when the CMTS creates a gate with a Gate-Set command and puts the gate in the Authorized state. The timer stops when the gate is put into the committed state. If the timer expires without the gate being committed, the CMTS must close the gate and release all associated resources.

Note The new timer values apply to all gates that are created after giving the command. Existing gates are not affected.

Examples

The following example shows the T0 timer being set to 20 seconds (20,000 milliseconds):

```
Router# configure terminal
Router(config)# packetcable timer T0 20000
```

Syntax Description	
<i>hour</i> <i>hour:minutes</i>	Specifies the time of day, in either hh or hh:mm format, during which monitoring occurs for the peak time. If the time is specified in hour (hh), the valid range is 1 to 23 using a 24-hour clock. If the time is specified in hour:minutes (hh:mm), the valid range for hour is 1 to 23 using a 24-hour clock, and the valid range for minutes is 0 to 59.
duration <i>minutes</i>	Specifies the size of the sliding window (in minutes) during which the subscriber usage is monitored for the first peak time, and optionally for a second peak time when used with the peak-time2 keyword. The valid range is 60 to 1440. For Cisco cBR Series Converged Broadband Routers, the valid range is 6 to 1440.
avg-rate <i>rate</i>	Specifies the average sampling rate in kilobits per second for the specified duration. The valid range is 1 to 400000 kilobits with no default.
duration <i>offpeak-minutes</i>	(Optional) Specifies the size of the sliding window (in minutes) during which the subscriber usage is monitored for the remaining offpeak time (time not specified for peak monitoring). The valid range is 60 to 1440. For Cisco cBR Series Converged Broadband Routers, the valid range is 6 to 1440.
avg-rate <i>offpeak-rate</i>	Specifies the average sampling rate in kilobits per second for the specified offpeak duration. The valid range is 1 to 400000 kilobits with no default.

peak-time2 hour hour:minutes	(Optional) Specifies the time of day during which monitoring occurs for a second peak time. The time can be specified either in hour or hour:minutes format. The valid range for hour is 1 to 23 using a 24-hour clock, and the valid range for minutes is 0 to 59.
sample-interval minutes	Specifies how often (in minutes) the CMTS router should sample a service flow to get an estimate of subscriber usage. The valid range is 1 to 30, with a default value of 15.
penalty minutes	(Optional) Specifies the period (in minutes) during which a cable modem can be under penalty. The valid range is 1 to 10080.
penalty-period minutes	(Optional) Specifies the period during which an enforced quality of service (QoS) profile should be in force for subscribers who violate their registered QoS profile.
downstream	Specifies monitoring of traffic in the downstream direction.
upstream	Specifies monitoring of traffic in the upstream direction.
enforce	(Optional) Specifies that the enforce-rule QoS profile should be applied automatically if a user violates their registered QoS profile.

Command Default

Peak and offpeak monitoring is disabled. The only default value for the **peak-time1** command is the 15-minute sample interval.

Command Modes

Enforce-rule configuration (enforce-rule)

Command History

Release	Modification
12.3(9a)BC	This command was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCD2	The minute-level granularity (hh:mm) for peak-time1 and peak-time2 duration, and the penalty keyword option were added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The penalty keyword option was removed. The penalty-period option was added.

Usage Guidelines

Note This command is applicable only after the **monitoring-basics** command is configured with the keyword **peak-offpeak**.

You can monitor two peak monitoring periods using the initial **peak-time1** command and its options, followed by the **peak-time2** keyword and the corresponding options. The remaining hours are considered offpeak and can be monitored by configuring the optional **duration** keyword and the corresponding options.

The **penalty** duration, which is configured using the **peak-time1** command, is unique to weekdays, and takes precedence over the global penalty duration configured using the **penalty-period** command.

When you use the **show running-configuration** command to display the configuration, the keyword options for the **peak-time1** command are truncated. In the following example, “d” represents **duration** (a single peak and offpeak duration are configured), “avg” represents **avg-rate**, “sa” represents **sample-interval**, “pen” represents penalty, “do” represents **downstream**, and “enf” represents **enforce**:

```
Router# show running-configuration
.
.
.
peak-time1 1 d 60 avg 2 d 60 avg 40 sa 10 pen 11 do enf
```

Examples

The following example shows an enforce-rule that defines two peak monitoring periods for upstream traffic:

```
Router(enforce-rule)# peak-time1 10:30 duration 120 avg-rate 10 peak-time2 23 duration 60
avg-rate 10 sample-interval 10 penalty 11 upstream enforce
```

The following example shows an enforce-rule being configured on a Cisco cBR Series Converged Broadband Router:

```
Router(enforce-rule)# peak-time1 1 duration 6 avg-rate 1 sample-interval 1 penalty-period
1 downstream enforce
```

Related Commands

Command	Description
cable qos enforce-rule	Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode.
debug cable subscriber-monitoring	Displays enforce-rule debug messages for subscriber traffic management on the Cisco CMTS routers.
duration	Specifies the time period and sample rate to be used for monitoring subscribers.
monitoring-basics	Specifies the type of monitoring for subscriber traffic management on a Cisco CMTS router.
penalty-period	Specifies the period during which an enforced quality of service (QoS) profile should be in force for subscribers who violate their registered QoS profile.
qos-profile enforced	Specifies a QoS profile that should be enforced when users violate their registered QoS profiles. This command is applicable for DOCSIS 1.0 cable modems
qos-profile registered	Specifies the registered QoS profile that should be used for this enforce-rule. This command is applicable for DOCSIS 1.0 cable modems

Command	Description
service-class (enforce-rule)	Identifies a particular service class for cable modem monitoring in an enforce-rule. This command is applicable for DOCSIS 1.1 or later cable modems.
show cable qos enforce-rule	Displays the QoS enforce-rules that are currently defined.
show cable subscriber-usage	Displays subscribers who are violating their registered QoS profiles.
weekend peak-time1	Configures peak and offpeak subscriber monitoring over weekends on a Cisco CMTS router.

penalty-period

To specify the time period that an enforced quality of service (QoS) profile should be in force for subscribers that violate their registered QoS profile, use the **penalty-period** command in enforce-rule configuration mode. To reset an enforce-rule to its default penalty period, use the **no** form of this command.

penalty-period *minutes* [**time-of-day** *hour*]
no **penalty-period** *minutes* [**time-of-day** *hour*]

Cisco cBR Series Converged Broadband Routers

penalty-period *minutes* [**time-of-day** {*hourhour:minutes*} **monitoring-on**]
no **penalty-period** *minutes* [**time-of-day** {*hourhour:minutes*} **monitoring-on**]

Syntax Description	
<i>minutes</i>	Specifies a time period (in minutes) during which a cable modem (CM) can be under penalty. The range is 1 to 10080, with a default value of 10080 (7 days).
time-of-day { <i>hour</i> / <i>hour:minutes</i> }	(Optional) Specifies the time of day (in hh or hh:mm format) when: <ul style="list-style-type: none"> • A CM that is under penalty is released from the penalty period. • A CM that is not under penalty has its subscriber monitoring counters reset. If the time of day is specified in hour (hh), the valid range is 1 to 23 using a 24-hour clock. If the time of day is specified in hour:minutes (hh:mm), the valid range for hour is 1 to 23 using a 24-hour clock, and the valid range for minutes is 0 to 59.
monitoring-on	(Optional) Specifies that monitoring should be turned on after the penalty release time. If this keyword is not specified, by default, monitoring is turned off after the release time, until the end of the day, that is 00:00 hrs.

Command Default The default time period is 10080 minutes (7 days).

Command Modes Enforce-rule configuration (enforce-rule)

Command History	Release	Modification
	12.2(15)BC1	This command was introduced.
	12.3(9a)BC	This command was integrated into Cisco IOS Release 12.3(9a)BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	12.3(23)BC2	The time-of-day keyword option was added.
	12.2(33)SCB	The time-of-day keyword option was integrated into Cisco IOS Release 12.2(33)SCB.
	12.3(23)SCD2	The minute-level granularity for the time-of-day duration, and the monitoring-on keyword option were added.

Release	Modification
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

When a subscriber overconsumes the maximum bandwidth that is specified in the enforce-rule, the Cisco CMTS router can automatically switch the subscriber to an enforced QoS profile for the time duration configured with the **penalty-period** command. When the penalty period expires, the Cisco CMTS router restores the subscriber to their registered QoS profile.

The penalty duration specified in the **penalty-period** command is a global configuration. This penalty duration is overridden if the individual penalty duration is already configured using the **duration**, **weekend duration**, **peaktime1** or **weekend peaktime1** commands. Similarly, if the individual penalty duration is not configured, the global penalty duration is used. The table below explains in detail the criteria for choosing the penalty duration:

Table 33: Criteria for Choosing Penalty Duration

Global Penalty-Period Configured	Weekday Penalty-Period Configuration (CLI: duration or peaktime1)	Weekend Penalty-Period Configuration (CLI: weekend duration, or weekend peaktime1)	Applied Penalty Duration for Weekdays	Applied Penalty Duration for Weekends
Yes	Yes	Yes	Weekday Penalty Configuration	Weekend Penalty Configuration
Yes	Yes	No	Weekday Penalty Configuration	Global Penalty Configuration
Yes	No	Yes	Global Penalty Configuration	Weekend Penalty Configuration
Yes	No	No	Global Penalty Configuration	Global Penalty Configuration

If the keyword monitoring-on is specified, monitoring starts immediately after the cable modems are released from penalty. However if this keyword is not specified, by default, all the cable modems using the enforce-rule are not monitored until the end of day, that is, 00:00 hrs.

The penalty period continues across reboots of the cable modem, so a user cannot avoid the enforced QoS profile by trying to reset their modem and reregister on the cable network. This allows service providers to set an appropriate penalty for users who consistently exceed the allocated maximum bandwidth.

Note To manually move a DOCSIS 1.0 cable modem back to its registered profile before the end of the penalty period, use the **cable modem qos profile** command. To manually move a DOCSIS 1.1(or later) cable modem back to its registered profile before the end of the penalty period, use the **cable modem {ip-address | mac-address} service-class-name** command.

When you change the configuration of a currently active enforce-rule, that rule begins using the new configuration immediately to manage the cable modems tracked by this enforce-rule.

Note Before making any changes to an active enforce-rule, we recommend that you first disable the enforce rule using the no enabled command.

A cable modem consists of two service flows, Primary upstream and Primary downstream. If a DOCSIS 1.0 cable modem enters the penalty period because one of its service flows has exceeded its allowed bandwidth, the QoS profile of the entire modem is changed. However, if a DOCSIS 1.1 or later cable modem enters the penalty period because its upstream or downstream service flow has exceeded the allowed bandwidth threshold, the service class name is changed only for the upstream or downstream service flow.

Examples

The following example shows an enforce-rule named “test”, which is configured with a penalty period of 1440 minutes (1 day):

```
Router# configure terminal
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# penalty-period 1440
```

The following example shows an enforce-rule named “test”, which is configured with a penalty period of 1440 minutes (1 day), but allowing the removal of the cable modems in penalty at 23:00. Monitoring will be turned off by default at 23:00, to 00:00 (1 hour):

```
Router# configure terminal
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# penalty-period 1440 time-of-day 23
```

The following example shows an enforce-rule named “test”, which is configured with a penalty period of 1440 minutes (1 day), allowing the removal of the cable modems in penalty at 23:00. However, after the cable modems are released from penalty, fresh monitoring starts, with all the subscriber monitoring counters reset to 0:

```
Router# configure terminal
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# penalty-period 1440 time-of-day 23 monitoring-on
```

The following example shows an enforce-rule being configured with a penalty period on a Cisco cBR Series Converged Broadband Router:

```
Router(enforce-rule)# penalty-period 1 time-of-day 1 monitoring-on
```

Related Commands

Command	Description
activate-rule at-byte-count	Specifies the number of bytes that a subscriber can transmit during the monitoring period on a Cisco CMTS router.

Command	Description
cable qos enforce-rule	Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic monitoring, and enters the enforce-rule configuration mode.
duration	Specifies the time period and sample rate to be used for monitoring subscribers.
enabled (enforce-rule)	Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.
qos-profile enforced	Specifies a QoS profile that should be enforced when users violate their registered QoS profiles. This command is applicable for only DOCSIS 1.0 cable modems.
qos-profile registered	Specifies the registered QoS profile that should be used for this enforce-rule. This command is applicable for only DOCSIS 1.0 cable modems.
service-class (enforce-rule)	Specifies a service class (enforced or registered) that should be used for the cable modem monitoring in an enforce-rule. This command is applicable for DOCSIS 1.1 or later cable modems.
show cable qos enforce-rule	Displays the QoS enforce-rules that are defined.
show cable subscriber-usage	Displays subscribers who are violating their registered QoS profiles.

periodic-rel-pxf enable

To enable the Reload PXF in the Standby PRE Support feature, use the **periodic-rel-pxf enable** command in redundancy configuration mode. To disable the Reload PXF in the Standby PRE feature, use the **no** form of this command.

periodic-rel-pxf enable
no periodic-rel-pxf enable

Syntax Description This command has no arguments or keywords.

Command Default None

Command Modes Redundancy configuration (config-red)

Command History	Release	Modification
	12.2(33)SCG2	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **periodic-rel-pxf enable** command is used to enable the [Reload PXF on Standby PRE Support feature](#). The **periodic-rel-pxf enable** command is supported on Cisco uBR10012 router only.

Examples The following example shows how to enable the Reload PXF on Standby PRE feature on the Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# redundancy
Router(config-red
)# periodic-rel-pxf enable
Router(config-red
)# end
```

Related Commands	Command	Description
	redundancy	Enters redundancy configuration mode.

ping docsis

To determine whether a specific cable modem (CM) is reachable from the CMTS at the DOCSIS MAC layer, use the **ping docsis** command in privileged EXEC mode.

```
ping docsis {mac-addr ip-addr | name fqdn} [count] [repeat queue-intervals] [verbose]
```

Cisco cBR Series Converged Broadband Routers

```
ping docsis {mac-addr ip-addr } [count] [repeat queue-intervals] [verbose]
```

Syntax Description

<i>mac-addr</i>	The 48-bit hardware (MAC) address of the CM. If you specify the MAC address of a CPE device, the command will resolve it to the MAC address of the CM servicing that CPE device and send the DOCSIS ping to the CM.
<i>ip-addr</i>	IPv4 or IPv6 address of the CM. If you specify the IP address of a CPE device, the command will resolve it to the IP address of the CM servicing that CPE device and send the DOCSIS ping to the CM.
name fqdn	Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router.
repeat queue-intervals	(Optional) Specifies the number of maintenance intervals for a queue. Valid values are from 1 to 2147483647.
verbose	(Optional) Specifies verbose mode for the output, giving additional details about the packets transmitted and received.

Command Default

If no count is specified, five DOCSIS ping packets are sent.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
11.3 NA	This command was introduced for the Cisco uBR7200 series router.
12.0(4)XI1	Support was added for the Cisco uBR924 cable access router.
12.1(3)XL	Support was added for the Cisco uBR905 cable access router.
12.1(5)XU1	Support was added for the Cisco CVA122 Cable Voice Adapter.
12.1(1a)T1	The command output was enhanced.
12.1(3)XQ1	Support was added for wireless radio modems.
12.1(5)EC	Support was added for the Cisco uBR7100 series routers.
12.2(2)XA	Support was added for the Cisco uBR925 cable access router.

Release	Modification
12.2(1)XF1	Support was added for the Cisco uBR10012 router.
12.2(4)BC1	This command was integrated into Cisco IOS Release 12.2(4)BC1.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM.
12.2(33)SCC	The repeat keyword was added to specify maintenance intervals for queues.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The name keyword and <i>fqdn</i> variable were removed.

Usage Guidelines

The DOCSIS ping is a unique Cisco patented technology that allows a cable operator to quickly diagnose the health of a channel between the CMTS router and any particular DOCSIS cable CPE device. The DOCSIS ping is similar in concept to the IP ping but uses the lower MAC layer instead of the datalink or transport layers. Using the MAC layer has two major advantages:

- A DOCSIS ping uses only 1/64 of the bandwidth of an IP ping.
- A DOCSIS ping can be used with CMs that have not yet acquired an IP address. This allows cable operators to ping CMs that were not able to complete registration or that were improperly configured at the IP layer.

In addition to providing connectivity information, the **ping docsis** command provides a real-time view and plot of requested power adjustments, frequency, timing offset adjustments, and a measure of optimal headend reception power.

If a CM responds to the **ping docsis** command, but does not respond to an IP ping, the problem could be one of the following:

- The CM is still in the registration process and has not yet come completely online. In particular, the CM could be waiting for the DHCP server to assign it an IP address.
- Severe interference or other faults on the physical layer (either the upstream or downstream).
- Significant upstream signal error, distortion, or amplitude errors, often resulting in frequent power adjustments (which are shown in the cable flap list).
- A non-DOCSIS compliant upstream carrier-to-noise power ratio (C/N) that is between 14 and 21 dB, along with a mixed modulation profile, such as ranging request/response messages being sent in QPSK mode and short and long data grants in 16-QAM mode.

Note The **ping docsis** command is a DOCSIS-compliant process that can be used with any two-way DOCSIS-compliant CM; the CM does not require any special features or code. The **ping docsis** command cannot be used with telco-return CMs.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

The table below explains the different characters that can appear in the output for the **ping docsis** command:

Table 34: ping docsis Command Output Characters

Output Character	Description
!	Indicates that a successful response was received from the ping request. This indicates that the CM is reachable from the CMTS and can respond to CMTS requests at the DOCSIS MAC layer.
.	Indicates that a DOCSIS ping request was sent out but that the ping request timed out without receiving a response. This indicates that the CM is having difficulties maintaining DOCSIS MAC layer connectivity to the CMTS. Note If the ping docsis command displays a number of periods (.) along with exclamation points (!), it strongly indicates the presence of RF noise or physical cable and plant issues that is causing a loss of MAC layer connectivity.
a	Indicates that a response was received but that an adjustment of frequency, power, or timing was also made in the response. This indicates that, although the upstream channel is functional, some sort of problem is forcing power averaging and other misreads of the upstream received power signals.
f	Indicates that the CMTS failed to send the DOCSIS ping request because the CM is offline, and therefore MAC-layer communication is not possible. This indicates that the CM had previously registered with the CMTS, but that at some point it stopped responding to the DOCSIS station maintenance messages and that the CMTS eventually marked the CM as offline. The CM might have lost power or might have been disconnected from the coaxial cable. Tip Use the show cable modem command with the same MAC or IP address as you used with the ping docsis command to show the current status of this CM.

Note If a CM is already in the flap list, the **ping docsis** command increments the hit, miss, and power-adjustment fields for it in the cable flap list.

Examples

Note The following example shows a default **ping docsis** command that sends five packets to the CM with the MAC address of 00d0.ba77.7595, with a response being received for each:

```

Queueing 22 MAC-layer station maintenance intervals, timeout is 25 msec:
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
Success rate is 100 percent (22/22)

```

Related Commands

Command	Description
cable flap-list aging	Specifies the number of days to keep a CM in the flap-list table before aging it out of the table.
cable flap-list insertion-time	Sets the insertion time interval that determines whether a CM is placed in the flap list.
cable flap-list miss-threshold	Specifies miss threshold for recording a flap-list event.
cable flap-list power-adjust threshold	Specifies the power-adjust threshold for recording a CM flap-list event.
cable flap-list size	Specifies the maximum number of CMs that can be listed in the flap-list table.
clear cable flap-list	Clears all the entries in the flap-list table.
ping	Outputs one or more IP ping requests to a particular IP address.
show cable flap-list	Displays the current contents of the flap list.

ping docsis pnm

To send RxMER probes on OFDMA channel assigned to the modem, use the **ping docsis pnm** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Routers

ping docsis pnm *mac-address* [**ignore** | **upstream** *us-channel* [**ignore**]]

Syntax Description

<i>mac-address</i>	MAC address of a specific CM to be displayed.
--------------------	---

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1c	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The usage for each of the commands are listed below:

- **ping docsis pnm** *mac-address* : sends RxMER probes on each OFDMA channel assigned to the modem. If enabled, auto profile management will analyze the results and potentially change the active profile.
- **ping docsis pnm** *mac-address upstream us-channel* : sends RxMER probes on a specified OFDMA channel assigned to the modem. If enabled, auto profile management will analyze the results and potentially change the active profile.
- **ping docsis pnm** *mac-address ignore*: sends RxMER probes on each OFDMA channel assigned to the modem. Auto profile management will always **ignore** the results of the probe.
- **ping docsis pnm** *mac-address upstream us-channel ignore*: sends RxMER probes on a specified OFDMA channel assigned to the modem. Auto profile management will always **ignore** the results of the probe.

Examples

The following example shows how to configure the system to send RxMER probes on OFDMA channel assigned to the modem:

```
Router# ping docsis pnm 34bd.fa0c.b480
```

Related Commands

Command	Description
show cable modem prof-mgmt upstream	Displays the results of RxMER probes.

platform power protection

To configure voltage thresholds to switch between different modes when power budget provided by AC PSMs is not sufficient to power Field Replaceable Units (FRUs), use the **platform power protection** command in global configuration mode. To use the default voltage thresholds, use the **no** form of the command.

By default, power protection action is disabled to avoid service outage. If protection action is disabled, any online FRU is not powered down in the event of insufficient power budget, but any newly installed line card is not powered up. To enable power protection action, use the **platform power protection action shutdown linecard** command.

platform power protection ac220v *voff von*

no platform power protection ac220v

platform power protection action shutdown linecard

Syntax Description

voff Specifies the hysteresis threshold value value. The hysteresis thresholds define when the PSM should switch modes.

For example, if the *voff* value is configured as 180V, the PSM switches to the 120V mode with 1300W capacity when input voltage drops below 180V.

von Specifies the hysteresis threshold value value. The hysteresis thresholds define when the PSM should switch modes.

For example, if the *von* value is configured as 200V, the PSM switches to the 220V mode when input voltage increases to more than 200V.

Command Default

The default value of *voff* is 190V while the default value of *von* is 197V.

Command Modes

Global configuration (config)

Command History

Release	Modification
IOS-XE 16.7.1	This command was introduced on the Cisco eBR Series Converged Broadband Routers.

Examples

The following example shows a sample configuration:

```
Router# configure terminal
Router(config)# platform power protection ac220v 180 200
Router(config)#
```

The following example shows how to enable power protection action.

```
Router# configure terminal
Router(config)# platform power protection action shutdown linecard
```

The following example shows how to verify the voltage threshold configuration.

```
Router# configure terminal  
Router(config)# sh run | i protection  
platform power protection ac220v 180 200
```

platform punt-policer

To rate-limit the aggregate punt-rate on a per-punt-cause basis, use the **platform punt-policer** command in global configuration mode. Using the **no** form of the command returns the rate to the default value.

platform punt-policer { **cable-snmpp** | *punt-cause_value* } *rate_value* [**high**]

no platform punt-policer

Syntax Description	
punt-policer <i>punt-cause_value</i>	Specifies the punt cause value. <i>punt-cause_value</i> can be obtained from show platform software punt-policer command.
cable-snmpp	This is the punt-cause assigned to SNMP packets destined to the CMTS.
<i>rate_value</i>	Specifies the rate in packets/second. The range is from 10 to 300000.

Command Default The default rate is 512 packets/second.

Command Modes Global configuration (config)

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
	IOS XE 16.12.1z1	This command was updated. cable-snmpp was added as a new punt cause to rate-limit SNMP packets destined to cBR-8.

Usage Guidelines In most cases, cable-snmpp punts are normal priority.

Examples The following example shows a sample configuration:

```
Router# configure terminal
Router(config)# platform punt-policer cable-snmpp 1000
Router(config)#
```

Related Commands	Command	Description
	show platform software punt-policer	Displays configuration and statistics for the per-cause punt-policer.
	show platform hardware qfp active infrastructure punt-policer summary	Displays detailed configuration data and statistics for the per-cause punt-policer.
	show platform hardware qfp active infrastructure punt summary	Displays the punt summary statistics which includes a summary of punted packets and aggregate drop-counts from CoPP, SBRL, the punt-policer and the global policer.
	show platform hardware qfp active infrastructure punt sbrl	Displays the SBRL statistics.

Command	Description
platform punt-sbri	Rate-limit packet streams identified by the Source-Based Rate-Limit (SBRL).
show policy-map control-plane	Displays configuration and statistics for the control-plane service-policy.
clear control-plane	Clears the control-plane service-policy statistics.
show platform hardware qfp active infrastructure punt statistics type global-drop	Displays the global punt-policer statistics.

platform punt-sbri

To rate-limit packet streams identified by the Source-Based Rate-Limit (SBRL), use the **platform punt-sbri** command in global configuration mode. To disable the rate-limiting, use the **no** form of the command.

Subscriber-side configuration before Cisco IOS XE Fuji 16.8.x

```
platform punt-sbri subscriber rate { rate_value | no-drop }
```

```
platform punt-sbri subscriber punt-cause punt-cause_value rate rate_value
```

Subscriber-side configuration in Cisco IOS XE Fuji 16.8.x

```
platform punt-sbri subscriber punt-cause punt-cause_value rate-per-4-sec { no-drop | rate_value [ quarantine-time q_time burst-factor b_value ] }
```

Subscriber-side configuration in Cisco IOS XE Fuji 16.9.x and later

```
platform punt-sbri subscriber punt-cause punt-cause_value rate-per-4-sec { no-drop | rate_value [ bucket-size b_size ] [ quarantine-time q_time burst-factor b_value ] }
```

WAN-side configuration before Cisco IOS XE Fuji 16.8.x

```
platform punt-sbri wan punt-cause punt-cause_value rate rate_value [ quarantine-time q_time burst-factor b_value ]
```

WAN-side configuration in Cisco IOS XE Fuji 16.8.x and later

```
platform punt-sbri wan punt-cause punt-cause_value rate-per-1-sec rate_value [ quarantine-time q_time burst-factor b_value ]
```

```
no platform punt-sbri
```

Syntax Description

punt-cause <i>punt-cause_value</i>	Specifies the punt-cause value in number 1 to 107 or string.
rate <i>rate_value</i>	Specifies the rate in packet per seconds. The range is from 1 to 256, specified in powers-of-2.
no-drop	Disables the rate-limiting.
rate-per-4-sec <i>rate_value</i>	Specifies the rate in packet per 4 seconds. The range is from 1 to 255.
rate-per-1-sec <i>rate_value</i>	Specifies the rate in packet per seconds. The range is from 1 to 256, specified in powers-of-2.
quarantine-time <i>q_time</i>	Specifies the quarantine time in minutes. The range is from 1 to 60.
bucket-size <i>b_size</i>	Specifies the bucket size in packets. The range is from 1 to 255.
burst-factor <i>b_value</i>	Specifies the quarantine burst factor in packets. The range is from 50 to 1000.

Command Default The WAN-side default rate is zero, which means that rate-limiting does not occur. Using the **no** configuration returns the rate to the default value.

The default subscriber-side global rate is zero. The default subscriber-side per-cause rate for CABLE_L3_MOBILITY is 4 packets per second. Using the **no** configuration returns the rate to the default value.

Command Modes Global configuration (config)

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers. The platform punt-sbri wan command replaces service divert-rate-limit ip and service divert-rate-limit ipv6 commands. The platform punt-sbri subscriber command replaces service divert-limit and cable divert-rate-limit commands.
	IOS XE Fuji 16.8.1	The command platform punt-sbri subscriber rate rate_value was deprecated.
	IOS XE Fuji 16.9.1	The keyword bucket-size was added in the command.

Usage Guidelines

WAN-side configuration

WAN configuration consists of two parts:

- 1) Configure CoPP to specify which WAN-side packet streams are subject to SBRL. The policy-map action **set qos-group 99** specifies that packets matching that class are subject to SBRL.
- 2) Configure WAN-side SBRL to specify which punt-causes are rate-limited. Trusted sites are specified by adding classes to the CoPP policy-map. ACLs are used to finely identify trusted streams. It is important to understand the CoPP applies to all punted packets, so it may be necessary to ensure that subscriber-side packets do not match the trusted-site ACLs. Quarantine can optionally be configured. When a packet-stream enters quarantine, all punts from the stream are dropped for the configured period of time. When (*burst-factor x rate*) packets arrive at a rate faster than *rate*, quarantine is activated for that stream.

For more information, see the WAN-side configuration example.

Subscriber-side configuration

The subscriber-side configuration is global. There is also a per-cause configuration which currently only applies to the CABLE_L3_MOBILITY punt-cause. All subscriber-side packets go to SBRL, regardless of the CoPP configuration.

Examples

The following example shows the subscriber-side configuration:

```
Router# configure terminal
Router(config)# platform punt-sbri subscriber punt-cause 99 rate 8
Router(config)#

Router# configure terminal
Router(config)# platform punt-sbri subscriber rate 64
Router(config)#
```

The following example shows a simple CoPP configuration which sends all WAN-side punts to SBRL:

```
Router# configure terminal
Router(config)# policy-map copp_policy
Router(config-pmap)# class class-default
Router(config-pmap-c)# set qos-group 99
Router(config-pmap-c)# exit
Router(config-pmap)# exit
Router(config)# control-plane
Router(config-cp)# service-policy input copp_policy
Router(config-cp)# exit
Router(config)# platform punt-sbri wan punt-cause 11 rate 64 quarantine 5 burst-factor 500
```

Related Commands

Command	Description
show platform hardware qfp active infrastructure punt summary	Displays the punt summary statistics which includes a summary of punted packets and aggregate drop-counts from CoPP, SBRL, the punt-policer and the global policer.
show platform hardware qfp active infrastructure punt sbri	Displays the SBRL statistics.
platform punt-policer	Configures the per-cause punt-policer.
show platform software punt-policer	Displays configuration and statistics for the per-cause punt-policer.
show platform hardware active qfp infrastructure punt-policer summary	Displays detailed configuration data and statistics for the per-cause punt-policer.
show policy-map control-plane	Displays configuration and statistics for the control-plane service-policy.
clear control-plane	Clears the control-plane service-policy statistics.
show platform hardware qfp active infrastructure punt statistics type global-drop	Displays the global punt-policer statistics.

platform aom pending-thresh

To configure a threshold value in seconds to notify that an AOM download is stuck, use the **platform aom pending-threshold** command in the global configuration mode.

If you configure the **no** form of the command, the *seconds-to-error* and *seconds-to-warning*, revert to their default values.

```
platform aom pending-thresh { seconds-to-error } { seconds-to-warning }
```

```
no platform aom pending-thresh { seconds-to-error } { seconds-to-warning }
```

Syntax Description

seconds-to-error Allows you to configure a threshold value in seconds to notify that an AOM download is stuck. The *seconds-to-error* specifies the threshold value in seconds to log an error on the console.

The valid range is 60 to 3600 seconds and the default value is 1800 seconds

seconds-to-warning Specifies the threshold value in seconds to log a warning in the trace log when the AOM download is stuck.

The valid range is 60 to 3600 seconds and the default value is 900 seconds

Command Default

The default value for *seconds-to-error* is 1800 seconds and the default value for *seconds-to-warning* is 900 seconds.

If you configure the **no** form of the command, the *seconds-to-error* and *seconds-to-warning*, revert to their default values.

Command Modes

Global configuration (config)

Command History

Release Modification

17.6.1z This command is introduced.

Usage Guidelines

The **platform aom pending-thresh** command allows you to configure a threshold value, in seconds, to notify that an AOM download is stuck. When the specified threshold time is reached, an error and warning notification is sent to the console and trace log, respectively. The valid range is 60–3600 seconds. Use the **no** form of the command to remove the threshold value.

Examples

The following example shows a sample configuration:

```
Router# configure terminal
Router(config)# platform aom pending-thresh 300 180
Router(config)#
```

In this example, 300 indicates the threshold value in seconds to log an error on the console and 180 specifies the threshold value in seconds to log an warning on the console.

pilot-scaling

To specify the value to calculate the number of continuous pilots, use the **pilot-scaling** command in OFDM channel profile configuration mode. To undo the pilot-scaling value assignment, use **no** form of this command.

pilot-scaling *value*

no pilot-scaling

Syntax Description

<i>value</i>	Value to scale the number of continuous pilots. Valid range is from 48 to 120.
--------------	--

Command Default

The default value is 48.

Command Modes

OFDM channel profile configuration (config-ofdm-chan-prof)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to specify the value to calculate the number of continuous pilots.

Examples

The following example shows how to specify the value to calculate the number of continuous pilots:

```
Router# configure terminal
Router(config)# cable downstream ofdm-chan-profile 21
Router(config-ofdm-chan-prof)# pilot-scaling 50
```

Related Commands

Command	Description
cable downstream ofdm-chan-profile	Define the OFDM channel profile on the OFDM channel.
cyclic-prefix	Specify the channel cyclic-prefix.
description (OFDM channel profile)	Specify a user defined description for the profile.
interleaver-depth	Specify the channel interleaver-depth.
profile-control	Specify default modulation or profile as the channel control profile.
profile-data	Specify default modulation or profile as the channel data profile.
profile-ncp	Specify default modulation or profile as the channel ncp profile.
roll-off	Specify the channel roll-off value.
subcarrier-spacing	Specify the spacing for specific subcarriers configured in this profile.

pme cem

To define parameters for the Cisco Edge QAM Manager server, use the **pme cem** command in the encryption configuration mode. To reset the parameters to default value, use the **no** form of this command.

Note There can be only one entry for VODS-ID, CEM IP, CEM Port, and Management Interface IP. Defining any configuration with newer values clears the previous configuration. The individual configurations can be cleared with the **no** form of the command.

```
pme cem ip-address tcp-port
no pme cem ip-address tcp-port
```

Syntax Description	ip-address	Specifies the IP address of the Cisco Edge QAM Manager server.
	tcp-port	Specifies the TCP port number of the Cisco Edge QAM Manager server. The valid range is from 1024 to 65534.

Command Default None

Command Modes Encryption configuration (config-video-encrypt)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command defines the parameters for the Cisco Edge QAM Manager server during privacy mode encryption configuration.

Examples The following example shows how to define parameters for the Cisco Edge QAM Manager server:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# encryption
Router(config-video-encrypt)# pme cem 172.16.1.163 1024
```

Related Commands	Command	Description
	encrypt	Encrypts the virtual carrier group.
	pme vods-id	Configures the VODSID of Cisco Edge QAM Manager server.
	pme mgmt-ip	Configures the privacy mode encryption management IP to establish Cisco Edge QAM Manager server connection.
	show cable video encryption pme	Displays the privacy mode encryption information.

Command	Description
show cable video encryption linecard	Displays the encryption configuration information of the line card.

pme mgmt-ip

To define the privacy mode encryption management IP address for establishing Cisco Edge QAM Manager server connection, use the **pme mgmt-ip** command in the encryption configuration mode. To reset to default configuration, use the **no** form of this command.

```
pme mgmt-ip ip-address
no pme mgmt-ip ip-address
```

Syntax Description	<i>ip-address</i> Specifies the management IP address.
---------------------------	--

Command Default	None
------------------------	------

Command Modes	Encryption configuration (config-video-encrypt)
----------------------	---

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command defines the privacy mode encryption management IP address.

Examples The following example shows how to define the privacy mode encryption management IP address:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)#encryption
Router#(config-video-encrypt)pme mgmt-ip 172.16.1.164
```

Related Commands	Command	Description
	encrypt	Encrypts the virtual carrier group.
	pme vodsids	Configures the VODSID of Cisco Edge QAM Manager server.
	pme cem	Configures the parameters for the Cisco Edge QAM Manager server.
	show cable video encryption pme	Displays the privacy mode encryption information.
	show cable video encryption linecard	Displays the encryption configuration information of the line card.

pme vodsid

To define VODSID of the Cisco Edge QAM Manager server, use the **pme vodsid** command in the encryption configuration mode. To reset to default configuration, use the **no** form of this command.

```
pme vodsid id
no pme vodsid id
```

Syntax Description

<i>id</i>	Specifies the VODSID ID of the Cisco Edge QAM Manager server. The valid range is from 2 to 2147483647.
-----------	--

Command Default

None

Command Modes

Encryption configuration (config-video-encrypt)

Command History

Release	Modification
IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command defines the VODSID for the Cisco Edge QAM Manager server.

Examples

The following example shows how to define VODSID for the Cisco Edge QAM Manager server:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# encryption
Router(config-video-encrypt)# pme vodsid 111
```

Related Commands

Command	Description
encrypt	Encrypts the virtual carrier group.
pme cem	Configures the parameters for the Cisco Edge QAM Manager server.
pme mgmt-ip	Configures the privacy mode encryption management IP to establish CEM connection.
show cable video encryption pme	Displays the privacy mode encryption information.
show cable video encryption linecard	Displays the encryption configuration information of the line card.

policy

To select modems based on the type of service flow that is balanced, use the **policy** command in the config-lb-group configuration mode. To reset the selection, use the **no** form of this command.

```
policy {pcmm | ugs | us-across-ds | pure-ds-load}
no policy {pcmm | ugs | us-across-ds | pure-ds-load}
```

Syntax Description	Command	Description
	pcmm	Enables balancing of modems with active PCMM service flows.
	ugs	Enables balancing of modems with active UGS service flows.
	us-across-ds	Sets load balancing on upstream (US) groups across downstream (DS) and DS group methods are ignored.
	pure-ds-load	Considers DS load and not US load when calculating DS utilization.

Command Default None

Command Modes DOCSIS load balancing group mode (config-lb-group)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to select the modems on the CMTS based on the type of service flow that is balanced using the **policy** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# policy
pure-ds-load
Router(config-lb-group)#
```

Related Commands	Command	Description
	cable load-balance docsis-group	Configures a DOCSIS load balancing group on the CMTS.
	show cable load-balance docsis-group	Displays real-time configuration, statistical, and operational information for load balancing operations on the router.

power-adjust

To adjust the channel's power level, use the **power-adjust** command in the RF channel sub configuration mode.

power-adjust *value*

Syntax Description *value* Value for the power level. Valid range is -6.0 to 2.0 dBmV.

Command Default None.

Command Modes RF channel sub configuration mode (config-rf-chan)

Usage Guidelines This command is used to adjust the channel's power levels.

The following example shows how to change the channel's power level:

```

router#configure terminal
router(config)#controller integrated-cable 3/0/0
router(config-controller)#rf-chan 5 10
router(config-rf-chan)#type video
router(config-rf-chan)#frequency 723000000
router(config-rf-chan)#rf-output alt
router(config-rf-chan)#power-adjust 0
router(config-rf-chan)#exit
router(config-controller)#exit
router(config)#exit
router#show controller integrated-Cable 3/0/0 rf-channel 5 10
Chan State Admin Frequency Type Annex Mod srates Interleaver dcid power output
 5 TEST UP 723000000 VIDEO B 256 5361 I32-J4 164 34 ALT
10 TEST UP 753000000 VIDEO B 256 5361 I32-J4 169 34 ALT

```

Related Commands

Command	Description
controller integrated-cable	Enters the controller configuration mode.
frequency	Defines the RF channel frequency.
qam-profile	Defines the QAM profile number.
rf-chan	Enters the RF channel sub configuration mode.
rf-output	Defines the QAM output mode.
power-adjust	Defines the channel power level.

power-tilt

To configure downstream power tilt for a controller port, use the **power-tilt** command in the controller sub configuration mode.

power-tilt {*cable-loss-approx* | *linear*}*tilt* **max-frequency** *frequency*

Syntax Description	<i>tile</i>	Measured cable loss at <i>frequency</i> , specified in 1/10 dB.
	<i>frequency</i>	The maximum frequency for the RF channel.
Command Default	None	
Command Modes	Controller sub configuration mode (config-controller).	
Command History	Release	Modification
	IOS XE Fuji 16.7.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command is used to configure downstream power tilt for a controller port.

The following example shows how to define the base channel power level:

```
router#configure terminal
router(config)#controller Integrated-Cable 3/0/0
router(config-controller)#max-ofdm-spectrum 192000000
router(config-controller)#max-carrier 32
router(config-controller)#base-channel-power 34
router(config-controller)#power-tilt linear 4.0 max-frequency 696000000
router(config-controller)#rf-chan 0 31
router(config-rf-chan)#type DOCSIS
router(config-rf-chan)#frequency 261000000
router(config-rf-chan)#rf-output NORMAL
router(config-rf-chan)#power-adjust -2.0
router(config-rf-chan)#qam-profile 1
router(config-rf-chan)#docsis-channel-id 1
router(config-rf-chan)#exit
router(config-controller)#rf-chan 158
router(config-rf-chan)#power-adjust 0
router(config-rf-chan)#docsis-channel-id 159
router(config-rf-chan)#ofdm channel-profile 20 start-frequency 600000000 width 96000000 plc
645000000
```

Related Commands	Command	Description
	base-channel-power	Sets the base channel power level.
	power-adjust	Adjusts the power levels of the RF channel.

prefix

To configure an IPv4 or IPv6 prefix in a source address verification (SAV) group, use the **prefix** command in SAV configuration mode. To disable the use of a configured prefix in a SAV group, use the **no** form of this command.

```
prefix{ipv4_prefix/ipv4_prefix_lengthipv6_prefix/ipv6_prefix_length}
no prefix{ipv4_prefix/ipv4_prefix_lengthipv6_prefix/ipv6_prefix_length}
```

Syntax Description

<i>ipv4_prefix</i>	IPv4 prefix associated with a particular SAV group, specified in the X.X.X.X/X format.
<i>ipv4_prefix_length</i>	Length of the IPv4 prefix. The valid range is from 0 to 32.
<i>ipv6_prefix</i>	IPv6 prefix associated with a particular SAV group, specified in the X:X:X:X::/X format.
<i>ipv6_prefix_length</i>	Length of the IPv6 prefix. The valid range is from 0 to 128.

Command Default

None

Command Modes

SAV Configuration (config-sav)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **prefix** command is used to configure IPv4 or IPv6 prefixes within a particular SAV groups. The Cisco CMTS uses these prefixes to authenticate a cable modem (CM). A CM may be configured with an IPv4 or IPv6 prefix belonging to a particular SAV group. The time, length, value (TLV) 43.7.2 specifies the prefix associated with the CM. The Cisco CMTS considers a packet from a CM authorized if that packet is sourced with an IP address that belongs to the configured prefix in a SAV group.

A maximum of four prefixes are supported on one SAV group. These prefixes can be either IPv4s, IPv6s, or a combination of both prefixes (maximum up to four)

Examples

The following example shows how to configure a SAV group with one IPv4 prefixes and one IPv6 prefixes:

```
Router(config)# cable source-verify group sav1
Router(config-sav)# prefix 10.16.0.0/12
Router(config-sav)# prefix 10::/12
Router(config-sav)# exit
```

Related Commands

Command	Description
cable source-verify enable-sav-static	Enables SAV prefix processing.

Command	Description
cable source-verify group	Configures SAV groups.

principal

To specify the principal core of the RPD, use the **principal** command in RPD core-interface configuration mode. To void the principal core configuration, use the **no** form of this command.

principal

no principal

Command Default

None

Command Modes

RPD core-interface configuration (config-rpd-core)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to specify the principal core of the RPD.

The following example shows how to specify the principal core of the RPD:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# core-interface tengigabitethernet 3/1/0
Router(config-rpd-core)# principal
```

Related Commands

Command	Description
core-interface	Configures the core-interface of the RPD.

privacy

To create a DOCSIS configuration file that enables and configures the DOCSIS Baseline Privacy Interface (BPI) option, use the **privacy** command in cable config-file configuration mode. To disable BPI for the CM, use the **no** form of this command.

```

privacy grace-time {authorization value | tek value}
privacy timeout {authorize value | operational value | re-authorize value | rekey value}
no privacy grace-time {authorization | tek}
no privacy timeout {authorize | operational | re-authorize | reject | rekey}
  
```

Syntax Description

authorization <i>value</i>	Authorization grace time in seconds. Valid values are 1 to 1800 seconds. Default value is 600 seconds.
tek <i>value</i>	TEK grace time in seconds. Valid range is 1 to 1800 seconds. Default is 600 seconds.
authorize <i>value</i>	Authorize wait timeout in seconds. Valid range is 1 to 30 seconds. Default value is 10 seconds.
operational <i>value</i>	Operational Wait timeout in seconds. Valid range is 1 to 10 seconds. Default is 1 second.
re-authorize <i>value</i>	Re-authorize wait timeout in seconds. Valid range is 1 to 20 seconds.
reject <i>value</i>	Authorize reject wait timeout in seconds. Valid range is 1 to 600 seconds. Default is 60 seconds.
rekey <i>value</i>	Rekey wait timeout in seconds. Valid range is 1 to 10 seconds. Default is 1 second.

Command Default

None

Command Modes

Cable config-file configuration

Command History

Release	Modification
12.1(2)EC1	This command was introduced.
12.2(11)BC2	This command was supported on the Release 12.2 BC train.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Specifying the **privacy** command without any of the keywords and arguments enables BPI encryption and decryption for the CM. In addition to this command, you must also specify the **service-class privacy** command to enable BPI operations on the cable modem.

Note The **privacy** command appears and is supported only in images with support for BPI or BPI+ encryption. This option configures the CM for BPI or BPI+ encryption. To use BPI encryption, the Cisco CMTS must also be configured for BPI or BPI+ encryption, using the **cable privacy** command.

Examples

The following example shows how to set the CM privacy TEK gracetime to 1200 seconds and enables BPI operations for the cable modem.

```
router(config)# cable config-file bpi.cm
router(config-file)# privacy grace-time tek 1200
router(config-file)# service-class 1 privacy

router(config-file)# exit

router(config)#
```

Related Commands

Command	Description
access-denied	Disables access to the network.
cable config-file	Creates a DOCSIS configuration file and enters configuration file mode.
cable privacy	Enables BPI or BPI+ encryption on the Cisco CMTS.
channel-id	Specifies upstream channel ID.
cpe max	Specifies CPE information.
download	Specifies download information for the configuration file.
frequency	Specifies downstream frequency.
option	Provides config-file options.
service-class	Specifies service class definitions for the configuration file.
snmp manager	Specifies Simple Network Management Protocol (SNMP) options.
timestamp	Enables time-stamp generation.

profile

To bind the profile to the controller, use the **profile** command in controller configuration mode. To undo the bind, use **no** form of this command.

profile *id*

no profile

Syntax Description	<i>id</i> The ID of the configured controller profile.
---------------------------	--

Command Default	None.
------------------------	-------

Command Modes	Controller configuration (config-controller)
----------------------	--

Command History	Release	Modification
	Cisco IOS XE Fuji 16.7.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines	Use this command to bind the profile to the controller.
-------------------------	---

Examples	The following example shows how to bind the profile to the controller:
-----------------	--

```
Router#configure terminal
Router(config)#controller integrated-cable 1/0/1
Router(config-controller)#profile 1
```

Related Commands	Command	Description
	cable downstream controller-profile	Configures the downstream controller profile.
	cable upstream controller-profile	Configures the upstream controller profile.

profile-control

To specify the control-plane profile used for MAC management and other control messages, use the **profile-control** command in OFDM channel profile configuration mode. To undo the control-plane profile assignment, use **no** form of this command.

profile-control {**modulation-default** *value* | **modulation-profile** *id*}

no profile-control

Syntax Description

modulation-default <i>value</i>	The default modulation. Valid values are 16-QAM, 64-QAM, 128-QAM, 256-QAM, 512-QAM, 1024-QAM, 2048-QAM, and 4096-QAM.
modulation-profile <i>id</i>	Global modulation profile ID.

Command Default

1024-QAM

Command Modes

OFDM channel profile configuration (config-ofdm-chan-prof)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to specify the control-plane profile used for MAC management and other control messages.

Examples

The following example shows how to specify the control-plane profile used for MAC management and other control messages:

```
Router# configure terminal
Router(config)# cable downstream ofdm-chan-profile 21
Router(config-ofdm-chan-prof)# profile-control modulation-default 1024-qam
```

Related Commands

Command	Description
cable downstream ofdm-chan-profile	Define the OFDM channel profile on the OFDM channel.
cyclic-prefix	Specify the channel cyclic-prefix.
description (OFDM channel profile)	Specify a user defined description for the profile.
interleaver-depth	Specify the channel interleaver-depth.
pilot-scaling	Specify the value used to calculate the number of continuous pilots.
profile-data	Specify default modulation or profile as the channel data profile.
profile-ncp	Specify default modulation or profile as the channel ncp profile.

Command	Description
roll-off	Specify the channel roll-off value.
subcarrier-spacing	Specify the spacing for specific subcarriers configured in this profile.

profile-data

To specify the data-plane profiles used for data packets, use the **profile-data** command in OFDM channel profile configuration mode. To undo the data-plane profile assignment, use **no** form of this command.

profile-data *id*{**modulation-default** *value* | **modulation-profile** *id*}

no profile-data *id*

Syntax Description	Command	Description
	profile-data <i>id</i>	Channel data profile ID. Valid range is from 1 to 5.
	modulation-default <i>value</i>	The default modulation. Valid values are 16-QAM, 64-QAM, 128-QAM, 256-QAM, 512-QAM, 1024-QAM, 2048-QAM, and 4096-QAM.
	modulation-profile <i>id</i>	Global modulation profile ID.

Command Default None.

Command Modes

OFDM channel profile configuration (config-ofdm-chan-prof)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to specify the data-plane profiles used for data packets.

Examples

The following example shows how to specify the data-plane profiles used for data packets:

```
Router# configure terminal
Router(config)# cable downstream ofdm-chan-profile 21
Router(config-ofdm-chan-prof)# profile-data 3 modulation-default 1024-qam
```

Related Commands

Command	Description
cable downstream ofdm-chan-profile	Define the OFDM channel profile on the OFDM channel.
cyclic-prefix	Specify the channel cyclic-prefix.
description (OFDM channel profile)	Specify a user defined description for the profile.
interleaver-depth	Specify the channel interleaver-depth.
pilot-scaling	Specify the value used to calculate the number of continuous pilots.
profile-control	Specify default modulation or profile as the channel control profile.
profile-ncp	Specify default modulation or profile as the channel ncp profile.

Command	Description
roll-off	Specify the channel roll-off value.
subcarrier-spacing	Specify the spacing for specific subcarriers configured in this profile.

profile-description

To provide a profile description for each profile in the selected cable multicast authorization profile, use the **profile-description** command in multicast authorization profile configuration mode. To remove the profile description, use the **no** form of this command.

profile-description *profile-description*
no profile-description *profile-description*

Syntax Description	<i>profile-description</i> Specifies profile description for the selected profile. You can use up to 128 characters to describe the profile.
---------------------------	--

Command Default Profile description is empty.

Command Modes Multicast authorization configuration—(config-mauth)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command is available only from the cable multicast authorization profile mode.

Examples The following example shows how to enter a profile description for a multicast authorization profile name:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable multicast auth profile-name
Router(config)# cable multicast auth profile-name gold
Router(config-mauth)# profile-description gold-configured-may
```

Related Commands	Command	Description
	cable multicast authorization enable default-action	Enables the cable multicast authorization features.
	cable multicast authorization profile-name	Defines the cable multicast authorization profile.
	show cable multicast authorization	Displays the list of defined multicast authorization profiles and all CMs associated with corresponding profiles.
	show running-config interface cable	Displays the running configuration for each of the cable interfaces.

profile-ncp

To specify the ncp profile, use the **profile-ncp** command in OFDM channel profile configuration mode. To undo the ncp profile assignment, use **no** form of this command.

profile-ncp {**modulation-default** *value* | **modulation-profile** *id*}

no profile-ncp

Syntax Description

modulation-default <i>value</i>	The default modulation. Valid values are QPSK, 16-QAM, and 64-QAM.
modulation-profile <i>id</i>	Global modulation profile ID.

Command Default

None.

Command Modes

OFDM channel profile configuration (config-ofdm-chan-prof)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to specify the ncp profile.

Examples

The following example shows how to specify the ncp profile:

```
Router# configure terminal
Router(config)# cable downstream ofdm-chan-profile 21
Router(config-ofdm-chan-prof)# profile-ncp modulation-default qpsk
```

Related Commands

Command	Description
cable downstream ofdm-chan-profile	Define the OFDM channel profile on the OFDM channel.
cyclic-prefix	Specify the channel cyclic-prefix.
description (OFDM channel profile)	Specify a user defined description for the profile.
interleaver-depth	Specify the channel interleaver-depth.
pilot-scaling	Specify the value used to calculate the number of continuous pilots.
profile-control	Specify default modulation or profile as the channel control profile.
profile-data	Specify default modulation or profile as the channel data profile.
roll-off	Specify the channel roll-off value.
subcarrier-spacing	Specify the spacing for specific subcarriers configured in this profile.

protect-tunnel

To configure a Downstream External PHY Interface (DEPI) tunnel for the protect cable interface line card on a Cisco CMTS router, use the **protect-tunnel** command in global configuration mode. To disable this configuration, use the **no** form of this command.

protect-tunnel *protect-depi-tunnel-name*
no protect-tunnel *protect-depi-tunnel-name*

Syntax Description	
	<i>protect-tunnel-name</i> DEPI tunnel name for the protect cable interface line card.

Command Default The N+1 DEPI redundancy feature is disabled.

Command Modes Global configuration (config)

Command History	Release	Modification
	12.2(33)SCE	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The protect tunnel must be explicitly configured. The working tunnel and the protect tunnel are configured using the same **depi-tunnel** command. The protect tunnel inherits L2TP class and DEPI class parameters from the working tunnel. When you configure the protect tunnel and specify the destination IP address for the protect tunnel, the protect tunnel inherits the QAM channel parameters specified for the working tunnel.

Examples The following example shows how to configure a DEPI tunnel for the protect cable interface line card on the Cisco uBR10012 router:

```
Router> enable
Router# configure terminal
Router(config)# depi-tunnel protect1
Router(config-depi-tunnel)# dest-ip 192.0.2.103
Router(config-depi-tunnel)# exit
Router(config)# depi-tunnel depi-tunnel working1
Router(config-depi-tunnel)# protect-tunnel protect1
Router(config-depi-tunnel)# end
```

Related Commands	Command	Description
	depi-tunnel	Specifies a template for DEPI tunnel configuration settings.

protocol

To specify the protocol used in the logical edge device, use the **protocol** command in logical edge device configuration mode. To undo the protocol assignment, use the **no** form of this command.

```
protocol {GQI | table-based}
no protocol {GQI | table-based}
```

Command Default

None.

Command Modes

Logical edge device configuration mode (config-video-led)

Command History

Release	Modification
IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command specifies the protocol.

Examples

The following example shows how to specify the protocol:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# logical-edge-device vod id 1
Router(config-video-led)# protocol table-based
```

Related Commands

Command	Description
logical-edge-device	Defines a logical edge device.
show cable video logical-edge-device	Displays the logical edge device information.

provider-name

To specify the provider name as part of the service descriptor, use the **provider-name** command in the service descriptor configuration mode. To revoke the configuration, use the **no** form of the command.

provider-name *string*

Syntax Description	<i>string</i> Specifies the provider name.
---------------------------	--

Command Default	None.
------------------------	-------

Command Modes	Service descriptor configuration mode (config-video-serv-desc)
----------------------	--

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1c	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following example shows how to specify the provider name:

```
router#configure terminal
router (config)#cable video
router (config-video)#service-descriptor-default
router (config-video-serv-desc)#provider-name test
```

Related Commands

Command	Description
serving-area	Configures the serving area which enables the set tops to discover VOD content.
service-descriptor-default	Enables the operator to specify the default values for the service descriptor.

psi-interval

To override the default PSI value, use the **psi-interval** command in the service distribution group configuration mode. To revert back to the default psi-interval value, use the **no** form of the command.

psi-interval *number*

Syntax Description	<i>number</i> Defines the new psi-interval value.
---------------------------	---

Command Default	None.
------------------------	-------

Command Modes	Service distribution group configuration mode (config-video-sdg)
----------------------	--

Command History	Release	Modification
	Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines	This command is used to override the default psi-interval value.
-------------------------	--

The following example shows how to override the default psi-interval:

```
router#configure terminal
router(config)#cable video
router(config-video)#service-distribution-group sdg id 1
router(config-video-sdg)#psi-interval 250
```

Related Commands

Command	Description
service-distribution-group	Defines a service distribution group.
rf-port integrated-cable	Defines the physical slot/bay/port to be used in a video service.
onid	Override the default ONID.
show cable video service-distribution-group	Displays the SDG configuration.

show ptp clock running

To display the PTP clock, use the **show ptp clock running** command.

show ptp clock running

Command Default

Command Modes

Command History

Release	Modification
Cisco IOS XE 16.8.x	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to display the running PTP clock.

The following example shows how to display the PTP clock.

```
router# show ptp clock running
PTP Ordinary Clock [Domain 55]
State Ports Pkts sent Pkts rcvd Redundancy
Mode
PHASE_ALIGNED 1 68938 138822 Hot standby
PORT SUMMARY
PTP Master
Name Tx Mode Role Transport State Sessions
Port Addr
slave-from-903 unicast slave Lo1588 Slave 1
10.90.3.93
```

pxf-fail-switchover-trap enable

To enable the sending of ciscoRFSwactNotif trap which is encoded with extended switchover, that indicates the Toaster SEU error triggered PRE switchover, use the **pxf-fail-switchover-trap enable** command in the redundancy configuration mode.

Note This command is a hidden command.

pxf-fail-switchover-trap enable

Syntax Description This command has no keywords or arguments.

Command Default None.

Command Modes Redundancy configuration mode (config-red)

Command History	Release	Modification
	12.2(33)SCJ1	This command was introduced in Cisco uBR10012 router.

Usage Guidelines Before configuring ciscoRFSwactNotif trap, use **snmp-server enable traps rf** to enable the sending of ciscoRFSwactNotif trap for cable related events.

The following example shows how to enable to send the extended switchover reason (uses private switchover reason 100) of ciscoRFSwactNotif trap:

```
router#configure terminal
router(config)#redundancy
router(config-red)#pxf-fail-switchover-trap enable
```

You need to notice the extended switchover reason is a private value (100), which is not ciscoRFSwactNotif trap standard value, the trap receive utility in customer side may need to be updated in order to understand the private switchover reason(100). The extended switchover reason will be sent out after PRE switchover when old active PRE boots up.

Related Commands	Command	Description
	snmp-server enable traps rf	Enables the sending of SNMP traps for cable related events.
	show redundancy switchover history	Displays the redundancy switchover information.

pxf-fail-switchover-trap enable

qos-profile enforced

To specify a quality-of-service (QoS) profile that should be enforced when users violate their registered QoS profiles, use the **qos-profile enforced** command in enforce-rule configuration mode. To delete the enforced QoS profile from the enforce-rule, use the **no** form of this command.

qos-profile enforced *profile-id* [**no-persistence**]
no qos-profile enforced *profile-id* [**no-persistence**]

Syntax Description

<i>profile-id</i>	Specifies the QoS profile to be enforced. The valid range is 0 to 16383, with a default of 0.
no-persistence	(Optional) Specifies that the enforced QoS profile should not remain in force when a cable modem reboots. Instead, when a cable modem that is in the penalty period reboots, it is automatically removed from the penalty period and assigned the QoS profile that is specified in its DOCSIS configuration file. The default behavior is that enforced QoS profiles remain in force for cable modems across reboots.

Command Default

The value of *profile-id* defaults to 0, and enforced QoS profiles are persistent across cable modem reboots.

Command Modes

Enforce-rule configuration (enforce-rule)

Command History

Release	Modification
12.3(9a)BC	This command was introduced. This command replaces the enforced qos-profile command.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Both the originally provisioned QoS profile and the enforced QoS profile must be created on the Cisco CMTS router. The *profile-id* does not support QoS profiles that are created by the cable modem.

An enforce-rule can specify an enforced QoS profile, which is automatically applied to subscribers who transmit more traffic than allowed by their registered QoS profile. The enforced QoS profile remains in effect during the penalty time period (see the **penalty-period** command). At the end of the penalty period, the subscriber returns to the registered QoS profile.

If a cable modem reboots while it is in its penalty time period, it continues using the enforced QoS profile, unless the service provider has manually changed the cable modem's registered QoS profile using the **cable modem qos profile** command.

When you change the enforced QoS profile for a currently active enforce-rule, any cable modems using this rule that are currently in the penalty period continue using the previously configured enforced QoS profile. Any cable modems that enter the penalty period after this configuration change, however, use the new enforced QoS profile.

An enforced QoS profile must already have been created on the Cisco CMTS router before you can assign it to an enforce-rule. If the rule does not exist, the system displays an error message.

When the **no-persistence** option is specified, the enforced QoS profile is still automatically applied to subscribers who violate their bandwidth requirements. However, when the cable modem reboots, the Cisco CMTS router allows the cable modem to use the QoS profile that is specified in its DOCSIS configuration file.

The **no-persistence** option can be used when initially using the Subscriber Traffic Management feature to identify potential problem applications and users. When repeat offenders are identified, they can then be assigned enforce-rules that do not use the **no-persistence** option, so that they remain in the penalty period even if they reboot their cable modems.

Note The system automatically applies the enforced QoS profile to violators only if the **enforce** keyword has been used with the **activate-rule-at-byte-count** command.

Examples

The following example shows profile 12 being assigned as the enforced QoS profile to an enforce-rule:

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
Router(enforce-rule)# qos-profile enforced 12
```

The following example shows profile 12 being assigned as the enforced QoS profile to an enforce-rule, but with the **no-persistence** option specified, so that the enforced QoS profile does not remain in force if the cable modem reboots:

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
Router(enforce-rule)# qos-profile enforced 12 no-persistence
```

The following example shows the error message that is displayed when the specified QoS profile does not exist on the CMTS:

```
Router# configure terminal
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# qos-profile enforced 98
```

The qos profile 98 doesn't exist or it's a cm created QoS profile

Related Commands

Command	Description
cable qos enforce-rule	Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode.

Command	Description
debug cable subscriber-monitoring	Displays enforce-rule debug messages for subscriber traffic management on the Cisco CMTS routers.
duration	Specifies the time period and sample rate to be used for monitoring subscribers.
enabled (enforce-rule)	Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.
monitoring-basics	Specifies the type of monitoring for subscriber traffic management on a Cisco CMTS router.
peak-time1	Specifies peak and offpeak monitoring times on a Cisco CMTS router.
qos-profile registered	Specifies the registered QoS profile that should be used for this enforce-rule.
service-class (enforce-rule)	Identifies a particular service class for cable modem monitoring in an enforce-rule.
show cable qos enforce-rule	Displays the QoS enforce-rules that are currently defined.
show cable subscriber-usage	Displays subscribers who are violating their registered QoS profiles.

qos-profile registered

To specify the registered quality of service (QoS) profile that should be used for this enforce-rule, use the **qos-profile registered** command in enforce-rule configuration mode. To remove the registered QoS profile from the enforce-rule, use the **no** form of this command.

qos-profile registered *profile-id*
no qos-profile registered *profile-id*

Syntax Description	<i>profile-id</i> Specifies the QoS profile to be monitored. This profile must be created on the Cisco CMTS router. If you want to manage a cable modem that uses a modem-created QoS profile, you must first create that exact QoS profile on the CMTS router before using this command. The valid range is 0 to 16383, with a default of 0.
---------------------------	---

Command Default The default profile ID is 0.

Command Modes Enforce-rule configuration (enforce-rule)

Command History	Release	Modification
	12.3(9a)BC	This command was introduced. This command replaces the registered qos-profile command.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
	IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines You must specify a registered QoS profile for each enforce-rule. The Cisco CMTS router then uses the registered profile ID to match subscribers' service flows to the proper enforce-rules.

When you change the registered QoS profile for an active rule, the cable modems that had been using the previous registered QoS profile are no longer managed by the Subscriber Traffic Management feature. Instead, the rule begins managing those cable modems that use the new registered QoS profile.

Note The registered QoS profile must be created on the Cisco CMTS router before you can assign it to an enforce-rule. If the rule does not exist, the system displays an error message. If you want to manage a cable modem that is currently using a modem-created QoS profile, you must first manually create a new QoS profile on the CMTS router that has the same QoS parameters as the modem-created profile. Then allow the modem to come online using the manually created profile, before using the **qos-profile registered** command.

Examples

The following example shows profile 50 being assigned as the registered QoS profile to an enforce-rule:

```
Router# configure terminal
```

```
Router(config)# cable qos enforce-rule enforce-rule
Router(enforce-rule)# qos-profile registered 50
```

The following example shows the error message that is displayed when the specified QoS profile does not exist on the CMTS:

```
Router# configure terminal
```

```
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# qos-profile registered 99
```

The qos profile 99 doesn't exist or it's a cm created QoS profile

Related Commands

Command	Description
cable qos enforce-rule	Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode.
debug cable subscriber-monitoring	Displays enforce-rule debug messages for subscriber traffic management on the Cisco CMTS routers.
duration	Specifies the time period and sample rate to be used for monitoring subscribers.
enabled (enforce-rule)	Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.
monitoring-basics	Specifies the type of monitoring for subscriber traffic management on a Cisco CMTS router.
peak-time1	Specifies peak and offpeak monitoring times on a Cisco CMTS router.
qos-profile enforced	Specifies a QoS profile that should be enforced when users violate their registered QoS profiles.
service-class (enforce-rule)	Enables the enforcing of QoS profiles according to service class.
show cable qos enforce-rule	Displays the QoS enforce-rules that are currently defined.
show cable subscriber-usage	Displays subscribers who are violating their registered QoS profiles.

qam-profile

To define the QAM profile number, use the **qam-profile** command in the RF channel sub configuration mode.

qam-profile *value*

Syntax Description

value Value for the QAM profile. The QAM profiles are defined before they are associated with rf-channels. Valid range is 0 to 31.

- QAM profile ID 0 to 5
- System defined 6 to 31

Once defined, the rf-channel associated with that profile must match the correct qam-profile type. For instance, qam-profile 4 is defined for video, and may be used with rf-channels of type VIDEO.

Command Default

None.

Command Modes

RF channel sub configuration mode (config-rf-chan)

Usage Guidelines

This command is used to define the QAM profile number.

The following example shows how to define the QAM profile number:

```
router#configure terminal
router(config)#controller integrated-cable 3/0/0
router(config-controller)#rf-chan 5 10
router(config-rf-chan)#type video
router(config-rf-chan)#frequency 723000000
router(config-rf-chan)#rf-output alt
router(config-rf-chan)#power-adjust 0
router(config-rf-chan)#qam-profile 4
router(config-rf-chan)#exit
router(config-controller)#exit
router(config)#exit
router#show controller integrated-Cable 3/0/0 rf-channel 5 10
Chan State Admin Frequency Type Annex Mod srates Interleaver dclid power output
 5 TEST UP 723000000 VIDEO B 256 5361 I32-J4 164 34 ALT
10 TEST UP 753000000 VIDEO B 256 5361 I32-J4 169 34 ALT
```

Related Commands

Command	Description
controller integrated-cable	Enters the controller configuration mode.
frequency	Defines the RF channel frequency.
qam-profile	Defines the QAM profile number.
rf-chan	Enters the RF channel sub configuration mode.
rf-output	Defines the QAM output mode.
power-adjust	Defines the channel power level.

r-dti

To specify the Remote DOCSIS Timing Interface (R-DTI) configuration ID to use in RPD, use the **r-dti** command in RPD configuration mode. To void the R-DTI configuration specification, use the **no** form of this command.

r-dti *configuration_id*

no r-dti

Syntax Description	<i>configuration_id</i> Specifies the ID of the R-DTI configuration previously created.
---------------------------	---

Command Default	None
------------------------	------

Command Modes	RPD configuration (config-rpd)
----------------------	--------------------------------

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines	Use this command to specify the R-DTI configuration ID.
-------------------------	---

The following example shows how to specify the R-DTI configuration ID:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# r-dti 1
```

rcp-id

To assign a receive channel profile (RCP) ID to a receive channel configuration (RCC) template, use the **rcp-id** command in RCC template configuration mode. To remove the RCP ID, use the **no** form of this command.

rcp-id *rcp-id*
no rcp-id *rcp-id*

Syntax Description

<i>rcp-id</i>	Specifies an RCP ID for the RCC template. The valid range is from 00 00 00 00 00 to FF FF FF FF FF.
---------------	---

Command Default

By default the RCP ID is set to 00 00 00 00 00. However, you must change the default value to a non-zero RCP ID.

Command Modes

RCC template configuration (config-rcc-template)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.

Usage Guidelines

A valid RCC template consists of a configured RCP ID, a receive module (RM) entry, and a receive channel (RC) entry.

First, you define an RCC template for an RCP, and then assign the template to a cable interface to generate RCCs based on the actual DS channel configuration.

Examples

The following example shows how to assign an RCP ID to an RCC template:

```
Router# configure terminal
Router(config)# cable rcc-template
1
Router(config-rcc-template)# rcp-id 00 10 00 00 03
```

Related Commands

Command	Description
rcp-id	Specifies an ID for the receive channel profile.
receive-module	Specifies a receive module entry in the form of a numeric value.
receive-channel	Specifies a receive channel entry in the form of a numeric value.

receive-channel

To associate a receive channel to a receive module (RC), use the **receive-channel** command in RCC template configuration mode. To restore the default value, use the **no** form of this command.

receive-channel *index* **center-frequency** *Hz* **connected-receive-module** *index* [**primary**]
no receive-channel *index* **center-frequency** *Hz* **connected-receive-module** *index*

Syntax Description

<i>index</i>	Specifies the index value for the receive channel. The valid range is 1 to 10.
center-frequency	Specifies the center frequency for the receive channel.
<i>Hz</i>	Specifies the center frequency value in Hz. The valid range is 55000000-858000000.
connected-receive-module	Specifies a nested receive module in the RCC template. Generally, only one receive module is configured for an RCC template.
<i>index</i>	Specifies the index value for the connected receive module. The valid range is 1 to 10.
primary	(Optional) Indicates that it is a CM primary channel and an RCC can be derived from this channel.

Command Default

None

Command Modes

RCC template configuration (config-rcc-template)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

A valid RCC template consists of a configured RCP ID, a receive module (RM) entry, and a receive channel (RC) entry. First, you define an RCC template for an RCP, and then assign the template to a cable interface to generate RCCs based on the actual DS channel configuration.

An RCC template configures the physical layer components described by an RCP, including receive modules and receive channels to specific downstream frequencies, and specifies the interconnections among receive modules or between receive modules and receive channels.

A receive module can include multiple receive channels. So we need to specify which receive channel belongs to which receive module.

Examples

The following example shows how to associate a receive channel to a receive module:

```
Router# configure terminal
```

```

Router(config)# cable rcc-template
1
Router(config-rcc-template)# rcp-id 00 10 00 00 03
Router(config-rcc-template)# receive-module 1 first-channel-center-frequency 555000000
Router(config-rcc-template)# receive-channel 1 center-frequency 555000000
connected-receive-module 1 primary
Router(config-rcc-template)# receive-channel 2 center-frequency 561000000
connected-receive-module 1

```

Related Commands

Command	Description
cable rcc-template	Defines a receive channel configuration (RCC) template for an RCP.
rcp-id	Specifies an ID for the receive channel profile.
receive-module	Specifies a receive module entry in the form of a numeric value.

receive-module

To associate a receive module (RC) to a Receive Channel Configuration (RCC) template, use the **receive-module** command in RCC template configuration mode. To restore the default value, use the **no** form of this command.

receive-module *index* **first-channel-center-frequency** *Hz* [**connected-receive-module** *index*]
no receive-module *index* **first-channel-center-frequency** *Hz* [**connected-receive-module** *index*]

Syntax Description

<i>index</i>	Specifies the index value for the receive module. The valid index range is 1 to 10.
first-channel-center-frequency	Specifies the center frequency of the first channel of the receive module channel block.
<i>Hz</i>	Specifies the center frequency value in Hz. The valid range is 55000000 to 858000000.
connected-receive-module	(Optional) Specifies a nested receive module in the RCC template. Generally, only one receive module is configured for an RCC template.
<i>index</i>	(Optional) Specifies the index value for the connected receive module. The valid range is 1 to 10.

Command Default

cable rcc-template	Defines a receive channel configuration (RCC) template for an RCP.
rcp-id	Specifies an ID for the receive channel profile.
receive-channel	Specifies a receive channel entry in the form of a numeric value.

redundancy

To configure line card redundancy, use the **redundancy** command in global configuration mode.

redundancy

Syntax Description This command has no arguments or keywords.

Command Default None.

Command Modes Global configuration (config)

Release	Modification
IOS-XE Release 3.16.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use the **redundancy** command to enter the redundancy configuration mode.

Examples The following example shows how to configure line card redundancy:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# redundancy
Router(config-red)# linecard-group 0 internal-switch
Router(config-red-lc)# description RedundancyGroup0
Router(config-red-lc)# class 1:N
Router(config-red-lc)# revertive 60
Router(config-red-lc)# member slot 1 primary
Router(config-red-lc)# member slot 0 secondary
```

Command	Description
linecard-group internal-switch	Creates a line card group for the line card.
description	Adds a description to the line card group.
class	Configures redundancy class on the line card.

redundancy force-failover main-cpu

To force a switchover, so that the standby Performance Routing Engine (PRE1) module becomes the active PRE1 module, use the **redundancy force-failover main-cpu** command in privileged EXEC mode.

redundancy force-failover main-cpu

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(4)XF1	This command was introduced for the Cisco uBR10012 router.
	12.2(11)BC3	The active PRE1 module checks to see if a switchover is currently in progress before implementing this command.
	12.3(21)BC	This command is replaced by the redundancy switch-activity command.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **redundancy force-failover main-cpu** command initiates a manual switchover, so that the standby PRE1 module becomes the active PRE1 module and assumes full responsibilities for router operations. This command requires that both PRE1 modules are running a Cisco IOS software image that supports the Route Processor Redundancy (RPR) feature.

Note The terms failover and switchover are interchangeable, but switchover is the term used across all Cisco platforms capable of high-availability operation.

A manual switchover is typically done for one of the following reasons:

- You want to upgrade or replace the active PRE1 module.
- You have upgraded the Cisco IOS software on the standby PRE1 module and want the standby PRE1 module to begin using the new software image. This also allows you to upgrade the software on the former active PRE1 module without interrupting systems operations.
- You want to test switchover operation on the system.

A switchover can also be manually initiated by removing the active PRE1 module from the chassis, but using the **redundancy force-failover main-cpu** command provides a more graceful switchover, without generating hardware alarms.

Tip Do not perform a switchover immediately after you change the configuration and save it to the NVRAM. Instead, wait a few minutes to allow the two PRE1 modules to synchronize the new configuration, and then perform the switchover.

Tip Wait two to three minutes after a switchover before switching the system back to the original PRE1 module, so as to allow the system to stabilize and so that both PRE1 modules are ready for the switch. In Cisco IOS Release 12.2(11)BC3 and later releases, the active PRE1 module will not initiate a new switchover until a current switchover is complete and the system has stabilized.

Examples

The following example shows a switchover being manually initiated:

```
Router# redundancy force-failover main-cpu
Proceed with switchover to standby PRE? [confirm] y
```

Note Pressing **enter** or **y** confirms the action and begins the switchover. Pressing any other key cancels the switchover and returns control to the current active PRE1 module.

The following example shows a switchover being attempted but failing because the standby PRE1 module is either not ready, not available, or not installed:

```
Router# redundancy force-failover main-cpu
Proceed with switchover to standby PRE? [confirm]
Standby PRE not ready, switchover aborted.
Router#
```

Note In some versions of Cisco IOS software, a failed software switchover will show the following message:
Unable to communicate with standby PRE, switchover aborted.

Related Commands

Command	Description
associate	Associates two line cards for Automatic Protection Switching (APS) redundancy protection.
redundancy	Enters redundancy configuration mode so that the synchronization parameters can be configured.
redundancy reload	Resets the standby PRE1 module, or to reset both the active and standby PRE1 modules.
redundancy switch-activity	Forces a switchover to the standby PRE module.

redundancy force-switchover main-cpu

To force a standby Performance Routing Engine (PRE) to assume the role of an active PRE, use the **redundancy force-switchover main-cpu** command in privileged EXEC mode.

redundancy force-switchover main-cpu

Syntax Description None

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Before using this command, install the Cisco IOS software image (to ensure high availability), and configure the Route Processor Redundancy (RPR) mode on both the PRE modules.

Note The terms failover and switchover are interchangeable, but switchover is the term used across all Cisco platforms capable of high-availability operation.

Note We recommend you use the **redundancy force-switchover main-cpu** command only on the active PRE module. The active PRE crashes used on the standby PRE.

Examples

The following example shows a manual switchover:

```
Router# redundancy force-switchover main-cpu
Proceed with switchover to standby PRE? [confirm] y
Preparing to Switch Activity
```

Note Pressing **enter** or **y** confirms the action and begins the switchover. Pressing any other key cancels the switchover and returns control to the currently active PRE module.

The following example shows a switchover being attempted but failing because the standby PRE module is either not ready, not available, or not installed:

```
Router# redundancy force-switchover main-cpu
Proceed with switchover to standby PRE? [confirm] n
Standby PRE not ready, switchover aborted.
Router#
```

Related Commands

Command	Description
redundancy	Enters the redundancy configuration mode so that the synchronization parameters could be configured.
redundancy reload	Resets the standby PRE module or resets both the active and standby PRE modules.
redundancy switch-activity	Forces a switchover to the standby PRE module.
show redundancy	Displays the current active and standby Supervisor card redundancy status.

redundancy linecard-group

To trigger a switchover from the working line card to the protect line card, or to revert from the protect line card to the working line card on the Cisco uBR10012 and Cisco cBR series routers, use the **redundancy linecard-group** command in privileged EXEC mode.

redundancy linecard-group {**lockout** | **resync** | **revertback** | **switchover from** | **unlockout**} **slot/subslot**
Cisco cBR Series Converged Broadband Routers
redundancy linecard-group switchover from *slot*

Syntax Description

lockout	Locks a line card switchover from the specified working slot and subslot.
resync	Specifies static synchronization from the working line card to the protect line card.
revertback	Reverts from the protect line card to the working line card.
switchover from	Triggers a switchover from the working line card to the protect line card.
<i>slot</i>	(Cisco cBR series routers) Slot number of the interface card. The range is from 0 to 3 and 6 to 9 on the Cisco cBR-8 router.
unlockout	Removes the switchover lockout from the specified working slot and subslot.
<i>slot / subslot</i>	(Cisco uBR10012 router) Specifies the cable interface line card. <ul style="list-style-type: none"> <i>slot</i>—Chassis slot number of the cable interface line card. The valid range is from 5 to 8. <i>subslot</i>—(Cisco uBR10012 router only) Secondary slot number of the cable interface line card. Valid subslots are 0 and 1.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(13a)BC	This command was introduced.
12.2(33)SCE	This command was modified. A new keyword, resync , was added to enable the Cisco uBR10012 router to perform a manual synchronization from the working line card to the protect line card.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The lockout , resync , revertback , and unlockout keywords were removed.

Usage Guidelines

The **redundancy linecard-group** command is supported only on the Cisco uBR10012 and Cisco cBR series routers.

When the normal (system initiated) static line card synchronization fails, use the **redundancy linecard-group** command with the **resync** keyword to enable the Cisco uBR10012 router to perform a manual synchronization from the working line card to the protect line card.

Examples

The following example shows how to lock a line card switchover from slot 5 and subslot 0 on the Cisco uBR10012 router using the **redundancy linecard-group** command with the **lockout** keyword:

```
Router# redundancy linecard-group lockout 5/0
HCCP LC: 5/0 Working will be locked out, this operation will prevent all kinds of switchover.
```

The following example shows how to remove the switchover lockout from slot 5 and subslot 0 on the Cisco uBR10012 router using the **redundancy linecard-group** command with the **unlockout** keyword:

```
Router# redundancy linecard-group unlockout 5/0
```

The following example shows how to enable the Cisco uBR10012 router to perform a manual synchronization from the working line card to the protect line card using the **redundancy linecard-group** command with the **resync** keyword:

```
Router# redundancy linecard-group resync 5/0

```

The following example shows how to trigger a switchover from working card to protect card on a Cisco cBR-8 router:

```
Router# redundancy linecard-group switchover from slot 3
```

Related Commands

Command	Description
show hccp	(Not for Cisco cBR Series Routers) Displays Hot Standby Connection-to-Connection Protocol (HCCP) group information for a specific cable interface.
show hccp interface	(Not for Cisco cBR Series Routers) Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured.
show hccp linecard	(Not for Cisco cBR Series Routers) Displays information about HCCP groups associated with a line card.

redundancy reload

To manually reload a standby Route Processor (RP) module, use the **redundancy reload** command in privileged EXEC mode.

redundancy reload {peer | shelf}

Syntax Description

peer	Reloads only the standby PRE1 module or Supervisor card.
shelf	Reloads both the active and standby PRE1 module or Supervisor card.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(4)XF1	This command was introduced for the Cisco uBR10012 router.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was removed from Cisco IOS Release 12.2(33)SCA. It is replaced by the hw-module standby-cpu reset command.
12.2(44)SQ	This command was integrated into Cisco IOS Release 12.2(44)SQ. Support for the Cisco RF Gateway 10 was added.
15.2(4)M	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **redundancy reload peer** command is used to reset the standby RP module when there are any failures, tracebacks, or functionality and behavior mismatches on either one or both active and standby RP modules.

This command does not have an impact on active device operations, assuming a switchover is not required while the standby module is resetting.

The **redundancy reload shelf** command reloads the Cisco IOS software on both the active and standby RP modules. This command interrupts services on the router until all the RP modules and the line cards initialize and come back online.

Examples

The following example shows how to manually reload the standby RP module:

```
Router# redundancy reload peer
Reload peer? [confirm] y

Preparing to reload peer
```

Note Pressing **enter** or **y** begins the reload. Pressing any other key cancels the reload and returns control to the active RP module.

The following is sample output when a standby RP module is not installed on a router:

```
Router# redundancy reload peer
System is running in SIMPLEX mode, reload anyway? [confirm] n

Peer reload not performed.
```

The following example shows how to reload all RP modules:

```
Router# redundancy reload shelf
Reload the entire shelf [confirm] y

Preparing to reload entire shelf
```

Note Pressing **enter** or **y** begins the reload. Pressing any other key cancels the reload and returns control to the current active PRE1 module.

Cisco RF Gateway 10

The following example shows the system response when a standby Supervisor card is not installed in the Cisco RFGW-10:

```
Switch# redundancy reload peer
System is running in SIMPLEX mode, reload anyway? [confirm] n

Peer reload not performed.
```

The following example shows how to reload both Supervisor cards on the Cisco RFGW-10:

```
Switch# redundancy reload shelf
Reload the entire shelf [confirm] y

Preparing to reload entire shelf
```

Note Pressing **Enter** or **y** confirms the action and begins the reload of both cards. Pressing any other key cancels the reload and returns control to the current active Supervisor card.

Related Commands

Command	Description
associate slot	Associates slots for APS processor redundancy.
redundancy	Enters redundancy configuration mode so that the synchronization parameters can be configured.

Command	Description
redundancy force-failover main-cpu	Forces a switchover, so that the standby RP module becomes the active RP module.
redundancy switch-activity	Forces a switchover to the standby RP module.

redundancy switch-activity

To force a switchover to the standby PRE module, use the **redundancy switch-activity** command in privileged EXEC mode.

Note The terms failover and switchover are interchangeable, but switchover is the term used across all Cisco platforms capable of high-availability operation.

redundancy switch-activity [force]

Syntax Description	force (Optional) Forces a switchover immediately, overriding any checks in the code or configuration that might prevent or delay a switchover.
---------------------------	---

Command Default None

Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(4)XF1	This command was introduced for the Cisco uBR10012 router.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **redundancy switch-activity** command is similar to the **redundancy force-failover main-cpu** command, except that it includes an option to force the switchover, overriding any configuration checks or other checks in the software that could prevent the switchover. In all cases, this command verifies that the standby PRE module is available and capable of performing the switchover before it transfers control to that PRE module. This command also synchronizes the current running-config and client data before initiating the switchover.

Examples

The following example shows a switchover being manually initiated, overriding any checks that might prevent or delay the switchover:

```
Router# redundancy switch-activity force
Proceed with switchover to standby PRE? [confirm] y
```

Note Pressing **enter** or **y** confirms the action and begins the switchover. Pressing any other key cancels the switchover and returns control to the current active PRE1 module.

Related Commands	Command	Description
	associate	Associates two line cards for Automatic Protection Switching (APS) redundancy protection.

Command	Description
redundancy	Enters redundancy configuration mode so that the synchronization parameters can be configured.
redundancy reload	Resets the standby PRE1 module or to reset both the active and standby PRE1 modules.
redundancy force-failover main-cpu	Forces a switchover, so that the standby Performance Routing Engine (PRE1) module becomes the active PRE1 module.

registered qos-profile

Note Effective with Cisco IOS Release 12.3(9a)BC, the **registered qos-profile** command is replaced by the **qos-profile registered** command.

To specify the registered quality of service (QoS) profile that should be used for this enforce-rule, use the **registered qos-profile** command in enforce-rule configuration mode. To remove the registered QoS profile from the enforce-rule, use the **no** form of this command.

registered qos-profile *profile-id*
no registered qos-profile *profile-id*

Syntax Description

<i>profile-id</i>	Specifies the QoS profile to be monitored. This profile must be created on the Cisco CMTS router. If you want to manage a cable modem that uses a modem-created QoS profile, you must first create that exact QoS profile on the CMTS router before using this command. The range is 0 to 16383. The default of 0.
-------------------	--

Command Default

The default profile ID is 0.

Command Modes

Enforce-rule configuration (enforce-rule)

Command History

Release	Modification
12.2(15)BC1	This command was introduced.
12.3(9a)BC	This command was replaced by the qos-profile registered command.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

You must specify a registered QoS profile for each enforce-rule. The Cisco CMTS router then uses the registered profile ID to match subscribers' service flows to the proper enforce-rules.

When you change the registered QoS profile for an active rule, the cable modems that had been using the previous registered QoS profile are no longer managed by the Subscriber Traffic Management feature. Instead, the rule begins managing those cable modems that use the new registered QoS profile.

Note The registered QoS profile must be created on the Cisco CMTS router before you can assign it to an enforce-rule. If the rule does not exist, the system displays an error message. If you want to manage a CM that is using a CM-created QoS profile, you must first create a QoS profile on the Cisco CMTS router that matches the CM-created profile exactly. Then use the **registered qos-profile** command to assign that profile to this enforce-rule.

Examples

The following example shows profile 50 being assigned as the registered QoS profile to an enforce-rule:

```
Router# configure terminal
Router(config)# cable qos enforce-rule enforce-rule
Router(enforce-rule)# registered qos-profile 50
```

The following example shows the error message that is displayed when the specified QoS profile does not exist on the CMTS:

```
Router# configure terminal
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# registered qos-profile 99
```

The qos profile 99 doesn't exist or it's a cm created QoS profile

Related Commands

Command	Description
activate-rule at-byte-count	Specifies the number of bytes that a subscriber can transmit during the monitoring period on a Cisco CMTS router.
cable qos enforce-rule	Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode.
duration	Specifies the time period and sample rate to be used for monitoring subscribers.
enabled (enforce-rule)	Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.
penalty-period	Specifies the time period that an enforced QoS profile should be in effect for subscribers that violate their registered QoS profiles.
qos-profile enforced	Specifies a QoS profile that should be enforced when users violate their registered QoS profiles.
show cable qos enforce-rule	Displays the QoS enforce-rules that are currently defined.
show cable subscriber-usage	Displays subscribers who are violating their registered QoS profiles.

remap pid vcg

To configure custom PID remapping, use the **remap pid vcg** command in video configuration mode. PID remapping enables you to specify remap rules for all four types of processing types—data, pass-through, remap, and remux sessions.

remap pid vcg *vcg*

Syntax Description

<i>vcg</i>	Specifies the virtual carrier group.
------------	--------------------------------------

Command Default

None.

Command Modes

Video configuration (config)

Command History

Release	Modification
IOS-XE 16.7.1	This command was introduced on the Cisco cBR Series Converged Broadband Router.

Examples

The following example shows a PID remap rule for a table-based unicast session on input port number 1 with vei-ip 198.51.100.1

```
logical-edge-device led1 id 1
    protocol table-based
        virtual-edge-input-ip 198.51.100.1 input-port-number 1
        vcg vcg1
        active
table-based
    vcg vcg1
        rf-channel 20
            session unicast input-port 1 start-udp-port 49152 processing-type passthru
```

The corresponding remap rule is shown below:

```
remap pid vcg vcg1
    rf-channel 20
        vei-ip 198.51.100.1 udp-port 49152
        pid 100-200 101-201
        pid 102-130 202-230
        pid 131 240
```

rep-period

To configure the time between two ECM packets at the output, use the **rep-period** command in the DVB scrambling ECMG override configuration mode. To void the ECM repetition period configuration, use the **no** form of this command.

rep-period *time*
no rep-period

rep-period <i>time</i>	Specifies the ECM repetition period in milliseconds.
-------------------------------	--

Command Default

None

Command Modes

DVB scrambling ECMG override configuration mode (config-video-encrypt-dvb-ecmg-override)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command specifies the time between two ECM packets at the output in milliseconds. The valid range is from 0 to 30000.

The following is an example of how to configure the ECM repetition period in milliseconds:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dwb
Router(config-video-encrypt-dwb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dwb-ecmg)#override
Router(config-video-encrypt-dwb-ecmg-override)#rep-period 10000
```

Related Commands

Command	Description
override	Enters DVB scrambling configuration mode.
ac-start-delay	Specifies the time between start of first CP after a change in AC and start of ECM broadcast.
ac-stop-delay	Specifies the time between end of last CP preceding a change in AC and end of ECM broadcast.
max-comp-time	Specifies the maximum time needed by ECMG to compute an ECM.
max-streams	Specifies the maximum number of simultaneous open streams supported by the ECMG on a channel.

Command	Description
min-cp-duration	Specifies the minimum crypto period.
start-delay	Specifies the delay between the start of CP and ECM broadcast.
stop-delay	Specifies the delay between the end of CP and ECM broadcast.
trans-start-delay	Specifies the transition start delay.
trans-stop-delay	Specifies the transition stop delay.

report-stream-error cc-error

To enable Continuity Counter (CC) error reporting on the chassis level, use the **report-stream-error cc-error** command in video configuration mode.

report-stream-error cc-error *[[report-interval value] threshold value*

Syntax Description

report-interval <i>value</i>	Specifies the event report interval in minutes.
threshold <i>value</i>	specifies the threshold value to report the event.

Command Default

None

Command Modes

Video configuration (config-video)

Command History

Release	Modification
IOS-XE Fuji 16.8.1	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

This example shows how to enable CC error reporting on the chassis level:

```
Router#configure terminal
Router(config)#cable video
Router(config-video)# report-stream-error cc-error report-interval 10 threshold value 5
```

report-stream-error input-stream-failure report-interval syslog

To configure a timeout value and syslog message for input stream failure trap for multicast sources, use the **report-stream-error input-stream-failure report-interval syslog** command in video configuration mode.

report-stream-error input-stream-failure report-interval *timeout value* **syslog** {enable | disable}

Syntax Description	timeout value	The interval after which input stream failure trap is sent if the input source down exceeds the configured timeout value. The timeout value range is 5–1800 seconds.
	syslog	Enable or disable logging for for input stream stream failure trap.

Command Default None

Command Modes Video configuration (config-video)

Command History	Release	Modification
	IOS-XE Fuji 16.8.1d	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

This example shows how to configure a timeout value and syslog message:

```
Router#configure terminal
Router(config)#cable video
Router(config-video)# report-stream-error input-stream-failure report-interval 10 syslog
enable
```

Related Commands	Command	Description
	showcable video snmp-alarms	Display the active alarms in the system.
	show cable video snmp-alarm-config	Display the alarm configuration in the system.
	snmp-trap input-stream-failure multicast	Disable input stream failure trap for EAS stream.
	snmp-server enable traps video-cable	Enable alarm event traps for cable related events.

request platform hardware diagnostic load

To load the field diagnostic image and start field diagnostic test, use the **request platform hardware diagnostic load slot *slot-id* *image-path* [autostart]** command in Privileged EXEC mode.

request platform hardware diagnostic load slot *slot-id* *image-path* [{autostart}]

Syntax Description	Parameter	Description
	slot <i>slot-id</i>	Specifies the slot to perform field diagnostic test.
	<i>image-path</i>	Specifies the path of the field diagnostic image, the image can be copied to hard disk, bootflash, or USB disk.
	autostart	Automatically performs the default diagnostic test after loading the field diagnostic image.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **request platform hardware diagnostic load slot *slot-id* *image-path* [autostart]** command loads the field diagnostic image and starts field diagnostic test.

Examples

The following example shows how to load the field diagnostic image and start field diagnostic test:

```
Router# request platform hardware diagnostic load slot 0 harddisk:field_diag autostart
Mar 2 16:00:51.933 CST: %IOSXE_OIR-6-REMCARD: Card (cc) removed from slot 0
Mar 2 16:00:51.934 CST: %CABLE_CLC-5-LOGGER_LC_REMOVED: Carrier Card 0 removed
```

Related Commands	Command	Description
	request platform hardware diagnostic unload	Removes the field diagnostic image from the line card.
	show platform hardware diagnostic status	Displays the field diagnostic tests status.

request platform hardware diagnostic unload

To unload the field diagnostic image from the line card and reload the run-time image, use the **request platform hardware diagnostic unload slot *slot-id*** command in Privileged EXEC mode.

request platform hardware diagnostic unload slot *slot-id*

Syntax Description	slot <i>slot-id</i>	Specifies the slot to unload the field diagnostic image.
---------------------------	-------------------------------	--

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **request platform hardware diagnostic unload slot *slot-id*** command unloads the field diagnostic image from the line card and reloads the run-time image.

Examples The following example shows how to unload the field diagnostic image:

```
Router# request platform hardware diagnostic unload slot 0
Mar 2 16:04:51.860 CST: %IOSXE_OIR-6-INSCARD: Card (cc) inserted in slot 0
```

Related Commands	Command	Description
	request platform hardware diagnostic load	Loads the field diagnostic image and starts field diagnostic test.
	show platform hardware diagnostic status	Displays the field diagnostic tests status.

request platform software package expand

To expand the package to bootflash, use the **request platform software package expand** command in Privileged EXEC mode.

```
request platform software package expand file bootflash:[{force | to bootflash:[{force | wipe |
[{force}]}] | wipe | [{force}]}]
```

Syntax Description

bootflash:	Expand the package to bootflash. Cisco cBR-8 router only boot from bootflash.
force	Proceed despite warnings.
wipe	Wipe destination media content first.
to	Location for contained files.

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.16.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use the **request platform software package expand** command in Privileged EXEC mode to expand the package to bootflash.

Examples

The following example shows how to expand the package to bootflash:

```
router# request platform software package expand file
bootflash:subpkg_3_16/cbrsup-universalk9.03.16.00.S.155-3.S-std.SPA.bin
```

Related Commands

Command	Description
request platform software package install	Perform single command ISSU install.

request platform software package install node

To install the package for upgrade process, use the **request platform software package install node** command in Privileged EXEC mode.

request platform software package install node {**abort** | **attach** | **file** **bootflash**:[**{linecard-delay** *delay* | [**{switchback}**]}] | **noreload** | [**{linecard}**]} | **linecard-only**{**all** | **slot** *slot-number*} | **rollback**}

Syntax Description	Parameter	Description
	abort	Cancel the ISSU process.
	attach	Enables the users to view the last run log that contains the reports of all the stages of the one-shot upgrade.
	file	Consolidated package file on active bootflash.
	linecard-delay <i>delay</i>	By default, all the line cards will be reloaded with 240s interval during the upgrade procedure. Use linecard-delay <i>delay</i> option to specify the linecard reload interval.
	switchback	By default, the active SUP will change to standby SUP after the upgrade procedure is complete. Use the switchback option to switchover the active and standby SUP at the end of upgrade procedure, so that the active SUP remains to be the active SUP after ISSU.
	noreload	With noreload option, both the SUP and linecard will not be reloaded during the upgrade procedure. Upgrade will take effect by the next system reboot. With noreload linecard option, only the linecard will not be reloaded during the upgrade procedure.
	linecard-only	Upgrade linecard only.
	rollback	Roll back the chassis to the previous image.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.16.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.
	IOS-XE 3.17.0S	This command was implemented on Cisco cBR Series Converged Broadband Routers. The abort , linecard-only and rollback keywords were added.

Usage Guidelines Use the **request platform software package install node** command in Privileged EXEC mode to install the package for upgrade process, cancel the upgrade process, or rollback the chassis.

Examples

The following example shows how to install the package file:

```
router# request platform software package install node file
bootflash:subpkg_3_16/cbrsup-universalk9.03.16.00.S.155-3.S-std.SPA.bin
```

Related Commands

Command	Description
request platform software package expand	Expand the package to bootflash.

request platform software package install rp

To rollback to old package or implement ISSU subpackages upgrade on single SUP, use the **request platform software package instal rp *rp-slot* rollback** command in Privileged EXEC mode.

```
request platform software package install rp rp-slot {file bootflash:[{interface-module-delay
delay-seconds}] | rollback[{as-booted}]}
```

Syntax Description	Parameter	Description
	interface-module-delay <i>delay-second</i>	Specify the interface module restart timeout delay.
	rollback	Un-do a previous install.
	as-booted	Return to software provisioned at boot.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.16.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use the **request platform software package instal rp *rp-slot* rollback** command in Privileged EXEC mode to rollback to old package.

Examples

The following example shows how to rollback the upgrade:

```
router# request platform software package install rp 0 rollback
```

Related Commands	Command	Description
	request platform software package install node	Install the package for upgrade process.

request platform software process restart

To restart processes in software platform, use the **request platform software process restart** command in Privileged EXEC mode.

request platform software process restart [*interval secs* | *slot slot-number*]

Syntax Description

interval secs	The interval between line card reload in seconds. Valid range is from 0 to 500.
slot slot-number	The line card slot number. The valid range is from 0 to 9.

Command Default

This command takes effect if the new iosd and iosdb, and the us-scheduler sub-packages have been previously installed on the Supervisor. Only line cards which are both active and primary will be affected.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.16.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use the **request platform software process restart** command only after installing new iosd, iosdb, and us-scheduler sub-packages on the Supervisor. This command will install the new sub-packages on the line cards and restarts the affected processes.

Examples

This example shows how to restart an isod process with an interval of 10 seconds:

```
Router# request platform software process restart interval 10
Restarting the process ubrclc_k9lc_ms
SUCCESS: Finished Restarting the process ubrclc_k9lc_ms
Will automatically restart process iosdb
```

This example shows how to restart a us-scheduler process:

```
Router#request platform software process restart slot 6
Restarting the process us-scheduler on slot 6
SUCCESS: Finished Restarting the process us-scheduler on slot 6

Router#
*Jan 23 16:51:36.160 PDT: %CMCC_CBR-4-PROC_DOWN: CLC6: cmcc: Process us-sched (cdman) is
down
*Jan 23 16:51:36.506 PDT: %CMCC_CBR-4-PROC_RESTART: CLC6: cmcc: Process us-sched (cdman)
restarted. Please redo any config changes
made during process restart
*Jan 23 16:51:39.737 PDT: lcpr_enqueue_reco_event: lc_slot=6 peer=6
*Jan 23 16:51:39.881 PDT: %CBR-4-RECONCL_CM_FINISH: Reconciliation (clc->sup) for slot 6
finished: total 31, success 31, failed 0,
clc-only 0, sup-only 0, mismatch 0, offline 0
```

Related Commands

Command	Description
request platform software package install	Upgrades a consolidated package or an individual sub-package.

reserve-pid-range

To configure reserved output PID range, use the **reserve-pid-range** command in video configuration mode. To delete the reserved output PID range, use the **no** form of this command.

reserve-pid-range *start-pid-end-pid*
no reserve-pid-range *start-pid-end-pid*

Syntax Description

reserve-pid-range <i>start-pid-end-pid</i>	Specifies a range of PIDs that will not be used as output for remapped sessions.
---	--

Command Default

None.

Command Modes

Video configuration (config-video)

Command History

Release	Modification
IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command configures reserved output PID range.

Examples

The following example shows how to configure reserved output PID range:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# reserve-pid-range 1-10
```

Related Commands

Command	Description
show cable video logical-edge-device	Displays the logical edge device information.

reset-interval

To set the default ONID number, use the **default-onid** command in the video configuration mode.

default-onid *number*

Syntax Description	<i>number</i> The ONID number. By default, the system ONID is 0, which is commonly used in North America. If the default value of the ONID is used, the TSID must be unique. If you change the ONID, the TSID-ONID pair must be unique. The ONID must be in the range of 0 to 65535.				
Command Default	None.				
Command Modes	Video configuration mode (config-video)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS-XE Release 3.18.0S</td> <td>This command was introduced on the Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
Release	Modification				
Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.				
Usage Guidelines	<p>This command is used to change the default system ONID.</p> <p>The following example shows how to change the default ONID number:</p> <pre> configure terminal cable video default-onid 1580 </pre>				

restart-retry

To set the retry times for cable line card process restart, use the **restart-retry** *times* command in the process restart configuration mode.

```
restart-retry times
```

Syntax Description	<i>times</i> Cable line card process restart retry times.
---------------------------	---

Command Default	None
------------------------	------

Command Modes	Process restart configuration (config-process-restart)
----------------------	--

Command History	Release	Modification
	IOS-XE 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command sets the retry times for cable line card process restart.

The following example shows how to set the retry times for cable line card process restart.

```
Router# configure terminal
Router(config)# process-restart
Router(config-process-restart)# restart-retry 3
```

Related Commands	Command	Description
	lc-control-plane-timeout	Sets the interval of monitoring cable line card control plane process restart.
	lc-us-scheduler-timeout	Sets the interval of monitoring cable line card upstream scheduler process restart.

restricted

To convert a general load balancing group (GLBG) to a restricted load balancing group (RLBG) for DOCSIS load balancing, use the **restricted** command in the config-lb-group configuration mode. To revert to the general group type for DOCSIS load balancing, use the **no** form of this command.

restricted
no restricted

Command Default By default, the general group type is selected for load balancing.

Command Modes DOCSIS load balancing group mode (config-lb-group)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples The following example shows how to convert a GLBG to a RLBG using the **restricted** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# restricted
Router(config-lb-group)#
```

Related Commands	Command	Description
	cable load-balance docsis-group	Configures a DOCSIS load balancing group on the CMTS.
	show cable load-balance docsis-group	Displays real-time configuration, statistical, and operational information for load balancing operations on the router.

revertive

To enable the revert operation on a protect card, use the **revertive** command in line card redundancy group mode. To disable the revert operation, use the **no** form of the command.

revertive *time*

no revertive *time*

Syntax Description

<i>time</i>	Specifies the revert operation time in seconds. The valid values are 1 to 35791. The valid values on the Cisco cBR series routers are 10 to 86400 seconds.
-------------	---

Command Default

None

Command Modes

Line card redundancy group (config-red-lc)

Command History

Release	Modification
12.2(33)SCA	This command was introduced in Cisco IOS Release 12.2(33)SCA.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to specify the revert operation time for a protect card on a uBR10012 router:

```
Router# configure terminal
Router(config)# redundancy
Router(config-red)# linecard-group 1 cable
Router(config-red-lc)# revertive 30
```

The following example shows how to specify the revert operation time on a Cisco cBR series router:

```
Router# configure terminal
Router(config)# redundancy
Router(config-red)# linecard-group 0 internal-switch
Router(config-red-lc)# revertive 30
```

Related Commands

Command	Description
linecard-group	Creates a line card group for one-to-one line card redundancy.
redundancy	Enters redundancy mode.
member subslot	Enables the redundancy role of a line card.

rf-chan

To enter the RF channel sub configuration mode to configure an individual channel or a block of channels, use the **rf-chan** command in the controller sub configuration mode.

rf-chan *starting QAM id ending QAM id*

Syntax Description

starting QAM id The starting QAM ID. The valid range is 0 to 127.

ending QAM id The ending QAM ID. The valid range is 0 to 127.

Command Default

None.

Command Modes

Controller sub configuration mode (config-controller)

Command History

Release	Modification
IOS-XE 3.15.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command is used to enter the RF channel configuration sub-mode. If an individual channel is specified, only that channel's configuration is changed. If a block of channels is specified, the configuration change is applied to all the channels in the block.

The following example shows how to enter into the RF channel configuration sub-mode:

```
router#configure terminal
router(config)#controller integrated-cable 3/0/0
router(config-controller)#rf-chan 0 2
router(config-rf-chan)#frequency 93000000
router(config-rf-chan)#exit
router(config-controller)#exit
router#show controller integrated-Cable 3/0/0 rf-channel 0-2
```

Chan	State	Admin	Frequency	Type	Annex	Mod	srate	Interleaver	dcid	power	output
0	UP	UP	93000000	DOCSIS	B	256	5361	I32-J4	1	34	NORMAL
1	UP	UP	99000000	DOCSIS	B	256	5361	I32-J4	2	34	NORMAL
2	UP	UP	105000000	DOCSIS	B	256	5361	I32-J4	3	34	NORMAL

Related Commands

Command	Description
controller integrated-cable	Enters the controller configuration mode.
frequency	Defines the RF channel frequency.
qam-profile	Defines the QAM profile number.
rf-output	Defines the QAM output mode.
type	Defines the QAM data type.
power-adjust	Defines the channel power level.

rf-channel

To enter the RF channel sub configuration mode to configure an individual channel, use the **rf-channel** command in the controller sub configuration mode.

rf-channel *number*

<i>number</i>	Identifies an RF channel and enters the RF channel sub configuration mode. The valid values are
---------------	---

Command Default

None

Command Modes

Controller sub configuration mode (config-controller)

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to enter the RF channel sub configuration mode:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#table-based
Router(config-video-tb)#vcg vcg1
Router(config-video-tb-vcg)#rf-channel 20
```

Related Commands

Command	Description
cable video	Enters cable video configuration mode.
table-based	Enables table-based session configuration.
vcg name	Specifies the virtual carrier group assigned to a logical edge device.

rf-channel (Virtual Carrier Group)

To specify the virtual RF channels in a virtual carrier group, use the **rf-channel** command in virtual carrier group configuration mode. To delete the virtual RF channels, use the **no** form of this command.

```
rf-channel start-channel-end-channel tsid start-tsid-end-tsid output-port-number start-port-end-port
no rf-channel start-channel-end-channel tsid start-tsid-end-tsid output-port-number
start-port-end-port
```

Syntax Description	Command	Description
	rf-channel start-channel-end-channel	Specifies the RF channel range.
	tsid start-tsid-end-tsid	Specifies the tsid range.
	output-port-number start-port-end-port	Specifies the output port range.

Command Default None.

Command Modes Virtual carrier group configuration (config-video-vcg)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command specifies the virtual RF channels.

Examples The following example shows how to specify the virtual RF channels:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# virtual-carrier-group vod id 1
Router(config-video-vcg)# rf-channel 1-11 tsid 1-11 output-port-number 1-11
```

Related Commands	Command	Description
	virtual-carrier-group	Defines a virtual carrier group.
	virtual-edge-input-ip	Specifies and configures a cable multicast QoS group.
	encrypt	Encrypts the virtual carrier group.
	service-type	Specifies the service type of the virtual carrier group.
	show cable video virtual-carrier-group	Displays the virtual carrier group information.

rf-channel (table-based vcg)

To configure the rf channel in the table-based session, use the **rf-channel** command in the table-based VCG configuration mode. To delete the configuration, use the **no** form of this command.

rf-channel *start_channel* [-*end_channel*]

<i>start_channel</i> - <i>end_channel</i>	Specifies the range of rf channels for the table-based session.
---	---

Command Default None

Command Modes Table-based VCG configuration mode (config-video-tb-vcg)

Release	Modification
Cisco IOS-XE 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to configure the rf channel in the table-based session:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#table-based
Router(config-video-tb)#vcg vcg1
Router(config-video-tb-vcg)#rf-channel 0-7
```

Related Commands

Command	Description
vcg (table-based)	Specifies the virtual carrier group associated with the table-based session.

rf-channel cable downstream channel-id

To assign a downstream channel ID to an RF channel, use the **rf-channel cable downstream channel-id** command in controller configuration mode. To remove a downstream channel ID for an RF channel, use the **no** form of this command.

```
rf-channel rf-port cable downstream channel-id channel-id
no rf-channel rf-port cable downstream channel-id channel-id
```

Syntax Description		
	<i>rf-port</i>	Specifies the RF channel physical port on the Wideband SPA FPGA. Valid values for <i>rf-port</i> depend on the configuration set with the annex modulation command.
	<i>channel-id</i>	A unique channel ID. Valid values for releases prior to Cisco IOS Release 12.2(33)SCB are from 0 to 255 and the valid values for Cisco IOS Release 12.2(33)SCB and later are from 1 to 255 as 0 is reserved for network management.

Command Default If the **rf-channel cable downstream channel-id** command is not issued, Cisco IOS software assigns a unique downstream channel ID to the RF channel.

Command Modes Controller configuration (config-controller)

Command History	Release	Modification
	12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
	12.2(33)SCB1	The downstream channel ID scheme was changed.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines For the wideband channel to work correctly, each RF channel on the fiber node that the wideband channel uses must have a unique downstream channel ID. By default, Cisco IOS software assigns a unique downstream channel ID to the RF channel. Use the **rf-channel cable downstream channel-id** command to change the default channel ID.

The downstream channel ID that is assigned to the RF channel must be unique on the fiber node.

- The ID cannot be the same ID as is used for another RF channel on the fiber node.
- The ID cannot be the same ID as is used for a primary downstream channel on the fiber node.

You can check downstream channel IDs that are being used by examining the CMTS router configuration file.

Refer to **cable downstream channel-id** *id command for the updated downstream channel ID scheme table*.

Note If you assign a downstream channel ID that is not unique on the fiber node, the **rf-channel cable downstream channel-id** command displays an error message. The command does assign the channel ID, but the status of the fiber node becomes invalid.

The Cisco uBR10012 router supports two Wideband SPAs. Each Wideband SPA supports up to 24 RF channels depending on how the SPA is configured with the **annex modulation** command.

- For annex A and 256 QAM, each Wideband SPA supports 18 RF channels. In this case, valid values for the *rf-port* argument are 0 to 17.
- For all other cases, the SPA supports 24 RF channels. In these cases, valid values for the *rf-port* argument are 0 to 23.

Note Effective with Cisco IOS Release 12.3(23)BC, the **annex modulation** command is obsolete and **annex** and **modulation** are included as keyword options in the **rf-channel frequency** command. Also, for annex A and 256 QAM, each Wideband SPA supports up to 18 RF channels at full rate or up to 24 RF channels at less than full rate.

Examples

The following example shows how to assign a downstream channel ID of 123 to RF channel 3 on the Wideband SPA located in slot/subslot/bay 1/0/1.

```
Router# configure terminal
Router(config)# controller modular-cable 1/0/1
Router(config-controller)# rf-channel 3 cable downstream channel-id 123
```

Related Commands

Command	Description
annex modulation	Sets the annex and modulation for the Wideband SPA.
cable primary	Specifies that a wideband channel is a primary wideband channel.
cable rf-channel	Associates an RF channel on a Wideband SPA with a wideband channel.
controller modular-cable	Enters controller configuration mode to configure the Wideband SPA controller.
ip-address (controller)	Sets the IP address of the Wideband SPA FPGA.
modular-host subslot	Specifies the modular-host line card.
rf-channel frequency	Sets the frequency for each RF channel.
rf-channel ip-address mac-address udp-port	Sets the IP address, MAC address and UDP port for each RF channel.
rf-channel network delay	Specifies the CIN delay for each RF channel.

Command	Description
rf-channel description	Specifies the description for each RF channel.

rf-channel depi-tunnel

To bind the depi-tunnel, which inherits the configuration of the specified l2tp-class and depi-class, to an rf-channel on a shared port adapter (SPA), use the **rf-channel depi-tunnel** command in controller configuration mode. The **tsid** keyword is used to associate the logical rf-channel of the SPA to a physical quadrature amplitude modulation (QAM) on the radio frequency gateway (RFGW-10). To unbind the depi-tunnel, use the **no** form of this command.

rf-channel *rf-channel* **depi-tunnel** *depi-tunnel-name* **tsid** *id*
no rf-channel *rf-channel* **depi-tunnel** *depi-tunnel-name* **tsid** *id*

Syntax Description

<i>rf-channel</i>	RF channel physical port on the Wideband SPA. The allowed range is from 0 to 3.
<i>depi-tunnel-name</i>	Name of the DEPI tunnel.
tsid <i>id</i>	TS ID value.

Command Default

None

Command Modes

Global configuration (config)

Subinterface configuration (config-subif)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

To configure DEPI on the M-CMTS, bind the depi-tunnel to an rf-channel on a SPA using the **rf-channel depi-tunnel** command in controller configuration mode. To associate the logical rf-channel on the SPA to a QAM on the RFGW, use the **tsid** keyword.

Examples

The following example shows how to bind the depi-tunnel SPA0 to rf-channel 0 on a SPA and associate tsid 100 to the QAM:

```
Router# configure terminal
Router(config)# controller modular-cable 1/0/0
Router(config-controller)# rf-channel 0 depi-tunnel SPA0 tsid 100
```

Related Commands

Command	Description
controller modular-cable	Specifies the slot, bay, and port to be configured.
show interface modular-cable	Displays the DEPI information for the modular cable.

rf-channel description

To configure the description of an RF channel on a Wideband SPA, use the **rf-channel description** command in controller configuration mode. To remove an RF channel configuration, use the **no** form of this command.

```
rf-channel rf-port description description
no rf-channel rf-port description description
```

Syntax Description

<i>rf-port</i>	Specifies the RF channel physical port on the Wideband SPA FPGA. Allowed range is 0 to 23. Valid values for <i>rf-port</i> depend on the configuration set with the annex modulation command (see the Usage Guidelines section).
description <i>description</i>	Specifies a description for the RF channel.

Command Default

No default RF channel configuration values are set for the description.

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The Cisco uBR10012 router supports two Wideband SPAs. Each Wideband SPA supports up to 24 RF channels depending on how the SPA is configured with the **annex modulation** command. For annex A and 256 QAM, each Wideband SPA supports up to 18 RF channels at full rate and up to 24 RF channels at less than full rate. For all other cases, the SPA supports 24 RF channels.

Note In Cisco IOS Release 12.3(21)BC, annex and modulation parameters were set globally for each SPA using the **annex modulation** command. Beginning in Cisco IOS Release 12.3(23)BC, annex and modulation values are set for each RF channel using the **rf-channel frequency** command. The **annex modulation** command is obsolete.

Examples

The following example shows how to configure the description of the RF channel characteristics for RF port 0:

```
Router# configure terminal
Router(config)# controller modular-cable 1/0/0
Router(config-controller)# rf-channel 0 description Primary downstream channel
```

Related Commands

Command	Description
cable primary	Specifies that a wideband channel is a primary wideband channel.
cable rf-channel	Associates an RF channel on a Wideband SPA with a wideband channel.
controller modular-cable	Enters controller configuration mode to configure the Wideband SPA controller.
ip-address (controller)	Sets the IP address of the Wideband SPA FPGA.
modular-host subslot	Specifies the modular-host line card for Wideband protocol operations.
rf-channel cable downstream channel-id	Assigns a downstream channel ID to an RF channel.
rf-channel frequency	Sets the frequency for each RF channel.
rf-channel ip-address mac-address udp-port	Sets the IP address, MAC address and UDP port for each RF channel.
rf-channel network delay	Configures the network delay for an RF channel.

rf-channel frequency

To configure the frequency of an RF channel on a wideband interface, use the **rf-channel frequency** command in controller configuration mode. To remove the frequency of an RF channel configuration, use the **no** form of this command.

Cisco IOS Releases 12.3(21)BC and 12.2(33)SCA

```
rf-channel rf-port frequency freq
no rf-channel rf-port frequency
```

Cisco IOS Releases 12.3(23)BC and 12.2(33)SCB

```
rf-channel rf-port frequency freq [annex {A | B} modulation {64 | 256} [interleave-depth {8 | 12 | 16 | 32 | 64 | 128}]]
no rf-channel rf-port frequency
```

Syntax Description

<i>rf-port</i>	Specifies the RF channel physical port on the Wideband SPA FPGA. Allowed range is 0 to 23. Valid values for <i>rf-port</i> depend on the configuration set with the annex modulation command (see the Usage Guidelines section).
<i>freq</i>	Sets the center frequency for the RF channel. Allowed range is 55000000 to 1050000000 MHz.
annex {A/B}	Specifies the MPEG framing format for each RF channel: <ul style="list-style-type: none"> • A—Annex A. The downstream is compatible with the European MPEG framing format specified in ITU-TJ.83 Annex A. • B—Annex B. The downstream is compatible with the North American MPEG framing format specified in ITU-TJ.83 Annex B.
modulation {64/256}	Specifies the modulation rate for each RF channel: <ul style="list-style-type: none"> • 64—64-QAM • 256—256-QAM
interleave-depth {8 12 16 32 64 128}	Indicates the downstream interleave depth. The default value is 32.

Command Default

No default RF channel configuration values are set for frequency, annex, and modulation.

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.3(23)BC	The following keyword options were added: <ul style="list-style-type: none"> • annex • modulation • interleave-depth
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. The annex , modulation , and interleave-depth keyword options are not supported.
12.2(33)SCB	The annex , modulation , and interleave-depth keyword options are supported.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Cisco IOS Release 12.3(21)BC and Cisco IOS Release 12.2(33)SCA

This command configures the frequency for an RF channel on a Wideband SPA.

The Cisco uBR10012 router supports two Wideband SPAs. Each Wideband SPA supports up to 24 RF channels depending on how the SPA is configured with the **annex modulation** command. For annex A and 256 QAM, each Wideband SPA supports up to 18 RF channels. For all other cases, the SPA supports up to 24 RF channels.

Note In Cisco IOS 12.3(21)BC and 12.3(21a)BC3 releases, **annex** and **modulation** parameters were set globally for each SPA using the **annex modulation** command. Beginning in Cisco IOS Release 12.3(23)BC, **annex** and **modulation** values are set for each RF channel using the **rf-channel frequency** command. The **annex modulation** command is obsolete.

Cisco IOS Releases 12.3(23)BC and 12.2(33)SCB

This command configures the frequency for an RF channel on a Wideband SPA. The Cisco uBR10012 router supports two Wideband SPAs. Each Wideband SPA supports up to 24 RF channels. For annex A and 256 QAM, each Wideband SPA supports up to 18 RF channels at full rate. For all other cases, the SPA supports up to 24 RF channels.

For each RF channel, use the **rf-channel frequency** command in controller configuration mode to configure RF-channel characteristics. For Cisco IOS Release 12.3(21)BC, for each RF channel (*rf-port*), the frequency option *must be configured* with the **rf-channel frequency** command.

Uniqueness of frequency is required for all cable downstream channels on all cable interfaces and all Wideband SPAs on the CMTS.

Note Be certain to verify that the RF channel values set with **rf-channel frequency** match the values configured for the QAM outputs on the edge QAM device. The frequency value must match. If the value does not match, the Wideband SPA will not successfully communicate with the edge QAM device.

Cisco IOS Release 12.2(33)SCE

In Cisco IOS Release 12.2(33)SCE and later, changing the frequency of a single RF channel in a controller will change the frequency of all RF channels in that controller. In the event of the frequency change, all DOCSIS 3.0 cable modems will start re-registering in downstream partial service mode (p-online).

Examples

The following example shows how to configure RF channel frequency for RF port 0:

```
Router# configure terminal

Router(config)# controller modular-cable 1/0/0
Router(config-controller)# rf-channel 0 frequency 699000000 annex A modulation 256
interleave-depth 64
```

Related Commands

Command	Description
cable primary	Specifies that a wideband channel is a primary wideband channel.
controller modular-cable	Enters controller configuration mode to configure the Wideband SPA controller.
rf-channel description	Specifies the description for each RF channel.
rf-channel ip-address mac-address udp-port	Sets the IP address, MAC address and UDP port for each RF channel.
rf-channel network-delay	Configure the network delay for an RF channel.

rf-channel group-address

To configure the DEPI multicast group address for the RF channel, use the **rf-channel group-address** command in controller configuration mode. To disable the configuration, use the **no** form of the command.

rf-channel *rf-number* **group-address** *ip-address*

no rf-channel *rf-number* **group-address**

Syntax Description	
	<i>rf-number</i> RF channel number. The range is from 0 to 23.
	<i>ip-address</i> DEPI multicast group IP address.

Command Default The DEPI multicast group address is not configured for the RF channel.

Command Modes Controller configuration (config-controller)

Command History	Release	Modification
	12.2(33)CX	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **rf-channel group-address** command provides upstream and downstream mapping information for a specific channel group.

The following example shows how to configure the DEPI multicast group address for RF channel 0:

```
Router# configure terminal
Router# controller Modular-Cable 8/1/0
Router(config-controller)# rf-channel 0 group-address 224.0.0.1
```

Related Commands	Command	Description
	controller modular-cable	Configures the DEPI controller.

rf-channel ip-address mac-address udp-port

To configure the IP address, MAC address, UDP port and DEPI remote ID of an RF channel on a Wideband SPA, use the **rf-channel ip-address mac-address udp-port** command in controller configuration mode. To remove the IP address, MAC address, UDP port and DEPI remote ID configuration of an RF channel, use the **no** form of this command.

Cisco IOS Releases 12.3(21)BC and 12.2(33)SCA

```
rf-channel rf-port ip-address ip-address mac-address mac-address udp-port portnum
no rf-channel rf-port ip-address ip-address mac-address mac-address udp-port portnum
```

Cisco IOS Releases 12.3(23)BC and 12.2(33)SCB

```
rf-channel rf-port ip-address ip-address mac-address mac-address {udp-port portnum|depi-remote-id
session-id}
no rf-channel rf-port ip-address ip-address mac-address mac-address {udp-port portnum|
depi-remote-id session-id}
```

Syntax Description

<i>rf-port</i>	Specifies the RF channel physical port on the Wideband SPA FPGA. Allowed range is 0 to 23. Valid values for <i>rf-port</i> depend on the configuration set with the annex modulation command (see the Usage Guidelines section).
<i>ip-address</i>	Specifies the IP address of the Gigabit Ethernet interface on the edge QAM device for this RF channel.
<i>mac-address</i>	Specifies the MAC address of the next-hop interface or of the edge QAM device for this RF channel.
<i>portnum</i>	Specifies the UDP port number for the edge QAM device that will be used for this RF channel. Allowed range is 0 to 65535.
<i>session-id</i>	Specifies the DEPI remote session ID to be used for encapsulation of frames in DOCSIS-MPT mode.

Command Default

None

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.3(23)BC	The depi-remote-id keyword option was added.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. The depi-remote-id keyword option is not supported.
12.2(33)SCB	The depi-remote-id keyword option is supported.

Release	Modification
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

For each RF channel, use the **rf-channel ip-address mac-address udp-port** command in controller configuration mode to configure RF-channel characteristics.

The Cisco uBR10012 router supports two Wideband SPAs. Each Wideband SPA supports up to 24 RF channels depending on how the SPA is configured with the **annex modulation** command. For annex A and 256 QAM, each Wideband SPA supports up to 18 RF channels. For all other cases, the SPA supports up to 24 RF channels.

Note In the Cisco IOS Release 12.3(21)BC and 12.3(21a)BC3 releases, **annex** and **modulation** options were set globally for each SPA using the **annex modulation** command. Beginning in Cisco IOS Release 12.3(23)BC, annex and modulation values are set for each RF channel using the **rf-channel frequency** command. The **annex modulation** command is obsolete.

For each RF channel (*rf-port*), the following items *must be configured* with **rf-channel ip-address mac-address udp-port** command:

Cisco IOS Release 12.3(21)BC and Cisco IOS Release 12.2(33)SCA

- IP address
- MAC address
- UDP port
- Associated wideband channel (see the **cable rf-channel** command)

Cisco IOS Releases 12.3(23)BC and 12.2(33)SCB

- IP address
- MAC address
- UDP port or DEPI remote ID
- Associated wideband channel (see the **cable rf-channel** command)

The value used for *mac-address* in the *mac-address* argument is as follows:

- If a Gigabit Ethernet router or Layer 3 switch is used between the Wideband SPA and the edge QAM device, the value specified for *mac-address* is the MAC address for the next-hop interface on the router or Layer 3 switch.
- If a Gigabit Ethernet router or Layer 3 switch is not used, the value specified for *mac-address* is the MAC address for the Gigabit Ethernet interface on the edge QAM device.

The UDP port number set for the RF channel allows mapping an input UDP session to a specific QAM output port. Wideband traffic from different Wideband SPAs cannot be mixed on the same QAM output ports.

Note Be certain to verify that the RF channel values set with **rf-channel frequency** match the values configured for the QAM outputs on the edge QAM device. IP address, MAC address, UDP port, and DEPI remote ID must match. If any of these values do not match, the Wideband SPA will not successfully communicate with the edge QAM device.

Examples

The following example shows how to configure the RF channel IP address, MAC address UDP port and DEPI remote ID characteristics for RF port 0:

```
Router# configure terminal

Router(config)# controller modular-cable 1/0/0
Router(config-controller)# rf-channel 0 ip-address 192.168.200.30 mac-address
0011-920e-a9ff udp-port 49152
```

Related Commands

Command	Description
cable primary	Specifies that a wideband channel is a primary wideband channel.
cable rf-channel	Associates an RF channel on a Wideband SPA with a wideband channel.
controller modular-cable	Enters controller configuration mode to configure the Wideband SPA controller.
ip-address (controller)	Sets the IP address of the Wideband SPA FPGA.
modular-host sub-slot	Specifies the modular-host line card for Wideband protocol operations.
rf-channel cable downstream channel-id	Assigns a downstream channel ID to an RF channel.
rf-channel description	Specifies the description for each RF channel.
rf-channel frequency	Sets the frequency for each RF channel.
rf-channel network delay	Configures the network delay for an RF channel.

rf-channel network-delay

To configure the network delay for an RF channel on a Wideband SPA, use the **rf-channel network delay** command in controller configuration mode. To remove the network delay configuration for an RF channel, use the **no** form of this command.

```
rf-channel rf-port network-delay delay [sampling-rate rate]
no rf-channel rf-port network-delay delay [sampling-rate rate]
```

Syntax Description

<i>rf-port</i>	RF channel physical port on the Wideband SPA FPGA. The allowed range is from 0 to 23. The valid values for <i>rf-port</i> depend on the configuration set with the annex modulation command (see the Usage Guidelines section).
<i>delay</i>	Converged Interconnect Network (CIN) delay. The default value is 550 us. The allowed range is from 0 to 3000 us. The delay value auto determines the delay through DEPI Latency Measurement (DLM) packets.
sampling-rate <i>rate</i>	(Optional) Specifies how often the DLM is sent. The range is from 1 to 500 sec. The default value is 10 sec. This option is available only when the delay value is set to auto.

Command Default

None

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
12.3(23)BC	This command was introduced for the Cisco uBR10012 universal broadband router.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB.
12.2(33)SCC	This command was modified to include sampling-rate <i>rate</i> to specify how often the DLM is sent.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The Cisco uBR10012 universal broadband router supports two Wideband SPAs. Each Wideband SPA supports up to 24 RF channels depending on how the SPA is configured with the **annex modulation** command. For annex A and 256 QAM, each Wideband SPA supports up to 18 RF channels. For all other cases, the SPA supports up to 24 RF channels.

Note In Cisco IOS releases 12.3(21) BC and 12.3(21a)BC3, **annex** and **modulation** parameters were set globally for each SPA using the **annex modulation** command. From Cisco IOS Release 12.3(23)BC onwards, annex and modulation values are set for each RF channel using the **rf-channel frequency** command. The **annex modulation** command is obsolete.

Examples

The following example shows how to configure the RF channel network delay characteristics for RF port 0:

```
Router# configure terminal

Router(config)# controller modular-cable 1/0/0
Router(config-controller)# rf-channel 0 network-delay 1000
```

The following example shows how to configure the RF channel network delay characteristics for RF port 0 with a sampling-rate of 1sec:

```
Router# configure terminal

Router(config)# controller modular-cable 1/0/0
Router(config-controller)# rf-channel 0 network-delay auto sampling-rate 1
```

Related Commands

Command	Description
cable primary	Specifies that a wideband channel is a primary wideband channel.
cable rf-channel	Associates an RF channel on a Wideband SPA with a wideband channel.
controller modular-cable	Enters controller configuration mode to configure the Wideband SPA controller.
ip-address (controller)	Sets the IP address of the Wideband SPA FPGA.
modular-host subslot	Specifies the modular-host line card for Wideband protocol operations.
rf-channel cable downstream channel-id	Assigns a downstream channel ID to an RF channel.
rf-channel description	Specifies the description for each RF channel.
rf-channel frequency	Sets the frequency for each RF channel.
rf-channel ip-address mac-address udp-port	Sets the IP address, MAC address, and UDP port for each RF channel.

rf-channel rf-power

To set the RF power output level on Cisco UBR-MC20X20V and Cisco uBR-MC88V cable interface line cards, use the **rf-channel rf-power** command in controller configuration mode. To reset the RF output power level to its default value, use the **no** form of this command.

rf-channel *rf-port* **rf-power** *power-level*
no rf-channel *rf-port* **rf-power** *power-level*

Syntax Description

<i>rf-port</i>	RF channel physical port on the Wideband SPA FPGA. The range is from 0 to 3. The values for <i>rf-port</i> depend on the configuration set with the annex modulation command.
power-level	Desired RF output power level in dBmV. The range is dependent on the cable interface line card. The format is XY.Z. By default, .Z is added as .0.

Command Default

None

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
12.2(33)SCD	This command was modified. Added support for the controller interface configuration on Cisco uBR7246VXR and Cisco uBR7225VXR universal broadband routers.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

For the Cisco UBR-MC20X20V cable interface line card, all the channels within a controller must have the same RF power value. When the RF power value is changed on any one channel, the same value is applied to all the channels within the controller. The recommended RF power range depends on the mode of the upconverter. The mode of the upconverter is decided by the highest numbered channel that is enabled.

Note RF power value outside the recommended RF power range is accepted but is automatically adjusted. If the input value exceeds the recommended RF power range, it is adjusted to a value lower than the upper limit of the range and if it is less than the recommended range, it is adjusted to a value higher than the lower limit of the range. The RF power level can be configured in decimals too.

Table below lists the recommended RF power range for different channel settings on the Cisco UBR-MC20X20V line card.

Table 35: RF Power Range on the Cisco UBR-MC20X20V Line Card

Upconverter Mode	Channel Setting	Recommended RF Power Range
Single	Only channel 0 is enabled	60.0 to 52.0 dBmV

Upconverter Mode	Channel Setting	Recommended RF Power Range
Dual	Channel 0 is either enabled or disabled. Channel 1 is enabled. Channel 2 and channel 3 are disabled.	56.0 to 48.0 dBmV
Triple	Channel 0, and channel 1 are either enabled or disabled. Channel 2 is enabled and channel 3 is disabled.	54.0 to 46.0 dBmV
Quad	Channels 0, 1, and 2 are either enabled or disabled. Channel 3 is enabled.	52.0 to 44.0 dBmV

Table below lists the recommended RF power range for different channel settings on the Cisco uBR-MC88V line card.

Table 36: RF Power Range on the Cisco uBR-MC88V Line Card

Upconverter Mode	Channel Setting	Recommended RF Power Range
Single	The RF channel stacking number equals to 1 in this mode. Channel 0 is enabled while the other channels are disabled.	45 to 63 dBmV
Dual	The RF channel stacking number equals to 2 in this mode. Channels 0 and 1 are enabled; channels 2 and 3 are disabled.	48 to 56 dBmV
Triple	The RF channel stacking number equals to 3 in this mode. Channels 0, 1, and 2 are enabled; channel 3 is disabled.	46 to 54 dBmV
Quad	The RF channel stacking number equals to 4. Channels 0, 1, 2, and 3 are enabled.	44 to 52 dBmV

Examples

The following example shows how to configure RF power for RF port 0 in modular-cable controller mode:

```
Router# configure terminal
Router(config)# controller modular-cable 1/0/0
Router(config-controller)# rf-channel 0 rf-power 50.6
```

The following example shows how to configure RF power for RF port 0 in integrated-cable controller mode:

```
Router# configure terminal
Router(config)# controller integrated-cable 1/0/0
Router(config-controller)# rf-channel 0 rf-power 50.6
```

Related Commands

Command	Description
cable primary	Specifies that a wideband channel is a primary wideband channel.
controller modular-cable	Enters controller configuration mode to configure the Wideband SPA controller.
controller integrated-cable	Enters integrated-cable controller configuration mode.
rf-channel description	Specifies the description for each RF channel.
rf-channel ip-address mac-address udp-port	Sets the IP address, MAC address and UDP port for each RF channel.
rf-channel frequency	Configures the frequency for the RF channel.
rf-channel network-delay	Configure the network delay for an RF channel.
rf-channel rf-shutdown	Enables or disables RF output on a Wideband SPA.

rf-channel rf-shutdown

To disable the RF output on a wideband interface, use the **rf-channel rf-shutdown** command in controller configuration mode. To enable the RF output, use the **no** form of this command.

rf-channel *rf-port* **rf-shutdown**
no rf-channel *rf-port* **rf-shutdown**

Syntax Description

<i>rf-port</i>	Specifies the RF channel physical port. The range is from 0 to 3. The valid values for <i>rf-port</i> depend on the configuration set with the annex modulation command.
----------------	---

Command Default

RF output is disabled.

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Starting with Cisco IOS Release 12.2(33)SCE, when you use the **rf-channel rf-shutdown** command, all DOCSIS 3.0 cable modems associated with the RF channel on a particular wideband interface will go offline and start re-registering in downstream partial service mode (p-online). In Cisco IOS Release 12.2(33)SCD and earlier, cable modems do not go offline while using the **rf-channel rf-shutdown** command.

For muting and unmuting the QAM on the Cisco RFGW-10, use the **rf-channel rf-shutdown** command in the M-CMTS.

Note This command cannot be executed on a Cisco 1 Gbps Wideband Shared Port Adapter (SPA) configured with manual DEPI.

Examples

The following example enables RF output on the Cisco wideband SPA:

```
Router# enable

Router# configure terminal
Router(config)# controller integrated-cable 7/1/0
Router(config-controller)# no rf-channel 0 rf-shutdown
```

Related Commands

Command	Description
controller modular-cable	Enters controller configuration mode to configure the Wideband SPA controller.
controller integrated-cable	Enters integrated-cable controller configuration mode.

Command	Description
rf-channel network-delay	Configure the network delay for an RF channel.
rf-channel rf-power	Sets the RF power output level on the Cisco UBR-MC20X20V cable interface line card.

rf-channel stacking

To suppress a carrier or mute a radio frequency (RF) channel on the Cisco uBR-MC88V cable interface line card, use the **rf-channel stacking command** in controller configuration mode. To remove the configuration, use the **no** form of this command.

```
rf-channel stacking stacking-number
no rf-channel stacking stacking-number
```

Syntax Description	<i>stacking-number</i> RF channel stacking number. The range is from 1 to 4. The default value is 4.
---------------------------	--

Command Default The RF channel stacking number is set to 4.

Command Modes Controller configuration (config-controller)

Command History	Release	Modification
	12.2(33)SCD	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines If you change the default stacking number configuration, traffic loss may occur on the active channels. For example, if you change the stacking number from 4 to 2, traffic is interrupted on the RF channels 0 and 1. However, traffic loss does not occur if you do not change the stacking number configuration when shutting down an RF channel using the **rf-channel rf-shutdownrf-channel rf-shutdown** command.

Note We recommend that you do not change the default stacking number configuration. You can change the default configuration when you want RF diagnostics performed on a particular channel. For example, if you want to perform RF diagnostics on RF channel 2, you need to change the default stacking number configuration to 2 to completely mute this channel.

Examples

The following example shows how to configure the RF channel stacking number for the Cisco uBR-MC88V cable interface line card:

```
Router# configure terminal

Router(config)# controller integrated-cable 5/1
Router(config-controller)# rf-channel stacking 3
```

Related Commands	Command	Description
	rf-channel rf-shutdown	Disables the RF output on a Cisco Wideband SPA, or a cable interface line card.

rf-output

To define the output mode for the RF channel, use the **rf-output** command in the RF channel sub configuration mode.

rf-output { **normal** | **alt** | **cw** | **prbs** }

Syntax Description

normal	Normal mode for production operation.
alt	Alternating symbol (two-tone). Diagnostic mode for hardware testing.
cw	Continuous Wave. Diagnostic mode for hardware testing.
prbs	Pseudo Random Binary Sequence. Diagnostic mode for hardware testing.

Command Default

None.

Command Modes

RF channel sub configuration mode (config-rf-chan)

Usage Guidelines

This command is used to define the output mode for the RF channel.

The following example shows how to change the output mode:

```

router#configure terminal
router(config)#controller integrated-cable 3/0/0
router(config-controller)#rf-chan 5 10
router(config-rf-chan)#frequency 723000000
router(config-rf-chan)#rf-output alt
router(config-rf-chan)#exit
router(config-controller)#exit
router(config)#exit
router#show controller integrated-Cable 3/0/0 rf-channel 5 10
Chan State Admin Frequency Type Annex Mod srate Interleaver dcid power output
 5 TEST UP 723000000 DOCSIS B 256 5361 I32-J4 164 34 ALT
10 TEST UP 753000000 DOCSIS B 256 5361 I32-J4 169 34 ALT

```

Related Commands

Command	Description
controller integrated-cable	Enters the controller configuration mode.
frequency	Defines the RF channel frequency.
qam-profile	Defines the QAM profile number.
rf-chan	Enters the RF channel sub configuration mode.
type	Defines the QAM data type.
power-adjust	Defines the channel power level.

rf-port integrated-cable

To define the physical slot/bay/port to be used in a video service, to define the Service Distribution Group (SDG) use the **rf-port integrated-cable** command in the service distribution group configuration mode. To delete the physical slot/bay/port, use the **no** form of the command.

rf-port integrated-cable *slot/bay/port*

Syntax Description

slot The line card slot number. Slot can be configured from 0-3 or 6-9. Slots 4 and 5 are the supervisor slots.

bay The Cisco cBR-8 chassis number. This is always configured as 0.

port The RF port number. This can be configured from 1-8.

Command Default

None.

Command Modes

Service distribution group configuration mode (config-video-sdg)

Command History

Release	Modification
Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command is used to define the physical slot/bay/port to be used in a video service, to define the SDG. To configure QAM replication for service group size alignment between the DOCSIS and video services to one or more ports, you can add more ports into the service distribution group configuration. Make sure that the controller type is video for the slot/bay/port that you would use for the SDG. For more information, see the Video QAM Carriers section here: http://www.cisco.com/c/en/us/td/docs/cable/cbr/configuration/guide/b_cbr_basic_config_prov_construct/video_qam_carriers.html.

The following example shows how to define the physical slot/bay/port :

```
router#configure terminal
router(config)#cable video
router(config-video)#service-distribution-group sdgid 1
router(config-video-sdg)#rf-port integrated-cable 7/0/0
router(config-video-sdg)#rf-port integrated-cable 7/0/1
```

Related Commands

Command	Description
service-distribution-group	Defines a service distribution group.
onid	Override the default ONID.
psi-interval	Override the default PSI value.
show cable video service-distribution-group	Displays the SDG configuration.

rf-switch auxport enable

To enable the AUX port of the RF switch, use the **rf-switch auxport enable** command in redundancy mode. To disable the AUX port, use the **no** form of this command.

rf-switch auxport enable
no rf-switch auxport

Syntax Description

enable	Enables the Cisco NGRFSW-ADV. In the default configuration, the Cisco NGRFSW-ADV is disabled. When the Cisco NGRFSW-ADV is enabled, the Cisco CMTS router starts polling the Cisco NGRFSW-ADV at a set interval to check its status.
---------------	--

Command Default

The AUX port of the Cisco NGRFSW-ADV is disabled by default.

Command Modes

Redundancy mode (config-red)

Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to enable the AUX port of the Cisco NGRFSW-ADV:

```
Router> enable
Router# configure terminal
Router(config)# redundancy
Router(config-red)# linecard-group 1 cable
Router(config-red-lc)# rf-switch auxport enable
```

Command History

The **rf-switch auxport enable** command is used to configure the Cisco uBR Advanced RF Switch (NGRFSW-ADV). See [Cisco uBR Advanced RF Switch Software Configuration Guide](#) .

Related Commands

Command	Description
linecard-group id cable	Assigns the Hot Standby Connection-to-Connection Protocol (HCCP) group to all interfaces on the cable interface line card, or Cisco Broadband Processing Engine.
show redundancy linecard	Displays information about a redundant line card or line card group.

roll-off

To specify the channel roll-off value, use the **roll-off** command in OFDM channel profile configuration mode. To undo the channel roll-off value assignment, use **no** form of this command.

roll-off *value*

no profile-control

Syntax Description

<i>value</i>	The channel roll-off value. Valid values are 64, 128, 192, and 256.
--------------	---

Command Default

128

Command Modes

OFDM channel profile configuration (config-ofdm-chan-prof)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to specify the channel roll-off value.

Examples

The following example shows how to specify the channel roll-off value:

```
Router# configure terminal
Router(config)# cable downstream ofdm-chan-profile 21
Router(config-ofdm-chan-prof)# roll-off 128
```

Related Commands

Command	Description
cable downstream ofdm-chan-profile	Define the OFDM channel profile on the OFDM channel.
cyclic-prefix	Specify the channel cyclic-prefix.
description (OFDM channel profile)	Specify a user defined description for the profile.
interleaver-depth	Specify the channel interleaver-depth.
pilot-scaling	Specify the value used to calculate the number of continuous pilots.
profile-data	Specify default modulation or profile as the channel data profile.
profile-ncp	Specify default modulation or profile as the channel ncp profile.
profile-control	Specify default modulation or profile as the channel control profile.
subcarrier-spacing	Specify the spacing for specific subcarriers configured in this profile.

route-ecmg

To configure the route to the ECMG server for session based scrambling, use the **route-ecmg** command in the DVB scrambling configuration mode. To void the route configuration, use the **no** form of this command.

route-ecmg *ip_address netmask interface forwarding_router_ip*
no route-ecmg *ip_address netmask interface forwarding_router_ip*

<i>ip_address</i>	Specifies the IP address of the ECMG server.
<i>netmask</i>	Specifies the netmask of the connection.
<i>interface</i>	Specifies the interface of the connection.
<i>forwarding_router_ip</i>	Specifies the IP address of the forwarding router.

Command Default

None

Command Modes

DVB scrambling configuration mode (config-video-encrypt-dvb)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to configure the route to the ECMG server:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#route-ecmg 1.200.1.0 255.255.255.0 TenGigabitEthernet 4/1/2
1.200.1.1
```

Related Commands

Command	Description
dvb	Enters DVB scrambling configuration mode.
strong-pairing-enforce	Switches on the NDS strong pairing enforcement
check-scg-at-prov	Enables Check SCG at provision time.
scramble-video-audio	Scrambles only video and audio pids.
mgmt-ip	Configures the management IP for EIS/Broadcast ECMG.
ca-interface	Configures the conditional access interface.
tier-based	Enters the tier-based scrambling configuration mode.

Command	Description
ecmg	Enters the ECM Generator configuration mode.
eis	Enters the Event Information Scheduler configuration mode.

routing-interface-ip

To automatically configure IP addresses of line card video interfaces from a pool of IP addresses that you provide, use the **routing-interface-ip** command.

routing-interface-ip *ip-address ip-mask* { **secondary** *ip-address ip-mask* }

Syntax Description

ip-address Specifies the starting IP address of the line card video interfaces.

ip-mask Specifies the IP mask IP address.

secondary Specifies the secondary interface of the line card video interfaces.

Command Modes

Video configuration mode (config-video)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Do not change the video interface IP configuration unless there are conflicts with customer subnets.

Video interface IP configuration is optional. By default, the Cisco cBR-8 uses 10.100.x.x subnets for primary IP addresses and 10.101.x.x subnets for secondary IP addresses of video interfaces. By default, all video interfaces are in the VRF *Mgmt-MPEG-video-intf*.

Configure the video interface IP before configuring any other video-specific configurations like logical edge device and virtual service group configurations. Use the **routing-interface-ip** only when the default configuration conflicts with the existing subnets in the network.

routing-interface-vrf

To configure user-specific VRF to line card video interfaces, use the **routing-interface-vrf** command in video configuration mode. To remove the user-specific VRF configuration, use the **no** form of this command.

routing-interface-vrf *slot* **vrf-name** *vrf-name*

Syntax Description

slot Slot where the line card resides. The valid range is 0–3 and 6–9.

vrf-name Name of the user-specific VRF

Command Modes

Video configuration mode (config-video)

Command History

Release	Modification
Cisco IOS XE Amsterdam 17.3.1x	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Virtual routing and forwarding configuration is optional. Use the **routing-interface-vrf** only when the video interface participates in NX-MVPN profile 12 or profile 14.

Do not use the **routing-interface-vrf** command for legacy L3VPN.

By default, all video interfaces are in the VRF *Mgmt-MPEG-video-intf*.

Configure VRF separately for each line card that is participating in NX-MVPN.

Configure virtual routing and forwarding before configuring any other video-specific configurations like logical edge device, virtual carrier group, or service distribution group configurations.

rpd-ds downstream-cable

To configure the downstream controller in the RPD, use the **rpd-ds downstream-cable** command in RPD core-interface configuration mode. To void the downstream controller configuration in the RPD, use the **no** form of this command.

rpd-ds 0 downstream-cable *slot/subslot/port* **profile id**

no rpd-ds 0 downstream-cable *slot/subslot/port*

Syntax Description	<i>slot/subslot/port</i> Specifies the slot, subslot and port of the downstream controller.
---------------------------	---

Command Default	None
------------------------	------

Command Modes	RPD core-interface configuration (config-rpd-core)
----------------------	--

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines	Use this command to configure the downstream controller in the RPD.
-------------------------	---

The following example shows how to configure the downstream controller in the RPD:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# core-interface tengigabitethernet 3/1/0
Router(config-rpd-core)# rpd-ds 0 downstream-cable 9/0/0 profile 0
```

Related Commands	Command	Description
	core-interface	Configures the core-interface of the RPD.
	rpd-us upstream-cable	Configures the upstream controller in the RPD.

rpd-ds downstream-oob-vom

To specify the downstream virtual OM and OOB profile, use the **rpd-ds downstream-oob-vom** command in RPD core-interface configuration mode. To void the downstream virtual OM and OOB profile assignment, use the **no** form of this command.

```
rpd-ds 0 downstream-oob-vom o-id profile dp-id
```

```
no rpd-ds 0 downstream-oob-vom
```

Syntax Description

o-id Specifies the ID of the virtual OM previously configured.

dp-id Specifies the ID of the downstream OOB profile previously configured.

Command Default

None

Command Modes

RPD core-interface configuration (config-rpd-core)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to specify the downstream virtual OM and OOB profile.

The following example shows how to specify the downstream virtual OM and OOB profile:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# core-interface tengigabitethernet 3/1/0
Router(config-rpd-core)# rpd-ds 0 downstream-oob-vom 1 profile 3
```

Related Commands

Command	Description
virtual-om	Defines a virtual OOB modulator configuration.
controller downstream-oob 55d1-profile	Configures the OOB downstream controller profile.

rpd-event

To specify the RPD event reporting profile to use in RPD, use the **rpd-event** command in RPD configuration mode. To void the RPD event reporting profile specification, use the **no** form of this command.

rpd-event profile *id*

no rpd-event profile

Syntax Description *id* Specifies the ID of the RPD event reporting profile previously created.

Command Default None

Command Modes RPD configuration (config-rpd)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use this command to specify the RPD event reporting profile.

The following example shows how to specify the RPD event reporting profile:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# rpd-event profile 1
```

rpd-us upstream-cable

To configure the upstream controller in the RPD, use the **rpd-us upstream-cable** command in RPD core-interface configuration mode. To void the upstream controller configuration in the RPD, use the **no** form of this command.

rpd-us port upstream-cable slot/subslot/port profile id

no rpd-us port upstream-cable slot/subslot/port

Syntax Description	<i>slot/port/interface</i> Specifies the slot, subslot and port of the upstream controller.
---------------------------	---

Command Default	None
------------------------	------

Command Modes	RPD core-interface configuration (config-rpd-core)
----------------------	--

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Description

Specifies a description for the upstream controller profile. The maximum length is 20 characters. This field is set to NULL by default. Different upstream controller profiles on the RPD ports can be easily distinguished if a description is specified.

Usage Guidelines	Use this command to configure the upstream controller in the RPD.
-------------------------	---

The following example shows how to configure the upstream controller in the RPD:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# core-interface tengigabitethernet 3/1/0
Router(config-rpd-core)# rpd-us 0 upstream-cable 9/0/0 profile 122
```

Related Commands	Command	Description
	core-interface	Configures the core-interface of the RPD.
	rpd-ds downstream-cable	Configures the downstream controller in the RPD.

rpd-us upstream-oob-varpd

To specify the upstream virtual ARPD and OOB profile, use the **rpd-us upstream-oob-varpd** command in RPD core-interface configuration mode. To void the upstream virtual ARPD and OOB profile assignment, use the **no** form of this command.

rpd-us port upstream-oob-varpd *a-id* **profile** *up-id*

no rpd-us port upstream-oob-varpd

Syntax Description

a-id Specifies the ID of the virtual ARPD previously configured.

up-id Specifies the ID of the upstream OOB profile previously configured.

Command Default

None

Command Modes

RPD core-interface configuration (config-rpd-core)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to specify the upstream virtual ARPD and OOB profile.

The following example shows how to specify the upstream virtual ARPD and OOB profile:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# core-interface tengigabitethernet 3/1/0
Router(config-rpd-core)# rpd-us 0 upstream-oob-varpd 1 profile 3
```

Related Commands

Command	Description
virtual-arpd	Defines a virtual ARPD configuration.
controller upstream-oob 55d1-profile	Configures the OOB upstream controller profile.

rpd downstream-cable

To specify the RPD in the SDG, use the **rpd downstream-cable** command in SDG configuration mode. To void the RPD assignment in the SDG, use the **no** form of this command.

rpd downstream-cable *slot/bay/port*

no rpd downstream-cable *slot/bay/port*

Syntax Description	<i>slot/bay/port</i> Specifies the slot, bay and port of the downstream cable interface.
---------------------------	--

Command Default	None
------------------------	------

Command Modes	service distribution group configuration (config-video-sdg)
----------------------	---

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines	Use this command to configure the downstream controller in the RPD.
-------------------------	---

The following example shows how to configure the downstream controller in the RPD:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# core-interface tengigabitethernet 3/1/0
Router(config-rpd-core)# rpd-ds 0 downstream-cable 9/0/0 profile 0
```

Related Commands	Command	Description
	core-interface	Configures the core-interface of the RPD.
	rpd-us upstream-cable	Configures the upstream controller in the RPD.

sbfd

To configure the Sbfd, use the **sbfd** command in RPD configuration mode. To void the Sbfd configuration, use the **no** form of this command.

sbfd {**sbfd** | **interval** *milliseconds* **multiplier** *value*}

no sbfd {**enable** | **interval**}

Syntax Description	
	<i>milliseconds</i> Specifies interval in milliseconds.
	<i>value</i> Specifies the value to multiply the interval.

Command Default	None
-----------------	------

Command Modes	RPD configuration (config-rpd)
---------------	--------------------------------

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines	Use this command to configure Sbfd.
------------------	-------------------------------------

The following example shows how to configure Sbfd:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# no sbfd enable
```

scramble-video-audio

To scramble only video and audio pids, use the **scramble-video-audio** command in the DVB scrambling configuration mode. To scramble all elementary streams, use the **no** form of this command.

scramble-video-audio
no scramble-video-audio

Command Default

None

Command Modes

DVB scrambling configuration mode (config-video-encrypt-dvb)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

When **scramble-video-audio** is configured, the elementary streams other than video and audio are not scrambled.

The following is an example of how to scramble only video and audio pids:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#scramble-video-audio
```

Related Commands

Command	Description
dvb	Enters DVB scrambling configuration mode.
strong-pairing-enforce	Switches on the NDS strong pairing enforcement
check-scg-at-prov	Enables Check SCG at provision time.
route-ecmg	Configures the route to the ECMG server.
mgmt-ip	Configures the management IP for EIS/Broadcast ECMG.
ca-interface	Configures the conditional access interface.
tier-based	Enters the tier-based scrambling configuration mode.
ecmg	Enters the ECM Generator configuration mode.
eis	Enters the Event Information Scheduler configuration mode.

secondary aux

To enable the auxiliary port on the standby PRE1 module, use the **secondary aux** command in redundancy configuration (main-cpu) mode. To disable the auxiliary port, use the **no** form of this command.

secondary aux
no secondary aux

Syntax Description This command has no keywords or arguments.

Command Default The auxiliary port on the standby PRE1 module is disabled.

Command Modes Redundancy configuration, main-cpu mode

Release	Modification
12.2(11)BC3	This command was introduced for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to enable the auxiliary port on the standby PRE1 module.

```
Router# config t
Router(config)# redundancy
Router(config-r)# main-cpu
Router(config-r-mc)# secondary aux
Router(config-r-mc)# exit
Router(config-f)# exit
Router(config)#
```

Related Commands

Command	Description
main-cpu	Enters main-CPU redundancy configuration mode, so that you can configure the synchronization of the active and standby Performance Routing Engine (PRE1) modules.
redundancy	Configures the synchronization of system files between the active and standby PRE1 modules.
redundancy force-failover main-cpu	Forces a manual switchover between the active and standby PRE1 modules.

server

To define the server IP address of the session resource manager, use the **server** command in the logical edge device protocol configuration mode. To reset to default configuration, use the **no** form of this command.

```
server ip-address
no server ip-address
```

Syntax Description

<i>ip-address</i>	Specifies the server IP address of the session resource manager.
-------------------	--

Command Default

None

Command Modes

Logical edge device protocol configuration (config-video-led-protocol)

Command History

Release	Modification
IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command defines the server IP address of the session resource manager.

Examples

The following example shows how to define the server IP address of the session resource manager:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)#logical-edge-device vod id 1
Router#(config-video-led)protocol gqi
Router#(config-video-led-protocol) server 172.16.3.75
```

Related Commands

Command	Description
logical-edge-device	Defines a logical edge device.
protocol	Specifies the protocol used in the logical edge device.
mgmt-ip	Defines the local management IP address for a logical edge device.
mac-address	Defines the MAC address for a logical edge device.
vcg	Specifies the virtual carrier group assigned to the logical edge device.
virtual-edge-input-ip	Defines a virtual edge input.
show cable video logical-edge-device	Displays the logical edge device information.
show cable video gqi connections	Displays the GQI connection information of the logical edge device with the Session Resource Manager.

Command	Description
show diag all eeprom detail include MAC	Displays the chassis MAC address information.

service divert-limit

To set the layer 3 mobility threshold limit, use the **service divert-limit** command in global configuration mode. To set the default value, use the **no** form of this command.

```
service divert-limit {I3-mobility-counter limit | I3-mobility-timeslot timeslot }
no service divert-limit {I3-mobility-counter limit | I3-mobility-timeslot timeslot }
```

Syntax Description	Parameter	Description
	I3-mobility-counter	Sets the layer 3 CPE mobility counter threshold.
	<i>limit</i>	Specifies the mobility counter threshold limit in packets. The range is from 1 to 127. The default is 16.
	I3-mobility-timeslot	Sets the layer 3 CPE mobility time slot configuration.
	<i>timeslot</i>	Specifies the mobility time slot in milliseconds. The range is from 1 to 4095. The default is 300.

Command Default This **divert-limit I3-mobility-counter** default value is 16 packets and **divert-limit I3-mobility-timeslot** default value is 300 ms.

Command Modes Global configuration (config)

Command History	Version	Description
	12.2(33)SCH2	The command was introduced.
	IOS-XE 3.15.0S	This command was replaced by the platform punt-sbrl subscriber command on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines If the **cable I3-mobility** command is enabled, the **service divert-limit** command is also enabled by default. This command is usually used to modify the default value.

Note This command does not work if **cable I3-mobility** command is disabled.

Examples

The following example shows how to set the CPE mobility threshold and time slot:

```
Router # enable
Router # configure terminal
Router (config) # service divert-limit I3-mobility-counter 127
Router (config) # service divert-limit I3-mobility-timeslot 4095
```

Related Commands	Command	Description
	cable I3-mobility	Enables mobility for a particular IPv4 or IPv6 subnet.

service divert-rate-limit

Note Effective with Cisco IOS Release 12.2(33)SCB, the **service divert-rate-limit fib-rp-glean** command is replaced on the WAN-side by the **service divert-rate-limit ip fib-rp-glean** command. See the **service divert-rate-limit ip** command for more information. The **service divert-rate-limit fib-rp-glean** command is replaced on the WAN-side non-IP by **service divert-rate-limit non-ip fib-rpf-glean** command. See the **service divert-rate-limit non-ip** command for more information. For cable-side DRL configuration, see the **cable divert-rate-limit** command.

To configure PXF Divert-Rate-Limit, use the **service divert-rate-limit** command in global configuration mode. To reset this feature to the default parameters, use the no form of this command.

service divert-rate-limit divert-code rate [limit limit]
no service divert-rate-limit divert-code

Syntax Description

<i>divert-code rate</i>	Configures the PXF Divert-Rate-Limit for the any of the following packets: <ul style="list-style-type: none"> • fwd-glean—Packets that hit a glean adjacency in the FIB. • rpf-glean—Packets that hit a glean adjacency during the RPF check. <p>The range is from 1 to 255 packet-per-second.</p> <p>The default rate is 20 packets-per-second.</p>
limit limit	(Optional) Sets the limit for the number of packets that will be diverted in an initial burst of packets.
	The range is from 4 to 255 packets.
	The default limit is 5 packets.
Note	Setting the limit has a limited effect on the behavior of the algorithm, so this part of the CLI is hidden.

Command Default

Divert-Rate-Limit contains the following default behavior and values:

- Divert-Rate-Limit is always active.
- The default rate is 20 packets-per-second.
- The default limit is 5 packets.

Command Modes

Global configuration (config)

Command History

12.3(17a)BC	The command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers.
12.2(33)SCA	This command was integrated into Cisco IOS release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

12.2(33)SCB	This command was replaced by the service divert-rate-limit ip <i>fib-rp-glean</i> command and service divert-rate-limit non-ip <i>fib-rpf-glean</i> command.
IOS-XE 3.15.0S	This command was replaced by the platform punt-sbri subscriber command on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This **service divert-rate-limit** command is used to configure the PXF Divert-Rate-Limit for fwd-glean and rpf-glean packets in order to identify packet streams that will cause congestion of the FP-to-RP interface.

Examples

The following example shows how to configure rate-limiting for fib-rp-glean, with a rate of 10 packets-per-second and a limit of 20 packets:

```
Router(config-if)# service divert-rate-limit fib-rp-glean 10 limit 20
```

The following example shows how to return rate-limiting for fib-rp-glean to the default values:

```
Router(config-if)# no service divert-rate-limit fib-rp-glean
```

Pass and fail counters are kept for fwd-glean, rpf-glean, and cable-ARP packets. To show the statistics for the pass and fail counter, use the **show pxf cpu statistics drl** command:

```
Router(config-if)# show pxf cpu statistics drl
Divert-Rate-Limit statistics
  code      total      diverted      dropped
  fib_rpf_glean  500        59           441
  fib_rp_glean  500        54           446
  arp_filter    0          0            0
```

Note The arp_filter stats shown above are global stats for PXF ARP Filtering. These stats cannot be cleared by the CLI. However, they will reset to zero upon reload.

Packets dropped by Divert-Rate-Limit and the ARP Filter will be recorded in the regular PXF drop statistics:

```
Router(config-if)# show pxf cpu statistics drop c5/0/0

FP drop statistics for Cable5/0/0
  vcci undefined      packets      bytes
  vcci C
  ...
  divert_rate_limit   441         28224
  arp_filter_reply    0           0
  arp_filter_request   0           0
```

Related Commands

Command	Description
show cable arp-filter	Displays the total number of Address Resolution Protocol (ARP) offenders.

service divert-rate-limit ip

To set DRL rate and limit for WAN-side IP packet streams, use the **service divert-rate-limit ip** command in global configuration mode. To reset the *rate* and *limit* to the default values for all IP divert-codes, use the **no** form of this command. Using **no service divert-rate-limit ip divert-code** will reset rate and limit to the default values for the specified divert code.

service divert-rate-limit ip divert-code rate rate limit limit
no service divert-rate-limit ip

Syntax Description

<i>divert code</i>	Specifies the applicable divert code.
<i>rate</i>	Specifies the divert rate in packets per second. Minimum rate is 1 packet per second. Maximum rate is 65535 packets per second. For WAN-side IP packets, the default rate is 4000 packets per second
<i>limit</i>	Specifies the number of packets to be diverted in an initial burst of packets. Minimum limit is 4 packets. Maximum limit is 4194 packets. For WAN-side IP packets, the default limit is 4000 packets.

Command Default

For WAN-side IP packet streams, the default rate is 4000 packets per second and default limit is 4000 packets. These defaults apply to each uniquely identified IP packet stream.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(33)SCB	This command was introduced. The service divert-rate-limit ip fib-rp-glean command is the WAN-side replacement for the service divert-rate limit fib-rp-glean command.
IOS-XE 3.15.0S	This command was replaced by the platform punt-sbri wan command on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

You can configure a rate and limit for a particular IP divert-code for WAN-side IP packets. However, each IP packet-stream is uniquely identified (using a hash of the VRF, the IP source address, and the divert-code), and then packets in that stream are sent through a rate-limiter with the configured rate and limit.

Examples

The following example shows how to set the rate and limit for the specified divert code:

```
Router(config)# service divert-rate-limit ip fib-rp-glean rate 1 limit 4
```

Related Commands

Command	Description
service divert-rate-limit non-ip	This command configures DRL for WAN-side non-IP packet streams.

Command	Description
service divert-rate-limit trusted-site	This command adds entries to the trusted site list.

service divert-rate-limit ipv6

To set the divert rate limit (DRL) rate and limit for WAN-side IPv6 packet streams, use the **service divert-rate-limit ipv6** command in global configuration mode.

service divert-rate-limit ipv6 *divert-code* **rate** *rate* **limit** *limit*
no service divert-rate-limit ipv6

Syntax Description

<i>divert-code</i>	Specifies the applicable divert code.
<i>rate</i>	Specifies the divert rate in packets per second. Minimum rate is 1 packet per second. Maximum rate is 65535 packets per second. For WAN-side IPv6 packets, the default rate is 4000 packets per second.
<i>limit</i>	Specifies the number of packets to be diverted in an initial burst of packets. Minimum limit is 4 packets. Maximum limit is 4194 packets. For WAN-side IPv6 packets, the default limit is 4000 packets.

Command Default

For WAN-side IPv6 packet streams, the default rate is 4000 packets per second and default limit is 4000 packets.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(33)SCE	This command was introduced.
IOS-XE 3.15.0S	This command was replaced by the platform punt-sbri wan command on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

You can configure rate and limit for a particular IPv6 divert-code for WAN-side IP packets. However, each IP packet-stream is uniquely identified (using a hash of the VRF, the IP source address, and the divert-code), and then packets in that stream are sent through a rate-limiter with the configured rate and limit.

This command is supported only on PRE4.

Use the **diversion** option of the **show pxf cpu statistics** command to troubleshoot the divert code, before configuring the DRL.

To configure the correct divert code, refer to the list of divert codes.

Table 37: List of divert codes

Divert Code	Description
6pe_dst_linklocal	6PE dst linklocal
6pe_dst_mcast	6PE dst multicast

Divert Code	Description
6pe_ttl	6PE ttl
icmpv6	IPv6 ICMP
ipv6_cable_filter_ds	ipv6 cable filter ds
ipv6_dhcp_ucast	IPv6 unicast DHCP
ipv6_hopopts	IPv6 HopOpts
ipv6_lng_ext_hdr	IPv6 long extension hdr
ipv6_mcast_rsvd	IPv6 multicast
ipv6_nd_na_mcast	IPv6 ND NA (multicast)
ipv6_nd_na_ucast	IPv6 ND NA (unicast)
ipv6_nd_ns_mcast	IPv6 ND NS (multicast)
ipv6_nd_ns_ucast	IPv6 ND NS (unicast)
ipv6_nd_rs_mcast	IPv6 ND RS (multicast)
ipv6_rp_dest	IPv6 receive adjacency
ipv6_rp_glean	IPv6 glean adjacency
ipv6_rp_pbr	IPv6 RP PBR
ipv6_rp_punt	IPv6 punt adjacency
ipv6_src_linklocal	IPv6 SRC LinkLocal
ipv6_src_ver_lq_req	IPv6 src ver leasequery request
ipv6_src_ver_mac_req	IPv6 src ver MAC request

Note To reset the *rate* and *limit* to the default values for all IPv6 divert-codes, use the no form of this command. Using **no service divert-rate-limit ipv6 divert-code** will reset *rate* and *limit* to the default values for the specified divert code.

Examples

The following example shows how to set the rate and limit for the specified divert code:

```
Router(config)# service divert-rate-limit ipv6 ipv6_rp_glean rate 20 limit 10
Router(config)#
```

Related Commands

Command	Description
service divert-rate-limit trusted-site	Adds IPv4-specific entries to the trusted site list.
service divert-rate-limit non-ip	Configures DRL for WAN-side non-IP packet streams.
service divert-rate-limit trusted-site-ipv6	Adds IPv6-specific entries to the trusted site list.
show pxf cpu statistics	Displays Parallel eXpress Forwarding (PXF) CPU statistics.

service divert-rate-limit ip trusted-site

To add entries to the trusted site list, use the **service divert-rate-limit ip trusted-site** command in the global configuration mode. To remove all entries from the trusted site list, use the **no** form of this command.

```
service divert-rate-limit ip trusted-site ip-address mask ip-address tos tos-value mask tos-mask
vrf vrf-name
no service divert-rate-limit ip trusted-site ip-address mask ip-address tos tos-value mask tos-mask
vrf vrf-name
```

Syntax Description

<i>ip-address</i>	Specifies the source IP address that should be matched.
mask <i>ip-address</i>	The mask to apply to the source IP address of the packet before testing if it matches. There are no restrictions on the mask value.
tos <i>tos-value</i>	The ToS value of the trusted site. There are no restrictions on the <i>tos_value</i> . Example: 0xD0
mask <i>tos-mask</i>	The mask to apply to the IP ToS value and the trusted-site <i>tos_value</i> before testing if it matches. There are no restrictions on the <i>tos_mask</i> value. Example: 0xF3 Note The ToS value can be wild-carded by setting the <i>tos_mask</i> to 0x00
vrf <i>vrf-name</i>	The VRF that this trusted site applies to. For the global VRF, use the global keyword. To apply the trusted-site to all VRFs (including the global VRF), hit enter after specifying the <i>tos-mask</i> . If a non-existent VRF is specified, the table entry is filled, but the information is not written to toaster memory. If the specified VRF is subsequently created, the information is written to toaster at that time.

Command Default

None

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **service divert-rate-limit ip trusted-site** command is used to configure trusted site list that contains a source IP address and mask, IP ToS value and mask, and a VRF. If no IP address is specified, the entire trusted site list is cleared. The trusted site list contains a source IP address and mask, IP ToS value and mask, and a VRF. The trusted site list applies only to WAN-IP IPv4 packets. There is a limitation of four trusted sites.

Examples

The following example shows how to configure trusted site list:

service divert-rate-limit ip trusted-site

```
Router(config)
)# service divert-rate-limit trusted-site 192.0.13.2 255.255.255.0
   tos 0xD0 mask 0xF3 vrf name1
```

Related Commands

Command	Description
service divert-rate-limit non-ip	This command sets and limit default values for the specified divert code.

service divert-rate-limit max-rate us-cable

To set per-divert-code rate limit on the upstream cable interface, use the **service divert-rate-limit max-rate us-cable** command in global configuration mode. To reset the divert-rate-limit parameters to the default values for all divert-codes, use the no form of this command.

service divert-rate-limit max-rate us-cable *divert-code* **rate** *rate* **limit** *limit*

Syntax Description

divert-code Configures the divert-rate-limit for any of the following packets:

- *mfib_224_0_0_x*—The Packet whose destination IP is 224.0.0.x.
- *icmpv6*—IPv6 ICMP
- *mfib_igmp*—IGMP protocol packet
- *ipv6_nd_na_mcast*—IPv6 ND NA (multicast)
- *ipv6_nd_na_ucast*—IPv6 ND NA (unicast)
- *ipv6_nd_ns_mcast*—IPv6 ND NS (multicast)
- *ipv6_nd_ns_ucast*—IPv6 ND NS (unicast)
- *fib_rp_dest*— IPv4 packets targeting to CMTS.
- *fib_rp_dest_precedence*—The packet whose destination is RP and has non-zero precedence value in IP header.
- *fib_rp_glean*—FIB glean adjacency used for IPv4 adjacency resolving.
- *fib_rp_punt*—FIB punt adjacency used for IPv4 adjacency resolving.
- *src_ver_leasequery_req*—Divert to RP due to zero MD and sid value and need to send lease query to DHCP server for those packets.
- *src_ver_unknown_ip_addr*—Divert to RP due to zero MD and sid value and no adjacency information for source IP address of those packets.
- *ipv6_rp_dest*—IPv4 packets targeting to CMTS.
- *ipv6_rp_dest_precedence*—The packet whose destination is RP and has non-zero precedence value in IPV6 header.
- *ipv6_rp_glean*—IPv6 receive adjacency used for IPv4 adjacency resolving.
- *ipv6_rp_punt*—IPv6 punt adjacency used for IPv4 adjacency resolving.
- *ipv6_src_linklocal*—IPv6 SRC LinkLocal
- *ipv6_src_ver_mac_req*—Divert to RP due to zero MD and sid value.

rate Specifies the divert rate in packets/sec. The range is from 1 to 65535. The default value is 4194.

limit Specifies the limit for the number of packets that will be diverted in an initial burst of packets. The range is from 4 to 4194. The default value is 4194.

Command Modes Global configuration (config)

Command History	Release	Modification
	12.2(33)SCJ	This command was introduced.

Usage Guidelines The **service divert-rate-limit max-rate us-cable** command can be configured when the DDos occurs and the flooding packets have one of the support divert codes.

Note Before you configure the service divert-rate-limit max-rate command, it is recommended to configure the source based DRL first.

Example

The following example shows how to set the rate and limit for the specified divert code:

```
Router(config)# service divert-rate-limit max-rate us-cable fib_rp_glean rate 5000 limit 100
```

Related Commands

Command	Description
show pxf cpu statistics drlmax-rate us-cable	Verifies the drop counters for the DRL max-rate on the upstream cable interface.

service divert-rate-limit max-rate wan

To set per-divert-code rate limit on the WAN interface, use the **service divert-rate-limit max-rate wan** command in global configuration mode. To reset the divert-rate-limit parameters to the default values for all divert-codes, use the no form of this command.

service divert-rate-limit max-rate wan *divert-code* **rate** *rate* **limit** *limit*

Syntax Description

divert-code Configures the divert-rate-limit for any of the following packets:

- *fib_rp_dest*— IPv4 packets targeting to CMTS.
- *fib_rp_glean*—FIB glean adjacency used for IPv4 adjacency resolving.
- *fib_rp_punt*—FIB punt adjacency used for IPv4 adjacency resolving.
- *ipv6_rp_dest*—IPv4 packets targeting to CMTS.
- *ipv6_rp_glean*—IPv6 receive adjacency used for IPv4 adjacency resolving.
- *ipv6_rp_punt*—IPv6 punt adjacency used for IPv4 adjacency resolving.
- *mfib_224_0_0_x*—The Packet whose destination IP is 224.0.0.x.
- *icmpv6*—IPv6 ICMP
- *mfib_igmp*—IGMP protocol packet
- *ipv6_nd_na_mcast*—IPv6 ND NA (multicast)
- *ipv6_nd_na_ucast*—IPv6 ND NA (unicast)
- *ipv6_nd_ns_mcast*—IPv6 ND NS (multicast)
- *ipv6_nd_ns_ucast*—IPv6 ND NS (unicast)
- *ipv6_rp_dest_precedence*—The packet whose destination is RP and has non-zero precedence value in IPV6 header.
- *ipv6_src_linklocal*—IPv6 SRC LinkLocal
- *fib_rp_dest_precedence*—The packet whose destination is RP and has non-zero precedence value in IP header.

rate Specifies the divert rate in packets/sec. The range is from 1 to 65535. The default value is 4194.

limit Specifies the limit for the number of packets that will be diverted in an initial burst of packets. The range is from 4 to 4194. The default value is 4194.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(33)SCH3	This command was introduced.

Release	Modification
12.2(33)SCJ	This command was updated to include more divert codes.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **service divert-rate-limit max-rate wan** command can be configured when the DDos occurs and the flooding packets have one of the support divert codes.

Note Before you configure the **service divert-rate-limit max-rate** command, it is recommended to configure the source based DRL first.

Example

The following example shows how to set the rate and limit for the specified divert code:

```
Router(config)# service divert-rate-limit max-rate wan fib_rp_glean rate 5000 limit 100
```

Related Commands

Command	Description
show pxf cpu statistics drlmax-rate wan	Verifies the drop counters for the DRL max-rate on the WAN interface.
clear pxf statistics drl max-rate	Clears the DRL max-rate statistics on the WAN interface.

service divert-rate-limit non-ip

To set DRL for WAN-side non-IP packet streams, use the **service divert-rate-limit non-ip** command in global configuration mode. To reset the *rate* and *limit* to the default values for all non-IP divert-codes, use the **no** form of this command. Using **no service divert-rate-limit non-ip divert-code** will reset rate and limit to the default values for the specified divert-code.

service divert-rate-limit non-ip divert-code rate rate limit limit
no service divert-rate-limit non-ip

Syntax Description

<i>divert-code</i>	Specifies the applicable divert code.
<i>rate</i>	Specifies the rate in packets per second. Minimum rate is one packet per second. Maximum rate is 65535 packets per second. For WAN-side non-IP packets, the default rate is 2000 packets per second.
<i>limit</i>	Specifies the number of packets to be diverted in an initial burst of packets. Minimum limit is 4 packets. Maximum limit is 4194 packets. For WAN-non-IP packets, the default limit is 2000 packets.

Command Default

For WAN-side non-IP packets, the default rate is 2000 packets per second and default limit is 2000 packets.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(33)SCB	This command was introduced. The service divert-rate-limit non-ip fib-rpf-glean command is the WAN-side non-IP replacement for the service divert-rate-limit fib-rpf-glean command.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

You can configure a rate and limit for a particular non-IP divert-code, and all packets arriving with that divert-code are sent through a single rate-limiter with the configured rate and limit. but the explanation is fairly straightforward: there is a single rate-limiter for each non-IP divert-code. No attempt is made to uniquely identify the source of the attacking packet stream.

Examples

The following example shows how to set and limit default values for the specified divert code:

```
Router(config)# service divert-rate-limit non-ip fib-rp-glean 10 rate 1 limit 4
```

Related Commands

Command	Description
service divert-rate-limit ip	This command configures DRL rate and limit for WAN-side IP packet streams.

service divert-rate-limit trusted-site

To add entries to the trusted site list, use the **service divert-rate-limit trusted-site** command in the global configuration mode. To remove all entries from the trusted site list, use the **no** form of this command.

```
service divert-rate-limit trusted-site ip-address mask-ip-address tos tos-value mask tos-mask
[{global | vrf vrf-name}]
no service divert-rate-limit trusted-site
```

Syntax Description

<i>ip-address</i>	Specifies the source IP address that should be matched.
mask <i>ip-address</i>	The mask to apply to the source IP address of the packet before testing if it matches. There are no restrictions on the mask value.
tos <i>tos-value</i>	The ToS value of the trusted site. There are no restrictions on the <i>tos_value</i> . Example: 0xD0
mask <i>tos-mask</i>	The mask to apply to the IP ToS value and the trusted-site <i>tos_value</i> before testing if it matches. There are no restrictions on the <i>tos_mask</i> value. Example: 0xF3 Note The ToS value can be wild-carded by setting the <i>tos_mask</i> to 0x00
vrf <i>vrf-name</i>	The VRF that this trusted site applies to. For the global VRF, use the global keyword. To apply the trusted-site to all VRFs (including the global VRF), hit enter after specifying the <i>tos-mask</i> . If a non-existent VRF is specified, the table entry is filled, but the information is not written to toaster memory. If the specified VRF is subsequently created, the information is written to toaster at that time.

Command Default

None

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **service divert-rate-limit ip trusted-site** command is used to configure trusted site list that contains a source IP address and mask, IP ToS value and mask, and a VRF. The trusted site list contains a source IP address and mask, IP ToS value and mask, and a VRF. The trusted site list applies only to WAN-IP IPv4 packets. There is a limitation of four trusted sites.

To remove specified entry from the trusted site list, use **no service divert-rate-limit trusted-site** *ip-address mask ip-address tos tos-value mask tos-mask* [**global | vrf vrf-name**]. If no IP address is specified, the entire trusted site list is cleared.

Examples

The following example shows how to configure trusted site list:

```
Router(config)
)# service divert-rate-limit trusted-site 192.0.13.0 255.255.255.0
   tos 0xD0 mask 0xF3 vrf name1
```

Related Commands

Command	Description
service divert-rate-limit non-ip	This command sets and limit default values for the specified divert code.

service divert-rate-limit trusted-site-ipv6

To add IPv6-specific entries to the trusted site list, use the **service divert-rate-limit trusted-site-ipv6** command in the global configuration mode. To remove all entries from the trusted site list, use the **no** form of this command.

```
service divert-rate-limit trusted-site-ipv6 ip-address traffic-class tc_value mask tc-mask [{global
| vrf vrf-name }]
no service divert-rate-limit trusted-site-ipv6
```

Syntax Description

<i>ip-address</i>	The source IPv6 address that should be matched.
traffic-class <i>tc_value</i>	The 8-bit traffic-class of the trusted site. There are no restrictions on the <i>tc_value</i> . Example: 0xD0
mask <i>tc-mask</i>	The mask to apply to the packet traffic-class and the trusted-site <i>tc_value</i> before testing if it matches. There are no restrictions on the <i>tc-mask</i> value. Example: 0xF3
vrf <i>vrf-name</i>	The virtual route forwarding (VRF) instance to which this trusted site is being applied. For the global VRF, use the global keyword. To apply the trusted-site to all VRFs (including the global VRF), hit enter after specifying the <i>tc-mask</i> .

Command Default

Disabled

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(33)SCE	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command is used to configure trusted site list that contains an IPv6 source-address/prefix-length, a traffic-class value and mask, and a VRF. There is a limitation of four trusted sites.

Note The **no** form of the command is used to remove all entries from the trusted site list. To remove a specific entry you should specify the matching source IP address. For example: **no service divert-rate-limit trusted-site-ipv6 ip-address traffic-class tc_value mask tc-mask [global | vrf vrf-name]**.

Examples

The following example shows how to configure IPv6 trusted site list:

```
Router(config)# service divert-rate-limit trusted-site-ipv6 2001:420:3800:800:21F:29FF::1/128
2001:420:3800:800:21F:29FF::1/128 traffic-class 0x3 mask 0xFF global
Router(config)#
```

Related Commands

Command	Description
show pxf cpu statistics drl us-cable	Displays the number of upstream cable packets that are dropped from the CMTS.
show pxf cpu statistics drl ipv6	Verifies the drop counters for WAN-IPv6 packets.
show pxf cpu statistics drl ipv4	Verifies the drop counters for WAN-IPv4 packets.

service instance

To configure an Ethernet service instance, use the **service instance** command in Layer 2 VPN configuration mode. To disable this configuration, use the **no** form of this command.

service instance *id service-type*
no service instance *id service-type*

Syntax Description	<i>id</i>	Service instance ID.
	<i>service-type</i>	Service type for the instance.

Command Default None

Command Modes Layer 2 VPN configuration (config-l2vpn)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines You must provision a Multiprotocol Label Switching (MPLS) pseudowire before configuring an Ethernet service instance in Layer 2 VPN configuration mode.

Examples The following example shows how to configure an Ethernet service instance on a Cisco uBR10012 router:

```
Router # configure terminal
Router(config) # cable l2vpn 001e.6fbf.0f9e customer2
Router(config-l2vpn) # service instance 7000 ethernet
```

Related Commands	Command	Description
	cable l2-vpn-service xconnect	Enables the use of Layer 2 tunnels based on an MPLS pseudowire.

service udp-small-servers max-servers no-limit

To enable use of minor servers that use the UDP protocol (such as ToD, echo, chargen, and discard), use the **service udp-small-servers max-servers no-limit** command in global configuration mode. To remove this configuration, use the **no** form of this command.

```
service udp-small-servers max-servers no-limit
no service udp-small-servers max-servers no-limit
```

Command Default DHCP or ToD servers are not configured by default.

Command Modes Global configuration

Command History	Release	Modification
	12.1 EC	Command support introduced on the Cisco CMTS.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Disabling the ping option can speed up address assignment when a large number of modems are trying to connect at the same time. However, disabling the ping option can also result in duplicate IP addresses being assigned if users assign unauthorized static IP addresses to their CPE devices.

Examples The following example illustrates configuration of this command:

```
Router# configure terminal
Router(config)# service udp-small-servers max-servers no-limit
Router(config)#
```

The following example shows a typical ToD server configuration:

```
service udp-small-servers max-servers no-limit
cable time-server
```

These are the only commands required to enable the ToD server.

Usage Guidelines The **max-servers no-limit** option allows a large number of cable modems to obtain the ToD server at one time, in the event that a cable or power failure forces many cable modems offline. When the problem has been resolved, the cable modems can quickly reconnect.

Note Do not disable the minor UDP servers if you are also enabling the other DHCP or TFTP servers.

For additional information about DHCP configuration on the Cisco CMTS, refer to the following documents on Cisco.com:

- *Filtering Cable DHCP Lease Queries on the Cisco CMTS*
- *DHCP and Time-of-Day Services on the Cisco CMTS*

Related Commands

Command	Description
cable dhcp-giaddr policy	Sets the DHCP <i>giaddr</i> field of DHCP request packets to the primary address for cable modems and the secondary address for CPE devices, allowing the use of separate address pools for the different clients.
cable dhcp-parse option (for uBR series router)	Enables the parsing of certain DHCP options.
cable helper-address	Enables load-balancing of DHCP requests from cable modems and CPE devices by specifying different DHCP servers according to the cable interface or subinterface.
ip dhcp ping packet 0	Instructs the DHCP server to assign an IP address from its pool without first sending an ICMP ping to test whether a client is already currently using that IP address.
ip dhcp relay information option	Configures the DHCP server to validate the relay agent information option in forwarded BOOTREPLY messages.
ip dhcp smart-relay	Enables the DHCP relay agent on the CMTS to automatically switch a cable modem or CPE device to a secondary DHCP server or address pool if the primary DHCP server does not respond to three successive requests.

service-class

To create a DOCSIS configuration file that specifies the quality-of-service (QoS) service-class options for the CM configuration file, use the **service-class** command in cable config-file configuration mode. To disable the specification, use the **no** form of this command.

```
service-class {guaranteed-upstream us-bandwidth | max-burst burst-size | max-downstream
max-dsbandwidth | max-upstream max-usbandwidth | priority priority-num | privacy}
no service-class
```

Syntax Description

<i>class</i>	Specifies service class number. The range is 1 to 16. Default value is 1.
guaranteed-upstream <i>us-bandwidth</i>	Specifies the guaranteed upstream bandwidth in kbps. Valid range for <i>us-bandwidth</i> is 0 to 100000 kbps. Default value is 0.
max-burst	Specifies the maximum upstream burst size in bytes. Valid range for <i>burst-size</i> is 0 to 65535. Default value is 0, unlimited burst length. Recommended value range is 1600 to 1800 bytes. Using a value of 0 or greater than 1800 bytes can cause latency issues for Voice-over-IP. A value of less than 1500 bytes prevents upstream transmission of large Ethernet frames for any modem or CMTS not implementing fragmentation (an optional feature in DOCSIS 1.0).
<i>burst-size</i> max-downstream <i>max-dsbandwidth</i>	Specifies the downstream bandwidth in kbps. Valid range for <i>max-dsbandwidth</i> is 0 to 100000 kbps. Default value is 0.
max-upstream <i>max-usbandwidth</i>	Specifies the upstream bandwidth in kbps. Valid range for <i>max-usbandwidth</i> is 0 to 100000 kbps. Default value is 0.
priority <i>priority-num</i>	Specifies the service class priority. Valid range for <i>priority-num</i> is 0 to 7, where 7 is the highest-priority service-class setting.
privacy	Enables baseline privacy interface (BPI).

Command Default

Service-class is not set by default. A CM cannot register on a Cisco CMTS unless at least one parameter in a service class is specified.

Command Modes

Cable config-file (config-file)

Command History

Release	Modification
12.1(2)EC1	This command was introduced.
12.2(4)BC1	This command was integrated into Cisco IOS Release 12.2(4)BC1.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Default values can be used only if **service-class** class is specified. A single configuration file should not contain multiple service-class ID numbers. Thus, all parameters should be set using a single service-class ID. However, different configuration files can reuse the same service-class ID.

Note To enable Baseline Privacy Interface (BPI) operations on the cable command, you must specify both the **service-class privacy** and **privacy** commands for the cable modem's DOCSIS configuration file.

Examples

The following example shows how to specify the **service-class** command for a DOCSIS configuration file:

```
router(config)# cable config-file upgrade.cm
router(config-file)# service-class 1 priority 0
router(config-file)# service-class 1 max-upstream 3247
router(config-file)# service-class 1 max-downstream 10000
router(config-file)# service-class 1 max-burst 1600
router(config-file)# service-class 1 privacy
router(config-file)# privacy

router(config-file)# exit
```

Related Commands

Command	Description
cable config-file	Creates a DOCSIS configuration file and enters configuration file mode.
access-denied	Disables access to the network.
channel-id	Specifies upstream channel ID.
cpe max	Specifies CPE information.
download	Specifies download information for the configuration file.
frequency	Specifies downstream frequency.
option	Specifies vendor-specific information fields and other config-file options.
privacy	Specifies privacy options for baseline privacy images.
snmp manager	Specifies SNMP options.
timestamp	Enables time-stamp generation.

service-class (cmts-tag)

To configure the specified service class name for the CMTS tag, use the **service-class** command in the cmts-tag configuration mode. To remove the configured service class name from the CMTS tag, use the **no** form of this command.

```
[exclude] service-class service-class-name
no service-class service-class-name
```

Syntax Description	exclude	(Optional) Configures the CMTS tag to exclude the specified service class name.
	<i>service-class-name</i>	Service class name with matching rule

Command Default None

Command Modes CMTS tag mode (cmts-tag)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to configure the specified service class name for the CMTS tag using the **service-class** command:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable tag 1
Router(cmts-tag)# service-class uBR
```

Related Commands	Command	Description
	cable load-balance docsis-group	To configure a DOCSIS load balancing group on the CMTS.
	show cable load-balance docsis-group	To display real-time configuration, statistical and operational information for load balancing operations on the router.
	cable tag	To configure a tag for a DOCSIS load balancing group on the CMTS.

service-class (enforce-rule)

To identify a particular service class for cable modem monitoring in an enforce-rule, use the **service-class (enforce-rule)** command in enforce-rule configuration mode. To remove the service class from the enforce-rule, use the **no** form of this command.

```
service-class {enforced | registered} name
no service-class {enforced | registered} name
```

Cisco cBR Series Converged Broadband Routers

```
service-class { {enforced name [no-persistence] | {registered name} } }
no service-class { {enforced name [no-persistence] | {registered name} } }
```

Syntax Description

enforced	Specifies an enforced service class.
registered	Specifies enforcing of QoS profiles for the registered service class.
<i>name</i>	Specifies the name of the service class.
no-persistence	(Optional) Specifies that the enforced QoS profile should not remain in force when a cable modem reboots.

Command Default

None

Command Modes

Enforce-rule configuration (enforce-rule)

Command History

Release	Modification
12.3(9a)BC	This command was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **service-class (enforce-rule)** command allows operators to identify the name of the initial registered service class for a CM in an enforce-rule, and also the name of a new service class to be enforced if the CM violates its registered service parameters.

Examples

The following example shows specification of the enforced service class called “test” in an enforce-rule:

```
Router(enforce-rule)# service-class enforced test
```

The following example shows service class being enforced with **no-persistence** option on a Cisco cBR Series Converged Broadband Routers:

```
Router(enforce-rule)# service-class enforced test1 no-persistence
```

Related Commands

Command	Description
cable qos enforce-rule (for uBR series router)	Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode.
debug cable subscriber-monitoring	Displays enforce-rule debug messages for subscriber traffic management on the Cisco CMTS routers.
duration	Specifies the time period and sample rate to be used for monitoring subscribers.
enabled (enforce-rule)	Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.
monitoring-basics	Specifies the type of monitoring desired for subscriber traffic management on a Cisco CMTS router.
peak-time1	Specifies peak and offpeak monitoring times on a Cisco CMTS router.
qos-profile registered	Specifies the registered QoS profile that should be used for this enforce-rule.
show cable qos enforce-rule	Displays the QoS enforce-rules that are currently defined.
show cable subscriber-usage	Displays subscribers who are violating their registered QoS profiles.

service-descriptor-default

To enable the operator to specify the default values for the service descriptor that will be encoded as part of the serving area table at chassis level, use the **service-descriptor-default** command in the video configuration mode. To disable the feature, use the **no** form of the command.

service-descriptor-default

Command Default

None.

Command Modes

Video configuration mode (config-video)

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1c	This command was introduced on the Cisco eBR Series Converged Broadband Routers.

The following example shows how to enable the feature:

```
router#configure terminal
router (config)#cable video
router (config-video)#service-descriptor-default
router (config-video-serv-desc)#
```

Related Commands

Command	Description
serving-area	Configures the serving area which enables the set tops to discover VOD content.
cable video	Enters the video configuration mode.

service-distribution-group

To define a service distribution group, use the **service-distribution-group** command in video configuration mode. To delete a service distribution group, use the **no** form of this command.

```

service-distribution-group name
id id
no service-distribution-group name
id id

```

Syntax Description	Command	Description
	service-distribution-group <i>name</i>	Specifies the service distribution group name.
	id <i>id</i>	Specifies the service distribution group identifier.

Command Default None.

Command Modes Video configuration (config-video)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command defines a service distribution group.

Examples The following example shows how to define a service distribution group:

```

Router#configure terminal
Router(config)#cable video
Router(config-video)#service-distribution-group west-region id 1

```

Related Commands	Command	Description
	rf-port integrated-cable	Specifies the RF port in a service distribution group.
	onid	Specifies the original network identifier in a service distribution group.
	psi-interval	Specifies the program specific information interval in a service distribution group.
	show cable video service-distribution-group all	Displays the service distribution group information.

service-id

To specify the service ID as part of the service descriptor, use the **service-id** command in the service descriptor configuration mode. To revoke the configuration, use the **no** form of the command.

service-id *value*

Syntax Description

value Specifies the service ID.

Command Default

None.

Command Modes

Service descriptor configuration mode (config-video-serv-desc)

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1c	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following example shows how to specify the service ID:

```
router#configure terminal
router (config)#cable video
router (config-video)#service-descriptor-default
router (config-video-serv-desc)#service-id 1
```

Related Commands

Command	Description
serving-area	Configures the serving area which enables the set tops to discover VOD content.
service-descriptor-default	Enables the operator to specify the default values for the service descriptor.

service-name

To specify the service name as part of the service descriptor, use the **service-name** command in the service descriptor configuration mode. To revoke the configuration, use the **no** form of the command.

service-name *string*

Syntax Description

string Specifies the service name.

Command Default

None.

Command Modes

Service descriptor configuration mode (config-video-serv-desc)

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1c	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following example shows how to specify the service name:

```
router#configure terminal
router (config)#cable video
router (config-video)#service-descriptor-default
router (config-video-serv-desc)#service-name test
```

Related Commands

Command	Description
serving-area	Configures the serving area which enables the set tops to discover VOD content.
service-descriptor-default	Enables the operator to specify the default values for the service descriptor.

service-type (service descriptor)

To specify the service type as part of the service descriptor, use the **service-type** command in the service descriptor configuration mode. To revoke the configuration, use the **no** form of the command.

service-type *value*

Syntax Description

value Specifies the service type.

Command Default

None.

Command Modes

Service descriptor configuration mode (config-video-serv-desc)

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1c	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following example shows how to specify the service type:

```
router#configure terminal
router (config)#cable video
router (config-video)#service-descriptor-default
router (config-video-serv-desc)#service-type 2
```

Related Commands

Command	Description
serving-area	Configures the serving area which enables the set tops to discover VOD content.
service-descriptor-default	Enables the operator to specify the default values for the service descriptor.

service-type (virtual carrier group)

To specify the service type of a virtual carrier group, use the **service-type** command in virtual carrier group configuration mode. To undo the service type assignment, use the **no** form of this command.

service-type {**narrowcast** | **broadcast**}

no service-type {**narrowcast** | **broadcast**}

narrowcast	Specifies video on demand and/or switched digital video service type. These narrowcast service types can share the same virtual carrier group.
broadcast	Specifies the broadcast service type.

Command Default Narrowcast service type

Command Modes Virtual carrier group configuration (config-video-vcg)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command specifies the service type of a virtual carrier group to be enabled on the linecard.

Examples The following example shows how to specify the service type of a virtual carrier group:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# virtual-carrier-group vod id 1
Router(config-video-vcg)# service-type broadcast
```

Related Commands	Command	Description
	virtual-carrier-group	Defines a virtual carrier group.
	virtual-edge-input-ip	Defines a virtual edge input.
	encrypt	Enables encryption on the virtual carrier group.
	rf-channel	Specifies the virtual RF channels in a virtual carrier group.
	show cable video virtual-carrier-group	Displays the virtual carrier group information.

service-type-id (load-balance)

To add a service type ID that is compared against the cable modem provisioned service type ID, to determine an appropriate restricted load balancing group (RLBG), use the **service-type-id** command in the config-lb-group configuration mode. To remove the service type ID, use the **no** form of this command.

service-type-id *string*

no service-type-id *string*

Syntax Description

<i>string</i>	Identifier of the service type that gets added to the load balancing group.
---------------	---

Command Default

No default behavior or values.

Command Modes

DOCSIS load balancing group mode (config-lb-group)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

You can use the **service-type-id** command to add a service type ID only to a RLBG.

Examples

The following example shows how to add a service type ID on the CMTS, using the **service-type-id** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# restricted
Router(config-lb-group)# service-type-id commercial
Router(config-lb-group)# no service-type-id commercial
Router(config-lb-group)#
```

Related Commands

Command	Description
cable load-balance docsis-group	Configures a DOCSIS load balancing group on the CMTS.
show cable load-balance docsis-group	Displays real-time configuration, statistical, and operational information for load balancing operations on the router.

service-type-id (cmts-tag)

To configure the specified service type ID for the CMTS tag, use the **service-type-id** command in the cmts-tag configuration mode. To remove the service type ID, use the **no** form of this command.

```
[exclude] service-type-id service-type-id
no service-type-id service-type-id
```

Syntax Description	exclude	(Optional) Configures the CMTS tag to exclude the specified service type ID.
	service-type-id	Sets a matching rule with the specified service type ID.

Command Default None

Command Modes CMTS tag mode (cmts-tag)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to configure the specified service type ID for the CMTS tag using the **service-type-id** command:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable tag 1
Router(cmts-tag)# service-type-id commercial
```

Related Commands	Command	Description
	cable load-balance docsis-group	To configure a DOCSIS load balancing group on the CMTS.
	show cable load-balance docsis-group	To display real-time configuration, statistical and operational information for load balancing operations on the router.
	cable tag	To configure a tag for a DOCSIS load balancing group on the CMTS.

serving-area

To configure the serving area which enables the set tops to discover VOD content, use the **serving-area** command in the service distribution group configuration mode. To revoke the configuration, use the **no** form of the command.

serving-area *value*

Syntax Description

value Specifies the serving-area at SDG level.

Command Default

None.

Command Modes

Service distribution group configuration mode (config-video-sdg)

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1c	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following example shows how to configure the serving area:

```
router#configure terminal
router(config)#cable video
router(config-video)#service-distribution-group sdg id 1
router(config-video-sdg)#serving-area 100
```

Related Commands

Command	Description
service-distribution-group	Defines a service distribution group.
show cable video service-distribution-group	Displays the SDG configuration.

session

To configure a table based video session, use the **session** command in session configuration mode. To disable the configuration, use the **no** form of this command.

Note Before configuring the table-based video sessions, you must configure the physical and virtual constructs for Cisco cBR-8. You must also configure the Logical Edge Device (LED), Service Distribution Group (SDG), binding and Virtual Carrier Group (VCG).

```

session sess-name {input-port number | bundle-id number} start-udp-port number num-sessions-per-qam
number processing-type {programdata} start-program program-num [{repeat}] jitter ms [{cbr | vbr}]
no session sess-name {input-port number | bundle-id number} start-udp-port number
num-sessions-per-qam number processing-type {programdata} start-program program-num [{repeat}]
jitter ms [{cbr | vbr}]

```

Cisco cBR Series Converged Broadband Routers

```

session sess-name multicast-label multicast label input-port vei-number group group_ip source source_ip
processing-type {remappassthruataremux} start-program program-num [{bit-rate bit-rate_number
}] [{jitter ms}] [{cbr | vbr}] input-program-num num output-program-num num
no session sess-name multicast-label multicast label input port vei-number group group_ip source source_ip
processing-type {remappassthruataremux} start-program program-num [{bit-rate bit-rate_number
}] [{jitter ms}] [{cbr | vbr}] input-program-num num output-program-num num

```

Syntax Description

<i>sess-name</i>	Specifies the session name for the table-based session.
<i>multicast label</i>	Specifies the multicast label name.
input-port <i>vei-number</i>	Specifies the virtual edge input port number.
group <i>group-ip</i>	Specifies the group name for the table-based session.
input-port <i>number</i>	Specifies the input port number for the table-based session.
bundle-id <i>number</i>	Specifies the virtual edge input bundle ID.
start-udp-port <i>number</i>	Specifies the UDP port number.
num-sessions-per-qam <i>number</i>	Specifies the number of sessions per QAM. The valid range is from 1 to 80.

processing-type	Specifies the processing type of session. program —Configures video session as program. data —Configures video streams that are not dejittered, and remapped. remap —Configures video streams that are remapped. passthru —Configures video streams that are passthrough. remux —Configures video streams that are remultiplexed. This processing type allows you to specify a program in a multi-program transport stream (MPTS) input session, renumber it, and send it to an output session.
start-program <i>program-num</i>	Specifies the starting program number. The valid range is from 1 to 65535.
bit-rate <i>bit-rate-number</i>	Specified the bits per second.
jitter <i>ms</i>	Specifies the jitter value in milliseconds. The valid range is from 10 to 200.
input-program-num <i>num</i>	Specifies the input program number. This is applicable only for remux sessions. The allowed range of program numbers is 1–65535.
output-program-num <i>num</i>	Specifies the output program number. This is applicable for remap and remux sessions. The allowed range of program numbers is 1–65535.

Command Default None

Command Modes Session configuration (config-video-tb-vcg-sess)

Command History

Release	Modification
IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.18.0SP	This command was modified on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 16.8.1	The remux and the input-program-num keywords were added.

Usage Guidelines This command configures a table based video session.

Examples

The following example shows how to configure the virtual carrier group and service distribution group for replication:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# table-based
Router(config-video-tb)# vcg pme_tbv
Router(config-video-tb-vcg)# rf-channel 20-22
Router(config-video-tb-vcg-sess)# session bago_tbv input-port 10 start-udp-port 1
num-sessions-per-qam 2 processing-type remap start-program 1 jitter 100 cbr
```

The following example shows how to configure the virtual carrier group with passthru processing type:

```

Router#configure terminal
Router(config)#cable video
Router(config-video)#table-based
Router(config-video-tb)#multicast-label a2 group 232.5.6.7 source 175.2.5.6
Router(config-video-tb)#multicast-label exampleLabel group 232.2.1.6 source 175.6.1.13
source2 175.6.1.12 source3 180.1.1.1 source4 175.6.1.14
Router(config-video-tb)#vcg VCG_PME4
Router(config-video-tb-VCG_PME4)#rf-channel 24
Router(config-video-tb-VCG_PME4-sess)#session SESS_PME4 group 232.5.6.15 source 175.2.6.7
processing-type passthru

```

The following example shows how to configure a session with remux processing type:

```

Router# session remux1 group 209.165.200.225 source 192.0.2.1 processing-type remux
input-program-num 1 output-program-num 1

```

The following example shows how to see the remux sessions with input and output program numbers:

```

Router#sh cable video session log id 31
Total Sessions = 80

```

Session Id	Output State	Output Port	Frequency Hz	Streaming Output Bitrate	Streaming Encrypt Type	Sess Type	Session Ucast	Source Lat	Source PMV	Source Name	UDP Port	Input Program	Output Program	Input State

Related Commands

Command	Description
virtual-carrier-group	Defines a virtual carrier group.
service-distribution-group	Defines a service distribution group.
rf-port integrated-cable	Specifies the RF ports in a service distribution group.
rf-channel	Specifies the virtual RF channels in a virtual carrier group.
bind-vcg	Binds a set of virtual RF-channels defined in the virtual carrier group to the physical port in the service distribution group.

session name multicast-label

The Cisco cBR Series Converged Broadband Routers supported two clock recovery modes: VBR and CBR. Both VBR and CBR modes use one phase-locked loop (PLL) to recover the program clock, using all the PCR packet identifiers (PIDs) found in content. Hence, for MPTS sessions with a large number of programs, the PCRs may have different clock frequencies and be of poor quality. This lead to excessive overdue drops and bad output video quality.

The *Clock Recovery Mechanism* is a new third clock recovery mode, supported from Cisco IOS XE Gibraltar 17.3.1x, and can handle this type of content with better results. The Clock Recovery Mechanism uses one phase-locked loop (PLL) to recover the program clock, using only one PCR PID as the primary. All the other PCR PIDs are subordinates and are re-timed using the clock recovered from the primary PCR PID. The output will be good if the primary PCR is of good quality.

session *name* **multicast-label** *label* **processing-type** *type* **primary-subordinate** [{ **pcr-pid** <*pid*> }]

Syntax Description	Parameter	Description
	<i>name</i>	Specifies the session name
	<i>label</i>	Specifies the multicast label name
	<i>type</i>	Specifies the processing type of session.
	<i>pcr-pid</i> < <i>pid</i> >	This is an optional parameter, and allows you to select a desired PCR-pid to be used for the primary PCR PID

Command Default None

Command Modes Service distribution group configuration mode (config-video-sdg)

Command History	Release	Modification
	Cisco IOS XE Gibraltar 17.3.1x	The Clock Recovery Mechanism command was introduced on the Cisco cBR Series Converged Broadband Routers.

The keyword *primary-subordinate* selects primary-subordinate Clock Recovery Mechanism for the session. One of the PCR PIDs is selected to serve as the primary PID. The selected PID is the first PCR PID found in the content, or first one found after a buffer overflow or underflow handling. The Clock Recovery Mechanism is available for both unicast and multicast sessions, for session of processing types remap, passhthru and remux. They are not available for data-piping sessions.

Note If the primary PCR PID is not configured, or is absent in the content, one of the PCR PIDs is selected to serve as the primary PID. The selected PID is the first PCR PID found in the content, or first one found after a buffer overflow or underflow handling.

Usage Guidelines To recover the overdue drops, you can configure the Clock Recovery Mechanism.

Examples

The following example shows how to configure the Clock Recovery Mechanism under cable video configuration:

```
Router# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable video
Router(config-video)# table-based
Router(config-video-tb)# $source3 175.10.3.2 source4 175.10.4.2
Router(config-video-tb)# vcg v2
Router(config-video-tb-vcg)# rf-channel 68
Router(config-video-tb-vcg-sess)# $ session check input-port 1 start-udp-port 1523
processing-type remux input-program-num 1 output-program-num 1 primary-subordinate pcr-pid
50
Router(config-video-tb-vcg-sess)# exit
Router(config-video-tb-vcg)# exit
Router(config-video-tb)# exit
Router(config-video)# exit
Router(config)#
```

session-range

To identify the multicast QoS group session range, use the **session-range** command in multicast QoS configuration mode. To disable the QoS group session range, use the **no** form of this command.

session-range *ip-address ip-mask*

no session-range *ip-address ip-mask*

Syntax Description

<i>ip-address</i>	Specifies the IP address of the multicast QoS group.
<i>ip-mask</i>	Specifies the IP mask of the multicast QoS group.

Command Default

A session range IP address and IP mask are not defined for a specific multicast QoS group.

Command Modes

Multicast QoS configuration (config-mqos)

Command History

Release	Modification
12.2(33)SCA	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use the **session-range** command to configure the session range to specify the number of multicast sessions to be admitted on a particular service flow. CMTS does not admit new sessions (no forwarding) if the current number of sessions has reached the defined limit, and waits until a session ends to free up a slot for new sessions. You can configure multiple session ranges.

Examples

The following example defines a session range IP address and IP mask using the **session-range** command:

```
Router(config)# cable multicast qos group 20 priority 55 global
Router(config-mqos)# session-range 224.10.10.01 255.255.255.254
```

Related Commands

Command	Description
cable multicast qos group	Specifies and configures a cable multicast QoS group.
show interface bundle multicast-sessions	Displays multicast session information for a specific virtual cable bundle.
show interface cable multicast-sessions	Displays multicast session information for a specific cable interface.

set clock

To set the system clock on the Cisco CMTS, use the **set clock** command in global configuration mode.

set clock *time-date*

Syntax Description

<i>time-date</i>	Time and date for which to set the clock on the Cisco CMTS.
------------------	---

Command Default

Time-of-Day, DHCP, and TFTP server configuration not defined on the Cisco CMTS by default.

Command Modes

Global configuration

Command History

Release	Modification
12.0(4)XI	This feature was introduced for the Cisco uBR7200 series routers.
12.1(5)EC	This feature was supported on the Cisco uBR7100 series routers.
12.2(4)BC1	This feature was supported on the Release 12.2 BC train for all Cisco CMTS platforms.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

To supply an accurate clock, the system clock on the Cisco CMTS should be configured for the correct time, either by using the **set clock** command or by configuring the Cisco CMTS to act as a Network Time Protocol (NTP) or Simple Network Time Protocol (SNTP) client.

For proper operation of the DOCSIS network, especially a DOCSIS 1.1 network using BPI+ encryption and authentication, the system clock on the Cisco CMTS must be set accurately. You can achieve this by manually using the **set clock** command, or by configuring the CMTS to use either the Network Time Protocol (NTP) or the Simple Network Time Protocol (SNTP).

For additional information about the **set clock** command, refer to the following documents on Cisco.com:

- http://www.cisco.com/en/US/docs/ios/cable/configuration/guide/cmts_services.html#wp1051747
Time-of-Day Server for the Cisco CMTS
- http://www.cisco.com/en/US/docs/ios/cable/configuration/guide/cmts_services.html DHCP, ToD, and TFTP Services for the Cisco Cable Modem Termination System

Related Commands

Command	Description
cable dhcp-giaddr policy	Sets the DHCP <i>giaddr</i> field of DHCP request packets to the primary address for cable modems and the secondary address for CPE devices, allowing the use of separate address pools for the different clients.
cable dhcp-parse option	Enables the parsing of certain DHCP options.
cable helper-address	Enables load-balancing of DHCP requests from cable modems and CPE devices by specifying different DHCP servers according to the cable interface or subinterface.

Command	Description
ip dhcp ping packet 0	Instructs the DHCP server to assign an IP address from its pool without first sending an ICMP ping to test whether a client is already currently using that IP address.
ip dhcp relay information option	Configures the DHCP server to validate the relay agent information option in forwarded BOOTREPLY messages.
ip dhcp smart-relay	Enables the DHCP relay agent on the CMTS to automatically switch a cable modem or CPE device to a secondary DHCP server or address pool if the primary DHCP server does not respond to three successive requests.

show application-buckets

To displays rules for any or all buckets supporting Service Flow Admission Control on the Cisco CMTS, use the **show application-buckets** command in privileged EXEC mode. The configured rules for any given bucket are displayed in order of precedence in the Rule field.

show application-buckets [**bucket-no** *n*]

Syntax Description

bucket-no <i>n</i>	You may specify a specific bucket number on the Cisco CMTS to display parameters for that bucket and no others. Valid range is 1 to 8, or all buckets if no specific bucket is designated.
---------------------------	--

Command Default

No default behavior or values for this command. However, Cisco IOS Release 12.3(21)BC supports default operation and non-default configuration for feature on the Cisco CMTS.

Command Modes

Privileged EXEC

Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router and the Cisco uBR7246VXR router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

For additional information for Service Flow Admission Control, commencing in Cisco IOS Release 12.3(21)BC, refer to the following document on Cisco.com:

- Service Flow Admission Control for the Cisco Cable Modem Termination System

Examples

The following example illustrates sample output of the show application-buckets command.

```
Router# show cable application-type

For bucket 1, Name PktCable
  Packetcable normal priority gates
  Packetcable high priority gates
For bucket 2, Name PCMM-Vid
  PCMM gate app-id = 30
For bucket 3, Name Gaming
  PCMM gate app-id = 40
For bucket 4, Name
For bucket 5, Name
For bucket 6, Name
For bucket 7, Name
For bucket 8, Name HSD
  Best-effort (CIR) flows
```

Related Commands	Command	Description
	cable admission-control ds-bandwidth	Sets minor, major and exclusive thresholds for downstream voice or data bandwidth for each or all interfaces on the Cisco CMTS
	cable admission-control preempt priority-voice	Changes the default PacketCable Emergency 911 call preemption functions on the Cisco CMTS, supporting throughput and bandwidth requirements for Emergency 911 calls above all other buckets on the Cisco CMTS.
	cable admission-control us-bandwidth	Configures global or interface-level upstream bandwidth thresholds and exclusive or non-exclusive resources on the Cisco CMTS.
	cable application-type include	Associates an application type with a specific and prioritized bucket on the Cisco CMTS.
	cable application-type name	Assigns an alpha-numeric name for the specified bucket.
	debug cable admission-control flow-categorization	Displays service flow categorization results, enabled when a service flow is classified.
	show application-buckets	Displays rules for any or all buckets supporting Service Flow Admission Control on the Cisco CMTS.
	show interface cable admission-control reservation	Displays service flows, categorizations, and bandwidth consumption on the Cisco CMTS, for the specified interface, and the specified service flow direction.

show bridge cable-modem

To display bridging information for the router's cable interface, use the **show bridge cable-modem** command in privileged EXEC mode.

Cisco uBR904, uBR905, uBR924, uBR925 cable access routers, Cisco CVA122 Cable Voice Adapter

show bridge cable-modem *number*

Syntax Description	<i>number</i>
	Identifies the cable interface (always 0).

Command Default No default behavior or values.

Command Modes Privileged EXEC

Command History	Release	Modification
	11.3(4)NA	This command was introduced for the Cisco uBR904 cable access router.
	12.0(4)X11	Support was added for the Cisco uBR924 cable access router.
	12.1(3)XL	Support was added for the Cisco uBR905 cable access router.
	12.1(5)XU1	Support was added for the Cisco CVA122 Cable Voice Adapter.
	12.2(2)XA	Support was added for the Cisco uBR925 cable access router.

Examples

The following example shows sample output for this **show bridge cable-modem** command:

```
Router#
show bridge cable-modem 0

Total of 300 station blocks, 298 free
Codes: P - permanent, S - self
Bridge Group 59:
```

Table 38: show bridge cable-modem Field Descriptions

Field	Description
Total of 300 station blocks	Total number of forwarding database elements in the system. The memory to hold bridge entries is allocated in blocks of memory sufficient to hold 300 individual entries. When the number of free entries falls below 25, another block of memory sufficient to hold another 300 entries is allocated. Thus, the total number of forwarding elements in the system is expanded dynamically, as needed, limited by the amount of free memory in the router.
Bridge Group	The number of the bridge group to which this interface is assigned.

Tip In Cisco IOS Release 12.2(8)T and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
show dhcp	Displays the current DHCP settings on point-to-point interfaces.
show interfaces cable-modem	Displays information about the cable interface.

show cable acfe controller

To display fairness across DOCSIS interfaces controller statistics, use the **show cable acfe controller** command in privileged EXEC mode.

show cable acfe controller modular-cable *slot/subslot/unit* [{**cluster** *cluster-index*}]

Cisco cBR Series Converged Broadband Routers

show cable acfe controller Integrated-Cable *slot/subslot/unit* [{**cluster** *cluster-index*}]

Syntax Description

modular-cable <i>slot/subslot/unit</i>	Displays information for all controllers on the specified modular cable interface on a Cisco uBR10012 router, where: <ul style="list-style-type: none"> • <i>slot</i>—Controller slot number. The range is from 0 to 8. • <i>subslot</i>—Controller subslot number. The range is from 0 to 3. • <i>unit</i>—Controller unit number. The valid value is 0.
Integrated-Cable <i>slot/subslot/port</i>	Displays information for all controllers on the specified integrated cable interface on a Cisco cBR series router, where: <ul style="list-style-type: none"> • <i>slot</i>—Controller slot number. The range is from 0 to 3 and 6 to 9 on the Cisco cBR-8 router. • <i>subslot</i>—Controller subslot number. The valid value is 0 on the Cisco cBR-8 router. • <i>port</i>—Controller port number. The range is from 0 to 7 on the Cisco cBR-8 router.
cluster <i>cluster-index</i>	Displays information at the cluster level. <ul style="list-style-type: none"> • <i>cluster-index</i>—Cluster index. The range is from 0 to 253 on a Cisco uBR10012 router, and 0 to 1021 on a Cisco cBR series router.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The Integrated-Cable keyword was added and modular-cable keyword was removed.

Usage Guidelines

Use the **show cable acfe controller** command to show fairness across DOCSIS interfaces status and statistics for each controller interface.

Examples

The following example shows a sample output of the **show cable acfe controller** command on a Cisco uBR10012 router:

```
Router# show cable acfe controller modular-Cable 1/0/0
```

```

EIR Rebalance invoked: 76476
Adaptive CIR granted: 0
Adaptive CIR rejected: 0
Total clusters:      2

Table 39: show cable acfe controller Field Descriptions

Field	Description
EIR Rebalance invoked	Number of EIR rebalance invoked.

Field	Description
Adaptive CIR granted	Number of CIRs granted.
Adaptive CIR rejected	Number of CIRs rejected.
Total Clusters	Cluster numbers.
RF	RF channel number.
FlexBW	Flexible bandwidth.
Intf	Interface number.
Demand	EIR demand.
CIR	CIR.
Max	Maximum bonus bandwidth allocation.
CstrMin	Minimum bonus bandwidth considering CIR.
Alloc	Allocated bandwidth.
NBonus	Non-guaranteed bonus bandwidth.
Ratio	Ratio between allocated bandwidth and demand.

Related Commands

Command	Description
show cable acfe interface	Displays fairness across DOCSIS interfaces statistics of a specific interface.
show cable acfe summary	Displays fairness across DOCSIS interfaces status and statistics.

show cable acfe interface

To display the fairness across DOCSIS interfaces statistics of a specific interface, use the **show cable acfe interface** command in privileged EXEC mode.

Cisco uBR Series Router

```
show cable acfe interface {modular-cable | wideband-cable |
integrated-cable} slot/subslot/port:interface-num [{verbose}]
```

Cisco cBR Series Router

```
show cable acfe interface {wideband-cable | integrated-cable} slot/subslot/port:interface-num [{verbose}]
```

Syntax Description

interface	<p>Specifies the cable interface.</p> <ul style="list-style-type: none"> • modular-cable—Specifies the modular cable interface. • wideband-cable—Specifies the wideband cable interface. • integrated-cable—Specifies the integrated cable interface. • slot—Slot number of the cable interface. The valid range is from 5 to 8 for uBR series router, 0 to 9 for cBR series router. • subslot—Subslot number of the cable interface. The valid values are 0 or 1 for uBR series router, 0 for cBR series router. • port—Port number. The valid values are 0 or 1 for uBR series router, 0 to 7 for cBR series router. • interface-num—Interface number. <ul style="list-style-type: none"> • For uBR series router, the valid range is from 0 to 23 for modular interface, 0 to 31 for the wideband interface, and 0 to 3 for the integrated interface. • For cBR series router, the valid range is from 0 to 63 for the wideband interface, and 0 to 157 for the integrated interface.
verbose	(Optional) Enables verbose mode for the output, giving additional details about the modular, wideband or integrated interfaces.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The modular-cable was removed.

Usage Guidelines

Use the **show cable acfe interface** command to display the fairness across DOCSIS interfaces statistics on a specific interface. For uBR series router, the command output also displays the route processor Service Flow Admission Control (SFAC) shadow with thresholds and reservations.

For uBR series router, the **integrated-cable** option works only on the Cisco UBR-MC20X20V cable interface line cards.

Examples

The following examples show sample outputs of the **show cable acfe interface** command in uBR series router:

```
Router# show cable acfe interface modular-Cable 1/0/0:1
Adaptive CIR granted:      0
Adaptive CIR rejected:    0
EIR Demand (raw/scale):   0/1
EIR Per-Flow BW (kbps):   18991
Guar Bonus BW (kbps):    18991
Non-guar Bonus BW (kbps): 9696
Reserved Bonus BW (kbps): 0
Router# show cable acfe interface wideband-Cable 1/0/0:1
Adaptive CIR granted:      0
Adaptive CIR rejected:    0
EIR Demand (raw/scale):   0/1
EIR Per-Flow BW (kbps):   18991
Guar Bonus BW (kbps):    19391
Non-guar Bonus BW (kbps): 37983
Reserved Bonus BW (kbps): 400
Router# show cable acfe interface integrated-Cable 6/1/0:0
Adaptive CIR granted:      0
Adaptive CIR rejected:    0
EIR Demand (raw/scale):   0/1
EIR Per-Flow BW (kbps):   20028
Guar Bonus BW (kbps):    20028
Non-guar Bonus BW (kbps): 10009
Reserved Bonus BW (kbps): 0
```

The following examples show sample outputs of the **show cable acfe interface** command in cBR series router:

```
Router# show cable acfe interface integrated-Cable 1/0/0:16
EIR Demand (raw/scale): 1/1000
Per-Flow EIR BW (kbps): 7200
Guar Bonus BW (kbps): 7200
Non-guar Bonus BW (kbps): 0
Reserved Bonus BW (kbps): 0
Cir total (kbps): 0
Cir unicast (kbps): 0
Cir multicast (kbps): 0
Router# show cable acfe interface wideband-Cable 1/0/0:1
EIR Demand (raw/scale): 1/1000
Per-Flow EIR BW (kbps): 94800
Guar Bonus BW (kbps): 94800
Non-guar Bonus BW (kbps): 60302
Reserved Bonus BW (kbps): 0
Cir total (kbps): 224
Cir unicast (kbps): 224
Cir multicast (kbps): 0
```

This table describes the significant fields shown in the display.

Table 40: show cable acfe interface Field Descriptions

Field	Description
Adaptive CIR granted	For uBR series router, number of adaptive CIRs granted.
Adaptive CIR rejected	For uBR series router, number of adaptive CIRs rejected.
EIR Demand (raw/scale)	Total EIR demand.
EIR Per-Flow BW (kbps)	Expected saturated throughput of a priority 0 BE flow on this interface.
Guar Bonus BW (kbps)	Guaranteed bonus bandwidth, in kilobytes per second.
Non-guar Bonus BW (kbps)	Non-guaranteed bonus bandwidth, in kilobytes per second.
Reserved Bonus BW (kbps)	Reserved bonus bandwidth, in kilobytes per second.

Related Commands

Command	Description
show cable acfe controller	Displays fairness across DOCSIS interfaces controller statistics.
show cable acfe summary	Displays fairness across DOCSIS interfaces status and statistics.

show cable acfe summary

To display the fairness across DOCSIS interfaces status and statistics, use the **show cable acfe summary** command in privileged EXEC mode.

show cable acfe summary

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The CIR Oversubscriptions item was added in the command output.

Usage Guidelines

The **show cable acfe summary** command displays the global fairness across DOCSIS interfaces status and statistics.

Examples

The following example shows a sample output of the **show cable acfe summary** command for uBR series router:

```
Router# show cable acfe summary

ACFE state: Enabled
EIR Rebalance period (secs): 5
EIR Rebalance invocations: 32416
CIR Acquire invocations: 1
CIR Acquire rate/limit: 100/100
CIR Acquire throttled: 0
Maximal EIR ratio: 16
```

The following example shows a sample output of the **show cable acfe summary** command for cBR series router:

```
Router# show cable acfe summary

ACFE state: Enabled
EIR Rebalance period (secs): 5
EIR Rebalance invocations: 153243
CIR Acquire rate/limit: 100/100
CIR Acquire invocations: 0
CIR Acquire throttled: 0
CIR Oversubscriptions: 8
Maximal EIR ratio: 10
```

This table describes the significant fields shown in the display.

Table 41: show cable acfe summary Field Descriptions

Field	Description
ACFE state	Fairness across DOCSIS interfaces state, enabled or disabled.
EIR Rebalance period (secs)	EIR rebalance period, in seconds.
EIR Rebalance invocations	Number of EIR rebalance invocations.
CIR Acquire invocations	Number of CIR acquire invocations.
CIR Acquire rate/limit	CIR acquire rate and limit.
CIR Acquire throttled	Number of CIR acquisitions that failed because they reached the rate limit.
Maximal EIR ratio	Maximum EIR ratio.
CIR Oversubscriptions	For cBR series router, number of CIR oversubscription times.

Related Commands

Command	Description
cable acfe enable	Enables Fairness Across DOCSIS Interfaces feature on the CMTS router.

show cable active-reman

To display the line card high availability information, use the show cable active-reman command in privileged EXEC mode.

show cable active-reman {*allslot/subslot*}

Syntax Description	all	Displays high availability information for all line card interfaces.
	<i>slot</i>	Cable interface line card slot. The valid range is from 5 to 8.
	<i>subslot</i>	Cable interface line card subslot. The valid range is 0 and 1.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCF	This command was introduced in Cisco IOS Release 12.2(33)SCF.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following is a sample output of the show cable active-reman command that shows high availability information for all cable interfaces on the Cisco uBR10012 router:

```
Router# show cable active-reman all

```

show cable admission-control

To display the current admission control (AC) configuration and status on a Cisco CMTS router, or on a specified interface, use the **show cable admission-control** command in privileged EXEC mode.

```
show cable admission-control [{global | interface | {slot/port slot/subslot/port }}] [{all | verbose}]
```

Cisco IOS Release 12.2(33)SCE and later

```
show cable admission-control {global | interface | {cable slot/subslot/cable-interface-index |
{integrated-cable | modular-cable | wideband-cable}}}slot/subslot/port:interface-num [{all | verbose}]
```

Cisco cBR Series Router

```
show cable admission-control interface {cable slot/subslot/cable-interface-index | {integrated-cable |
wideband-cable}}slot/subslot/port:interface-num all
```

Syntax	Description
global	For uBR series router, displays the following information: <ul style="list-style-type: none"> Parameters configured for AC. Number of requests that crossed minor, major, and critical levels for each resource.
interface <i>slot/port slot/subslot/port</i>	Displays admission control information for the specified interface. For uBR series router, this includes the following: <ul style="list-style-type: none"> slot—Slot on the interface. The valid range is from 5 to 8 for the Cisco uBR10012 router and from 3 to 6 for the Cisco uBR7200 series routers. subslot—Subslot on the interface. The valid values are 0 or 1. port—Port on the interface. The valid range is from 0 to 4 for the Cisco uBR10012 router and 0 or 1 for the Cisco uBR7200 series routers. cable-interface-index <ul style="list-style-type: none"> Cisco uBR7200 series routers—The valid values are 0 or 1. Cisco uBR10012 router—The valid range is from 0 to 4 for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards, and 0 to 14 for the Cisco uBR-MC3GX60V line card. interface-num—Interface number. The valid range is from 0 to 23 for the modular interface, 0 to 31 for the wideband interface, and 0 to 3 for the integrated interface.
all	(Optional) Displays information for all interfaces configured for AC on the Cisco CMTS.
verbose	(Optional) For uBR series router, displays detailed information for the wideband interface configured for AC on the Cisco CMTS.

Command Modes

Privileged EXEC (#)

Command History	Release	Modification
	12.3(13a)BC	This command was introduced on the Cisco uBR10012 router and the Cisco uBR7246VXR router.
	12.3(23)BC	This command was modified; new fields were added to the output.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	12.2(33)SCC	This command was modified to display DS threshold values and reservations per bucket on a modular cable, interface cable, or DS channel bonding.
	12.2(33)SCE	This command was modified. The port parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.
	12.2(33)SCF	This command was modified to display guaranteed and non-guaranteed bonus bandwidth from the ACFE functionality.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The global , modular-cable and verbose keywords are removed.

Usage Guidelines

The **show cable admission-control** command offers flexible syntax that enables display of the AC as specifically configured on the Cisco CMTS. See the examples for additional information.

Examples

The following example displays upstream and downstream AC information for the specified cable interface:

```
Router# show cable admission-control interface cable 7/0/0

Interface Cable7/0/0

Resource - Upstream Bandwidth
-----
Thresholds applicable to upstream ports with no interface level
configurations in place
Bucket      Minor      Major      Exclusive      Non-Excls
No          Level      Level      Level          Level
1           0          0          0              0
2           0          0          0              0
3           0          0          0              0
4           0          0          0              0
5           0          0          0              0
6           0          0          0              0
7           0          0          0              0
8           0          0          0              0

```

Effective from Cisco IOS Release 12.2(33)SCF, the **show cable admission-control** command output for wideband cable interface was modified.

The following example displays the upstream and downstream AC information for the wideband-cable interface:

Router# show cable admission-control interface wideband-Cable 1/0/0:1

```

Interface Wideband-Cable1/0/0:1
Configured AC Max Reservable Bandwidth = 600000 bps

This table describes the significant fields for the show cable admission-control command for upstream and downstream throughput.

Table 42: show cable admission-control Field Descriptions

Field	Description
Bucket No	Specific bucket number.
Names	Bucket name.
Minor Level	Minor threshold as currently defined in a percentage on the Cisco CMTS.
# of Times	Number of times traffic has crossed this threshold since the counters on the Cisco CMTS were last cleared.
Major Level	Major threshold as currently defined in a percentage on the Cisco CMTS.
Excls Level	Percentage of exclusive throughput that is reserved for the corresponding traffic type on the Cisco CMTS. Applies to downstream or upstream traffic.

Field	Description
Non-Ex Level	Percentage of non-exclusive throughput configured on the Cisco CMTS. Commonly used with Best Effort (lowest priority) traffic.
Curr Resv	Percentage of throughput reserved exclusively for the corresponding flow type.
Conf Level	Configuration level that indicates the scope of configuration is actually applied for that US/ DS (whether the global, interface, or the upstream level is applied). The values in this field can be as follows: <ul style="list-style-type: none"> • U—Upstream • I—Interface • G—Global
# of Rejec	Number of rejections.
Sched Type	Available for upstream only. This field displays the following information: <ul style="list-style-type: none"> • UGS—UGS thresholds configured and traffic rates. • RTPS—RTPS thresholds configured and traffic rates. • BE—Best Effort thresholds configured and traffic rates.
Flow Type	Available for Downstream only. This field displays voice and data information: <ul style="list-style-type: none"> • voice—Voice thresholds configured and traffic rates. • data—Data thresholds configured and traffic rates.
Class Name	Available for upstream only.
CM-Registration event	Counter increments once for every cable modem that crosses a threshold during its registration. For example, if the minor, major, and critical thresholds on the Cisco CMTS are 60%, 70%, and 80% respectively, and a cable modem tries to register when the current value is 80%, then the cable modem is allowed to register, but the counters for minor, major and critical thresholds are each incremented by one.
Voice-Call event	Counter increments if the resource check fails when a voice-call is made. For example, assume both the MTAs are on the same Cisco CMTS, and minor, major, and critical thresholds for I/O memory are 50%, 60%, and 70%, respectively. Then assume the current I/O memory value is 75%. In this scenario, before the gate creation, AC performs an I/O memory check. This results in the counters for minor, major, and critical thresholds each being incremented by one, and the voice call fails. No packetcable gates are created because the voice calls fail.

The following example displays the upstream and downstream AC information for the wideband-cable interface:

```
Router# show cable admission-control interface wideband-Cable 8/0/0:0

Interface Wideband-Cable8/0/0:0

Resource - Downstream Bandwidth
-----
Max Reserved BW = 18000000 bps
Total Current Reservation = 1000000 bps
```

```
Guaranteed Bonus BW = 0 bps
Non-guaranteed Bonus BW = 0 bps
```

The following example displays the reserved and reservable bandwidth for a particular interface:

```
Router#show cable admission-control interface wideband-Cable 2/0/0:1

Interface Wi2/0/0:1
BGID: 8194

Note Effective with Cisco IOS-XE Release 3.18.0SP, if an OFDM channel has both Control Profile (profile A) and Data Profiles (profile B, C, and so on) configured, the lowest Data Profile rate is used for admission control calculation. Otherwise, the Control Profile rate is used.

Related Commands

Command	Description
cable admission-control	Configures the CPU and memory thresholds for the Cisco CMTS and supporting broadband processing engines.
cable admission-control event	Configures and enables AC event types.
cable admission-control ds-bandwidth	Configures AC downstream bandwidth thresholds.
cable admission-control max-reserved-bandwidth	Defines the maximum reserved bandwidth per bonding group for all service flows that are allowed by the Cisco CMTS.
cable admission-control us-bandwidth	Configures AC upstream bandwidth thresholds.
clear cable admission control counters	Clears all AC resource counters.
debug cable admission-control	Enables automatic AC troubleshooting processes.

show cable admission-control fiber-node

To display Service Group Admission Control (SGAC) configuration information for a fiber-node, use **show cable admission-control fiber-node** command in privileged EXEC mode.

show cable admission-control fiber-node *node-id*

Syntax Description

<i>node-id</i>	The cable fiber-node id. Valid range is from 1 to 512.
----------------	--

Command Default

None.

Command Modes

Privileged EXEC(#)

Command History

Release	Modification
IOS-XE 3.16.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use the **show cable admission-control fiber-node** command to verify admission-control configuration.

Examples

The following example displays SGAC configuration information for an fiber-node:

```
Router# show cable admission-control fiber-node 2
Constraint      Name      Limit
1               15%
```

Router#

Related Commands

Command	Description
show cable admission-control interface	Displays current reservation and other AC related information for a specific interface.

show cable arp-filter

To display the total number of Address Resolution Protocol (ARP) replies and requests that have been sent and received, including the number of requests that have been filtered, use the **show cable arp-filter** command in privileged EXEC mode.

Cisco uBR7246VXR Router

```
show cable arp-filter cable slot/port [{ip-requests-filtered number}] [{requests-filtered number | replies-filtered number}]
```

Cisco uBR10012 Router

```
show cable arp-filter cable slot/subslot/port [{ip-requests-filtered number}] [{requests-filtered number | replies-filtered number}]
```

Cisco cBR-8 Router

```
show cable arp-filter {cable slot/subslot/port | bundle number} [{ip-requests-filtered number}] [{requests-filtered number | replies-filtered number}]
```

Syntax Description	
cable slot/port	Displays information for all CMs on the specified cable interface and downstream port on the Cisco uBR7246VXR router. On the Cisco uBR7246VXR router, <i>slot</i> can range from 3 to 6, and <i>port</i> can be 0 or 1, depending on the cable interface.
cable slot/subslot/port	Displays information for all CMs on the specified cable interface on the router. The following are the valid values: <ul style="list-style-type: none"> • <i>slot</i> = 5 to 8 for uBR10012 router, 0 to 9 for cBR-8 router • <i>subslot</i> = 0 or 1 for uBR10012 router, 0 for cBR-8 router • <i>port</i> = 0 to 4 for uBR10012 router, 0 to 15 for cBR-8 router (depending on the cable interface)
bundle number	Bundle interface number. The value range for <i>number</i> is 1 to 255.
[ip-requests-filtered number]	(Optional) Displays the Service IDs (SIDs) that are generating or forwarding more filtered ARP requests for IP packets than the specified minimum <i>number</i> of packets. The valid range for <i>number</i> is 1 to 65535, with no default. Note This field shows the modems that are forwarding IP traffic that could be an part of an attack, such as TCP SYN floods, ping scans, and so forth.
[requests-filtered number]	(Optional) Displays the Service IDs (SIDs) that are generating or forwarding more filtered ARP requests than the specified minimum <i>number</i> of packets. The valid range for <i>number</i> is 1 to 65535, with no default.

[replies-filtered <i>number</i>]	(Optional) Displays the Service IDs (SIDs) that are generating or filtering more filtered ARP replies than the specified minimum <i>number</i> of packets. The valid range for <i>number</i> is 1 to 65535, with no default.
---	--

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(15)BC2	This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers.
12.2(15)BC2b	The ip-requests-filtered option was added to display the specific Service IDs (SIDs) that are generating or forwarding a minimum number of ARP packets.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The value ranges for the <i>slot/subslot/port</i> variables were changed.

Usage Guidelines

The **cable arp filter** command enables the filtering of ARP request and reply packets on a cable interface. ARP packets might need to be filtered when a user on the cable network generates a large volume of ARP traffic as part of a theft-of-service or denial-of-service attack, or when a virus is using ARP requests to find other computers that it might infect.

The **show cable arp-filter** command displays the total number of ARP reply packets that have been received and the number of ARP request packets that have been sent on the cable interface, as well as the number of such packets that have been filtered.

Tip To clear the counters on all interfaces, use the **clear counters** command. To clear the counters on a specific interface, use the **clear counters cable interface** command.

Examples

The following example shows the typical output from the **show cable arp-filter** command on a Cisco uBR10012 router. The displays for other Cisco CMTS platforms are similar.

```
Router# show cable arp-filter Cable6/0/0

ARP Filter statistics for Cable6/0/0:
  Replies Rcvd: 177387 total, 1869 unfiltered, 8824 filtered
  Requests Sent For IP: 68625 total, 964 unfiltered, 36062 filtered
  Requests Forwarded: 7969175 total, 7213 unfiltered, 366167 filtered
Router#
```

Table 43: show cable arp-filter Field Descriptions in Cisco uBR10012 Router

Field	Description
Replies Rcvd	
Total	Total number of ARP reply packets received on the cable interface since power-on.

Field	Description
Unfiltered	Number of ARP reply packets that the cable interface received and accepted while filtering was enabled using the cable arp filter reply-accept command.
Filtered	Number of ARP reply packets that the cable interface dropped while filtering was enabled, because they would have otherwise exceeded the allowable threshold value that was configured for the interface using the cable arp filter reply-accept command.
Requests Sent For IP	
Total	Total number of ARP request packets that the cable interface was asked to forward since power-on.
Unfiltered	Number of ARP request packets that the cable interface sent while filtering was enabled using the cable arp filter request-send command.
Filtered	Number of ARP request packets that the cable interface dropped, because they would have otherwise exceeded the allowable threshold value that was configured for the interface using the cable arp filter request-send command.
Requests Forwarded	
Total	Total number of ARP request packets that the cable interface was asked to forward to the ARP proxy since power-on.
Unfiltered	Number of ARP request packets that the cable interface sent to the ARP proxy while filtering was enabled using the cable arp filter request-send command.
Filtered	Number of ARP request packets for the ARP proxy that the cable interface dropped, because they would have otherwise exceeded the allowable threshold value that was configured for the interface using the cable arp filter request-send command.
Note	All counters are 16-bit counters, with a maximum value of 65,535 packets. If the number of packets exceeds this amount, the counter wraps back to zero and begins incrementing again.

Note The Total counts in the **show cable arp-filter** command continue to increment, regardless of whether ARP filtering has been enabled. The Unfiltered and Filtered counts increment only when ARP filtering has been enabled using the **cable arp filter** command. When cable ARP filtering is disabled, these counters retain their current values until manually reset, using the **clear counters** command.

The following example shows how to display the devices that are generating or filtering more than 100 ARP requests per reporting period. Repeat the command to see how quickly the device is generating ARP packets.

```
Router# show cable arp-filter c6/0/0 requests-filtered 100

Sid  MAC Address      IP Address      Req-Filtered    Req-For-IP-Filtered  Rep-Filtered
1    0006.2854.72d7  50.3.81.4      12407           0                     0
Router# show cable arp-filter c6/0/0 requests-filtered 100

Sid  MAC Address      IP Address      Req-Filtered    Req-For-IP-Filtered  Rep-Filtered
1    0006.2854.72d7  50.3.81.4      14597           0                     0
Router#
```

The following example shows how to display the devices that are generating or filtering more than 200 ARP replies per reporting period. Repeat the command to see how quickly the device is generating ARP packets.

```
Router# show cable arp-filter c6/0/0 replies-filtered 200

Sid  MAC Address      IP Address      Req-Filtered    Req-For-IP-Filtered  Rep-Filtered
2    0006.53b6.562f  50.3.81.6      0               0                     2358
Router# show cable arp-filter c6/0/0 replies-filtered 200

Sid  MAC Address      IP Address      Req-Filtered    Req-For-IP-Filtered  Rep-Filtered
2    0006.53b6.562f  50.3.81.6      0               0                     4016
Router#
```

The following example shows how to display the devices that are generating or filtering more than 10 ARP requests for IP packets per reporting period. Repeat the command to see how quickly the device is generating ARP packets.

```
Router# show cable arp-filter c6/0/0 ip-requests-filtered 10

Sid  MAC Address      IP Address      Req-Filtered    Req-For-IP-Filtered  Rep-Filtered
2    0006.2854.71e7  50.3.72.4      0               1926                 0
Router#
```

Table 44: show cable arp-filter Detail Field Descriptions in Cisco uBR10012 Router

Field	Description
SID	Service ID (SID) of the device.
MAC Address	Hardware (MAC-layer) address of the cable modem or CPE device.
IP Address	IP address of the cable modem or CPE device.

Field	Description
Req-Filtered	Total number of ARP requests that the device has generated or forwarded.
Req-For-IP-Filtered	Total number of ARP requests that the device has generated or forwarded for IP packets.
Rep-Filtered	Total number of ARP replies that the device has generated or forwarded.
Note	The Req-Filter and Rep-Filtered counters are 16-bit counters, with a maximum value of 65,535 packets. If the number of packets exceeds this amount, the counter wraps back to zero and begins incrementing again.

The following example shows the typical output from the **show cable arp-filter** command on a Cisco cBR-8 router.

```
Router# show cable arp-filter c9/0/0 requests-filtered 100

May  8 16:28:17.252 CST: %IP-4-ZERO_ADDR: Zero MAC address for 30.140.2.1 in ARP cache

```

The following example shows how to display the devices that are generating or filtering more than 10 ARP requests for IP packets per reporting period. Repeat the command to see how quickly the device is generating ARP packets.

```
Router# show cable arp-filter c9/0/0 ip-requests-filtered 100

Interface Cable9/0/0
SID  CPE Mac          CPE IP          Modem Mac       Modem IP       M/S Rate Pro IP
1    0000.af0e.26e4 30.141.0.2     c8fb.26a5.5954 30.140.1.3     MAC -      RP 1203
```

Table 45: show cable arp-filter Field Descriptions in Cisco cBR-8 Router

Field	Description
SID	Service ID (SID) of the device.
CPE MAC	Hardware (MAC-layer) address of the cable CPE device.
CPE IP	IP address of the CPE device.
Modem MAC	Hardware (MAC-layer) address of the cable modem.
Modem IP	IP address of the Cable Modem
M/S	Type of filtering, M means per MAC filtering, S means per Sid filtering.
Rate	The rate of filtered packets, only hardware assist filtering has the value.
Pro	Where is the filtering performed, with options RP and PXF(FP).
[REQ REP REQIP]	REQ means arp request packets, REP means arp reply, REQIP means arp request for IP.

Clearing the ARP Packet Counters

The following example shows the cable ARP counters being cleared by the **clear counters cable interface** command. This can be useful because the ARP counters are 16-bit counters that can wrap around to zero relatively quickly when large amounts of ARP traffic is being generated. Also, the ARP packet counters could include SIDs that had forwarded large amounts of ARP traffic in the past, but that are not currently forwarding such traffic. Clearing the counters allows you to clearly see the SIDS that are currently forwarding the ARP traffic that is triggering the ARP filters.

For uBR series router:

```
Router# show cable arp cable 6/0/0

ARP Filter statistics for Cable6/0/0:
  Replies Rcvd: 3278 total. 84 unfiltered, 3194 filtered
  Requests Sent For IP: 941 total. 30 unfiltered, 911 filtered
  Requests Forwarded: 941 total. 37 unfiltered, 904 filtered
Router# show cable arp-filter cable 6/0/0 requests-filtered 10

Sid  MAC Address      IP Address      Req-Filtered    Req-For-IP-Filtered  Rep-Filtered
1    0006.2854.72d7  10.3.81.4       8                0                    0

To display the forwarding table for the specified interface, use the **show cable bundle** in user EXEC or privileged EXEC mode.

```
show cable bundle n [{forwarding-table | mobility}]
```

Syntax Description		
	<i>n</i>	Specifies the bundle identifier. Valid range is from 1 to 255.
	forwarding-table	Displays the forwarding table for the specified interface.
	mobility	Displays the mobility subnet in the bundle interface.

Command Modes

User EXEC or Privileged EXEC

Command History

Release	Modification
12.0(7)XR2	This command was introduced.
12.0(8) SC	This command was supported.
12.1(2) EC1	This command was supported.
12.2(4)BC1	Support was added to the Release 12.2 BC train.
12.1(13)EC, 12.2(11)BC1	The Flags, Location, link, and sublink fields were added to the display to aid in debugging.
12.3(21)BC	All cable bundles are now automatically converted and configured to be in a virtual bundle, and standalone cable interfaces must be manually configured to be in a virtual bundle to operate properly. Previously, new virtual interface bundles and bundle members required reconfiguration, and there could also be standalone interfaces not part of a bundle at all.
12.2(33)SCH2	This command was modified. The mobility parameter was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

- For uBR series router, beginning with Cisco IOS Release 12.3(21)BC, all cable bundles are automatically converted and configured to be in a virtual bundle after loading the software image.
- For uBR series router, in releases prior to Cisco IOS Release 12.3(21)BC, if you delete the virtual bundle interface, the virtual bundle disappears.
- For uBR series router, beginning with Cisco IOS Release 12.3(21)BC, standalone cable interfaces must be manually configured to be in a virtual bundle to operate properly.
- The virtual bundle interface accumulates the counters from members; counters on member links are not cleared when they are added to the bundle. If a bundle-only counter is desired, clear the bundle counter on the members before adding them to the bundle, or before loading the image (for Cisco IOS Release 12.3(21)BC and later).

Refer to the following document on Cisco.com for additional information about cable interface bundling and virtual interface bundling on the Cisco CMTS:

- [Cable Interface Bundling and Virtual Interface Bundling on the Cisco CMTS](#)

Examples

The following is a typical example of the **show cable bundle** command:

```
Router# show cable bundle 1 forwarding-table
MAC address      Interface      Flags Location  link      sublink
00c0.5e01.0203   Cable8/0/0    3    64E5BF60  0         64E5BE00
00c0.5e01.0203   Cable7/0/0    3    64E5BE00  0         0
00c0.5e01.0101   Cable8/0/0    3    64E5BEE0  0         64E5BE40
00c0.5e01.0101   Cable7/0/0    3    64E5BE40  0         0
00c0.a375.cc1c   Cable8/0/0    1    64E5BEC0  0         0
00c0.0e01.a835   Cable8/0/0    1    64E5BEA0  0         0
00c0.0e01.a799   Cable8/0/0    1    64E5BDE0  0         0
00c0.0e01.a405   Cable8/0/0    1    64E5BF00  0         0
00c0.0e01.a5d1   Cable7/0/0    1    64E5BE20  0         0
00c0.0e01.a5d9   Cable8/0/0    1    64E5BE60  0         0
00c0.0e01.a5e1   Cable7/0/0    1    64E5BF40  0         0
00c0.0e01.a5f1   Cable7/0/0    1    64E5BE80  0         0
00c0.0eb4.0a41   Cable5/0/0    1    63704D1C  0         0
00c0.f03b.ed59   Cable6/1/0    1    6370427C  0         0
00c0.f03b.ed97   Cable6/1/0    1    63703F3C  0         0
00c0.0eb4.1373   Cable5/0/0    1    6370479C  0         0
00c0.f03b.edd3   Cable6/1/0    1    637042BC  0         0
00c0.7371.6df6   Cable5/0/0    1    63703DFC  0         0
```

The table describes the fields shown in the **show cable bundle** command display.

Table 46: show cable bundle Command Field Descriptions

Field	Description
MAC address	Identifies the MAC (hardware) address for each interface in the bundle.
Interface	Identifies the cable interface slot and port number.
Flag	The current value of the flag byte for this bundle entry. The following bits can be set: <ul style="list-style-type: none"> • Bit 0 (0x01) = Bundle is active. • Bit 1 (0x02) = Bundle is a static multicast group. <p>Note If more than one bit is set, add the values together. For example, 3 indicates an active, static multicast group.</p>
Location	The location in the router's memory for the flags byte for this bundle entry. This value is useful only to TAC engineers during debugging.
link	The value of the link pointer for this bundle entry. This value is useful only to TAC engineers during debugging.
sublink	The value of the sublink pointer for this bundle entry. This value is useful only to TAC engineers during debugging.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

The following example shows typical output for the **show cable bundle forwarding-table** command, supporting virtual interface bundling on the Cisco CMTS in later 12.3 BC Cisco IOS releases:

```
Router# show cable bundle 1 forwarding-table
Location link      sublink      MAC address      Interface      Flags
00c0.5e01.0203 Cable8/0/0    3 64E5BF60 0 64E5BE00
00c0.5e01.0203 Cable7/0/0    3 64E5BE00 0 0
00c0.5e01.0101 Cable8/0/0    3 64E5BEE0 0 64E5BE40
00c0.5e01.0101 Cable7/0/0    3 64E5BE40 0 0
00c0.a375.cc1c Cable8/0/0    1 64E5BEC0 0 0
00c0.0e01.a835 Cable8/0/0    1 64E5BEA0 0 0
00c0.0e01.a799 Cable8/0/0    1 64E5BDE0 0 0
00c0.0e01.a405 Cable8/0/0    1 64E5BF00 0 0
00c0.0e01.a5d1 Cable7/0/0    1 64E5BE20 0 0
00c0.0e01.a5d9 Cable8/0/0    1 64E5BE60 0 0
00c0.0e01.a5e1 Cable7/0/0    1 64E5BF40 0 0
00c0.0e01.a5f1 Cable7/0/0    1 64E5BE80 0 0
00c0.0eb4.0a41 Cable5/0/0    1 63704D1C 0 0
00c0.f03b.ed59 Cable6/1/0    1 6370427C 0 0
00c0.f03b.ed97 Cable6/1/0    1 63703F3C 0 0
00c0.0eb4.1373 Cable5/0/0    1 6370479C 0 0
00c0.f03b.edd3 Cable6/1/0    1 637042BC 0 0
00c0.7371.6df6 Cable5/0/0    1 63703DFC 0 0
Total = 18, sublink total = 2
Free = 1016, low_mark = 1016
```

The following example shows typical output for the **show cable bundle mobility** command:

```
Router# show cable bundle 1 mobility

Interface          IP/IPv6 Subnet
-----
Bundle1            ---
Bundle1.1          192.0.3.0/16
                   192.0.3.1/16
                   192.0.4.1/16
                   2001:DB:5:4:100::1/32
                   2001:DB:5:4:101::1/32
Bundle1.2          192.0.3.1/16
```

Related Commands

Command	Description
cable bundle	Creates an interface bundle.
show ip interface brief	Displays a brief summary of an interface's IP information and status, to include virtual interface bundle information.
show pxf cable (for uBR series router)	Displays multicast echo, packet intercept, or source-verify features for one or all cable interfaces, to include information for virtual interface bundles.

show cable bundle multicast

To display Multicast information for the specified virtual interface bundle, based on IGMPv3, use the **show cable bundle multicast** command in privileged EXEC mode:

```
show cable bundle bundle# multicast group
show cable bundle bundle# multicast [{MAC addr IP addr}]
```

Syntax Description

<i>bundle#</i>	The alphanumeric identifier for the virtual interface bundle.
<i>group</i>	Multicast group membership identifier.
<i>MAC addr</i>	Optional parameter specifies the MAC address for which to return information.
<i>IP addr</i>	Optional parameter specifies the IP address for which to return information.

Command Modes

User EXEC or Privileged EXEC

Command History

Release	Modification
12.3(21)BC	This command was introduced to support virtual interface bundling on the Cisco CMTS. All cable bundles are now automatically converted and configured to be in a virtual bundle, and standalone cable interfaces must be manually configured to be in a virtual bundle to operate properly. Previously, new virtual interface bundles and bundle members required reconfiguration, and there could also be standalone interfaces not part of a bundle at all.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

- For uBR series router, beginning with Cisco IOS Release 12.3(21)BC, all cable bundles are automatically converted and configured to be in a virtual bundle after loading the software image.
- For uBR series router, in releases prior to Cisco IOS Release 12.3(21)BC, if you delete the virtual bundle interface, the virtual bundle disappears.
- For uBR series router, beginning with Cisco IOS Release 12.3(21)BC, standalone cable interfaces must be manually configured to be in a virtual bundle to operate properly.
- The virtual bundle interface accumulates the counters from members; counters on member links are not cleared when they are added to the bundle. If a bundle-only counter is desired, clear the bundle counter on the members before adding them to the bundle, or before loading the image (for Cisco IOS Release 12.3(21)BC and later).

Refer to the following document on Cisco.com for additional information about cable interface bundling and virtual interface bundling on the Cisco CMTS:

- *Cable Interface Bundling and Virtual Interface Bundling on the Cisco CMTS*

Examples

The following example illustrates this new command. This command translates the bundle's multicast MAC address to Multicast IP address information, including the associated multicast source.

```
Router# show cable bundle bundle1.1 multicast
CableBundle Interface Source IP      Multicast IP  MAC Address
1           Bundle1.1  *                230.1.1.1    0100.5e00.0001
```

The following example illustrates multicast information for the specified virtual bundle:

```
Router# sh cable bundle 1 multicast
CableBundle Interface Source IP      Multicast IP  MAC Address
1           Bundle1   *                239.0.0.100  0100.5e00.0001
```

To translate a MAC address back to Multicast IP address, use the following optional syntax:

show cable bundle *bundle#* **multicast** [<MAC addr | IP addr >]

The following example illustrates this enhanced **show** command:

```
Router# show cable bundle bundleID multicast 0100.5e00.0001
MAC address      Interface  Flags Location  link  sublink
0100.5e00.0001  Bundle1   1    646FE4D8  0     646FE4EC
0100.5e00.0001  Cable6/0/0 1    646FE4EC  0     0
^^^^^^^^^^^^^^
```

Related Commands

Command	Description
cable bundle	Creates an interface bundle.
show ip interface brief	Displays a brief summary of an interface's IP information and status, to include virtual interface bundle information.
show pxf cable (for uBR series router)	Displays multicast echo, packet intercept, or source-verify features for one or all cable interfaces, to include information for virtual interface bundles.

show cable burst-profile

To display the upstream data burst profiles used to configure the upstream PHY, use the **show cable burst-profile** command in privileged EXEC mode.

show cable burst-profile

Note This command has been deprecated and removed in the current versions of the Cisco IOS software for all Cisco CMTS routers.

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC

Command History	Release	Modification
	11.3 NA	This command was introduced.
	11.3(5)NA, 12.0(5)T1, 12.0(6)SC, 12.1(2)EC1	This command was removed and replaced with the show cable modulation-profile command.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command displayed configuration of the cable burst profiles, which were what DOCSIS initially used to control the data, ranging, and station maintenance bursts. The Cisco CMTS routers now support a more comprehensive set of modulation profiles, which are displayed by the **show cable modulation-profile** command.

Note The **show cable burst-profile** command displayed fields and values that were supported only in the initial versions of the DOCSIS specification. The current DOCSIS 1.0 and 1.1 specifications use different parameters and values, as shown by the **show cable modulation-profile** command.

Examples

The following example shows typical output from the **show cable burst-profile** command:

```
Router# show cable burst-profile
```

```

Burst   Type Preamb Diff   FEC err FEC      Scrambl Max   Guard Last   Scrambl profile
number  size size size length size size shortened
1       1    48    no    0x0  0x6   0x152  1    16    1    yes
2       1    48    no    0x0  0x6   0x152  1    12    1    no
3       1    48    no    0x5  0x2C  0x152  0    48    1    yes
4       1    48    no    0x5  0x2C  0x152  0    48    1    yes
5       1    48    no    0x5  0x32  0x152  0    20    1    yes

```

```

6      1      48      no      0x0      0x32      0x152      0      20      1      no
Router#

```

Table 47: show cable burst-profile Field Descriptions

Field	Description
Burst profile number	The number of the burst profile.
Type	Type of burst profile.
Preamb length	Length of the preamble.
Diff encode	Shows if there is a diff encode.
FEC err correct	Shows the forward error correction.
FEC codeword length	Shows the length of the forward error correction codeword.
Scrambl seed	Shows the seed of the scrambler.
Max size	Designates the maximum burst size.
Guard size	Indicates the guard time size.
Last codeword shortened	Shows the last codeword shortened.
Scrambl	Indicates whether scramble is enabled (yes) or not (no).

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable upstream modulation-profile	Configures a spectrum group to use a specified frequency.
show cable hop	Displays CM configuration settings.
show cable modulation-profile	Displays the currently defined modulation profiles.
show interface cable sid	Displays cable interface information.

show cable calls

To display voice call history information and status for PacketCable Emergency 911 Services Listing and History, use the **show cable calls** command in privileged EXEC mode. This command displays voice call history information that is enabled with the **cable high-priority-call-window** command in global configuration mode.

show cable calls [*{slot slot/subslot}*]

Syntax Description

interface	Selects the interface for which to enable PacketCable E911 call history.
<i>slot</i>	Designates the slot or slot and port for a particular cable interface on the Cisco router. The following are the valid values for the Cisco uBR7246VXR router: <ul style="list-style-type: none"> • <i>slot</i> can range from 3 to 6
<i>slot/subslot</i>	Designates the slot or slot and port for a particular cable interface on the Cisco router. The following are the valid values for the Cisco uBR10012 router: <ul style="list-style-type: none"> • <i>slot</i> = 5 to 8 • <i>subslot</i> = 0 or 1 The following are the valid values for the Cisco cBR-8 router: <ul style="list-style-type: none"> • <i>slot</i> = 0 to 9 • <i>subslot</i> = 0

Command Modes

Privileged EXEC

Command History

Release	Modification
12.3(13a)BC	This command was introduced supporting PacketCable Emergency 911 Services Listing and History on the Cisco CMTS: <ul style="list-style-type: none"> • Cisco uBR7246VXR router • Cisco uBR10012 router
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The value ranges for <i>slot/subslot</i> variables were changed.

Usage Guidelines

This command supports the PacketCable Emergency 911 Services Listing and History feature on the Cisco CMTS. Cisco IOS release 12.3(13a)BC introduces enhanced informational support for PacketCable Emergency 911 calls on the Cisco CMTS, to include the following information and related history:

- active Emergency 911 calls
- recent Emergency 911 calls
- regular voice calls
- voice calls made after recent Emergency 911 calls

To set the call window (in minutes) during which the Cisco CMTS maintains records of Emergency 911 calls, use the **cable high-priority-call-window** command. For more information on the **cable high-priority-call-window** command, see [Cisco IOS CMTS Cable Command reference](#).

Additional information for voice call support with PacketCable and PacketCable MultiMedia (PCMM) is available in the following document on Cisco.com:

[Cisco CMTS PacketCable and PacketCable Multimedia Features Configuration Guide, Release 12.2SC](#)

Examples

The following example illustrates call status on the Cisco CMTS:

```
Router# show cable calls
Interface  ActiveHiPriCalls  ActiveAllCalls  PostHiPriCallCMs  RecentHiPriCMs
Cable3/0   0                  0                0                  1
Cable3/1   0                  0                0                  0
Cable4/0   0                  0                0                  1
Cable4/1   0                  0                0                  0
Total      0                  0                0                  2
Router #
```

The following command example illustrates that one Emergency 911 call was made on the Cable8/1/1 interface on the Cisco uBR10012 router during the window set for high priority calls:

```
Router# show cable calls
Interface  ActiveHiPriCalls  ActiveAllCalls  PostHiPriCallCMs  RecentHiPriCMs
Cable5/0/0 0                0                0                  0
Cable5/0/1 0                0                0                  0
Cable5/1/0 0                0                0                  0
Cable5/1/1 0                0                0                  0
Cable5/1/2 0                0                0                  0
Cable5/1/3 0                0                0                  0
Cable5/1/4 0                0                0                  0
Cable6/0/0 0                0                0                  0
Cable6/0/1 0                0                0                  0
Cable7/0/0 0                0                0                  0
Cable7/0/1 0                0                0                  0
Cable8/1/0 0                0                0                  0
Cable8/1/1 1                1                0                  0
Cable8/1/2 0                0                0                  0
Cable8/1/3 0                0                0                  0
Cable8/1/4 0                0                0                  0
Total      1                1                0                  0
```

Related Commands

Command	Description
cable high-priority-call-window	Sets the call window (in minutes) during which the Cisco CMTS maintains records of Emergency 911 calls.
show cable modem calls	Displays voice call information for a particular cable modem.

show cable card

To display various upstream/downstream phy and mac devices related information which are needed for debugging upstream and down stream traffic related issues, use **show cable card** command in privileged EXEC mode.

```
show cable card slot/sub-slot {{ds-mac {all} | {bg} | {index} | {links} | {resources} |
{state}} | {ds-phy {display | trigger}} | {memory [summary]} | {proc-cpu [history |
sorted]} | {qam-repl {config-validate}} | {group [group-id [counters | verbose]]} | {port
downstream port number {{group} | {pilot} | {rf-channel grouplist}}}} | {tech-support} |
{us-mac {config {bpi BPI index segment value} | {bwr physical channel number} | {gs MAC domain
number} | {hwflow physical channel number SID value segment value} | {swflow HW flow value
segment value}} | {counts {all} | {ccf} | {esi} | {frag} | {frame} | {global} | {ilk}
| {interrupt} | {pkt} | {uepi}}}} | {us-phy {channel {MG device instance physical channel
number [clear] logical channel number {{all} | {get} | {show IUC number}}}} | {fec-summary}}
| {driver [MG device instance]} | {errors [MG device instance]}}}}
```

Syntax Description

<i>slot/sub-slot</i>	The slot/sub-slot number. The slot value ranges from 0 to 9 and sub-slot value is 0.
ds-mac	Specifies the ds-mac information.
all	Specifies all ds-mac information.
bg	Specifies ds-mac bg alloc information.
index	Specifies ds-mac hw-flow, DSID and BPI index allocation information.
links	Specifies ds-mac links information.
resources	Specifies ds-mac resources (free/used jib/spr grps).
state	Specifies ds-mac state information.
ds-phy	Specifies DSPHY commands to collect and display DSPHY related information.
display	Specifies DSPHY information collected from hardware.
trigger	Specifies DSPHY hardware information collection trigger.
memory	Specifies memory information.
summary	(Optional) Specifies memory statistics information.
pro-cpu	Specifies CPU information.
history	(Optional) Displays CPU history in graph format.
sorted	(Optional) Displays sorted output based on percentage of utilization.
qam-repl	Specifies card level qam-repl information.
config-validate	Specifies validate configuration for QAM replication

group	Displays qam-repl group information.
<i>group-id</i>	(Optional) The qam-repl group ID. The value ranges from 24576 to 25599.
counters	(Optional) Displays counters for QAM replication group.
verbose	(Optional) Displays detailed QAM replication group information.
pilot	Specifies the pilot channels on the card.
port	Specifies the downstream port.
<i>downstream port number</i>	The downstream port number. The value ranges from 0 to 7.
rf-channel	Displays RF channel information.
<i>group list</i>	The list of rf-channels and range of rf-channels.
tech-support	Displays technical support information.
us-mac	Specifies important us-mac information.
config	Specifies us-mac configuration information.
bpi	Specifies us-mac BPI configuration information.
<i>BPI index number</i>	The BPI index number. The value ranges from 0 to 32767.
<i>segment value</i>	The segment value. The value ranges from 1 to 14.
bwr	Specifies us-mac bw request configuration information.
<i>physical channel number</i>	The physical channel number. The value ranges from 0 to 127.
gs	Specifies us-mac gs configuration information.
<i>MAC domain number</i>	The MAC domain number. The value ranges from 0 to 127.
hwflow	Specifies us-mac HW flow configuration information.
<i>SID value</i>	The SID value. The value ranges from 0 to 16383.
swflow	Specifies us-mac SW flow configuration information.
<i>HW flow value</i>	The HW flow value. The value ranges from 0 to 131071.
counts	Displays us-mac count information.
all	Displays all us-mac information.
ccf	Displays us-mac ccf information.
esi	Displays us-mac esi information.
frag	Displays us-mac fragment proc information.
frame	Displays us-mac frame proc information.

global	Displays us-mac global information.
ilk	Displays us-mac ilk information.
interrupt	Displays us-mac interrupt information.
pkt	Displays us-mac packet proc information.
uepi	Displays us-mac uepi/sgmii information.
us-phy	Specifies us-phy related information.
channel	Specifies 3142 channel counters.
<i>MG device instance</i>	The MG device instance. The value ranges from 0 to 7.
clear	Clears the channel counters.
logical channel number	The logical channel number. The value ranges from 0 to 1.
get	Specifies get IUC from Mg's.
show IUC number	Displays dump IUC's.
fec-summary	Displays all channels FEC errors.
driver	Displays internal driver information.
errors	Specifies 3142 error counters.

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

Usage GuidelinesThe **show cable card** command is used for debugging downstream related issues.**Examples**The following example shows a typical display for the **show cable card** command:

```

Router# sh cab card 3/0 ds-mac ?
all          show all ds-mac information
bg          show ds-mac bg alloc information
index       show ds-mac hw-flow index alloc information
links       show ds-mac links information
resources   show ds-mac resources (free/used jib/spr grps)
state       show ds-mac state information

```

show cable cgd-associations

To display the Channel Group Domain (CGD) downstream associations on the Cisco CMTS, use the **show cable cgd-associations** command in privileged EXEC mode.

show cable cgd-associations

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC(#)

Command History

Release	Modification
12.2(33)SCG	This command was introduced.
12.2(33)SCG4	This command was modified.
12.2(33)SCH	The output field Active Remote DS was modified to Active DS
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following is a sample output of the **show cable cgd-associations** command displaying the Cisco Wideband SPA downstream association with Cisco uBR-MC3GX60V and Cisco uBR-MC20X20V line cards:

```
Router# show cable cgd-associations
CGD Host  Resource  DS Channels      Upstreams (AllUS)  Active DS
Ca7/1/0   7/1/0        4                0-3                Yes           4
```

Note In the AllUS field, Yes indicates all the upstream channels are associated with the downstream channels in the MAC domain. If the AllUS field is blank, all the upstream channels are not associated with the downstream channels.

This table describes the fields shown in the **show cable cgd-associations command** display.

Table 48: show cable cgd-associations Field Descriptions

Field	Description
CGD Host	MAC domain interface for CGD.
Resource	Downstream cable interface line card.
DS Channels	Downstream RF channels.
Upstreams	Association of upstream channels in the MAC domain.

show cable cgd-associations

Field	Description
(AllUS)	Association of all upstream channels with downstream channels in the MAC domain.
Active Remote DS	Active downstream channels. Note Effective with Cisco IOS Release 12.2(33)SCG4, the field Active Remote DS has been modified to Active DS.
Active DS	Effective with Cisco IOS Release 12.2(33)SCG4, this field displays active downstream channels.

Related Commands

Command	Description
show cable mac-domain cable cgd-associations	Displays the summary of the CGD associations for all cable MAC domains.
show cable mac-domain cable downstream-service-group	Displays the MAC Domain Downstream Service Group information for a primary downstream channel.

show cable channel-group

To display the channel group information, use the **show cable channel-group** command in privileged EXEC mode.

show cable channel-group {**all** *group-id*}

Syntax Description	all Displays the channel group information for all channel groups.						
	<i>group-id</i> Channel group ID. The valid range is from 1 to 1000.						
Command Default	None						
Command Modes	Privileged EXEC (#)						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS Release 12.2(33)CX</td> <td>This command was introduced.</td> </tr> <tr> <td>IOS-XE 3.15.0S</td> <td>This command is not supported on the Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS Release 12.2(33)CX	This command was introduced. Associated CMC List (total/registered: 4/1):
MAC Address   Registered  Offset
0010.2024.7035 Y           0
badb.ad02.1cca N           -
badb.ad02.1cc6 N           -
badb.ad02.1cee N           -
```

The table below describes the significant fields in the output of the **show cable channel-group** command.

Table 49: show cable channel-group Field Descriptions

Field	Description
Channel Group	Channel group ID.
State	State of the channel group.
Host	Host name for the channel group.
Upstream channels (total <i>number</i>)	Upstream channel information.
Downstream channels (total <i>number</i>)	Downstream channel information.
Associated CMC List (total/registered: <i>number/number</i>)	Information on the associated Cisco CMCs.
MAC Address	MAC address of the Cisco CMC.
Registered	Indicates if the Cisco CMC is registered.
Offset	Internal index of the Cisco CMC in the channel group.

Related Commands

Command	Description
cable channel-group	Configures channel group.

Command	Description
upstream cable channel	Configures upstream cable channel for a channel group.
downstream modular-cable rf-channel	Configures downstream modular cable RF channel for a channel group.
cmc	Configures Cisco CMC in a channel group.

show cable clock

To display clock reference status information for the clock card and to display information about displaying Timing, Communication and Control (TCC) card DOCSIS Timing Interface (DTI) client and server statistic counts, use the **show cable clock** command in user EXEC or privileged EXEC mode.

Cisco uBR Series Router

```
show cable clock [slot] {client port id | server port id | counters}
```

Cisco cBR Series Router

```
show cable clock dti {client | server} slot/subslot
```

Syntax Description

<i>slot</i>	(Optional) Identifies a TCC interface on the Cisco RF Gateway 10. Valid TCC slots are 13 and 14.
client <i>port id</i>	Specifies the DTI client port ID. Valid port values are 1 and 2.
server <i>port id</i>	Specifies the DTI server port ID. Valid port values are 1 and 2.
counters	Specifies the DTI client counters.
<i>slot/subslot</i>	Specifies the slot and subslot location of the DTCC ports. Valid values are 4/1 or 5/1.

Command Default

Information on the TCC DTI client and server is displayed. Counters are not displayed.

Command Modes

User EXEC or Privileged EXEC

Command History

Release	Modification
12.1(1a)T1	This command was introduced.
12.1(2)EC1	This command was supported on the EC train.
12.2(1)XF1, 12.2(4)BC1	This command was supported for the Cisco uBR10012 universal broadband router.
12.3(23)BC	This command was supported for DTI mode.
12.2(44)SQ	This command was modified in Cisco IOS Release 12.2(44)SQ to support the Cisco RF Gateway 10. The <i>slot</i> , client , server , and counters options were added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The dti keyword was added.

Usage Guidelines

This command supports the Cisco CMTS clock feature set, which provides a synchronized clock for improved Voice-over-IP (VoIP) operations. The clock feature set requires one of the following configurations:

- A Cisco uBR10012 router with one or two TCC+ cards that are connected to an external national clock source.

Note Beginning in Cisco IOS Release 12.3(23)BC, TCC+ is replaced with DOCSIS Timing and Control Card (DTCC).

- A Cisco uBR7246 VXR router using a Cisco uBR-MC16S, Cisco uBR-MC16E, Cisco uBR-MC28C, or Cisco uBR-MC28C-BNC cable interface line card. The router must also be equipped with a Cisco cable clock card and be running Cisco IOS 12.1(1a)T1, 12.1(2)EC1, or a later release. The Cisco cable clock card should be connected to an external national clock source.

Only these cable interface cards support the external clock card reference from a clock card to distribute that signal to CMs or set-top boxes (STBs) attached to the specific network segments. You can use other cable interface cards, such as the Cisco uBR-MC16C, with the clock card, but these other cable interfaces will not synchronize their downstream SYNC messages with the external clock source.

Each CM or STB must also support VoIP applications and the clock feature set. For example, the Cisco uBR924, running Cisco IOS Release 12.0(7)T or later, supports clock card feature automatically.

Note This command does not appear if a clock card is not installed in the system.

Examples

The following sample output from the **show cable clock** command on a Cisco uBR7246VXR router shows that both external sources are available and the clock card is providing the clock reference:

```
Router# show cable clock

Clockcard primary input is present
Clockcard secondary input is present
Cable clock reference is clockcard primary input
Cable3/0 Timestamp clock reference is from Clockcard
Cable4/0 Timestamp clock reference is from Clockcard
```

The following sample output from the **show cable clock** command on a Cisco uBR10012 router shows that both external sources are available and that the TCC+ card in slot 1/1 is providing the clock reference:

```
Router# show cable clock

Number of TCCplus Cards in the Chassis: 2
Active TCCplus Card is in slot: 1 subslot: 1
Backup TCCplus Card is in slot: 2 subslot: 1
Clock reference used by the active card is Primary T1
External T1 References:
Card: 1/1
Primary T1 : Available
Secondary T1: Available
Card: 2/1
Primary T1 : Available
Secondary T1: Available
```

The following sample output from the **show cable clock** command on a Cisco uBR10012 router shows that the TCC+ card in slot 1/1 is in maintenance mode, and that the TCC+ card in slot 2/1 is providing the clock reference:

```
Router# show cable clock

Number of TCCplus Cards in the Chassis: 2
TCCplus card in 1/1 under maintenance
Active TCCplus Card is in slot: 2 subslot: 1
Clock reference used by the active card is Primary T1
External T1 References:
Card: 2/1
Primary T1 : Available
Secondary T1: Available
```

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

The following sample output from the **show cable clock** command on a Cisco uBR10012 router shows that the DTCC card in slot 1/1 is in DTI mode.

```
Router# show cable clock

Number of TCC Cards in the Chassis: 1
Active TCC Card is in slot: 1 subslot: 1, (DTCC Eightbells card)
Clock reference used by the active card is DTI
Active TCC card in slot 1/1
TCC Card 1/1 DTI status:
-----
Active Client port           : 2
Active Client status        : normal
Active Client Server status  : freerun
Active Client frame error rate : < 2%
Active Client CRC error count : 0xAD
Standby Client Signal detected : yes
No card in slot 2/1
```

Cisco RF Gateway 10

The following example shows the TCC DTI client and server statistic counts information:

```
Router# show cable clock
DTI Client status: TCC 13
-----
Client status                : normal
Client clock type            : ITU type 1
Client firmware version      : 7
Client dti version           : 0
Client timestamp             : 657519453
Client phase correction      : 65535
Client normal time          : 65535
Client holdover time        : 0
Client transition t3 count   : 0
Client transition t4 count   : 1
Client transition t6 count   : 0
Client transition t7 count   : 0
Client port switch count     : 1
Client Integral Frequency Term : 64518
Client EFC Value             : 63282
DTI Client Port 1 Status:
```

```

-----
Port Status           : Active
Signal detected       : yes
CRC error count       : 2
Frame error rate      : < 2%
Cable advance         : 2560
-- Connected server information ---
Server status         : Active free-run
Root Server clock type : ITU type 3
Root Server source    : none
Server Type           : Root
Client Performance Stable : yes
Client Cable advance Valid : yes
DTI Client Port 2 Status:
-----
Port Status           : Inactive
Signal detected       : no
CRC error count       : 66
Frame error rate      : > 5%
Cable advance         : 0
DTI Client status: TCC 14
-----
Client status         : normal
Client clock type     : ITU type 1
Client firmware version : 7
Client dti version    : 0
Client timestamp      : 672169320
Client phase correction : 65535
Client normal time    : 65535
Client holdover time  : 0
Client transition t3 count : 0
Client transition t4 count : 1
Client transition t6 count : 0
Client transition t7 count : 0
Client port switch count : 1
Client Integral Frequency Term : 64760
Client EFC Value      : 63832
DTI Client Port 1 Status:
-----
Port Status           : Inactive
Signal detected       : no
CRC error count       : 26
Frame error rate      : > 5%
Cable advance         : 0

DTI Client Port 2 Status:
-----
Port Status           : Active
Signal detected       : yes
CRC error count       : 2
Frame error rate      : < 2%
Cable advance         : 1792
-- Connected server information ---
Server status         : Active free-run
Root Server clock type : ITU type 3
Root Server source    : none
Server Type           : Root
Client Performance Stable : yes
Client Cable advance Valid : yes

```

The following is sample output of a TCC card in slot 13 on a Cisco RF Gateway 10:

```

Router#show cable clock 13 client 1
DTI Client Port 1 Status:

```

```

-----
Port Status           : Inactive
Signal detected       : no
CRC error count       : 63006
Frame error rate      : > 5%
Cable advance         : 0x0000

```

Table 50: show cable clock client Field Descriptions

Field	Description
Port status	Indicates the current status of the DTI port on the TCC card.
Signal detected	Indicates whether the DTI signal was detected.
CRC error count	The number of cyclic redundancy check (CRC) errors. It can indicate intermittent upstream, laser clipping, or common-path distortion.

The following example shows the server status of the TCC card in slot 13 on a Cisco RFGW-10:

```

Router#show cable clock 13 server 2
TCC Card 13 port 2 DTI Server status:
-----
Server signal detected : yes
Server status          : free-run
Root Server clock type : ITU type 3
Root Server source     : none
Server Type            : Root
Client Performance Stable : yes
Client Cable advance Valid : yes
TOD Setting Mode       : Short
TOD gpssec             : 902825745
TOD leap seconds       : 14

```

Table 51: show cable clock server Field Descriptions

Field	Description
Server signal detected	Indicates whether the server was detected.
Server status	Indicates the state in which the server is functioning. The states are warm-up, free-run state, fast mode, normal, holdover, or bridge mode.
Root server source	The server source such as internal, external, GPS or none.
Root server clock type	The clock type. The types are 1, 2, 3 or ITU Stratum 3 or DTI Min. clock.
TOD setting mode	Displays the time (user time, NTP, GPS) mode such as short or long.

The following is a sample output showing the counters on TCC card 13 on Cisco RFGW-10:

```

Router#show cable clock 13 counters
TCC Card 13 DTI counters:
-----
Client Normal time      : 0x1EB6
Client Holdover time    : 0x0000
Client Phase Correction : 0
Client Freq Correction   : 63213

```

```

Client EFC Correction           : 61039
Client transition count t3      : 0
Client transition count t4      : 1
Client transition count t6      : 0
Client transition count t7      : 0
Client port switch count       : 1

```

Related Commands

Command	Description
show controllers clock-reference	Displays hardware information, register values, and current counters for the cable clock card.
show cable clock dti status	Displays information on the DOCSIS Timing Interface (DTI) Client status.
cable clock free-run	Allows the clock to be in free-run mode.
clear cable clock counters	Clears DTI client transition counters of a TCC DTI client and server.

show cable clock dti counters

To display DTI counters for the clock card, use the **show cable clock dti counters** command in user EXEC or privileged EXEC mode.

show cable clock dti counters *slot/subslot*

Syntax Description

<i>slot/subslot</i>	Specifies the slot and subslot location of the DTCC ports. Valid values are 1/1 or 2/1.
---------------------	---

Command Modes

User EXEC or Privileged EXEC

Command History

Release	Modification
12.3(23)BC	This command was supported for DTI mode.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following is a sample output from the **show cable clock dti counters** command in user EXEC mode:

```
Router> show cable clock dti counters 1/1
TCC Card 1/1 DTI counters:
-----
Client Normal time           : 0xFFFF
Client Holdover time         : 0x0000
Client Phase Correction       : 0x0000
Client Freq Correction        : 0xFBD7
Client EFC Correction         : 0xF7AD
Client transition count t3    : 0x00
Client transition count t4    : 0x01
Client transition count t6    : 0x00
Client transition count t7    : 0x00
```

Related Commands

Command	Description
cable clock dti clear-counters	Resets the counters that are displayed with the show cable clock dti counters command.
show cable clock dti status	Displays information on the DOCSIS Timing Interface (DTI) Client status.

show cable clock dti status

To display information on the DOCSIS Timing Interface (DTI) Client status, use the show cable clock dti status command in privileged EXEC mode.

show cable clock dti status

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use this command to display information on the DTI Client status.

Examples The following is a sample output from the **show cable clock dti** command:

```
Router# show cable clock dti status
Status of DTI component:
Active TCC card in slot 1/1
TCC Card 1/1 DTI status:
-----
Active Client port           : 2
Active Client status         : normal
Active Client Server status  : freerun
Active Client frame error rate : < 2%
Active Client CRC error count : 0x06
Standby Client Signal detected : no
No card in slot 2/1
```

Related Commands	Command	Description
	show cable clock	Displays clock reference status information for the clock card.

show cable cmc

To display the Cisco CMC information, use the **show cable cmc** command in privileged EXEC mode.

show cable cmc [{**summary** | *cmc-value* {**cap** | **dom** | **ds_cnt** | **frx_info** | **info** | **modem** | **spec-analysis** *upstream_id low_freq high_freq* | **us_uepi_cnt** | **verbose**}]

Syntax Description		
summary		Optional. Displays a summary of the Cisco CMC.
<i>cmc-value</i>		Optional. Specifies the details of the Cisco CMC. <ul style="list-style-type: none"> • <i>mac-address</i>—MAC address of the Cisco CMC. • <i>ip-address</i>—IP address of the Cisco CMC. • <i>cmc-index</i>—Cisco CMC ID. The valid range is from 1 to 4096.
cap		Displays the Cisco CMC capability information
dom		Displays the digital diagnostic monitoring information of the optical transceivers on Cisco CMC.
ds_cnt		Displays the downstream counter information for Cisco CMC.
frx_info		Displays the FRx information for the Cisco CMC.
info		Displays the Cisco CMC information.
modem		Displays the information for the cable modem associated with the Cisco CMC.
spec-analysis <i>upstream_id low_freq high_freq</i>		Displays the spectrum monitoring information for the upstream of Cisco CMC. <ul style="list-style-type: none"> • <i>upstream_id</i>— ID of the upstream. • <i>low_freq</i>— The lowest frequency of the spectrum. The valid range is from 5000 to 85000. • <i>high_freq</i>— The highest frequency of the spectrum. The valid range is from 5000 to 85000.
us_uepi_cnt		Displays the upstream UEPI counter information for Cisco CMC.
verbose		Displays the detailed information for Cisco CMC.
Command Default		None
Command Modes		Privileged EXEC (#)
Command History	Release	Modification
	Cisco IOS Release 12.2(33)CX	This command was introduced.

Release	Modification
Cisco IOS Release 12.2(33)CY	This command was modified. The dom and spec-analysis keyword was added, the verbose keyword was modified. Note Cisco CMC image cmc-16x4-os-1.2.bin is required to use these command options.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

The following is a sample output of the **show cable cmc** command:

```
Router# show cable cmc
```

```
MAC Address      IP Address      State      Group Offset CMCID Conn ID   IF
0010.2024.7035  192.168.0.4    online     710  1      2      0xF0000   Gi7/1/0
```

The table below describes the significant fields in the output of the **show cable cmc** command.

Table 52: show cable cmc Field Descriptions

Field	Description
MAC Address	MAC address of the Cisco CMC.
IP Address	IP address assigned to the Cisco CMC.
State	Current state of the Cisco CMC. <ul style="list-style-type: none"> • Offline: CMC is not operational • Reject(i): IP assign failed • Init(d): DHCP discovery • Init(g): GCP connection establishing • Init(est): GCP connection established • Init(c): Get CMC Capability • Init(s): Download configuration to CMC • Reject(c): Get CMC Capability failed • Online: CMC is operational
Group	Channel group ID to which the Cisco CMC is assigned.
Offset	Internal index of the Cisco CMC in the channel group.
CMC ID	Cisco CMC ID.

Field	Description
Conn ID	GCP connection ID per Cisco uBR-MC3GX60V-RPHY line card.
IF	Interface to which the Cisco CMC is connected.

The following is a sample output of the **show cable cmc summary** command:

```
Router# show cable cmc summary
```

```
Gi7/1/0      :1
```

The following is a sample output of the **show cable cmc** command, which displays the capability information for the Cisco CMC with MAC address 0010.2024.7035:

```
Router# show cable cmc 0010.2024.7035 cap
```

```
cmcDsChanNum : 16
cmcUsChanNum  : 4
IsFRxEmbedded : 0
```

The table below describes the significant fields in the output of the **show cable cmc cap** command.

Table 53: show cable cmc cap Field Descriptions

Field	Description
cmcDsChanNum	Number of downstream channels on the Cisco CMC.
cmcUsChanNum	Number of upstream channels on the Cisco CMC.
IsFRxEmbedded	Indicates if the FRx is installed in the Cisco CMC.

The following is a sample output of the **show cable cmc** command, which displays the digital diagnostic monitoring information for the Cisco CMC with MAC address 0004.9f01.9100:

```
Router# show cable cmc 0004.9f01.9100 dom
```

```

          Temperature  Voltage      Current      Optical      Optical

The table below describes the significant fields in the output of the **show cable cmc dom** command.

Table 54: show cable cmc dom Field Descriptions

Field	Description
Temperature	Internally measured transceiver temperature.
Voltage	Internally measured transceiver supply voltage.
Current	Measured transmitter bias current in μ A.
Optical Tx Power	Measured transmitter output power in mW.
Optical Rx Power	Measured receiver received average optical power in mW.
High Alarm Threshold	Upper limit to trigger alarm.
High Warn Threshold	Upper limit to trigger warning.
Low Alarm Threshold	Lower limit to trigger alarm.
Low Warn Threshold	Lower limit to trigger warning.

The following is a sample output of the **show cable cmc** command, which displays the downstream counter information for the Cisco CMC with ID 2:

```

Router# show cable cmc 2 ds_cnt

IpVerErr          : 0

```

The table below describes the significant fields in the output of the **show cable cmc ds_cnt** command.

Table 55: show cable cmc ds_cnt Field Descriptions

Field	Description
IpVerErr	Number of IP version errors.
IpLenErr	Number of IP length errors.
IpChsmErr	Number of checksum errors in the IP header.
QamChanMismatchErr	Number of QAM channel mismatch errors.
SeqMismatchErr	Number of sequence mismatch errors.
MpegLenErr	Number of MPEG length errors.
L2TPv3HdrErr	Number of L2TPv3 header errors.
DLMPacketCounter	Number of DEPI Latency Measurement (DLM) packets.
DepiCtrlPacketCounter	Number of DEPI control packets.
NonDepiPacketCounter	Number of non-DEPI control packets.
GCPPacketCounter	Number of GCP packets.
DepiChanPacketCounter QAMchaID	Number of DEPI channel packets for the specified QAM channel ID.
DepiPacketCounter	Number of DEPI packets.

The following is a sample output of the **show cable cmc** command, which displays the FRx information for the Cisco CMC with ID 1

```
Router# show cable cmc 1 frx_info

FrxCtrlType      : 8581
FrxCtrlNum       : ABCDEFGHIJK
FrxCtrlPID       : 12345678
FrxCtrlVID       : V01
FrxCtrlHWVer     : 0.1
FrxCtrlSWVer     : FRx_0.00.06
FrxCtrlTemp      : 14.5 Celsius Degree
FrxCtrlTimeInSvc : 300 day
FrxCtrlOptStat   : No optical input
FrxCtrlAgcStat   : Out of range
FrxCtrlOptLevel  : -16.0 dBm
FrxCtrlAtt       : 0 dB
FrxCtrlEQ        : 3 dB
```

The table below describes the significant fields in the output of the **show cable cmc frx_info** command.

Table 56: show cable cmc frx_info Field Descriptions

Field	Description
FrxCtrlType	Controller used to identify the FRx.
FrxCtrlNum	Serial number of the FRx.
FrxCtrlPID	Product Identifier (PID) of the FRx.
FrxCtrlVID	Version Identifier (VID) of the FRx.
FrxCtrlHWVer	Hardware version of the FRx.
FrxCtrlSWVer	Software version of the FRx.
FrxCtrlTemp	Temperature of the FRx.
FrxCtrlTimeInSvc	Time for which the FRx is in service.
FrxCtrlOptStat	Status of the optical input power on the FRx.
FrxCtrlAgcStat	Status of Automatic Gain Control (AGC) on the FRx.
FrxCtrlOptLevel	Optical input power level of the FRx.
FrxCtrlAtt	FRx attenuation value in dB.
FrxCtrlEQ	FRx equalization value in dB.

The following is a sample output of the **show cable cmc** command, which displays the information for the Cisco CMC with MAC address 0010.2024.7035:

```
Router# show cable cmc 0010.2024.7035 info

Load for five secs: 5%/0%; one minute: 6%; five minutes: 6%
Time source is NTP, 04:06:39.772 UTC Mon Feb 24 2014
```

show cable cmc

```

cmcModeName : DOCSIS-CMC-4P-FN
cmcDescription : 0
cmcVendorName : 0
cmcSerialNumber : CSJ13152101
cmcHWVersion : 1.0
cmcSWVersion : 0.10(Feb 18 10:40:03 CST 2014)
cmcTimeInService : 237616

```

The table below describes the significant fields in the output of the **show cable cmc info** command.

Table 57: show cable cmc info Field Descriptions

Field	Description
cmcModeName	Product number of the Cisco CMC.
cmcDescription	Description of the Cisco CMC.
cmcVendorName	Vendor name for the Cisco CMC.
cmcSerialNumber	Serial number of the Cisco CMC.
cmcHWVersion	Version number of the Cisco CMC hardware.
cmcSWVersion	Version number of the Cisco CMC software.
cmcTimeInService	Time for which the Cisco CMC is in service.

The following is a sample output of the **show cable cmc** command, which displays the modem information for the Cisco CMC with MAC address 0010.2024.7035:

```

Router# show cable cmc 0010.2024.7035 modem

```

MAC Address	IP Address	I/F	MAC State	Prim Sid	RxPwr (dBmV)	Timing Offset	Num CPE	D
e448.c7bf.80aa	192.168.0.2	C7/1/0/UB	w-online(pt)	1	!-3.00	2089	0	N

The table below describes the significant fields in the output of the **show cable cmc modem** command.

Table 58: show cable cmc modem Field Descriptions

Field	Description
MAC Address	MAC address of the cable modem.
IP Address	IP address assigned to the cable modem.
I/F	Interface to which the cable modem is connected.
MAC State	State of the cable modem.
Prim Sid	Primary service ID assigned to the cable modem.
RxPwr (dBmV)	Power received at the cable modem in dBmV.

Field	Description
Timing Offset	Timing offset for the cable modem, in ticks, as recognized on the Cisco CMTS. A tick is 6.25/64 microseconds. This is the delay between the time when the cable modem is scheduled to make a transmission and when the Cisco CMTS actually receives it.
Num CPE	Number of Customer Premises Equipments (CPE).

The following is a sample output of the **show cable cmc** command, which displays the spectrum monitoring information for the Cisco CMC with MAC address 0004.9f01.9100:

```
Router# show cable cmc 0004.9f01.9100 spec-analysis 1 5000 85000
Spectrum Analysis Measurements for CMC spectrum-analysis upstream channel 1

```

The table below describes the significant fields in the output of the **show cable cmc verbose** command.

Table 59: show cable cmc verbose Field Descriptions

Field	Description
Primary MAC Address	MAC address of the Cisco CMC.
IP Address	IP address assigned to the Cisco CMC.
Last IP Address	Previous IP address assigned to the Cisco CMC.
IP Mode	IP mode of the Cisco CMC.
State	State of the Cisco CMC.
Next Hop Hw Address	The hardware address of the CMTS's next hop between CMTS and CMC.
Next Hop IP Address	The IP address of the CMTS's next hop between CMTS and CMC.
Online Time	Time, in seconds, for which the Cisco CMC is online.
ARP Enabled	Indicates if ARP is enabled.
Reason	Reason for the previous reset of the Cisco CMC.

Related Commands

Command	Description
cable cmc	Configures the downstream RF power and FRx on the Cisco CMC.
clear cable cmc	Clears the information on the Cisco CMC.

show cable cmts-id

To display the configured CMTS ID, use the **show cable cmts-id** command in privileged EXEC mode.

show cable cmts-id

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Example

The following is a sample output of the **show cable cmts-id** command:

```
Router# show cable cmts-id
Configured CMTSID is:9000
```

Related Commands

Command	Description
show cable cmts-id	Configures the CMTS ID.

show cable depi multicast

To display the DEPI multicast information, use the **show cable depi multicast** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

```
show cable depi multicast [ counter { Downstream-Cable | interface | ip { ip_address | ipv6
ipv6_address } ip { ip_address | all } | ipv6 { ipv6_address | all } | pool [ id id | ipv4 |
ipv6 [ id id ] ] }
```

Syntax	Description
ip <i>ip_address</i>	Assigned IP address.
ipv6 <i>ipv6_address</i>	Assigned IPv6 address.
id <i>id</i>	DEPI multicast pool ID.
ipv6 id <i>id</i>	IPv6 DEPI multicast pool ID.
counter	Statistics information of each group
Downstream-Cable	Downstream-Cable controller
interface	Interface of DPIC

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Bengaluru 17.6.1z	This counter statement is introduced for the Cisco cBR Series Converged Broadband Routers.
	Cisco IOS XE Fuji 16.7.1	This command is introduced for the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use this command to display the DEPI multicast information.

The following example shows the IPv6 multicast DEPI pool:

```
Router#show cable depi multicast pool ipv6
Load for five secs: 8%/2%; one minute: 7%; five minutes: 8%
No time source, *06:57:11.898 UTC Sun Oct 22 2017
POOL ID    IPv6                                DESCRIPTION
22         FF3B::8000:0/100
50         FF3A::8000:0/126                    zyq
100        FF39::8000:0/120                    zyq

Infra_C05#show cable depi multicast pool ipv6 id 22
Load for five secs: 8%/2%; one minute: 8%; five minutes: 8%
No time source, *07:00:03.577 UTC Sun Oct 22 2017
POOL ID    IPv6                                DESCRIPTION
```

```
22          FF3B::8000:0/100
```

The following example shows the assigned IPv6 multicast address:

```
Router#show cable depi multicast ipv6 all
Load for five secs: 10%/3%; one minute: 8%; five minutes: 8%
No time source, *07:01:33.659 UTC Sun Oct 22 2017
IPv6                                POOL ID   CONTROLLER
FF3A::8000:0                        50        9/0/2 (291)
FF3A::8000:1                        50        9/0/28 (317)
FF39::8000:0                        100       9/0/29 (318)
FF3A::8000:2                        50        9/0/30 (319)
```

The following example shows the statistics information of each group:

```
Router#show cable depi multicast counter
IP                                POOL ID pps          bps          IF
Controller                        1          4686          39335848     Te3/1/0
225.225.225.0
DS3/0/1
```

show cable device access-group

To display a list of CMs and their customer premises equipment (CPE) devices, along with their access groups, use the **show cable device access group** command in privileged EXEC mode.

show cable device [*ip-address*] **access-group**

Note The **show cable device access-group** command is not supported on the Cisco uBR10012 universal broadband router.

Syntax Description

<i>ip-address</i>	(Optional) Specifies the IP address for a particular CM or host.

Release	Modification
11.NA	This command was introduced.
12.1(3a)EC1	Support was added to the Release 12.1 EC train.
12.2(4)BC1	Support was added to the Release 12.2 BC train for the Cisco uBR7100 series and Cisco uBR7200 series routers. (This command might appear in the CLI for the Cisco uBR10012 router but is not functional.)
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command displays information about both CMs and their associated CPE devices. To display information only for hosts and other CPE devices, use the **show cable host access-group** command. To display information only for CMs, use the **show cable modem access-group** command.

If an SNMP manager is requesting information about CM or CPE devices at the same time that this command is given, the command displays the following error message:

```
No information is available, please try later.
```

Wait until the SNMP retrieval is done and retry the CLI command.

Examples

The following example shows how to display a list of the CMs and their hosts:

```
Router# show cable device access-group

MAC address      IP address      Type      Access-group
00d0.ba77.7595   10.20.114.34   modem     resident

Router#

```

This table describes the fields that are shown in the **show cable device access-group** display:

Table 60: Descriptions for the show cable device access-group Fields

Field	Description
MAC Address	The MAC address for the CM or CPE device.
IP Address	The IP address that the DHCP server has assigned to the CM or CPE device.
Type	Identifies the type of device: <ul style="list-style-type: none"> • host = CPE device • modem = cable modem
Access-group	Displays the access group name or number in use (if any) for this CM or CPE device.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable device	Configures the access list for a CM device or host.
cable host access-group	Configures the access list for the specified hosts.
clear cable host	Clears the host from the table.
show cable host access-group	Displays the hosts behind the CMs in the network, along with their access groups.
show cable modem access-group	Displays the access groups for the CMs on a particular cable interface.

show cable downstream controller-profile

To display the cable downstream controller profile, use the **show cable downstream controllerprofile** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router
show cable downstream controller profile *id*

Syntax Description

profile *id* Profile identifier.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Fuji 16.7.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to verify the cable downstream controller profile.

The following example shows the sample output for the **show cable downstream controllerprofile** command:

```
Router#show cable downstream controller-profile 100
Load for five secs: 24%/3%; one minute: 10%; five minutes: 8%
No time source, *07:10:28.074 UTC Sun Oct 22 2017

Downstream controller-profile 100, type RPHY
Description:
Downstream controller-profile 100 is being used by controller Downstream-Cable:
 0/0/30,
Admin: UP
MaxOfdmSpectrum: 192000000
MaxCarrier: 158
Mode: normal
Free freq block list has 3 blocks:
 45000000 - 449999999
 594000000 - 602999999
 795000000 - 1217999999
DS Splitting: Yes
Multicast Pool ID: 50
OFDM frequency exclusion bands: None

Configured RF Channels:
Chan Admin Frequency Type Annex Mod srate Qam-profile dcid output
0 UP 453000000 DOCSIS B 256 5361 1 1 NORMAL
1 UP 459000000 DOCSIS B 256 5361 1 2 NORMAL
2 UP 465000000 DOCSIS B 256 5361 1 3 NORMAL
```

show cable dp aqm

To display cable dataplane aqm information, use the **show cable dp aqm** command in Privileged EXEC mode.

```
show cable dp aqm { Cable | Downstream-Cable | Integrated-Cable | Wideband-Cable }
slot/subslot/port:interface-number { hist | low-latency }
```

Syntax Description	aqm	Specifies cable dataplane aqm information.
	Cable	Specifies CMTS interface.
	Downstream-Cable	Specifies downstream cable interface.
	Integrated-Cable	Specifies integrated cable interface.
	Wideband-Cable	Specifies wideband CMTS interface.
	<i>slot/subslot/port:interface-number</i>	<ul style="list-style-type: none"> • <i>slot/subslot</i> - The slot/subslot where the linecard resides. • <i>port</i> - Downstream controller number on the linecard. • <i>interface-number</i> - The cable interface number.
	hist	Specifies the latency histogram stats, if available.
	low-latency	Specifies the low latency flow stats.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Dublin 17.12.1x	You can use this command to view Queue protection Statistics.
	Cisco IOS XE Cupertino 17.9.1x	This command is introduced on Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **show cable dp aqm** command displays queue information for the specified interface.

Examples

The following example shows a typical display for the **show cable dp aqm** command:

Related Commands

Command	Description
show cable dp pfg	Displays cable dataplane packet filter group information.

show cable dsg

To display the current DOCSIS Set-Top Gateway (DSG) tunneling parameters, use the **show cable dsg** command in privileged EXEC mode.

show cable dsg {stats | tunnel} [{vendor CA-vendor-name tunnel-mac-address}]

Syntax Description

stats	Displays configuration and run-time statistics about the currently-defined DSG tunnels.
tunnel	Displays the mapping of DSG tunnels to vendors or well-known MAC addresses.
vendor CA-vendor-name	(Optional) Displays information about a specific Conditional Access (CA) vendor. This parameter can be any arbitrary string up to 8 characters in length.
<i>tunnel-MAC-address</i>	(Optional) Displays information for the specified well-known MAC address for the DSG tunnel. If you specify a MAC address of 0000.0000.0000, the command displays information for all DSG tunnels, which is the default display.

Command Default

Displays information for all DSG tunnels.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(15)BC2	This command was introduced for the Cisco uBR7100 series and Cisco uBR7246VXR routers.
12.3(9a)BC	This command was introduced on the Cisco uBR10012 router.
12.3(13a)BC	This command is obsolete and replaced by the show cable dsg tunnel command.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows a typical display for the **show cable dsg tunnel** form of the command:

```
Router# show cable dsg tunnel

Group-ip      Src-ip      Tunnel-MAC      Interface      Packets      CA-vendor
225.2.2.2     *           0001.0002.0003 Cable3/0       1589         BBB

230.7.7.7     *           000e.000e.000e Cable3/0       24330138    abc
230.4.4.4     *           000b.000b.000b Cable3/0       22008648    cisco
230.5.5.5     *           000c.000c.000c Cable3/0       6424012     abc
229.1.1.1     *           0009.0009.0009 Cable3/0       12868440    cisco
228.1.1.1     *           0008.0008.0008 Cable3/0       6424012     cisco
230.1.1.1     *           000a.000a.000a Cable3/0       24370812    cisco
230.8.8.8     *           000f.000f.000f Cable3/0       23035116    abc
Router#
```

The following example shows a typical display for the **show cable dsg stats** command:

```

Router# show cable dsg stats

DSG statistics information
DSG keepalive is set
Vendor: DDD, Tunnel count: 1
Vendor: BBB, Tunnel count: 2
Vendor name is DDD, tunnel MAC is 0001.0002.0003
Group address is 226.2.2.2, source address is *
  Interface is Cable5/1, mapping entry is used 1
    Received 5968 packets, forwarded 5289 packets
    Dropped 679 packets, last second rate 16878 bits/sec
Vendor name is BBB, tunnel MAC is 0009.0010.0011
Group address is 227.2.2.2, source address is *
  Interface is Cable3/0, interface Cable3/0 is bundle master
  mapping entry is used 2
    Received 0 packets, forwarded 0 packets
    Dropped 0 packets, last second rate 0 bits/sec
Vendor name is CCC, tunnel MAC is 0005.0006.0007
Group address is 228.3.3.3, source address is *
  Interface is Cable5/1, mapping entry is used 2
    Received 5970056 packets, forwarded 400333 packets
    Dropped 5569723 packets, last second rate 96768 bits/sec
Router#

```

The following example shows a typical display for the **show cable dsg stats** command for an individual vendor:

```

Router# show cable dsg stats vendor CCC

DSG statistics information
DSG keepalive is set
Vendor: CCC, Tunnel count: 1
Vendor name is CCC, tunnel MAC is 0005.0006.0007
Group address is 228.3.3.3, source address is *
  Interface is Cable5/1, mapping entry is used 2
    Received 5970056 packets, forwarded 400333 packets
    Dropped 5569723 packets, last second rate 96768 bits/sec
Router#

```

Note The packet counters for both the **stats** and **tunnel** options for a particular DSG tunnel continue to increase as long as traffic is received over that tunnel. If the tunnel does not receive any traffic for three minutes or more, the counters are automatically reset to 0.

The following example shows a typical display for the **show cable dsg stats** command for an individual vendor when the associated cable interface is shut down. The Received, Forwarded, and Dropped counters are not displayed when an interface is shut down.

```

Router(config)# interface c5/1

Router(config-if)# shutdown

Router(config-if)# exit

Router(config)# exit

Router# show cable dsg stats vendor CCC

```

```

DSG statistics information
DSG keepalive is set
Vendor: CCC, Tunnel count: 1
Vendor name is CCC, tunnel MAC is 0005.0006.0007
Group address is 228.3.3.3, source address is *
  Interface is Cable5/1, mapping entry is used 2
Router#

```

Table 0-1 describes the major fields shown in the **show cable dsg** command:

Table 0-1: show cable dsg Field Descriptions

Field	Description
DSG keepalive is set	If keepalive messages have been enabled for an IP multicast group, using the show cable dsg keepalive command, this message is displayed.
Dest-ip, Group address	Multicast group IP address for the DSG stream.
Src-ip, Source address	Source IP address for the DSG stream. If an asterisk (*) appears as the source IP address, it indicates that the source IP address is 0.0.0.0, which allows any IP address as the source IP address.
Mapped-MAC, Tunnel-MAC	Well-known MAC address used for the DSG tunnel. If you configured the DSG tunnel with a MAC address of 0000.0000.0000 using the show cable dsg command, this field shows the MAC address that the CMTS derived using the MAC to IP multicast addressing mapping that is specified in RFC 1112.
Interface	Cable interface on which this DSG tunnel is configured.
mapping entry is used	Number of times that this particular DSG tunnel mapping has been used to resolve the well-known MAC address from the tunnel's group address. This can be used as a very rough approximation of the number set-top boxes (STBs) that have been mapped to this DSG tunnel since the last time the counter was cleared. Note Use the clear cable dsg command to clear this counter.
Packets	Number of packets transmitted over the DSG tunnel.
CA-vendor	Name for the Conditional Access (CA) vendor that owns this tunnel.
Received	Number of packets received by the multicast group. This counter includes all interfaces that are receiving traffic for the multicast group. The field is not shown when an interface is shut down, but the counter continues to increase as long as the multicast group is receiving traffic. When the interface is reenabled, the counter shows the latest number of packets received.
Forwarded	Number of packets forwarded on the cable interface for the multicast group. This counter is reset to 0 whenever an interface is shut down and reenabled. The field is not shown when an interface is shut down.
Dropped	Number of packets that were dropped that were for the multicast group. This counter includes all interfaces that are receiving traffic for the multicast group. The field is not shown when an interface is shut down, but the counter continues to increase as long as the multicast group is receiving traffic and dropping packets. When the interface is reenabled, the counter shows the latest number of packets dropped.

Note The Received and Dropped counters reflect activity for the multicast group and are not affected when a cable interface is shut down and reenabled, as long as the multicast group continues to receive traffic. The Forwarded counter reflects activity for the particular cable interface and is reset to zero whenever the interface is shut down and reenabled. All packet counters are also automatically reset to zero if the DSG tunnel does not receive traffic for three minutes or more.

Related Commands	Command	Description
	cable dsg	Enables the DOCSIS Set-Top Gateway (DSG) on a cable interface, and configures its tunnel-mapping parameters.
	cable dsg keepalive	Enables keepalive messages over DOCSIS Set-Top Gateway (DSG) tunnels on a cable interface.
	clear cable dsg	Resets counters related to DOCSIS Set-Top Gateway (DSG) tunnels.
	debug cable dsg	Enables the display of debugging messages for the operation of the DOCSIS Set-Top Gateway (DSG) feature.

show cable dsg cfr

To display DOCSIS Set-Top Gateway (DSG) classifier details, such as the classifier state, source, and destination IP addresses, use the **show cable dsg cfr** command in privileged EXEC mode.

show cable dsg cfr [*index*] [*verbose*]

Syntax Description

<i>index</i>	DSG classifier identification. The valid range is from 1 to 65535.
verbose	Provides detailed output for DSG classifiers.

Command Default

Displays details of all DSG classifiers.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following is a sample output of the **show cable dsg cfr** command that shows details of all DSG classifiers:

```
Router# show cable dsg cfr
cfr id state resolved applied conflict dest-ip          src-ip
-----
1000  en   yes    yes    no    232.10.10.0    dsg-server-a
(40.0.0.30)
1010  en   yes    yes    no    232.10.10.10   dsg-server-b
(40.0.0.40)
2000  en   yes    yes    no    232.10.11.0    dsg-server-c
(40.0.0.50)
2010  en   no     no     no    232.10.11.10   non-exist-hostnam
(----)
```

The following is a sample output of the **show cable dsg cfr** command that shows details of a specified DSG classifier:

```
Router# show cable dsg cfr 1010
cfr id state resolved applied conflict dest-ip          src-ip
-----
1010  en   yes    yes    no    232.10.10.10   dsg-server-b
(40.0.0.40)
```

The following is a sample output of the **show cable dsg cfr** command with the verbose keyword that shows detailed output for all DSG classifiers:

```
Router# show cable dsg cfr verbose

This table describes the significant fields shown in the **show cable dsg cfr** command display:

Table 62: show cable dsg cfr Field Description

Field	Description
cfr id	DSG classifier ID.
state	DSG classifier state shown either as “enable” or “disable.”
resolved	Indicates whether the destination and source IP addresses of a hostname are resolved or not.
applied	Indicates that a hostname is configured without any error.
conflict	Indicates that the IP address of the hostname is changed after the hostname is configured, and the DSG classifier cannot be updated due to an error.
dest-ip	IP address configured as the destination IP address or the resolved hostname IP address. This IP address might differ from the destination hostname IP address if the classifier is not applied or in a conflict state.
src-ip	IP address configured as the source IP address or the resolved hostname IP address. This IP address might differ from the source hostname IP address if the classifier is not applied or in a conflict state.
Conflict Cfr Id	Indicates the classifier ID that conflicts with the new classifier due to an identical MAC address or classifier ID.
Error Code	Indicates why the classifier is resolved but cannot be applied.
Tunnel Id	DSG tunnel ID.
Dest Hostname	The hostname configured as the destination IP address.
Dest Hostname IP	Resolved IP address of the destination hostname.
Src Hostname	The hostname configured as the source IP address.
Src Hostname IP	Resolved IP address of the source hostname.
Src Prefix Length	Source prefix length of the source IP address.
Dest Port Start	Start range for the Destination TCP/UDP port.
Dest Port End	End range for the Destination TCP/UDP port.
Priority	DSG classifier priority.
In DCD	Indicates whether the DSG classifier is included or excluded from the downstream channel descriptor (DCD) message.
Forwarded	Forwarded statistics.

show cable dsg cfr

Field	Description
Received	Received statistics.

Related Commands

Command	Description
show cable dsg host	Displays the mapping of the DSG host names and IP addresses on the Cisco CMTS router.

show cable dsg host

To display the mapping of the hostnames and IP addresses on a Cisco CMTS router, use the **show cable dsg host** command in privileged EXEC mode.

show cable dsg host [**verbose**]

Syntax Description

verbose	Provides verbose description on the mapping of the hostnames and IP addresses.
----------------	--

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The show cable dsg host command is used for debugging of host IP addresses.

Examples

The following is a sample output of the **show cable dsg host** command that shows the mapping of the host names and IP addresses on a Cisco CMTS router:

```
Router# show cable dsg host
Host      IP Address      Reference  Last Update Time
dsgserver1  232.1.1.10      2          21:41 08/01/2011

```

show cable dsg host

```
Cfrs:
cable dsg cfr 30 dest-ip g3 tunnel 1 priority 0 disable
```

This table describes the significant fields shown in the **show cable dsg host** command display:

Table 63: show cable dsg host Field Description

Field	Description
Host	Hostname of the DSG classifier.
IP Address	IP address that is mapped to the hostname.
Reference	DSG classifiers that use the host as a fully-qualified domain name (FQDN).
Last Update Time	Last updated time of the DSG server.

Related Commands

Command	Description
show cable dsg cfr	Displays DSG classifier details.

show cable dsg static-group bundle

To display details of the DOCSIS Set-Top Gateway (DSG) static groups configured under a bundle interface, use the **show cable dsg static-group bundle** command in privileged EXEC mode.

show cable dsg static-group bundle *index*

Syntax Description

<i>index</i>	Bundle interface number. The valid range is from 1 to 255.
--------------	--

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The IGMP static group IP address created automatically under a bundle interface at the time of DSG configuration is not displayed in the **show running-config interface command output** in Cisco IOS Release 12.2(33)SCG and later. To display the DSG static groups configured under a bundle interface, use the **show cable dsg static-group bundle** command in privileged EXEC mode in Cisco IOS Release 12.2(33)SCG and later.

Examples

The following is a sample output of the **show cable dsg static-group bundle** command that lists the DSG static groups configured under a bundle interface on the Cisco uBR10012 router:

```
Router# show cable dsg static-group bundle 2
Bundle Interface      Group      Source
Bundle2              228.0.0.1  0.0.0.0
Bundle2              228.0.0.1  1.2.3.4
Bundle2              232.1.1.1  2.3.4.5
```

This table describes the significant fields shown in the **show cable dsg static-group bundle** command display:

Table 64: show cable dsg static-group bundle Command Field Description

Field	Description
Bundle Interface	Bundle interface number.
Group	DSG static group configured under the specified bundle interface.
Source	SSM source address.

show cable dsg static-group bundle**Related Commands**

Command	Description
command cable dsg cfr	Enables Advanced-mode DOCSIS Set-Top Gateway (A-DSG) classifiers on the Cisco CMTS router.

show cable dsg tg

To display information about the Advanced-mode DOCSIS Set-top Gateway (A-DSG) tunnel group configuration on a Cisco CMTS router, use the `show cable dsg tg` command in privileged EXEC mode.

show cable dsg tg [*tunnel-group-id* {**channel** *channel-id*} [**verbose**]

Syntax Description		
<i>tunnel-group-id</i>	(Optional) Alphanumeric identifier for a specified tunnel group.	
<i>channel channel-id</i>	Specifies the DSG tunnel group channel identifier.	
<i>verbose</i>	(Optional) Displays DSG tunnel group detail information.	

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.3(17a)BC	This command was introduced to support A-DSG on the Cisco uBR10012 router and Cisco uBR7200 series routers.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	12.2(33)SCD5	This command was modified. The output of the show cable dsg tg command was changed.
	12.2(33)SCG	The command output was changed.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
	Cisco IOS-XE Gibraltar 16.10.1f	This command was enhanced to support DSG configuration under mac-domain with OPS md-profile.

Usage Guidelines This command displays information about all DSG tunnel groups. Beginning with Cisco IOS Release 12.2(33)SCG, the “TG state” field in the **show cable dsg tg** command output was replaced by “Channel state” to indicate that a channel belonging to a tunnel group is either enabled or disabled. It is possible that a tunnel group is enabled but a particular channel in that tunnel group is disabled.

Examples

The following is a sample output from the **show cable dsg tg** command with the configured parameters for all DSG tunnel groups in Cisco IOS Release 12.2(33)SCG and later:

```
Router# show cable dsg tg
TG      Chan  Chan      Rule Vendor UCID
id      id    state I/F   pri  Param list
-----
10      1     en      C6/0   0
```

show cable dsg tg

```

10 2 en C6/0 0

```

Table 1 describes the significant fields shown in the output.

Table 65: show cable dsg tg Field Descriptions

Field	Description
TG id	Tunnel group identifier.
Chan id	Channel identifier.
TG state	Current state of the cable interface.
Chan state	Current state of the channel (enabled or disabled).
pri	Traffic priority parameter.
Vendor	Vendor name.
UCID	Upstream channel identifier.
I/F	Interface.
rule id	Rule identifier.
tunnel state	Tunnel state.
mac-addr	MAC address.
cfr state	Classifier state.
dest-ip	Destination IP address.
In-DCD	Downstream channel descriptor.
clients listId	Client list identifier.

Related Commands

Command	Description
debug cable dsg	Enables general, DCD, or packet-related debugging.
show cable dsg tunnel	Displays information about A-DSG tunnel configuration on a Cisco CMTS router.
show interface	Displays general interface information for the specified or all interfaces.
show interface cable dsg downstream	Displays A-DSG configuration and status information for downstream interfaces.

show cable dsg tunnel

To display information about Advanced-mode DOCSIS Set-top Gateway (A-DSG) tunnel configuration on a Cisco CMTS router, use the `show cable dsg tunnel` command in privileged EXEC mode.

show cable dsg tunnel *tunnel-id* [{**cfrs** | **clients** | **interfaces** | **statistics** | **verbose**}]

Syntax Description

<i>tunnel-id</i>	(Optional) Alphanumeric identifier for a specified tunnel.
cfrs	Show DSG tunnel classifiers.
clients	Show DSG tunnel clients.
interfaces	Show DSG tunnel interfaces.
statistics	Show DSG tunnel statistics.
verbose	Show DSG tunnel detail information.

Command Default

No default behaviors or values

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(13a)BC	This command was introduced to support A-DSG 1.1 on the Cisco uBR10012 router and Cisco uBR7200 series routers.
12.3(17a)BC	The output was modified to support A-DSG 1.2. <ul style="list-style-type: none"> • The “TG id” field was added to the show cable dsg tunnel and verbose forms of the command. • The “State” and “MAC Addr” fields switched places in the show cable dsg tunnel verbose form of the command. • The “vendor group” field was added to the show cable dsg tunnel clients form of the command.
12.2SB	This command was integrated into Cisco IOS Release 12.2SB. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command replaces the **show cable dsg** form of command available in Cisco IOS Release 12.3(9a)BC.

Examples

The following example displays CLI help for `show cable dsg tunnel` command syntax.

```
Router# show cable dsg tunnel 1 ?
cfrs      Show DSG tunnel classifiers
clients   Show DSG tunnel clients
```

```

interfaces Show DSG tunnel interfaces
statistics Show DSG tunnel statistics
verbose Show DSG tunnel detail information
| Output modifiers
<cr>

```

Examples: Displaying information about all A-DSG Tunnels

The following command displays tunnel MAC address, state, associated classifiers, and state information for Advanced-mode DSG version 1.1 tunnels on a Cisco CMTS router. This output was changed in Cisco IOS Release 12.3(17a)BC for A-DSG version 1.2 (see following example).

```

Router# show cable dsg tunnel
tunnel tunnel tunnel      cfr  cfr  tunnel in  rule rule  client service
id      state mac-addr  id  state interface id  state listId class
1       en    0100.5e01.0114 1   en   Cable6/0  1   en   2     SI

```

Examples: Displaying Information for a Specified A-DSG Tunnel

The following example displays the same information as the **show cable dsg tunnel** command, but for a specified tunnel. The following example shows sample output for A-DSG version 1.1. This output was changed in Cisco IOS Release 12.3(17a)BC for A-DSG version 1.2 (see following example).

```
Router# show cable dsg tunnel 1
tunnel tunnel tunnel      cfr cfr  tunnel in  rule rule  client service
id      state mac-addr    id  state interface id  state listId class
1       en    0100.5e01.0114  1  en   Cable6/0  1  en   2      SI
                    5  en                    7  en   10
                    11 en                    8  en   2
                    14 en                    20 en   2
                                Cable6/1  1  en   4
                                3  en   3
                                4  en   4
                                11 en   2
```

Beginning in Cisco IOS Release 12.3(17a)BC, this output was modified to add the tunnel group ID (“TG id”) field in support of A-DSG version 1.2 as shown below:

```
Router# show cable dsg tunnel 1
      tunnel      TG
      cfr  tunnel  rule  client service
id  state mac-addr      id
      id state I/F  id state listId class
1   en  0100.5e01.0001  1   1   en C5/0  1   en 1   DSG-Rate1
                    6   en
                    7   en
                    8   en
```

Examples: Displaying Information for A-DSG Tunnel Classifiers

The following example displays detailed information about all A-DSG classifiers associated with the specified tunnel.

```
Router# show cable dsg tunnel 1 cfrs
tunnel cfr  cfr  cfr destination ip  source ip  srcPre d_port d_port
id     id  state pri address          address          length start end
1     1   en   1  230.1.1.20      0.0.0.0         32     0    65535
      5   en   1  230.1.1.60      0.0.0.0         32     0    65535
      11  en   1  224.25.25.134  0.0.0.0         32     0    65535
      14  en   0  230.1.1.20      0.0.0.0         32    1000 2000
```

Examples: Displaying Information for A-DSG Tunnel Clients

The following example displays detailed information about all the clients associated with the specified tunnel for A-DSG version 1.1. This output was changed in Cisco IOS Release 12.3(17a)BC for A-DSG version 1.2 (see following example).

```
Router# show cable dsg tunnel 1 clients
tunnel client client client  client
id     listId id    id type  address
```

```

1      2      1      CA System ID    0X951
          3      Broadcast
          8      MAC Addr      1111.1111.1111
3      1      Application ID  0X1
4      1      CA System ID    0X701
10     1      Application ID  0X6

```

Beginning in Cisco IOS Release 12.3(17a)BC, this output was modified to add the “vendor group” field in support of A-DSG version 1.2 as shown below:

```

Router# show cable dsg tunnel 1 clients
tunnel client client client      client      vendor
id      listId id    id type      address     group
1      1      1      MAC Addr    0100.5e00.0001
          2      Application ID  0x0951
          3      Broadcast     Unspecified
          4      Broadcast     4

```

Examples: Displaying Information for A-DSG Tunnel Interfaces

The following example displays all the interfaces and rules associated with a specified tunnel.

```

Router# show cable dsg tunnel 1 interfaces
tunnel downstream rule
id      interface  id
1      Cable6/0    1 7 8 20
          Cable6/1    1 3 4 11

```

Examples: Displaying Information for A-DSG Tunnel Statistics

The following example displays the packets statistics information about the specified tunnel.

```

Router# sh cab dsg tunnel 1 statistics
tunnel cfr  cfr destination ip  source ip      total      total
id      id    state address          address        forwarded  received
1      1      en   230.1.1.20      0.0.0.0        0          0
          5      en   230.1.1.60      0.0.0.0        0          0
          11     en   224.25.25.134   0.0.0.0        0          0
          14     en   230.1.1.20      0.0.0.0        0          0

```

Examples: Displaying Detailed Information for a Specified A-DSG Tunnel

The following example shows all the detailed information about a specified tunnel for A-DSG version 1.1. This output was changed in Cisco IOS Release 12.3(17a)BC for A-DSG version 1.2 (see following example).

```

Router# show cable dsg tunnel 1 verbose

Related Commands

Command	Description
debug cable dsg	Enables general, DCD or packet-related debugging.
show cable dsg tg	Displays information about A-DSG tunnel groups on a Cisco CMTS router.
show interface	Displays general interface information for the specified or all interfaces.
show interface cable dsg downstream	Displays A-DSG configuration and status information for downstream interfaces.

show cable dynamic-qos trace

To display the number of subscribers for whom call trace is enabled on the Cisco CMTS router, use the **show cable dynamic-qos trace** command in privileged EXEC mode.

show cable dynamic-qos trace

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS Release 12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The output of the command was changed.

Usage Guidelines

Use the **show cable dynamic-qos trace** command after enabling the call trace functionality for PacketCable or PacketCable Multimedia (PCMM) service subscribers using the **cable dynamic-qos trace** command.

Examples

The following is a sample output of the **show cable dynamic-qos trace** command that shows the number of subscribers for whom call trace is enabled on the Cisco uBR10012 router in Cisco IOS Release 12.2(33)SCF:

```
Router# show cable dynamic-qos trace
Total number of subscribers: 0
Max configured number of subscribers: 12
```

The following is a sample output of the **show cable dynamic-qos trace** command that shows the number of subscribers for whom call trace is enabled on the Cisco cBR-8 router:

```
Router# show cable dynamic-qos trace
Total number of subscribers: 0
```

This table describes the significant fields shown in the show packetcable cms command display.

Table 66: show packetcable cms Field Descriptions

Field	Description
Total number of subscribers	Number of subscribers for whom call trace is enabled. The number ranges from 0 to the maximum configured number of subscribers.
Max configured number of subscribers	Maximum number of subscribers for whom call trace can be enabled at any point of time.

Related Commands

Command	Description
cable dynamic-qos trace	Enables the call trace functionality on the Cisco CMTS router for PacketCable or PCMM service subscribers.
debug cable dynamic-qos subscriber	Enables debugging of the call trace functionality on the Cisco CMTS router for a particular subscriber.
debug cable dynamic-qos trace	Enables call trace debugging on the Cisco CMTS router for all the subscribers for whom call trace is configured.

show cable dynamic-bonding-group

To display the details of the dynamically created bonding groups, use the **show cable dynamic-bonding-group** command in privileged EXEC mode.

show cable dynamic-bonding-group [**quota**] [**reclaim-history**] **summary** *slot/subslot/controller*

Syntax Description	Parameter	Description
	quota	Shows the usage of bonding group resource.
	reclaim-history	Shows the the reclaimed bonding group
	<i>slot/subslot/controller</i>	Modular cable line card slot, subslot, and controller. <ul style="list-style-type: none"> • slot—Modular cable line card slot. • subslot—Modular cable line card subslot. • controller—Modular cable line card controller.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Bengaluru 16.7.1a	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use the **show cable dynamic-bonding-group** command to check the dynamic bonding group configuration details.

Examples

The following is a sample output of the **show cable dynamic-bonding-group summary** command that shows the details of the dynamically created bonding groups:

```
Router# show cable dynamic-bonding-group summary
Dynamic bonding group: Enable
DBG operation with Registration: Enable
DBG operation with Load-Balance: Enable
BG ID BG Name   BG Size CMs ServFlows Create Time   Create Client BG State   RFid list
33026 Wi6/0/1:1 33     2  2       Dec 22 16:03 MODEM_ONLINE OPERATIONAL 33024-33055
33282 Wi6/0/2:1 33     2  2       Dec 22 16:05 MODEM_ONLINE OPERATIONAL 33280-33311
```

The following is a sample output of the **show cable dynamic-bonding-group slot** command:

```
Router# show cable dynamic-bonding-group slot 6
Dynamic bonding group: Enable
BG ID BG Name   BG Size CMs ServFlows Create Time   Create Client BG State   RFid list
33026 Wi6/0/1:1 33     2  2       Dec 22 16:03 MODEM_ONLINE OPERATIONAL 33024-33055
33282 Wi6/0/2:1 33     2  2       Dec 22 16:05 MODEM_ONLINE OPERATIONAL 33280-33311
```

The following is a sample output of the **show cable dynamic-bonding-group controller** command:

```
Router# show cable dynamic-bonding-group controller 6/0/1
Dynamic bonding group: Enable
```

show cable dynamic-bonding-group

```

BG ID BG Name    BG Size CMs ServFlows Create Time  Create Client BG State    RFid list
33026 Wi6/0/1:1 33      2    2          Dec 22 16:03 MODEM_ONLINE  OPERATIONAL  33024-33055

```

```
Router# show cable dynamic-bonding-group controller 6/0/2
```

```
Dynamic bonding group: Enable
```

```

BG ID BG Name    BG Size CMs ServFlows Create Time  Create Client BG State    RFid list
33282 Wi6/0/2:1 33      2    2          Dec 22 16:05 MODEM_ONLINE  OPERATIONAL  33280-3331

```

The following is a sample output of the **show cable dynamic-bonding-group quota controller** command that shows the usage of bonding group resource:

```
Router# show cable dynamic-bonding-group quota controller 6/0/2
```

```

slot/subslot/ctrlr: 6/0/2
  Total BG number: 128
  Used BG number (static/dynamic): 2(1/1)
  Available BG number: 126
  Available BG list port: 2-127

```

```
Router# show cable dynamic-bonding-group quota controller 6/0/1
```

```

slot/subslot/ctrlr: 6/0/1
  Total BG number: 128
  Used BG number (static/dynamic): 2(1/1)
  Available BG number: 126
  Available BG list port: 2-127

```

The following is a sample output of the **show cable dynamic-bonding-group quota slot** command:

```
tb32-cbr8#show cable dynamic-bonding-group quota slot 6
```

```

slot/subslot/ctrlr: 6/0/0
  Total BG number: 128
  Used BG number (static/dynamic): 4(4/0)
  Available BG number: 124
  Available BG list port: 4-127
slot/subslot/ctrlr: 6/0/1
  Total BG number: 128
  Used BG number (static/dynamic): 2(1/1)
  Available BG number: 126
  Available BG list port: 2-127
slot/subslot/ctrlr: 6/0/2
  Total BG number: 128
  Used BG number (static/dynamic): 2(1/1)
  Available BG number: 126
  Available BG list port: 2-127
slot/subslot/ctrlr: 6/0/3
  Total BG number: 128
  Used BG number (static/dynamic): 1(1/0)
  Available BG number: 127
  Available BG list port: 1-127
slot/subslot/ctrlr: 6/0/4
  Total BG number: 128
  Used BG number (static/dynamic): 1(1/0)
  Available BG number: 127
  Available BG list port: 1-127
slot/subslot/ctrlr: 6/0/5
  Total BG number: 128
  Used BG number (static/dynamic): 1(1/0)
  Available BG number: 127
  Available BG list port: 1-127
slot/subslot/ctrlr: 6/0/6
  Total BG number: 128
  Used BG number (static/dynamic): 1(1/0)
  Available BG number: 127
  Available BG list port: 1-127
slot/subslot/ctrlr: 6/0/7
  Total BG number: 128
  Used BG number (static/dynamic): 1(1/0)

```

```

Available BG number: 127
Available BG list port: 1-127

```

The following is a sample output of the **show cable dynamic-bonding-group quota summary** command:

```

Router# show cable dynamic-bonding-group quota summary
Available DSBG Interface:
slot/subslot/ctrlr: 6/0/0
  Total BG number: 128

```

This table describes the significant fields shown in the show cable dynamic-bonding-group command display.

Table 67: show cable dynamic-bonding-group summary — Field Descriptions

Field	Description
BG ID	Bonding group ID.
BG Name	Name of the bonding group.
BG Size	Size of the bonding group.
CMs	Total number of CMs associated with the dynamic bonding group.
ServFlows	The total number of service flows used on the dynamic bonding group.
Create Time	The time when the dynamic bonding group was created.
Create Client	Client that creates the dynamic bonding group. Client can be modem registration, static load balance, or dynamic load balance.
BG State	Current state of the dynamic bonding group.
RFid list	RF ID associated to a specific bonding group.

Related Commands

Command	Description
cable dynamic-bonding-group	Enables dynamic bonding group.
show cable load-balance docsis-group target wide show cable load-balance docsis-group target dbg	Check the potential target bonding group for each of the source bonding group.

show cable entropy status

To view the status of the cBR-8 entropy sources, use the **show cable entropy status** command in user EXEC or privileged EXEC mode. This command is only supported on SUP IOSd.

show cable entropy status

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes User EXEC (>)

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Dublin 17.12.1	This command is introduced on the Cisco cBR-8 Converged Broadband Routers.

Usage Guidelines

The command displays the status of the cBR-8 entropy sources.

Examples

The following example shows typical output:

```
Router#show cable entropy status
Load for five secs: 2%/0%; one minute: 4%; five minutes: 5%
Time source is NTP, 13:02:40.227 EDT Fri Apr 14 2023
```

```
Entropy source      successes      failures
=====
RDRAND              473            0
CPU Jitter          457            0
ACT2                 0              0
```

Here, ACT2 is the backup source for CPU jitter.

show cable fiber-node

To display information about a fiber node, use the **show cable fiber-node** command in privileged EXEC mode.

show cable fiber-node *fiber-node-id* [**spectrum** | **mapping** | **derived**]

Syntax Description	
<i>fiber-node-id</i>	Specifies a fiber node ID. Valid values range from 1 to 256. The valid values for the Cisco cBR router is 1 to 512.
spectrum	Displays upstream channel frequency assignment information and the spectrum group number.
mapping	Displays upstream and downstream channel mapping information.
derived	Displays MAC domain and wideband interfaces associated to this fiber-node.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3BC	This command was introduced
12.2(33)SCC	This command was integrated into Cisco IOS Release 12.2(33)SCC.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.
IOS-XE 3.17.0S	This command was modified. The mapping and derived keywords were added.

Usage Guidelines

For each fiber node, a traditional DOCSIS downstream channel on a Cisco uBR10-MC5X20 cable interface line card is used to carry MAC management and signaling messages. This traditional DOCSIS downstream channel used for a MAC domain is called the *primary downstream channel*. The associated traditional DOCSIS upstream channel is used for return data traffic and signaling.

Examples

The following is a sample output of the **show cable fiber-node** command:

```
Router# show cable fiber-node 2
Fiber-Node          Config Status
Fiber-Node 2
  downstream Modular-Cable 1/0/0: 0-3
  downstream Cable 7/1/0
  upstream Cable 7/1: 10-19
  FN Config Status: Configured (status flags = 0x01)
  MDD Status: Valid
Router#
```

Command History

Release	Modification
Cisco IOS XE Cupertino 17.15.1w	The output of the command is updated to display the RPD Alias (RPD Name) and RPD mac.

The following is a sample output of the **show cable fiber-node** command on the Cisco cBR router:

```

Router# show cable fiber-node
Load for five secs: 8%/0%; one minute: 5%; five minutes: 5%
No time source, *07:11:31.689 EDT Fri Sep 13 2024

  RPD Details:
    MAC Address      Name
    9088.556b.a40c   RPD_dev3

```

This table describes the fields shown in the **show cable fiber-node** command display.

Table 68: show cable fiber-node Field Descriptions

Field	Description
Fiber-Node	Displays the fiber nodes configured on the CM.
Config Status	Displays the configuration status of the fiber node. Status flags are as follows: <ul style="list-style-type: none"> • 0x01 - CMTS_FN_CONFIG • 0x02 - CMTS_FN_FREQ_INVALID • 0x04 - CMTS_FN_CHID_INVALID • 0x08 - CMTS_FN_BUNDLE_INVALID • 0x10 - CMTS_FN_BOND_CHID_INVALID • 0x20 - CMTS_FN_US_FREQ_INVALID • 0x40 - CMTS_FN_NO_US_CONFIGURED
MDD Status	Displays the MAC Domain Descriptor (MDD) status. MDD status of a fiber node is set as invalid in the following cases: <ul style="list-style-type: none"> • Frequency is not unique. • Channel ID is not unique. • Bonding group ID is not unique. • Bundle is mismatched.

```
Router# show cable fiber-node 2 spectrum
```

Fiber Node No.	Upstream Port	Physical Port	Frequency (MHz)	Spectrum Group No.
2	Cable7/1/0 U0	10	21.939 [1.6]	1
2	Cable7/1/0 U1	11	10.695 [1.6]	1
2	Cable7/1/0 U2	12	5.834 [1.6]	1
2	Cable7/1/0 U3	13	9.055 [1.6]	1
2	Cable7/1/4 U0	16	unassigned	No
2	Cable7/1/4 U1	17	unassigned	No
2	Cable7/1/4 U2	18	unassigned	No
2	Cable7/1/4 U3	19	unassigned	No

This example shows the output of the **spectrum** keyword on the Cisco cBR router:

```
Router# show cable fiber-node 2 spectrum
```

Fiber Node No.	Upstream Port	Physical Port	Frequency (MHz)	Spectrum Group No.
2	UC3/0/1:U0	1	13.200 [6.4]	No
2	UC3/0/1:U1	1	19.600 [6.4]	No
2	UC3/0/1:U2	1	26.000 [6.4]	No
2	UC3/0/1:U3	1	32.400 [6.4]	No
2	UC3/0/1:U4	1	unassigned	No
2	UC3/0/1:U5	1	unassigned	No
2	UC3/0/1:U6	1	unassigned	No
2	UC3/0/1:U7	1	unassigned	No
2	UC3/0/1:U8	1	unassigned	No
2	UC3/0/1:U9	1	unassigned	No
2	UC3/0/1:U10	1	unassigned	No
2	UC3/0/1:U11	1	unassigned	No

This table describes the fields shown in the **show cable fiber-node** command display when the **spectrum** keyword is used.

Table 69: show cable fiber-node Field Descriptions

Field	Description
Upstream Port	Displays the upstream port associated with the fiber node.
Physical Port	Displays the physical port of the upstream channel.
Frequency	Displays the upstream channel frequency of the CM.
Spectrum Group No.	Displays the spectrum group number of the fiber node. A spectrum group is a list of upstream frequencies and nominal power levels. Spectrum groups ranging from 1 to 32 can be created for each cable modem upstream port.

This example shows the output of the **mapping** keyword on the Cisco cBR router:

```
Router# show cable fiber-node 2 mapping
```

```
Fiber-node 2:
Upstream:
```

```

Sg chan Us-chan      Op state

14   3/0/0:14 Up
15   3/0/0:15 Up

```

This table describes the fields shown in the **show cable fiber-node** command display when the **mapping** keyword is used.

Table 70: show cable fiber-node Field Descriptions

Field	Description
Sg chan	Display the service group channel ID in service group profile.
Us-chan	Physical upstream channel.
Op state	Displays the state of the channel.
Ds-rf-chan	Physical downstream RF channel

This example shows the output of the **derived** keyword on the Cisco cBR router:

```

Router# show cable fiber-node 2 derived

Fiber-node 2:
Assoc                               succeeded
mac-domain 0 interface Cable3/0/0   Y
Wideband 1 Wideband-Cable3/0/0:0   Y

```

This table describes the fields shown in the **show cable fiber-node** command display when the **derived** keyword is used.

Table 71: show cable fiber-node Field Descriptions

Field	Description
Assoc	Display the association information of mac domain and wideband interface in service group profile which is associated to this fiber-node.
succeeded	Shows if all configuration of these interfaces are generated successfully.

Related Commands

Command	Description
show cable modem	Displays information for registered and unregistered cable modems (including wideband cable modems).
show cable modem wideband	Displays information for registered and unregistered wideband cable modems.

show cable filter

To display the DOCSIS 1.1 filter groups that are currently defined, use the **show cable filter** command in user EXEC or privileged EXEC mode.

show cable filter [*group group-index* [*index index-num*]] [*verbose*]

Syntax Description	
group <i>group-id</i>	(Optional) Specifies the filter group to be displayed. The valid range is 1 to 256. For Cisco cBR-8 routers, the valid range is 1 to 254
index <i>index-num</i>	(Optional) Specifies the index of the particular filter within a group to be displayed. The valid range is 1 to 128 on a uBR7200 series router and 1 to 256 on a uBR10012 router. For Cisco cBR-8 routers, valid range is 1 to 256.
verbose	(Optional) Displays complete information about the filter groups in a format that is easier to read than the default display.

Command Modes

User EXEC, Privileged EXEC (#)

Command History

Release	Modification
12.1(6)EC1	This command was introduced on the Cisco uBR7100 series and Cisco uBR7200 series routers.
12.2(2)XF, 12.2(4)BC1	This command was supported on the Cisco uBR10012 routers.
12.2(8)BC2	An option was added to the cable filter group command to allow filter groups to be activated and deactivated without removing the filter group's configuration.
12.2(33)SCA	The output was changed to add fields for IPv6 information, including the "v6" field in the show cable filter command, and the "Source IPv6 Address," and "Destination IPv6 Address" fields of the show cable filter verbose command.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Examples

The following example shows a typical display of the **show cable filter** command:

```
Router# show cable filter
Filter  SrcAddr/Mask      DestAddr/Mask      Prot ToS  SPort  DPort  TCP  Action  Status
Grp Id
1 1
1 2          10.37.11.151/24    6
1 3          17                 68        67    0,0    drop active
1 4          256                161       0,0    drop active
1 5          256                53        0,0    drop active
1 6          10.37.11.151/29    256
1 7    10.37.11.196/29    10.11.0.98/32     256
1 8    10.37.11.195/32    10.11.0.98/32     6
                                drop active
```

```

1 9 10.37.11.195/32 10.11.0.98/32 256 accept active
1 10 10.37.11.194/32 10.11.0.98/16 6 accept active
1 11 10.37.11.193/32 10.11.0.98/8 17 drop active
1 12 10.37.11.192/32 10.11.0.98/32 6 F,F accept active
1 13 10.37.11.191/32 10.11.0.98/32 17 F,F accept active
1 14 10.37.11.190/32 10.11.0.98/24 17 8,F accept active
1 15 10.37.11.189/32 10.11.0.98/32 256 F,8 drop active
1 16 10.37.11.189/32 10.11.0.98/32 256 F,8 accept active
1 17 10.37.11.188/32 10.11.0.98/8 17 accept active
1 18 10.37.11.188/32 10.11.0.98/32 6 drop active
1 19 10.37.11.187/32 10.11.0.98/30 256 accept active
1 20 10.11.0.98/0 256 drop active
Router#

```

The following shows typical output for the verbose form of this command:

```

Router# show cable filter group 10 index 10 verbose

Filter Group          : 1
Filter Index          : 1
Matches               : 0
  Match action        : accept
  Status              : active
Filter Group          : 10
Filter Index          : 10
Matches               : 0
  Source IP Address   : 10.7.7.7/16
  Destination IP Address : 10.8.8.8/16

  IP ToS (Mask, Value) : 1, 2
  TCP/UDP Source Port  : 2000
  TCP/UDP Destination Port : 3000
  TCP Flags (mask, value) : 0, 0
  Match action        : accept
  Status              : active
Router#

```

IPv6 Examples

The following examples show examples of output for the **show cable filter** commands with changes beginning in Cisco IOS Release 12.2(33)SCA in support of IPv6 cable filter groups.

```

Router# show cable filter
Filter   SrcAddr/Mask   DestAddr/Mask   Prot ToS   SPort DPort TCP   Action Status
Grp Id v6                                     Flags
254 128Y Use Verbose     Use Verbose     drop active
Router# show cable filter group 254
Filter   SrcAddr/Mask   DestAddr/Mask   Prot ToS   SPort DPort TCP   Action Status
Grp Id v6                                     Flags
254 128Y Use Verbose     Use Verbose     drop active
Router# show cable filter group 254 index 128
Filter   SrcAddr/Mask   DestAddr/Mask   Prot ToS   SPort DPort TCP   Action Status
Grp Id v6                                     Flags
254 128Y Use Verbose     Use Verbose     drop active

```

Table 72: show cable filter Field Descriptions

Field	Description
Filter Gp	ID number of the filter group. Defined by the <i>group-id</i> argument of the cable filter group command.
Filter Id	Index number of the filter group. Defined by the <i>index-num</i> argument of the cable filter group command.
v6	IP version 6 filter group type indicator. Defined by the ip-version keyword of the cable filter group command. Possible values are Y or N.
SrcAddr/Mask	<ul style="list-style-type: none"> IP version 4—Filter source IP address and mask to be matched by the filter. Defined by the src-ip and src-mask keywords of the cable filter group command. IP version 6—“Use Verbose” appears because IPv6 addresses will not fit in the output display area; need to use the show cable filter group verbose command to view IPv6 addresses.
DestAddr/Mask	<ul style="list-style-type: none"> IP version 4—Filter destination IP address and mask to be matched by the filter. Defined by the dest-ip and dest-mask keywords of the cable filter group command. IP version 6—“Use Verbose” appears because IPv6 addresses will not fit in the output display area; need to use the show cable filter group verbose command to view IPv6 addresses.
Prot	IP protocol number(s) to be matched by the filter. Defined by the ip-proto keyword of the cable filter group command.
ToS	Type of Service mask and value to be matched by the filter. Defined by the ip-tos keyword of the cable filter group command.
SPort	TCP/UDP source port number to be matched by the filter. Defined by the src-port keyword of the cable filter group command.
DPort	TCP/UDP destination port number to be matched by the filter. Defined by the dest-port keyword of the cable filter group command.
TCP Flags	TCP flag mask and value to be matched by the filter. Defined by the tcp-flags keyword of the cable filter group command.
Action	Action to be taken on packet (accept or drop) when filter match occurs. Defined by the match-action keyword of the cable filter group command.
Status	Filter group status (active or inactive). Defined by the status keyword of the cable filter group command.

```

Router# show cable filter group 254 index 128 verbose
Filter Group           : 254
Filter Index          : 128
Filter Version        : IPv6
Matches               : 0
  Source IPv6 address  : 2001:33::20B:BFFF:FEA9:741F/128
  Destination IPv6 address : 2001:1::224/128

```

```

Match action          : drop
Status                : active

```

Table 73: show cable filter verbose Field Descriptions

Field	Description
Filter Group	ID number of the filter group. Defined by the <i>group-id</i> argument of the cable filter group command.
Filter Index	Index number of the filter group. Defined by the <i>index-num</i> argument of the cable filter group command.
Filter Version	IP version of the filter group. Defined by the ip-version keyword of the cable filter group command. Possible values are IPv4 or IPv6.
Matches: Source IP address or Matches: Source IPv6 address	<ul style="list-style-type: none"> Source IP address—IPv4 source IP address and mask to be matched by the filter. Defined by the src-ip and src-mask keywords of the cable filter group command. Source IPv6 address—IPv6 source IP address and prefix to be matched by the filter. Defined by the v6-src-address and v6-src-pfxlen keywords of the cable filter group command.
Matches: Destination IP address or Matches: Destination IPv6 address	<ul style="list-style-type: none"> Destination IP address—IPv4 destination IP address and mask to be matched by the filter. Defined by the dest-ip and dest-mask keywords of the cable filter group command. Destination IPv6 address—IPv6 destination IP address and prefix to be matched by the filter. Defined by the v6-dest-address and v6-dest-pfxlen keywords of the cable filter group command.
Matches: IP Protocol type	IP protocol number(s) to be matched by the filter. Defined by the ip-proto keyword of the cable filter group command.
Matches: IP ToS (Mask, Value)	Type of Service mask and value to be matched by the filter. Defined by the ip-tos keyword of the cable filter group command.
Matches: TCP/UDP Source Port	TCP/UDP source port number to be matched by the filter. Defined by the src-port keyword of the cable filter group command.
Matches: TCP/UDP Destination Port	TCP/UDP destination port number to be matched by the filter. Defined by the dest-port keyword of the cable filter group command.
Matches: TCP Flags (mask, value)	TCP flag mask and value to be matched by the filter. Defined by the tcp-flags keyword of the cable filter group command.
Matches: Match action	Action to be taken on packet (accept or drop) when filter match occurs. Defined by the match-action keyword of the cable filter group command.
Matches: Status	Filter group status (active or inactive). Defined by the status keyword of the cable filter group command.

This example shows the output for the **show cable filter** command on the Cisco cBR-8 router:

```
Router#show cable filter
```

```
Grp Id v6 SrcAddr/Mask      DestAddr/Mask      Prot ToS      Action Status
255 1 N                      Router#             drop active
```

Related Commands

Command	Description
cable filter group	Creates, configures, and activates a DOCSIS 1.1 filter group that filters packets on the basis of the TCP/IP and UDP/IP headers.

show cable flap-list

To display the cable flap-list on a Cisco CMTS, use the **show cable flap-list** command in user EXEC or privileged EXEC mode.

show cable flap-list

show cable flap-list sort-interface [{**sort-flap** | **sort-int** | **sort-mac** | **sort-time**}]

Cisco cBR Series Converged Broadband Router

show cable flap-list

show cable flap-list [**cable slot/subslot/cable-interface-index**] [{**sort-flap** | **sort-interface** | **sort-time**}]

Syntax Description

cable <i>slot/port</i>	(Optional) Displays information for all CMs on the specified cable interface and downstream port on the Cisco uBR7100 series and Cisco uBR7200 series routers: <ul style="list-style-type: none"> • <i>slot</i>—Chassis slot number of the cable interface line card. • <i>port</i>—Downstream port number. Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering.
cable <i>slot/subslot/port</i>	(Optional) Displays information for all CMs on the specified cable interface on a Cisco uBR10012 router: <ul style="list-style-type: none"> • <i>slot</i>—Chassis slot number of the cable interface line card. Valid slots are from 5 to 8. • <i>subslot</i>—Secondary slot number of the cable interface line card. Valid subslots are 0 or 1. • <i>port</i>—Downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.
cable <i>slot/subslot/cable-interface-index</i>	(Optional) Displays information for all CMs on the specified cable interface on a Cisco cBR router: <ul style="list-style-type: none"> • <i>slot</i>—Chassis slot number of the cable interface line card. Valid slots are from 0 to 3, and 6 to 9. • <i>subslot</i>—Secondary slot number of the cable interface line card. Valid subslot is 0. • <i>cable-interface-index</i>—cable interface index number. Valid index numbers are 0 to 15.
upstream <i>port</i>	(Optional) Displays the flap list for a particular upstream on the selected cable interface.
sort-interface	(Optional) Displays the flap list for all cable interfaces, sorted by interface.
sort-flap	(Optional) Sorts the list by the number of times the CM has flapped.

sort-int	(Optional) Sorts the list first by the Cisco CMTS cable interface. This keyword is not supported on Cisco cBR-8 router
sort-mac	(Optional) Sorts the list first by the Cisco CMTS cable interface and then by the CM MAC (hardware) address. This keyword is not supported on Cisco cBR-8 router
sort-time	(Optional) Sorts the list by the most recent time the CM is detected to have flapped.

Command Modes

User EXEC (>), Privileged EXEC (#)

Command History

Release	Modification
11.3 NA	This command was introduced.
12.0(3)T	This command was supported on the Cisco mainline release.
12.0(7)XR and 12.1(1a)T1	The output of this command was enhanced to show that the Cisco CMTS has detected an unstable return path for a particular CM and has compensated with a power adjustment. An asterisk (*) appears in the power adjustment field for a modem when a power adjustment has been made; an exclamation point (!) appears when the CM has reached its maximum power transmit level and cannot increase its power level further.
12.3(9a)BC	The sort-int and sort-mac options were added.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCC	The output of this command was modified to show the aggregated data across all upstream channels for each flap detector for CMs in the Multiple Transmit Channel (MTC) mode on a Cisco uBR10012 router.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. The upstream and sort-mac keywords were removed.

Usage Guidelines

The **sort** options operate differently on the different Cisco CMTS routers. On the Cisco uBR7100 series and Cisco uBR7200 series routers, the **sort** options apply to all cable interface line cards and merge the output into a single display.

On the Cisco uBR10012 router, the sort options apply to individual cable interfaces. For example, the **sort-time** option sorts all of the flap entries on the first cable interface (c5/0/0), then the entries on the second cable interface (c5/0/1), and so forth.

Note Occasionally, the **show cable flap-list** command might temporarily show duplicate entries for the same cable modem. This can occur after a cable modem has gone offline and before it has completed the registration process and come back online. When the cable modem does reach the online state, the duplicate entries disappear.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Examples

The following example shows the output of the **show cable flap-list** command:

```
router# show cable flap-list
MAC Address      Upstream      Ins   Hit   Miss  CRC   P-Adj  Flap  Time
0010.7bb3.fd19  Cable5/0/U1  0     2792 281   0     *45    58   Jul 27 16:54:50
0010.7bb3.fcfc  Cable5/0/U1  0     19    4     0     !43    43   Jul 27 16:55:01
0010.7bb3.fcdd  Cable5/0/U1  0     19    4     0     *3     3    Jul 27 16:55:01
```

Note The asterisk (*) in the P-Adj field indicates that a power adjustment has been made for that CM. The exclamation point (!) indicates that the CM has reached its maximum power transmit level and cannot increase its power level further.

The following example shows the display of flap-list tables sorted by MAC address:

```
router# show cable flap-list sort-flap
Mac Addr      CableIF      Ins   Hit   Miss  CRC   P-Adj  Flap  Time
0010.1eab.2c0b C6/0 U0     108   318   27    0     0     108 Sep 10 15:26:56
0010.1eb2.bb07 C6/0 U0      0     293   31    1     1     1 Sep 10 15:15:49
0010.7b6b.71cd C6/0 U0      1     288   32    0     0     1 Sep 10 15:12:13
0010.1eb2.bb8f C6/0 U0      1     295   30    0     0     1 Sep 10 15:11:44
```

The following example shows the display of flap-list tables sorted by time:

```
Router# show cable flap-list sort-time
Mac Addr      CableIF      Ins   Hit   Miss  CRC   P-Adj  Flap  Time
00e0.2222.2202 C4/0 U0     464   2069 242    0     421   885 Oct 16 22:47:23
0010.7b6b.57e1 C4/0 U0      0     2475  43     0     1041  1041 Oct 16 22:47:04
```

The following sample output of the **show cable flap-list** command provides the aggregated data across all upstream channels for CMs in the MTC mode on a uBR10012 router in Cisco IOS Release 12.2(33)SCC:

```
router# show cable flap-list
MAC Address      Upstream      Ins   Hit   Miss  CRC   P-Adj
Flap  Time

Table 74: show cable flap-list Command Field Descriptions

Field	Description
Mac Addr	The MAC address for the CM.
CableIF	The cable interface line card, including upstream, for this CM.
Ins	<p>The number of times the CM comes up and inserts itself into the network. This counter indicates the number of times the RF link was abnormally reestablished into the network. This counter is increased when the time between initial link establishment and a reestablishment was less than the threshold parameter configured using the cable flap-list insertion-time command.</p> <p>Normal modem activity uses the following sequence:</p> <ul style="list-style-type: none"> • Initial link insertion is followed by a station maintenance message between the CMTS and cable modem. • Power on • Initial maintenance • Station maintenance • Power off <p>When the link is broken, initial maintenance is repeated to reestablish the link.</p> <ul style="list-style-type: none"> • Initial maintenance @ Time T1 • Station maintenance • Initial maintenance @ Time T2 <p>The Ins and Flap counters in the flap list are incremented whenever $T2 - T1 < N$ where N is the insertion-time parameter configured in the cable flap-list insertion-time command.</p> <p>This count may indicate intermittent downstream synchronization loss or DHCP or modem registration problems. In the latter case, the Ins count tends to track the Flap count. If the downstream is unstable (levels move outside the modem's range occasionally), insertions can occur. If the modem cannot provision correctly, many insertions occur.</p> <p>If link reestablishment happens too frequently, the modem usually has a registration problem. To check for this potential problem, check to see if the insertion counter is the same order of magnitude as the Flap counter.</p>
Hit	The number of times the CM responds to MAC-layer station maintenance (keepalive) messages. (The minimum hit rate is once per 30 seconds. It can indicate intermittent upstream, laser clipping, or common-path distortion.

Field	Description
Miss	The number of times the CM misses and does not respond to a MAC-layer station maintenance (keepalive) message. An 8 percent miss rate is normal for the Cisco cable interface line cards. It can indicate intermittent upstream, laser clipping, or common-path distortion.

Field	Description
-------	-------------

Field	Description
<p>Note The Hit and Miss columns are keepalive polling statistics between the CMTS and the cable modem. The station maintenance process occurs for every modem approximately every 25 seconds. When the CMTS receives a response from the modem, the event is counted as a hit. If the CMTS does not receive a response from the cable modem, the event is counted as a miss.</p> <p>Ideally, the hit count should be much greater than the miss count. If a modem has a hit count much less than its miss count, then registration is failing. Noisy links cause the miss or hit ratio to deviate from a nominal 10 percent or less. High miss counts can indicate:</p> <ul style="list-style-type: none"> • Intermittent upstream possibly due to noise • Laser clipping • Common-path distortion • Ingress or interference • Too much or too little upstream attenuation <p>A cable modem fails to respond either because of noise or if it is down. Modems that log only misses and zero hits are assumed to be powered off. If noise caused a poll to be missed, then the transition from miss to hit is detected as a flap condition. The poll rate is increased to 1 per second whenever the modem misses a poll. This is used to accelerate the offline state detection and decrease station maintenance overhead.</p> <p>Misses are not desirable, because they usually indicate a return path problem; however, having a small number of misses is normal. After 16 misses, the modem is assumed to have powered off and the link is broken.</p> <p>The flap count is incremented if there are M consecutive misses, where M is</p>	

Field	Description
<p>configured in the cable flap miss-threshold command. The parameter value ranges from 1 to 12, with a default of 6.</p> <p>Hit and miss analysis could be done after the Ins count stops incrementing. In general, if the hit and miss counts are about the same order of magnitude, and the CRC count is low or nonexistent, then the upstream is experiencing noise.</p> <p>If the miss count is greater, then the modem is probably experiencing common-path distortion and is dropping out frequently or not completing registration. Check grounding connections and if you see noise disappear after breaking a cable connection, but build back up again later, check the end-of-line terminators. You may be using a substandard frequency translator instead of a Digital Signal Processor. If the line is simply noisy, but not too noisy, you see an increase in the percentage of misses. If it is very noisy, then more than 80% of the ranging responses (RNG-RSP) are missed and the modem has many insertions.</p>	
CRC	<p>The number of cyclic redundancy check (CRC) errors for this cable modem. CRC errors are calculated on per modem basis and refer to upstream impairments. Cable modems with high CRC errors either have bad upstream paths, or have in-home wiring problems.</p> <p>The CRC counter field indicates:</p> <ul style="list-style-type: none"> • Intermittent upstream • Laser clipping • Common-path distortion • Impulsive noise or interference

Field	Description
P-Adj	<p>The number of times the headend instructed the CM to adjust transmit (TX) power more than 3 dB. It can indicate amplifier degradation, poor connections, or thermal sensitivity.</p> <p>* means the noise power-adjustment method is active for this modem.</p> <p>! means the modem has reached its maximum transmit power.</p> <p>The station maintenance poll in the CMTS constantly adjusts the modem transmit power, frequency, and timing. The power-adjustment (P-Adj) column indicates the number of times the modem's power adjustment exceeded the threshold value. The power adjustment threshold may be set using the cable flap-list power-adjust threshold command with a value range of 0 to 10 dB and a default value of 2 dB. Tuning this threshold is recommended to decrease irrelevant entries in the flap list. Power-adjustment values of 2 dB and below continuously increment the P-Adj counter. The modem transmitter step size is 1.5 dB, whereas the headend may command 0.25 dB step sizes.</p> <p>Power-adjustment flap strongly suggests upstream plant problems such as:</p> <ul style="list-style-type: none"> • Amplifier degradation • Poor connections • Thermal sensitivity • Attenuation problem <p>The P-Adj column is often watched as an indicator of plant stability. It may give a forewarning of a future plant outage. If the upstream path contains too much or too little loss, the modem is undergoing many power adjustments.</p>
Flap	<p>The total number of times a modem has flapped, which is the sum of P-Adj and Ins values. This counter is incremented when one of the following events is detected:</p> <ul style="list-style-type: none"> • Unusual modem insertion or re-registration attempts. The Flap and the Ins counters are incremented when the modem tries to reestablish the RF link with the CMTS within a period of time that is less than the user-configured insertion interval value. • Abnormal miss or hit ratio. The Flap counter is incremented when N consecutive misses are detected after a hit where N can be user-configured with a default value of 6. • Unusual power adjustment. The Flap and P-Adj counters are incremented when the modem's upstream power is adjusted beyond a user-configured power level.

Field	Description
Time	<p>Time is the most recent time that the modem dropped the connection or flapped. The value is based on the clock configured on the local CMTS. If no time is configured, this value is based on the current uptime of the CMTS. When a cable modem meets one of the three flap list criteria, the Flap counter is incremental and Time is set to the current time.</p> <p>Note This field displays a value in brackets in the output of the show cable modem flap command to indicate the duration (milliseconds) between the cable interface to become active and the first ranging success after a line card switchover (cable modem recovery time).</p>

Examples for the Cisco cBR Series Converged Broadband Router

This example shows the output of the **show cable flap-list** command on the Cisco cBR router:

```
Router#show cable flap-list
MAC Address      Upstream      Ins   Hit   Miss  CRC   P-Adj  Flap  Time
b0c2.87c2.830b  C9/0/0/UB    0     3734  16    0     3      5    Jan 4  02:38:40
0010.18de.8134  C9/0/0/UB    0     4139  11    0     0      2    Jan 4  00:26:45

Related Commands

Command	Description
cable flap-list aging	Specifies the number of days to keep a CM in the flap-list table before aging it out of the table.
cable flap-list insertion-time	Sets the insertion time interval that determines whether a CM is placed in the flap list.
cable flap-list miss-threshold	Specifies the miss threshold for recording a flap-list event.
cable flap-list power-adjust threshold	Specifies the power-adjust threshold for recording a CM flap-list event.
cable flap-list size	Specifies the maximum number of CMs that can be listed in the flap-list table.
clear cable flap-list	Clears all the entries in the flap-list table.
debug cable flap	Displays information about the operation of the CM flap list that is maintained for the cable interfaces.
ping docsis	Sends a DOCSIS ping to a CM and increments the flap-list counters as appropriate.
show cable modem	Displays information about all CMs on an interface or about a particular CM.
show cable modem flap	Displays flap list statistics for one or more cable modems.

show cable flap-list reset-cm-list

To display the Docsis 3.1 cable modem list that was reset by the partial service reset timer, use the **show cable flap-list reset-cm-list** command in privileged EXEC mode.

show cable flap-list reset-cm-list

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Examples

This example shows the output of the **show cable flap-list reset-cm-list** command:

```
router# show cable flap-list reset-cm-list
```

Related Commands

Command	Description
cable lcha partial-service-reset-timer	Configures the timer to reset cable modems in partial service mode.

show cable flap-list wb-rf

To display the wideband RF related data for all w-online cable modems, use the **show cable flap-list wb-rf** command in privileged EXEC mode.

show cable flap-list [**{cable slot/subslot/port}**]**wb-rf** [**{modular-cable slot/bay/port | integrated-cable slot/bay/port WB RF channel number}**] [**{QAM | MDD}**]

Cisco cBR Series Converged Broadband Router

show cable flap-list [**{cable slot/subslot/cable-interface-index}**]**wb-rf integrated-Cable slot/subslot/port**

Syntax Description	
cable <i>slot/subslot/port</i>	(Optional) Displays information for all cable modems on the specified cable interface on a Cisco uBR10012 router, where: <ul style="list-style-type: none"> • <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8. • <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1. • <i>port</i>—Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.
cable <i>slot/subslot/cable-interface-index</i>	On a Cisco cBR-8 router: <ul style="list-style-type: none"> • <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 0 to 3, and 6 to 9. • <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslot is 0. • <i>cable-interface-index</i>—Specifies the cable interface index. Valid indices are 0 to 15.
modular-cable <i>slot/bay/port</i>	(Optional) Displays information for all cable modems on the specified modular cable interface on a Cisco uBR10012 router, where <ul style="list-style-type: none"> • <i>slot</i>—The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs. • <i>bay</i>—The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay). • <i>port</i>—Specifies the interface number on the SPA. This keyword is not supported on Cisco cBR-8 router.
integrated-cable <i>slot/subslot/port</i>	(Optional) Displays information for all cable modems on the specified integrated cable interface on a Cisco cBR-8 router, where <ul style="list-style-type: none"> • <i>slot</i>—Valid slots are 0 to 3 and 6 to 9. • <i>subslot</i>—Valid subslot is 0. • <i>port</i>—Valid ports are 0 to 15.

integrated-cable <i>slot/bay/port</i>	(Optional) Displays information for all cable modems on the specified integrated cable interface on a Cisco uBR10012 router, where <ul style="list-style-type: none"> • <i>slot</i>—The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs. • <i>bay</i>—The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay). • <i>port</i>—Specifies the interface number on the SPA.
<i>WB RF channel number</i>	(Optional) Specifies the wideband RF channel number.
QAM	(Optional) Specifies the number of QAM flaps.
MDD	(Optional) Specifies the number of MDD flaps.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The QAM and MDD keywords and <i>WB-RF channel number</i> variable were removed.

Usage Guidelines

None

ExamplesThis example shows the output of the **show cable flap-list wb-rf** command:

```
router# show cable flap-list wb-rf

RF          Timeout Recover Failure Recover Flaps CM      Percent
-----
3/0/0 1 1      1      0      0      1      3      33
          2 0      0      1      0      1      3      33
```

Examples for the Cisco cBR Series Converged Broadband RouterThis example shows the output of the **show cable flap-list wb-rf** command on the Cisco cBR router:

```
Router#show cable flap-list wb-rf
          MDD          QAM/FEC
RF          Timeout Recover Failure Recover Flaps CM      Percent
-----
1/0/0 158 0      0      1      0      0      2      0

Router#
```

Related Commands

Command	Description
show cable flap-list	Displays the cable flap-list on a Cisco CMTS.
clear cable flap-list	Clears all the entries in the flap-list table.
debug cable flap	Displays information about the operation of the CM flap list that is maintained for the cable interfaces.
show cable modem flap	Displays flap list statistics for one or more cable modems.

show cable freq-profile

To display information about the frequency profile, use the **show cable freq-profile** command in privileged EXEC mode.

```
show cable freq-profile freq-profile-id
```

Syntax Description

<i>freq-profile-id</i>	Specifies a freq-profile ID. Valid values range from 0 to 15.
------------------------	---

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use the **show cable freq-profile** command to display information about a qam-profile. If you specify the *freq-profile-id*, the command displays the frequency profile with the specified ID.

Examples

The following is a sample output of the **show cable freq-profile** command:

```
Router# show cable freq-profile
Frequency Profile ID 0 annex-b-low:
  Lane 1 start-freq 90000000hz
    Block 1 start-freq 90000000hz
    Block 2 start-freq 138000000hz
    Block 3 start-freq 186000000hz
    Block 4 start-freq 234000000hz
  Lane 2 start-freq 282000000hz
    Block 1 start-freq 282000000hz
    Block 2 start-freq 330000000hz
    Block 3 start-freq 378000000hz
    Block 4 start-freq 426000000hz
  Lane 3 start-freq 474000000hz
    Block 1 start-freq 474000000hz
    Block 2 start-freq 522000000hz
    Block 3 start-freq 570000000hz
    Block 4 start-freq 618000000hz

Related Commands

Command	Description
cable downstream freq-profile	Set the frequency profile for the cable interface line card.

show cable hop

To display cable-hop statistics on a Cisco CMTS, use the **show cable hop** command in privileged EXEC mode.

```
show cable hop [{cable slot/port}] [{upstream uport}] [{history}] [{threshold}]
show cable hop [{cable slot/subslot/port}] [{upstream uport}] [{history}] [{threshold}]
```

Cisco cBR-8 Converged Broadband Router

```
show cable hop [{upstream-cable slot/subslot/controller}] [{upstream uport}] [{history}] [{threshold}]
```

Syntax Description

cable slot/port	(Optional) Specifies a cable interface on the Cisco uBR7100 series and Cisco uBR7200 series routers. On the Cisco uBR7100 series router, the only valid value is 1/0 . On the Cisco uBR7200 series router, <i>slot</i> can range from 3 to 6, and <i>port</i> can be 0 or 1, depending on the cable interface.
cable slot/subslot/port	(Optional) Specifies a cable interface on the Cisco uBR10012 router. The following are the valid values: <ul style="list-style-type: none"> • <i>slot</i>—Chassis slot number of the cable interface line card. Valid slots are from 5 to 8. • <i>subslot</i>—Secondary slot number of the cable interface line card. Valid subslots are 0 or 1. • <i>port</i>—Downstream port number. Valid ports are from 0 to 4, depending on the cable interface line card.
upstream uport	(Optional) Specifies an upstream port for which to display the frequency hop status.
upstream-cable slot/subslot/controller	(Optional) Specifies a cable interface on the Cisco cBR router. The following are the valid values: <ul style="list-style-type: none"> • <i>slot</i>—Chassis slot number. Valid slots are from 0 to 3, and 6 to 9. • <i>subslot</i>—Secondary slot number. Valid subslot is 0. • <i>controller</i>—Upstream controller. Valid controllers are from 0 to 4, depending on the cable interface line card.
history	(Optional) Displays changes from one state to another, at any time and for any reason, for frequency, modulation, and channel width.
summary	(Optional) Displays summary of information for Cisco cBR router.
threshold	(Optional) Displays the user defined thresholds and current carrier-to-noise ratio (CNR), signal-to-noise ratio (SNR), correctable forward error correction (FEC) percentage, uncorrectable FEC percentage, and missed station maintenances percentage values of the upstreams.

Command Modes

Privileged EXEC (#)

Command History	Release	Modification
	12.0(4)XI	This command was introduced.
	12.3(13a)BC	This command was enhanced with the addition of two new keywords, history and threshold .
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	12.3(23)BC7	The output of the show cable hop history command is modified to include more information in the 'change from' and 'change to' fields of the output. Now, the modulation profile number is displayed when a change occurs, instead of the modulation order.
	12.2(33)SCC	This command was integrated into Cisco IOS Release 12.2(33)SCC.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The summary and upstream-cable keywords were added.

Examples

The following example shows typical output from the **show cable hop** command:

```
Router# show cable hop

Upstream      Port      Poll Missed Min      Missed Hop  Hop      Corr      Uncorr
Port          Status    Rate Poll   Poll   Poll   Thres  Period  FEC      FEC
              (ms) Count Sample Pcnt  Pcnt  (sec)  Errors  Errors
Cable4/0/U0   down     1000 * * *   frequency not set * * * 0      0
Cable4/0/U1   down     1000 * * *   frequency not set * * * 0      0
Cable4/0/U2   down     1000 * * *   frequency not set * * * 0      0
Cable4/0/U3   down     1000 * * *   frequency not set * * * 0      0
Cable4/0/U4   down     1000 * * *   frequency not set * * * 0      0
Cable4/0/U5   down     1000 * * *   frequency not set * * * 0      0
Cable5/0/U0   down     1000 * * *   interface is down * * * 0      0
Cable5/0/U1   down     1000 * * *   frequency not set * * * 0      0
Cable5/0/U2   down     1000 * * *   interface is down * * * 0      0
Cable5/0/U3   down     1000 * * *   interface is down * * * 0      0
Cable5/0/U4   down     1000 * * *   interface is down * * * 0      0
Cable5/0/U5   down     1000 * * *   interface is down * * * 0      0
Cable6/0/U0   down     1000 * * *   interface is down * * * 0      0
Cable6/0/U1   22.000 Mhz 1000 * * *set to fixed frequency * * * 31375 1912
Cable6/0/U2   26.000 Mhz 1000 * * *set to fixed frequency * * * 0      0
Cable6/0/U3   admin down 1000 * * *   frequency not set * * * 0      0
```

The following example shows typical output from the **show cable hop**

```
upstream
command:
Router# show cable hop c2/0 upstream 2

Upstream      Port      Poll Missed Min      Missed Hop  Hop      Corr      Uncorr
Port          Status    Rate Poll   Poll   Poll   Thres  Period  FEC      FEC
              (ms) Count Sample Pcnt  Pcnt  (sec)  Errors  Errors
Cable2/0/U2   admin down 1000 * * *   frequency not set * * * 0      0
Router#
```

Table 75: show cable hop Command Field Descriptions

Field	Description
Upstream Port	The upstream port for this information line.

Field	Description
Port Status	Lists the status of the port. Valid states are down if frequency is unassigned or admin down if the port is shut down. If the port is up, this column shows the center frequency of the channel.
Poll Rate	The rate that station maintenance polls are generated (in milliseconds).
Missed Poll Count	The number of missing polls, per codeword/FEC block.
Min Poll Sample	The number of polls in the sample, per codeword/FEC block.
Missed PollPcnt	The ratio of missing polls to the number of polls, expressed as a percentage.
Hop Thres Pcnt	The level that the missed poll percentage must exceed to trigger a frequency hop, expressed as a percentage.
Hop Period	The maximum rate that frequency hopping will occur (in seconds).
Corr FEC Errors	The number of correctable forward error corrections (FEC) errors on this upstream port, per codeword/FEC block.
Uncorr FEC Errors	The number of uncorrectable FEC errors on this upstream port, per codeword/FEC block.
Note	The show cable hop and show controllers cable commands display FEC errors per codewords, while the show interface cable upstream command displays FEC errors per packets, where a packet could contain multiple codewords.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

The following example shows typical output from the **show cable hop threshold** command:

```
Router# show cable hop c6/0/0 threshold
Upstream SNR(dB) CNR(dB) CorrFEC% UncorrFEC% MissedSM%
Port Val Thre1 Thre2 Val Thre1 Thre2 Pcnt Thre Pcnt Thre Pcnt Thre
Ca6/0/0/U0 27 25 15 39 35 25 0 3 0 1 75 75
Ca6/0/0/U1 31 25 15 51 35 25 0 3 0 1 90 75
Ca6/0/0/U2 -- 35 25 -- 35 25 0 3 0 1 0 75
Ca6/0/0/U3 -- 35 25 -- 35 25 0 3 0 1 0 75
```

Table 76: show cable hop threshold Command Field Descriptions

Field	Description
Upstream Port	The upstream port for this information line.
SNR (dB)	The signal-to-noise ratio (SNR) for a particular cable modem (CM), in decibels (dB).
CNR (dB)	The current upstream carrier-to-noise ratio (CNR) for a particular cable modem (CM), in decibels (dB).
Corr FEC Errors	The number of correctable forward error corrections (FEC) errors on this upstream port, per codeword/FEC block.
Uncorr FEC Errors	The number of uncorrectable FEC errors on this upstream port, per codeword/FEC block.
Missed SM	The number of missing station maintenance polls, per codeword/FEC block.

The following example shows typical output from the **show cable hop history** command:

```
Router# show cable hop c8/1/1 upstream 0 history
F = Frequency Hop, M = Modulation Change, C = Channel Width Change
Upstream Action          Chg   Chg   Action
Port      Time                Code From To     Reason
C8/1/1 U0 Feb 20 12:21:29 M 142  141  SNR 28>=28 CFEC 0<=3 UnCFEC 0<=1
          Feb 20 12:09:08 F   0.000 24.000 Configuration changed
```

Table 77: show cable hop history Command Field Descriptions

Field	Description
Upstream Port	The upstream port for this information line.
Action Time	The time of the spectrum management action.
Code	The code associated with the type of hop.
Chg From	The previous state of the spectrum management action.
Chg To	The current state of the spectrum management action.
Action Reason	The reason for changing the frequency.

This example shows the output of the **show cable hop upstream-cable** command on the Cisco cBR-8 Converged Broadband Router.

```
Router# show cable hop upstream-cable 1/0/0
Upstream Channel Poll Missed Min Missed Hop Hop Corr Uncorr
Channel Status Rate Poll Poll Poll Thres Period FEC FEC
          (ms) Count Sample Pcnt Pcnt (sec) Errors Errors
UC1/0/0:U0 13.200 MHz 1000 * * * set to fixed frequency * * * 0 0
UC1/0/0:U1 19.600 MHz 1000 * * * set to fixed frequency * * * 0 2
UC1/0/0:U2 26.000 MHz * * * us-channel is not binded to any MD * * * 0 0
UC1/0/0:U3 32.400 MHz * * * us-channel is not binded to any MD * * * 0 0
UC1/0/0:U4 admindown * * * us-channel is not binded to any MD * * * 0 0
UC1/0/0:U5 admindown * * * us-channel is not binded to any MD * * * 0 0
```

show cable hop

```

UC1/0/0:U6      admindown * * * us-channel is not binded to any MD * * * 0      0
UC1/0/0:U7      admindown * * * us-channel is not binded to any MD * * * 0      0
UC1/0/0:U8      admindown * * * us-channel is not binded to any MD * * * 0      0
UC1/0/0:U9      admindown * * * us-channel is not binded to any MD * * * 0      0
UC1/0/0:U10     admindown * * * us-channel is not binded to any MD * * * 0      0
UC1/0/0:U11     admindown * * * us-channel is not binded to any MD * * * 0      0

```

Router#

Related Commands

Command	Description
cable spectrum-group hop period	Changes the minimum time between frequency hops.
cable spectrum-group hop threshold	Specifies a frequency hop threshold for a spectrum group.
cable upstream hop-priority	Configures the priority of the corrective actions to be taken when a frequency hop is necessary due to ingress noise on the upstream.
cable upstream modulation-profile	Configures up to three modulation profiles to an upstream port to activate Dynamic Upstream Modulation.
cable upstream threshold	Configures the upstream for the CNR and FEC threshold values to be used in determining the allowable noise levels.
cable upstream threshold hysteresis	Configures a hysteresis value to be used in conjunction with the dynamic modulation upgrade thresholds.
clear cable hop	Clears the forward error corrections (FEC) hop counters on one or all cable interfaces on a Cisco CMTS.
show cable host access-group	Displays the statistics for the host behind the CM.
show cable modem	Displays CM configuration settings.

show cable host access-group

To display the hosts and other customer premises equipment (CPE) devices behind the CMs in the network, along with their access groups, use the **show cable host access-group** command in privileged EXEC mode.

show cable host [*ip-address**mac-address*] **access-group**

Note The **show cable host** command is not supported on the Cisco uBR10012 universal broadband router.

Syntax Description

<i>mac-address</i>	(Optional) Specifies the 48-bit hardware address for a particular CM or host.
<i>ip-address</i>	(Optional) Specifies the IP address for a particular CM or host.

Command Modes

Privileged EXEC

Command History

Release	Modification
11.NA	This command was introduced.
12.1(3a)EC1	Support was added to the Release 12.1 EC train.
12.2(4)BC1	Support was added to the Release 12.2 BC train for the Cisco uBR7100 series and Cisco uBR7200 series routers. (This command also appears in the CLI for the Cisco uBR10012 router but is not functional.)
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

This command displays information only for hosts and other CPE devices. To display information for CMs and their associated CPE devices, use the **show cable device access-group** command. To display information only for CMs, use the **show cable device access-group** command.

If an SNMP manager is requesting information about CM or CPE devices at the same time that this command is given, the command displays the following error message:

```
No information is available, please try later.
```

Wait until the SNMP retrieval is done and retry the CLI command.

Examples

The following example shows how to display all the hosts behind the CMs in the network:

```
Router# show cable host access-group
MAC address      IP address      Type      Access-group
0080.c6f9.b42e   24.168.220.52  host
0020.7806.defe   192.168.28.134 host
0050.baa0.5ccd   24.168.223.251 host
0050.046f.f4cf   192.168.33.25  host
```

show cable host access-group

```

0050.bacf.5d89 192.168.37.113 host
0050.1800.a8cb 192.168.33.90 host
0040.d00f.44f0 192.168.34.128 host
0050.e456.9641 192.168.39.66 host
0050.badd.2883 192.168.32.230 host
0050.badd.3b12 192.168.33.246 host
0020.78c7.f887 192.168.32.32 host
00e0.2969.a1a5 192.168.36.246 host
0020.78d5.ddf0 192.168.32.107 host
00001.02c5.9936 192.168.38.233 host
0020.78d0.fb32 192.168.28.45 host
0050.1800.f458 192.168.36.209 host
0002.e301.df8f 192.168.30.191 host
00a0.2451.b7eb 24.168.223.41 host
0080.c7db.afba 192.168.33.153 host
00D0.2717.1899 192.168.39.189 host
Router#

```

This table describes the fields that are shown in the **show cable host access-group** display:

Table 78: show cable host access-group Field Descriptions

Field	Description
MAC Address	The MAC address for the CPE device.
IP Address	The IP address that the DHCP server has assigned to the CPE device.
Type	Identifies the type of device. With this command, this field should always be host to indicate a CPE device. Use the show cable device access-group or show cable modem access-group command to display information for CMs.
Access-group	Displays the access group name or number in use (if any) for this CPE device.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable device	Configures the access list for a CM device or host.
cable host access-group	Configures the access list for the specified hosts.
clear cable host	Clears the host from the table.
show cable device access-group	Displays a list of CMs and their CPE devices, along with their access groups.
show cable modem access-group	Displays the access groups for the CMs on a particular cable interface.

show cable ib-ipc

To display the status of local IB IPC server and information on participating line cards, use the show cable ib-ipc command in privileged EXEC mode.

```
show cable ib-ipc {status | ports}
```

Syntax Description

status	Displays status of local IB IPC server.
ports	Displays information on participating line cards.

Command Modes

Privileged EXEC

Command History

Release	Modification
12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Examples

The following is sample output from the **show cable ib-ipc** command. The command **show cable ib-ipc ports** displays the internal virtual channel identifiers and internal service flows for Ironbus based IPC.

```
Router# show cable ib-ipc ports
6/0: LCP High Priority VCCI 135, SFID 32891
LCP Normal Priority VCCI 135, SFID 135
8/0: LCP High Priority VCCI 153, SFID 32909
LCP Normal Priority VCCI 153, SFID 153
```

show cable ipc-stats

To display statistics of all IPC messages on a Cisco CMTS router, use the **show cable ipc-stats** command in privileged EXEC mode.

show cable ipc-stats

Syntax Description This command has no arguments or keywords.

Command Default None

Command Modes Privileged EXEC (#)

Release	Modification
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
12.2(33)SCF	The command output displays the IPC port information such as service type of the IPC messages.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines You must enable the Cable IPC Statistics Collection tool using the cable ipc-stats command before using the show cable ipc-stats command. When you use this show command, a separate shadow database buffer is allocated, and the contents of the active database are copied into the shadow database to display the IPC statistics. This ensures that all the statistics are frozen at the same time for easy comparison and analysis.

Examples

The following is a sample output of the show cable ipc-stats command that shows statistics of all IPC messages on a Cisco CMTS router:

```
Router# show cable ipc-stats

```

This table describes the fields displayed by the **show cable ipc-stats** command.

Table 79: show cable ipc-stats Command Field Descriptions

Field	Description
entity	Route processor-to-line card connection or a line card-to-line card connection.
app	Message group.
io	Send request or a send response, or a receiver request or a receiver response.
s/s	Slot/subslot

Field	Description
reqid	Nonsequential message ID for the original request.
idx	Sequential message index for the original request.
pkts	Number of messages.
bytes	Number of bytes.
lastEvt (sec)	Seconds since the last send or receive event.
totalDur (msec)	Total time in milliseconds for the blocked send wait or received request process.
maxDur (msec)	Maximum time in milliseconds for the blocked send wait or received request process.
lastMax (sec)	Seconds since the last maxDur is recorded.

Related Commands

Command	Description
cable ipc-stats	Enables the Cable IPC Statistics Collection tool on a Cisco CMTS router.
clear cable ipc-stats	Clears the active database and resets all IPC statistics in the active database to zero.

show cable ipv6 leasequery-filter

On the Cisco cBR Series Converged Broadband Router, to view the subscriber information, use the **show cable ipv6 leasequery-filter** command to view the leasequery filter statistics.

show cable ipv6 leasequery-filter[*cableslot/subslot/cable-interface-index*]

Syntax Description	<i>cableslot/subslot/cable-interface-index</i>	(Optional) For the Cisco cBR router— <ul style="list-style-type: none"> • The valid range for the <i>slot</i> is 0 to 3 and 6 to 9. • The valid value for the <i>subslot</i> is 0. • The valid range for <i>cable-interface-index</i> is 0 to 15.
Command Default	None	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines To view the leasequery filter statistics for a specific cable interface, use the *cableslot/subslot/cable-interface-index* option.

Example for Cisco cBR router

This example shows the output for the **show cable ipv6 leasequery-filter** command on the Cisco cBR router:

```
Router#show cable ipv6 leasequery-filter
Lease Query IPv6 Filter statistics for Unknown Sid
  Requests Sent : 0 total. 0 unfiltered, 0 filtered

Router#
```

This example shows the output for the **show cable ipv6 leasequery-filter** command for a specific cable interface on the Cisco cBR router:

```
Router#show cable ipv6 leasequery-filter cable 1/0/0
Lease Query IPV6 Filter statistics for Cable1/0/0:
  Requests Sent : 0 total. 0 unfiltered, 0 filtered

Router#
```

show cable ipv6 leasequery-stats

To display the IPv6 cable leasequery packet processing statistics. Counters collect statistics and show the queries that are sent to the DHCP server and the replies received by the cBR-8 routers. Use the **show cable ipv6 leasequery-stats** command in the privileged EXEC mode.

show cable ipv6 leasequery-stats [**clear**]

Cisco cBR Series Converged Broadband Router

show cable ipv6 leasequery-stats [**clear**]

Syntax Description

clear	(Optional) Resets all DHCPv6 counters on the cBR-8 router to zero.
--------------	--

Command Modes

Privileged EXEC (#)

Release	Modification
17.6.1z1	This command was introduced.

Usage Guidelines

The **show cableipv6 leasequery-stats** command displays the IPv6 cable leasequery packet processing statistics. The counters are grouped by queries and replies.

Examples

The following example shows the IPv4 cable leasequery statistics output on the cBR-8 router:

```
Router# show cable ipv6 leasequery-stats
IPv4 Source Verify LeaseQuery Statistics:
Queries: 1 sent, 0 timed out
Replies: 1 allowed, 0 rogues, 0 dropped
```

Table 80: show cable leasequery-stats Field Descriptions

Field	Description
Queries	
Sent	Number of leasequeries sent by cBR-8.
Timed out	Number of leasequeries timed out before receiving replies.
Replies	
Allowed	Number of replies that are valid, so that the CPE traffic is allowed.
Rogue	Number of replies that indicate a CPE is a rogue device, so that the CPE is added into the rogue list.
Dropped	No of replies that are invalid, so they are dropped without further processing.

show cable l2-vpn dot1q-nsi-redundancy

The **show cable l2-vpn dot1q-nsi-redundancy** command in privileged EXEC mode displays the following information:

- Configured primary and the backup DOT1Q Ethernet Network System Interface (NSI).
- Current active NSI, through which the traffic flows.
- Time elapsed from latest switchover.

show cable l2-vpn dot1q-nsi-redundancy

Command Default	None	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	12.2(33) SCJ	This command was introduced on the Cisco uBR Series Universal Broadband Routers
	IOS-XE 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The following conditions trigger a restart as indicated by the Elapsed-after-SW field:

- When the backup pair is created for the first time.
- When the Active-NSI in the pair fails and triggers a switchover.
- When you manually switch over the current active uplink NSI port.

Example

The following example shows the DOT1Q NSI port backup pair details:

```
Router# show cable l2-vpn dot1q-nsi-redundancy
Primary-NSI   Backup-NSI   Active-NSI   Elapsed-after-SW
Te4/0/1       Te4/0/7     Te4/0/1     31m9s
Te4/0/2       Te4/0/3     Te4/0/2     59s
```

When two uplink DOT1Q NSI ports are UP, you can manually switch over an active uplink port from current active uplink port to another using **show cable l2-vpn dot1q-nsi-redundancy force-switchover from Te4/0/1** command. The following example shows the current NSI uplink active port after switchover:

```
Router# show cable l2-vpn dot1q-nsi-redundancy
Primary-NSI   Backup-NSI   Active-NSI   Elapsed-after-SW
```

Te4/0/1	Te4/0/7	Te4/0/7	41m27s
Te4/0/2	Te4/0/3	Te4/0/2	10m17s

show cable l2-vpn dot1q-vc-map

To display the mapping of one or all cable modems to IEEE 802.1Q Virtual Local Area Networks (VLANs) on the router's Ethernet interfaces, use the **show cable l2-vpn dot1q-vc-map** command in privileged EXEC mode.

show cable l2-vpn dot1q-vc-map [*mac-address* [**vpn** *vpnid*] [**verbose**]] [**customer** *cust-name*] [**vpn** *vpnid*]

Syntax Description

<i>mac-address</i>	(Optional) Displays the mapping for the cable modem with the specified hardware MAC address.
vpn <i>vpnid</i>	(Optional) Displays Layer 2 VPN information on a cable modem with the specified MAC address, or for the specified VPN ID across all cable modems.
verbose	(Optional) Displays additional information about the Layer 2 mapping, including the number of packets and bytes received on the upstream and downstream.
customer <i>cust-name</i>	(Optional) Displays the VLAN mappings for this particular customer name.

Command Default

Displays information for all cable modems that have a defined IEEE 802.1Q VLAN mapping.

Command Modes

Privileged EXEC

Command History

Release	Modification
12.2(15)BC2	This command was introduced for Cisco uBR7246VXR universal broadband routers.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA on the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers. Support for the Cisco uBR7225VXR router was added. The vpn keyword was added and the output fields were modified to display L2VPN information.
12.2(33)SCF	This command is obsolete for Cisco uBR10012 Series Universal Broadband Routers.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

This command displays the cable modem to VLAN mappings that have been defined using the **show cable dot1q-vc-map** command. It displays the MAC address, service ID (SID), and cable interface being used by the cable modem, and the interface and VLAN ID to which it has been mapped.

Tip The **customer** option displays only those VLAN mappings that have been configured with a particular customer name, using the **show cable dot1q-vc-map** command.

The command also displays L2VPN information for cable modem traffic and service flows on CMTS router Ethernet interfaces that have been defined using the **show cable l2-vpn-service default-nsi** command.

TLS in Cisco IOS Release 12.2BC Examples

The following example shows typical output for the **show cable l2-vpn dot1q-vc-map** command for all cable modems that are mapped to IEEE 802.1Q VLANs:

```
Router# show cable l2-vpn dot1q-vc-map
MAC Address      Ethernet Interface  VLAN ID  Cable Intf  SID  Priv Bits
0010.7bed.9c95  FE0/0.2             3        Cable4/0    3    0
0007.0e03.69f9  FE0/0.1             4        Cable4/0    1    0
Router#
```

The following example shows typical output for a particular cable modem with the MAC address of 0001.0203.0405:

```
Router# show cable l2-vpn dot1q-vc-map 0001.0203.0405
MAC Address      Ethernet Interface  VLAN ID  Cable Intf  SID  Priv Bits
0010.7bed.9c91  GE2/0              5        Cable5/0    7    0
Router#
```

The following example shows a typical example for the **verbose** option:

```
Router# show cable l2-vpn dot1q-vc-map 0001.0203.0405 verbose
MAC Address          : 0010.7bed.9c91
Prim Sid             : 7
Cable Interface      : Cable5/0
Ethernet Interface   : GigabitEthernet2/0
DOT1Q VLAN ID       : 5
Total US pkts        : 6
Total US bytes       : 1402
Total DS pkts        : 71
Total DS bytes       : 21975
```

This table describes the fields shown in the display.

Table 81: show cable l2-vpn dot1q-vc-map Field Descriptions

Field	Description
MAC Address	Hardware (MAC) address for the CM being mapped.
Ethernet Interface	Destination interface (Ethernet, Fast Ethernet, or Gigabit Ethernet) for the VLAN being used for the mapping.
VLAN ID	Destination VLAN on the Ethernet, Fast Ethernet, or Gigabit Ethernet interface for the traffic coming from the CM.
Cable Intf	Cable interface to which the CM is connected.
SID	Primary service ID (SID) for this cable modem.

Field	Description
Priv Bits	<p>Identifies the current settings of the two privacy bits in the extended header (EH) that is used for BPI-encrypted packets.</p> <ul style="list-style-type: none"> • First bit = Enable bit. Set to 1 when BPI or BPI+ is enabled. • Second bit = Toggle bit. Matches the least-significant bit (LSB) of the key sequence number (KSN) in the EH. <p>For example, a value of “0” indicates that BPI is not enabled. A value of “10” indicates that BPI is enabled and that the KSN is an even number. A value of “11” indicates that BPI is enabled and that the KSN is an odd number.</p> <p>Note For more information on these bits, see the DOCSIS Baseline Privacy Interface Plus Interface Specification (SP-BPI+-I08-020301 or later).</p>
Total US pkts/bytes	Total number of packets and bytes sent on the upstream to the Layer 2 tunnel by this cable modem.
Total DS pkts/bytes	Total number of packets and bytes received on the downstream from the Layer 2 tunnel by this cable modem.

L2VPN over Cable in Cisco IOS Release 12.2SB Examples

The following example shows sample output of VLAN information for all cable modems configured for L2VPN support:

```
Router# show cable l2-vpn dot1q-vc-map
MAC Address      Ethernet Interface      VLAN ID   Cable Intf  SID   Customer Name/VPN ID
0014.f8c1.fd66  GigabitEthernet4/0/0    68       Cable6/0/0  3     0234560001
```

The following example shows sample output of VLAN information for a VPN with ID 0234560001:

```
Router# show cable l2 dot1q-vc-map vpn 0234560001
MAC Address      Ethernet Interface      VLAN ID   Cable Intf  SID   Customer Name/VPNID
0014.f8c1.fd66  GigabitEthernet4/0/0    68       Cable6/0/0  3     0234560001
```

The following example shows sample output of VLAN information for a VPN with ID 0234560001 on the cable modem with MAC address 0014.f8c1.fd66:

```
Router# show cable l2-vpn dot1q-vc-map 0014.f8c1.fd66 vpn 0234560001
MAC Address      Ethernet Interface      VLAN ID   Cable Intf  SID   Customer Name/VPNID
0014.f8c1.fd66  GigabitEthernet4/0/0    68       Cable6/0/0  3     0234560001
```

The following example shows sample output of detailed VLAN information for a VPN with ID 0234560001 on the cable modem with MAC address 0014.f8c1.fd66:

```
Router# show cable l2-vpn dot1q-vc-map 0014.f8c1.fd66 vpn 0234560001 verbose
MAC Address      : 0014.f8c1.fd66
Prim Sid         : 3
Cable Interface  : Cable6/0/0
VPN ID          : 0234560001
L2VPN SAID      : 12294
```

```

```

This table describes the fields shown in the display.

Table 82: show cable l2-vpn dot1q-vc-map with L2VPN Field Descriptions

Field	Description
MAC Address	Hardware (MAC) address for the CM being mapped.
Prim Sid	Primary service ID for the CM.
Cable Interface	Cable interface to which the CM is connected.
L2VPNs provisioned	Number of L2VPNs supported by the CM.
DUT Control/CMIM	State of Downstream Unencrypted Traffic (DUT) filtering and Cable Modem Interface Mask (CMIM).
VPN ID	Identification number of the Layer 2 VPN tunnel.
L2VPN SAID	Layer 2 VPN Security Association Identifier (SAID).
Upstream SFID	Upstream Service Flow Identifier (SFID).

Field	Description
Downstream CFRID [SFID]	Downstream classifiers (classifier identifiers) and corresponding downstream service flows identifiers for this L2VPN.
CMIM	Cable Modem Interface Mask.
Ethernet Interface	Ethernet Network System Interface (NSI).
DOT1Q VLAN ID	Destination VLAN on the Ethernet, Fast Ethernet, or Gigabit Ethernet interface for the traffic coming from the CM.
Total US pkts/bytes	Total number of packets and bytes sent on the upstream to the Layer 2 tunnel by this CM.
Total US pkt/byte Discards	Total number of packets and bytes dropped on the upstream to the Layer 2 tunnel by this CM.
Total DS pkts/bytes	Total number of packets and bytes received on the downstream from the Layer 2 tunnel by this CM.
Total DS pkt/byte Discards	Total number of packets and bytes dropped on the downstream from the Layer 2 tunnel by this CM.

Related Commands

Command	Description
cable l2-vpn-service dot1q	Enables the use of Layer 2 tunnels for the Customer Premises Equipment (CPE) traffic that is behind cable modems so that individual CPE traffic can be routed over a particular Virtual Local Area Network (VLAN).
cable dot1q-vc-map	Maps a cable modem to a particular VLAN on a local outbound Ethernet interface.
cable l2-vpn-service default-nsi	Configures an Ethernet Network System Interface for Layer 2 VPN support over cable.
debug cable l2-vpn	Displays debugging messages for the Layer 2 mapping of cable modems to particular PVCs or VLANs.

show cable l2-vpn vc-map

To display the mapping of one or all cable modems to permanent virtual connections (PVC) on Asynchronous Transfer Mode (ATM) interfaces, use the **show cable l2-vpn vc-map** command in privileged EXEC mode.

```
show cable l2-vpn vc-map [mac-address] [customer cust-name]
```

Syntax Description		
	<i>mac-address</i>	(Optional) Displays the mapping for the cable modem with the specified hardware (MAC).
	customer <i>cust-name</i>	(Optional) Displays the PVC mappings for this particular customer name.

Command Default Displays information for all cable modems that have a defined ATM PVC mapping.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(11)BC3	This command was introduced for Cisco uBR7100 series and Cisco uBR7246VXR universal broadband routers.
	12.2(15)BC2	Support was added for the customer option.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines This command displays the cable modem to ATM PVC mappings that have been defined using the **cable vc-map** command. It displays the MAC address, service ID (SID), and cable interface being used by the cable modem, and the ATM interface and PVC/PVI to which it has been mapped.

Tip The **customer** option displays only those PVC mappings that have been configured with a particular customer name, using the **cable vc-map** command.

Examples

The following example shows typical output for the **show cable l2-vpn vc-map** command for all cable modems that are mapped to ATM PVCs:

```
Router# show cable l2-vpn vc-map
MAC Address    ATM Intf    VPI/VCI    Cable Intf  SID    Priv Bits
0010.7bed.9c95 ATM2/0.2    1/2        Cable4/0    3      0
0007.0e03.69f9 ATM2/0.1    1/1        Cable4/0    1      0
Router#
```

The following example shows typical output for a particular cable modem with the MAC address of 0001.0203.0405:

```
Router# show cable l2-vpn vc-map 0001.0203.0405
```

show cable l2-vpn vc-map

```

MAC Address      ATM Intf      VPI/VCI      Cable Intf  SID  Priv Bits
0001.0203.0405  ATM3/0.2      1/2          Cable5/0    3    0
Router#

```

Table 83: show cable l2-vpn vc-map Field Descriptions

Field	Description
MAC Address	Hardware (MAC) address for the CM being mapped.
ATM Intf	Destination ATM interface that contains the VPI/VCI being used for the mapping.
VPI/VCI	Destination VPI/VCI on the ATM interface for the traffic coming from the CM.
Cable Intf	Cable interface to which the CM is connected.
SID	Primary service ID (SID) for this cable modem.
Priv Bits	<p>Identifies the current settings of the two privacy bits in the extended header (EH) that is used for BPI-encrypted packets.</p> <ul style="list-style-type: none"> • First bit = Enable bit. Set to 1 when BPI or BPI+ is enabled. • Second bit = Toggle bit. Matches the least-significant bit (LSB) of the key sequence number (KSN) in the EH. <p>For example, a value of “0” indicates that BPI is not enabled. A value of “10” indicates that BPI is enabled and that the KSN is an even number. A value of “11” indicates that BPI is enabled and that the KSN is an odd number.</p> <p>Note For more information on these bits, see the DOCSIS Baseline Privacy Interface Plus Interface Specification (SP-BPI+-I08-020301 or later).</p>

Related Commands

Command	Description
cable l2-vpn-service atm-vc	Enables the use of Layer 2 tunnels for the Customer Premises Equipment (CPE) traffic that is behind cable modems, so that individual CPE traffic can be routed to a particular PVC on an ATM interface.
cable vc-map	Maps a cable modem to a particular PVC on an ATM interface.
debug cable l2-vpn	Displays debugging messages for the Layer 2 mapping of cable modems to particular PVC on an ATM interface.

show cable l2-vpn xconnect

To display details about the mapping between a Multiprotocol Label Switching (MPLS) pseudowire and its virtual circuits, use the **show cable l2-vpn xconnect** command in privileged EXEC mode.

```
show cable l2-vpn xconnect {dot1q-vc-map | mpls-vc-map}[ customer customer-name | mac-address
| vpn vpn-id [verbose]
```

Syntax Description		
dot1q-vc-map		Specifies the mapping of one or all cable modems to IEEE 802.1Q Virtual Local Area Networks (VLANs) on the Ethernet interfaces of a router.
mpls-vc-map		Specifies the mapping between an MPLS pseudowire and its virtual circuits.
mac-address		(Optional) MAC address for a cable modem.
customer customer-name		(Optional) Specifies the customer name.
state		(Optional) Specifies the state of all virtual circuits.
vpn vpn-id		(Optional) Displays Layer 2 VPN information on a cable modem with the specified MAC address, or for the specified VPN ID across all cable modems.
verbose		(Optional) Specifies verbose mode for the output, giving additional details about the mapping between an MPLS pseudowire and its virtual circuits.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
	12.2(33)SCF	This command was modified. The verbose keyword option was added.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Examples

Example of the show cable l2-vpn xconnect Command for the Mapping Between an MPLS Pseudowire and All Virtual Circuits

The following is a sample output of the **show cable l2-vpn xconnect** command that shows the mapping between an MPLS pseudowire and all virtual circuits on a Cisco uBR10012 router:

```
Router# show cable l2-vpn xconnect mpls-vc-map
MAC Address      Peer IP Address  VCID      CktID      Cable Intf  SID  Customer
Name/VPNID
0000.396e.6a68  101.1.0.2       221       Bu254:221  Cable7/0/0  1    customer1
```

show cable l2-vpn xconnect

```

0014.f8c1.fd66 10.76.1.1      2004      Bu254:5121  Cable7/0/0  8
0019.474a.d566 10.76.1.1      2001      Bu254:5122  Cable7/0/0  4      0234560002

Example of the show cable l2-vpn xconnect Command for a Particular MAC Address

The following sample output displays the mapping between an MPLS pseudowire and the virtual circuit for a particular MAC address of a cable modem on a Cisco uBR10012 router:

```

Router# show cable l2-vpn xconnect mpls-vc-map 0000.396e.6a68
MAC Address      Peer IP Address  VCID      CktID      Cable Intf  SID  Customer
Name/VPNID
0000.396e.6a68  101.1.0.2       221       Bu254:221  Cable7/0/0  1    customer1

```

Example of the show cable l2-vpn xconnect Command for a Particular Customer

The following sample output displays the mapping between an MPLS pseudowire and all virtual circuits configured for a particular customer on a Cisco uBR10012 router:

```

Router# show cable l2-vpn xconnect mpls-vc-map customer1
MAC Address      Peer IP Address  VCID      CktID      Cable Intf  SID  Customer
Name/VPNID
0000.396e.6a68  101.1.0.2       221       Bu254:221  Cable7/0/0  1    customer1

```

Example of the show cable l2-vpn xconnect Command that Shows Information About the State of All Virtual Circuits

The following sample output displays the state of all virtual circuits associated with an MPLS pseudowire on a Cisco uBR10012 router:

```

Router# show cable l2-vpn xconnect mpls-vc-map state
Peer IP Address  VCID      STATE  MAC Address      Customer Name/VPNID  STATE
101.1.0.2       22        DOWN  0000.396e.6a68  customer1             UP

The table describes the fields shown in the **show cable l2-vpn xconnect** command display.

Table 84: show cable l2-vpn xconnect Field Descriptions

Field	Description
MAC Address	MAC address of a cable modem.
Peer IP Address	IP address of the remote provider edge router.
VCID	Virtual circuit ID.
CktID	Circuit ID.
Cable Intf/Interface	Cable interface for the MPLS pseudowire.
SID	Service ID.
STATE	State of all virtual circuits.
Customer Name	Customer name.
Prim Sid	Primary service ID.
MPLS-EXP	Multiprotocol Label Switching experimental bit value.
PW TYPE	Pseudowire type.
Backup enable delay	Interval to enable backup.
Backup disable delay	Interval to disable backup.
Peer IP Adress (Active)	IP address of the active peer router.
XConnect VCID	Xconnect virtual circuit ID.
Circuit ID	Circuit ID.
Local State	Local state.
Remote State	Remote state.

Field	Description
Total US pkts	Total number of packets sent on the upstream.
Total US bytes	Total number of bytes sent on the upstream.
Total US pkts discards	Total number of packets discarded on the upstream.
Total US bytes discards	Total number of bytes discarded on the upstream.
Total DS pkts	Total number of packets received on the downstream.
Total DS bytes	Total number of bytes received on the downstream.
Total DS pkts discards	Total number of packets discarded on the downstream.
Total DS bytes discards	Total number of bytes discarded on the downstream.

The following examples show the output of the show cable l2-vpn xconnect command on the Cisco cBR router:

```
Router# show cable l2-vpn xconnect mpls-vc-map
MAC Address      Peer IP Address VCID Type Prio CktID      Cable Intf SID Customer Name/VPNID

Related Commands

Command	Description
show xconnect	Displays information about attachment circuits and pseudowires.

show cable leasequery-filter

To display the number of Dynamic Host Configuration Protocol (DHCP) LEASEQUERY request messages that have been filtered for all cable modems (CMs) or for a particular cable interface, use the **show cable leasequery-filter** command in privileged EXEC mode.

```
show cable leasequery-filter [{cable | {slot/portslot/subslot/port } | [{requests-filtered
[{minimum-requests}]}]]]
```

Cisco cBR Series Converged Broadband Router

```
show cable leasequery-filter cable slot/subslot/cable-interface-index[{requests-filtered
[{minimum-requests}]}]]]
```

Syntax Description	
cable <i>slot/port</i>	(Optional) Displays information for all CMs on the specified cable interface and downstream port on the Cisco uBR7200 series routers. <ul style="list-style-type: none"> • <i>slot</i> —3 to 6 • <i>port</i> —0 or 1 (depending on the cable interface)
cable <i>slot/subslot/port</i>	(Optional) Displays information for all CMs on the specified cable interface on the Cisco uBR10012 router. The following are the valid values: <ul style="list-style-type: none"> • <i>slot</i> —5 to 8 • <i>subslot</i> —0 or 1 • <i>port</i> —0 to 4 (depending on the cable interface)
cableslot/subslot/cable-interface-index	(Optional) Displays information for all CMs on the specified cable interface on the Cisco uBR10012 router. The following are the valid values: <ul style="list-style-type: none"> • <i>slot</i> —0 to 3 and 6 to 9 • <i>subslot</i> —0 • <i>cable-interface-index</i> — 0 to 15
requests-filtered	(Optional) Displays the number of DHCP LEASEQUERY requests that have been filtered for each particular cable modem on a cable interface. <ul style="list-style-type: none"> • <i>minimum-requests</i> —(Optional) Displays only those cable modems for which the router has filtered at least this minimum number of lease queries. The valid range is from 1 to 65535, with a default of 1.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(15)BC1d, 12.2(15)BC2b	This command was introduced.

Release	Modification
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCF1	This command was modified. The command output has been augmented to display IPv6 data.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The <i>cable-interface-index</i> variable is added.

Usage Guidelines

The **show cable leasequery-filter** command displays the total number of DHCP LEASEQUERY requests that have been filtered on a Cisco Cable Modem Termination System (CMTS) router and on a particular cable interface. This command can also optionally display details for each particular cable modem on an interface that has had DHCP lease queries filtered.

Examples

The following examples show how to display the total number of DHCP LEASEQUERY requests that have been filtered on the router and on a particular cable interface:

```
Router# show cable leasequery-filter
Lease Query Filter statistics for Unknown Sid
Requests Sent : 138 total. 41 unfiltered, 97 filtered
Router# show cable leasequery-filter cable 8/1/0

Lease Query Filter statistics for Cable8/1/0:
Requests Sent : 35 total. 25 unfiltered, 10 filtered
```

The following examples show how to display the total number of DHCP LEASEQUERY requests that have been filtered on the router and on a particular cable interface in Cisco IOS Release 12.2(33)SCF1:

```
Router# show cable leasequery-filter
IPv4 Lease Query Filter statistics for Unknown Sid
Requests Sent : 0 total. 0 unfiltered, 0 filtered
IPv6 Lease Query Filter statistics for Unknown Sid
Requests Sent : 0 total. 0 unfiltered, 0 filtered
Router# show cable leasequery-filter cable 7/0/0

IPv4 Lease Query Filter statistics for Cable7/0/0:
Requests Sent : 0 total. 0 unfiltered, 0 filtered
IPv6 Lease Query Filter statistics for Cable7/0/0:
Requests Sent : 0 total. 0 unfiltered, 0 filtered
```

The following example shows how to display a list of cable modems on a cable interface and the number of DHCP LEASEQUERY messages that have been filtered for each interface:

```
Router# show cable leasequery-filter cable 8/1/0 requests-filtered

Sid   MAC Address      IP Address      Req-Filtered
1     0050.7366.1243  92.1.1.20      0
2     0007.0e06.953b  95.1.1.24      0
3     0007.0e06.97b5  93.1.1.24      2
4     00d0.ba45.4bd5  91.1.1.35      0
```

show cable leasequery-filter

```

5    0007.0e06.9773 95.1.1.23      12
6    0001.42aa.737d 94.1.1.23      645
7    0001.42aa.738b 95.1.1.22      0
8    00d0.ba45.4955 92.1.1.23      0
9    0007.0e06.51ef 94.1.1.25      0
10   00d0.ba77.743b 91.1.1.36      3
11   0001.42aa.6e6f 93.1.1.22      2
12   0007.0e06.512f 91.1.1.23      2
13   0007.0e06.5137 92.1.1.25      0
14   0007.0e06.9be7 92.1.1.24      0
15   0002.b970.0027 92.1.1.22      1
16   0001.42aa.738d 91.1.1.21      10

```

The following example shows how to display a list of cable modems on a cable interface and the number of DHCP LEASEQUERY messages that have been filtered for each interface in Cisco IOS Release 12.2(33)SCF1:

```
Router# show cable leasequery-filter cable 8/1/0 requests-filtered
```

```

Sid  MAC Address      IP Address      Req-Filtered
1    0018.6835.2756 0.0.0.0        0
2    0025.2e2d.7440 0.0.0.0        0
Sid  MAC Address      IP Address      Req-Filtered
1    0018.6835.2756 2001:DB8:1::1  0
2    0025.2e2d.7440 2001:DB8:1::2  0

```

The following example shows how to display a list of cable modems on a cable interface that have had ten or more DHCP LEASEQUERY messages that have been filtered:

```
Router# show cable leasequery-filter cable 8/1/0 requests-filtered 10
Sid  MAC Address      IP Address      Req-Filtered
5    0007.0e06.9773 95.1.1.23      12
6    0001.42aa.737d 94.1.1.23      645
16   0001.42aa.738d 91.1.1.21      10

```

This example shows the output of the **show cable leasequery-filter** command for the Cisco cBR Series Converged Broadband Router:

```

Router#show cable leasequery-filter cable 1/0/0
IPv4 Lease Query Filter statistics for Cable1/0/0:
Requests Sent : 0 total. 0 unfiltered, 0 filtered
IPv6 Lease Query Filter statistics for Cable1/0/0:
Requests Sent : 0 total. 0 unfiltered, 0 filtered

Router#show cable leasequery-filter
IPv4 Lease Query Filter statistics for Unknown Sid
Requests Sent : 0 total. 0 unfiltered, 0 filtered

```

Table 85: show cable leasequery-filter Field Descriptions

Field	Description
Sid	Service ID (SID) of the device.
MAC Address	Hardware (MAC-layer) address of the cable modem or CPE device.
IP Address	IP address of the cable modem (CMs) or customer premises equipment (CPE).

Field	Description
Req-Filtered	Total number of Address Resolution Protocol (ARP) requests that the device has generated or forwarded.

Related Commands

Command	Description
cable arp	Activates the cable ARP.
cable arp filter	Controls the number of ARP requests and replies that are forwarded on a cable interface.
cable source-verify	Enables verification of IP addresses for CMs and CPE devices on the upstream.
cable source-verify leasequery-filter downstream	Controls the number of DHCP lease query messages that are sent for unknown IP addresses on all cable downstream interfaces on the Cisco CMTS router.
cable source-verify leasequery-filter upstream	Controls the number of DHCP lease query messages that are sent for unknown IP addresses for each SID on an upstream.

show cable leasequery-stats

To display the IPv4 cable leasequery packet processing statistics. Counters collect statistics and show the queries that are sent to the DHCP server and the replies received by the cBR-8 routers. Use the **show cable leasequery-stats** command in the privileged EXEC mode.

show cable leasequery-stats [**clear**]

Cisco cBR Series Converged Broadband Router

show cable leasequery-stats [**clear**]

Syntax Description

clear	(Optional) Resets all DHCPv4 counters on the cBR-8 router to zero.
--------------	--

Command Modes

Privileged EXEC (#)

Release	Modification
17.6.1z	This command was introduced.

Usage Guidelines

The **show cable leasequery-stats** command displays the IPv4 cable leasequery packet processing statistics. The counters are grouped by queries and replies.

Examples

The following example shows the IPv4 cable leasequery statistics output on the cBR-8 router:

```
Router# show cable leasequery-stats
IPv4 Source Verify LeaseQuery Statistics:
Queries: 1 sent, 0 timed out
Replies: 1 allowed, 0 rogues, 0 dropped
```

Table 86: show cable leasequery-stats Field Descriptions

Field	Description
Queries	
Sent	Number of leasequeries sent by cBR-8.
Timed out	Number of leasequeries timed out before receiving replies.
Replies	
Allowed	Number of replies that are valid, so that the CPE traffic is allowed.
Rogue	Number of replies that indicate a CPE is a rogue device, so that the CPE is added into the rogue list.
Dropped	No of replies that are invalid, so they are dropped without further processing.

show cable licenses all

To view license information as applied to RF channels on the CMTS chassis, use the `show cable licenses all` command in the privileged EXEC mode.

show cable licenses all

Syntax Description This command has no arguments or keywords.

Command Default Disabled

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCE	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Examples

The following example indicates information about licenses applied to RF channels on the CMTS chassis.

```
Router# show cable licenses all

Router#

If you enable Core Peak Bandwidth (CPB), the **show cable licenses all** command displays only the CPB usage information.

```
show cable licenses all
Entitlement: CPB License
Consumed count: 987
Consumed count reported to SmartAgent: 987
Enforced state: No Enforcement
Quarterly CPB is 987 (100Mbps) in the First quarter of 2018.
First monthly CPB is: 103585495480 bps, 987 (100Mbps).
Second monthly CPB is: 103595095264 bps, 987 (100Mbps).
Third monthly CPB is: 103595124064 bps, 987 (100Mbps).
```

Related Commands

Command	Description
show license call-home pak	Displays the stock keeping unit (SKU) list and features available in a product authorization key (PAK).
license call-home install pak	Installs a license by using the Cisco License Call Home feature.

show cable licenses cpb

To view the Core Peak Bandwidth (CPB) license information on the Cisco cBR Series Converged Broadband Router, use the **show cable licenses cpb** command in the privileged EXEC mode.

show cable licenses cpb

[show cable licenses cpb-records year <year> month <month> day <day>]

Syntax Description		
	cpb-records	Shows the history of CPB samples.
	year <year>	Enter the year.
	month <month>	Enter the month.
	day <day>	Enter the date.

This command has no arguments or keywords.

Command Default Disabled

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS XE Fuji 16.9.1	This command was introduced on the Cisco cBR Series Converged Broadband Router.

show cable licenses cpb

This example shows the output of the **show cable licenses cpb** command on the Cisco cBR Series Converged Broadband Router.

```
show cable licenses cpb
Entitlement: CPB License
Consumed count: 987
Consumed count reported to SmartAgent: 987
Enforced state: No Enforcement
Quarterly CPB is 987 (100Mbps) in the First quarter of 2018.
First monthly CPB is: 103585495480 bps, 987 (100Mbps).
Second monthly CPB is: 103595095264 bps, 987 (100Mbps).
Third monthly CPB is: 103595124064 bps, 987 (100Mbps).
```

This example shows the output of the **show cable licenses cpb-records year <year> month <month> day <day>** command on the Cisco cBR Series Converged Broadband Router.

```
show cable licenses cpb-records year 2018 month 4 day 28

```

show cable license wan

To display the WAN license information for the 100G and 10G ports on a Supervisor 250G.

show cable license wan

Syntax Description This command has no arguments or keywords.

Command Default Disabled

Command Modes Privileged EXEC (#)

Release	Modification
IOS-XE 16.8.1	This command was introduced.

The command displays the following information, depending on the **cable license 100G-conversion** configuration.

- With the **cable license 100G-conversion**, the **show cable license wan** would display:

```
Router(config)# show cable licenses wan
-----
Entitlement: WAN License
Consumed count: 20
Consumed count reported to SmartAgent: 20
Enforced state: No Enforcement
```

- With the **no cable license 100G-conversion**, the **show cable license wan** would display:

```
Router(config)# show cable license wan
-----
Entitlement: WAN License
Consumed count: 0
Consumed count reported to SmartAgent: 0
Enforced state: No Enforcement
```

show cable load-balance

To display real-time configuration, statistical and operational information for load balancing operations on the router, use the **show cable load-balance** command in privileged EXEC mode.

```
show cable load-balance [{{group n}}] | all | load | pending | {statistics error [{detail | linecard slot /subslot | summary}]} | target | fiber-node-validation | vdoc}]
```

Cisco cBR Series Converged Broadband Router

```
show cable load-balance [ { all | fiber-node-validation | load | pending | statistics | target | move-history cable slot/subslot/controller-interface-index } ]
```

Syntax Description	
group n	(Optional) Specifies the number of the load balancing group to be displayed. In Cisco IOS Release 12.2(33)SCE3 and earlier, the valid range is from 1 to 336. The range from 1 to 80 is reserved for legacy load balancing groups (LBG). The range from 81 to 336 is reserved for DOCSIS LBGs. In Cisco IOS Release 12.2(33)SCE4 and later, the valid range is from 1 to 256. This range is reserved for legacy LBGs only. In the Cisco cBR Series Converged Broadband Router, this option is not supported.
all	(Optional) Displays all information about the LBG.
load	(Optional) Displays the current interface load and load balancing group assignments.
pending	(Optional) Displays the list of cable modems that are moved from one downstream or upstream to another.
statistics	(Optional) Displays cumulative statistics for load balancing operations.
error detail	(Optional) Displays the error statistics of all the active line card in detail. In the Cisco cBR Series Converged Broadband Router, this option is not supported.
error linecard slot /subslot	(Optional) Displays the error statistics of the line card, which is located in the specified <i>slot/ subslot</i> . In the Cisco cBR Series Converged Broadband Router, this option is not supported.
error summary	(Optional) Displays the error statistics summary for each of the active line cards. In the Cisco cBR Series Converged Broadband Router, this option is not supported.
target	(Optional) Displays the current and target interfaces (upstreams and downstreams) used for load balancing.
fiber-node-validation	(Optional) Displays DOCSIS LBG and channel information after checking if the channel configuration in load balancing fits in the fiber node configuration.
vdoc	(Optional) Displays information about all LBGs that have the rule "video-over-DOCSIS (vdoc)-enabled" configured. In the Cisco cBR Series Converged Broadband Router, this option is not supported.

Command Default

Displays information for all load balancing groups for each cable interface and its current load and load balancing status. Starting with Cisco IOS Release 12.2(33)SCE4, the **show cable load-balance** command supports only the legacy LBGs.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(15)BC1	This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 routers.
12.2(33)SCC	This command was modified. The fiber-node-validation parameter was added to the command.
12.2(33)SCF	This command was modified. The vdoc keyword was added to the command.
12.2(33)SCE4	The valid range for the load balance group was changed.
12.2(33)SCG	A new column in the output displays the group index for the legacy LBG.
12.2(33)SCH1	The output of this command (when used without any keyword) was modified.
12.2(33)SCI	This command was modified. The error keyword was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The group , error (including detail , linecard and summary options), and vdoc keywords were removed
IOS-XE 17.6.1w	The option move-history slot/subslot/controller-interface-index was added.

Usage Guidelines

Use the **show cable load-balance** command to display the current, real-time statistics for load balancing operations.

Use this command to display the status of the **cable load-balance docsis30-enable downstream-only** command.

Examples

The following is a sample output from the **show cable load-balance** command:

```
Router# show cable load-balance

Group  Interval  Method          DCC Init  Threshold
              Technique  Minimum  Static  Enforce  Ugs    PCMM
1       10         service-flows  1         1         2%      2%      ---    ---
2       10         modems         0         5         10%     ---     ---    ---

DOCSIS LB Enabled: No
```

Effective with Cisco IOS Release 12.2(33)SCG, a new column in the output for the **show cable load-balance** command also displays the group index for the legacy LBG. The Group Index column identifies the mapping between the legacy LBG ID and the internal group index of the legacy LBG.

```
Router# show cable load-balance
Legacy Group Interval Method          DCC Init  Threshold
Group  Index  Technique  Minimum  Static  Enforce  Ugs    PCMM
```

```

1      513    30      modems      0      5      10%    ---    ---    ---
2      514    30      modems      0      5      10%    ---    ---    ---

```

Table 87: show cable load-balance Field Descriptions (default display)

Field	Description
Fields for the Default Displays and load Option	
Group Index	Identifies the mapping between the legacy LBG ID and the internal group index of the legacy LBG.
Interface	Cable interface (downstream or upstream) that belongs to a load balancing group.
Group	Number of the load balancing group to which the cable interface has been assigned.

Field	Description
Utilization	<p>This field is a long-term average of the upstream utilization and displays current load usage of the cable interface expressed as a percentage of the total bandwidth. For upstreams, this field shows a single percentage value, which is the average percentage of bandwidth being used on the upstream.</p> <p>For downstreams, this field shows a set of three percentage values:</p> <ul style="list-style-type: none"> • The percentage shows the load usage for the entire interface. • The first percentage, within the parentheses, shows the load for the downstream. • The second percentage, within the parentheses, shows the average load for all upstreams on the downstream. <p>For example, if this field shows 18%(18%/12%), it indicates that downstream and upstream channels on the interface are running on an average load of 18 percent. The downstream is running on an average load of 18 percent and all upstreams for this downstream are running on an average load of 12 percent.</p> <p>Note To view the short-term average of the utilization, use the show interface cable mac-scheduler command.</p>
State	<p>Current state of the cable interface.</p> <p>The following states indicate normal operational states, depending on the configuration:</p> <ul style="list-style-type: none"> • down—Interface is shut down. The CMTS cannot use the interface for load balancing in this state. • initial—Interface is currently in the initialization phase. The CMTS uses the interface for load balancing after the initialization completes. • up—Interface is up and passing traffic. The CMTS actively uses the interface for load balancing. • testing—Interface is currently under a load balancing test. The CMTS is unable to use the interface for normal load balancing operations until the test completes. <p>The following states indicate abnormal states. The CMTS does not use interfaces in these states for load balancing operations, but continues to monitor and update the status every time the CMTS polls the interfaces for their current load usage:</p> <ul style="list-style-type: none"> • suspicious—Interface is in an unknown state. The interface might be up and passing traffic, but is not consistent enough to support load balancing operations. The CMTS attempts to reinitialize the interface after a timeout period. If the interface has failed initialization more than 10 times, the CMTS moves the interface to the disabled state. • disabled—Interface has been disabled because a load balancing test is in-progress or because the interface reinitialization failed after 10 attempts. • unstable—Interface has failed repeated initialization attempts. The CMTS will attempt to reinitialize the interface after a timeout period. If a load balance test is not in-progress and if reinitialization fails, the CMTS moves it to the unstable state.
Reserved	Percentage of bandwidth that is currently reserved by unsolicited grant service (UGS) service flows.
Modems	Number of cable modems currently online on this cable interface.
Weight	Interface bandwidth, in megabits per second (mbps), for the downstream or upstream. The system uses this value in calculating whether the loads on the interfaces are balanced. Changing a channel parameter, such as modulation profile or channel width, affects the channel bandwidth and weight value.
Additional Fields When Displaying Load Balancing Groups	

Field	Description
Interval	Indicates in seconds, the current load on each cable interface in the LBG as configured using the cable load-balance group interval command.
Method	Load balancing method used for the LBG as configured using the cable load-balance group (global configuration) command.
Threshold	<p>Thresholds configured for this load balancing group:</p> <ul style="list-style-type: none"> • M = Minimum <p>Minimum difference in the number of cable modems or service flows that can exist on two interfaces in the group before cable modems are moved between the interfaces. If the imbalance between interfaces is below this value, cable modems are not moved. This field contains a value only when the group is configured for the modems or service flows method of load balancing. (This value is configured using the load minimum option of the cable load-balance group threshold command.)</p> <ul style="list-style-type: none"> • S = Static <p>Minimum difference in the percentage of total load that must exist between interfaces in a load balancing group before the Cisco CMTS performs static load balancing. When the load between interfaces is greater than this value, cable modems that are in the process of registering with the CMTS are moved between interfaces until the load difference is again below this value. (This value is configured using the load option of the cable load-balance group threshold command.)</p> <ul style="list-style-type: none"> • E = Enforce <p>Minimum difference in the percentage of total load that must exist between interfaces in a load balancing group before the Cisco CMTS performs dynamic load balancing and begins moving cable modems that are currently online. When the difference in load between two interfaces falls below this value, the CMTS stops dynamic load balancing and performs static load balancing. (This value is configured using the enforce option of the cable load-balance group threshold command.)</p> <ul style="list-style-type: none"> • U = Ugs <p>Percentage of the bandwidth that is allocated for Unsolicited Grant Services (UGS) traffic, such as Voice-over-IP (VoIP), that is in use on an interface because the CMTS moves cable modems that are online with active UGS service flows. (This value is configured using the ugs option of the cable load-balance group threshold command.)</p> <ul style="list-style-type: none"> • P = PacketCable MultiMedia (PCMM) • Percentage of the reserved bandwidth threshold. Above this level, cable modems with active PCMM service flows participate in load balancing. The default threshold is 70%.
Additional Fields for the target Option	
Interface	Source downstream or upstream interface that is part of a cable load balancing group. If the Target field contains a value, it indicates that the source interface is currently oversubscribed. To reduce the cable load, the CMTS moves cable modems from the source interface to the target interface.

Field	Description
Target	<p>Downstream or upstream interface to which cable modems on the source interface are being moved as part of load balancing operations. This field indicates the following:</p> <ul style="list-style-type: none"> • If it is a downstream interface, the display shows the center frequency of the downstream within parentheses. • If only a frequency is shown, it indicates that the CMTS is moving cable modems to a different center frequency on the same downstream interface. • When the display includes the words “enforce”, it indicates that the CMTS is performing dynamic load balancing on the interfaces. • If this field is blank, it indicates that the source interface is not oversubscribed.
Additional Fields for the statistics Option	
Target interface	Downstream or upstream interface. If this is a downstream interface, the display shows the center frequency of the downstream within parentheses.
Transfers	<p>The following information is tracked for the indicated target interface:</p> <ul style="list-style-type: none"> • complete—Number of cable modems successfully moved to the target interface. • pending—Number of cable modems in the process of being moved to the target interface. • retries—Number of times that the CMTS unsuccessfully tried to move the same cable modem to the target interface. This occurs when one or more MAC layer messages to the cable modem are dropped due to radio frequency (RF) noise or because the modem is not DOCSIS-compliant. If the number of retries exceeds five for a particular cable modem, the CMTS counts this as a failure. • failures—Number of times that the CMTS exceeded the maximum number of allowable retries (5) when trying to move a particular cable modem to the target interface. A large number of failures could indicate one or more possible problems: <ul style="list-style-type: none"> • The specific cable modems are not DOCSIS-compliant. • One or both interfaces are having problems passing traffic. • One or both interfaces are having persistent RF noise problems. • The source and target interfaces are not combined in the same node and do not share the same physical connectivity (which is required when interfaces are part the same load balancing group).
Additional Fields for the pending Option	
Modem	Hardware (MAC) address of the cable modem that is moved as part of load balancing operations.
Source interface	Downstream or upstream cable interface on which the cable modem is currently online.
Target interface	Downstream or upstream cable interface to which the CMTS is trying to move the cable modem to load balance the interfaces in this load balancing group. If the CMTS is moving the cable modem to a different frequency on the same downstream interface, this field shows only the new center frequency.
Retries	Number of times that the CMTS has attempted to move this cable modem to the target interface. The CMTS attempts to move the cable modem 5 times before counting this load balancing move as a failure.
Additional Fields for the fiber-node-validation Option	

show cable load-balance

Field	Description
DOCSIS LBG ID	The DOCSIS LBG ID.
Channel	The upstream or downstream channel that is associated with the DOCSIS LBG.
Fiber-node list	The list of all fiber nodes that include the channel.
Additional Fields for the move-history option	
Modem	The mac address of the moved cable modem
Host Interface	The mac-domain of the cable modem.
Group ID	The load balance group ID of cable modem.
Primary RF/RCC Source	Old downstream information of the cable modem, including the primary downstream channel, RCC ID before moving.
Primary RF/RCC Target	New downstream information of the cable modem, including the new primary downstream channel, RCC ID after moving.
MD/TCS Source	Old upstream information of the cable modem including the index of mac-domain, the bitmap of the upstream channel before moving.
MD/TCS Target	New upstream information of the cable modem including the index of mac-domain, the bitmap of the upstream channel after moving.
Action	The action of the cable modem movement, such as DBC, DCC, UCC, REINIT(DCC with init-tech 0).
Trans-Start Time	The trigger of the cable modem movement, such as D2.0 LB, D3.0 static LB, D3.0 dynamic LB.
Elapse Time (ms)	The start time of the cable modem movement.
Client	The elapsed time - how long the cable modem movement spent.
Result	The result of the action on modem movement - success, failure, and the internal confirmation code.

The following is a sample output from the **vdoc** keyword of the **show cable load-balance** command:

```
Router# show cable load-balance vdoc

Related Commands

Command	Description
cable load-balance group policy ugs	Configures how the Cisco CMTS should load balance cable modems with active unsolicited grant service (UGS) service flows.
cable load-balance group threshold	Configures the threshold values that a load balancing group should use for load balancing operations.
show cable load-balance docsis-group	Displays real time configurational, statistical, and operational information of the load balancing operations on the router.

show cable load-balance docsis-group

To display real-time configurational, statistical, and operational information of the load balancing (LB) operations on the router, use the **show cable load-balance docsis-group** command in privileged EXEC mode.

Cisco uBR10012 Router

```
show cable load-balance docsis-group {docsis-group-id | FN fn-id MD cable slot / subslot
/ controller-interface-index} [{all | load | pending | restrict | statistics | target | modem-list | primary-load
| rcs-cm-list}]
```

Cisco uBR7225VXR and Cisco uBR7246VXR Routers

```
show cable load-balance docsis-group {docsis-group-id | FN fn-id MD cable slot /port} [{all |
init-tech-ovr | load | modem-list | pending | service-type-id | statistics | tag | target | vdoc}]
```

Cisco cBR Series Converged Broadband Router

```
show cable load-balance docsis-group {docsis-group-id | FN fn-id MD cable slot / subslot
/ controller-interface-index} [{all | pending | restrict | rfch-util | service-type-id | tag | move-history
}]
show cable load-balance docsis-group {docsis-group-id} [{load | modem-list | statistics |
target}] [{wideband | dbg}]
```

Syntax Description

<i>docsis-group-id</i>	DOCSIS load balancing group ID. The group ID is in the range of 1 to 2147483647.
FN <i>fn-id</i>	Specifies the fiber node (FN) where certain DOCSIS 3.0 GLBG parameters, such as disable , docsis-policy , init-tech-list , interval , method , policy , and threshold , can be configured.
MD cable <i>slot/subslot/cable-interface-index</i>	Specifies the MAC domain interface of the fiber node. <ul style="list-style-type: none"> <i>slot</i>—Slot where the line card resides. The permitted range is from 5 to 8. <i>subslot</i>—Subslot where the line card resides. The available slots are 0 or 1. <i>cable-interface-index</i>—Downstream controller number on the line card. The permitted range is from 0 to 4. For Cisco cBR Series Converged Broadband Router, the valid range is 0 to 15.
MD cable <i>slot/port</i>	Specifies the MAC domain interface of the fiber node on the Cisco uBR7246VXR or Cisco uBR7225VXR routers. <ul style="list-style-type: none"> <i>slot</i>—Slot where the line card resides. <ul style="list-style-type: none"> Cisco uBR7225VXR router—The valid range is from 1 to 2. Cisco uBR7246VXR router—The valid range is from 3 to 6. <i>port</i>—The downstream controller port on the line card. The permitted values are 0 or 1.
all	(Optional) Displays all load balancing group information.

init-tech-ovr	(Optional) Displays the initialization technique override rules associated with this DOCSIS load balancing group (LBG). Not supported on Cisco cBR Series Converged Broadband Router
load	(Optional) Displays current interface load and LBG assignments.
modem-list	(Optional) Displays cable modems assigned to the specified DOCSIS LBG.
move-history	(Optional) Displays detailed information for every cable modem movement triggered through load balance.
pending	(Optional) Displays a list of cable modems that are pending movement from one downstream or upstream to another.
primary-load	(Optional) Displays the primary channel load information for specified DOCSIS LBG. Not supported on Cisco cBR Series Converged Broadband Router
restrict	(Optional) Displays the restricted cable modem list associated with this DOCSIS LBG.
rfch-util	(Optional) Displays the RF channel utilization.
service-type-id	(Optional) Displays information about the service type ID list associated with this DOCSIS LBG.
statistics	(Optional) Displays cumulative statistics of load balancing operations for one group.
tag	(Optional) Displays the tag list associated with this DOCSIS LBG.
target	(Optional) Displays current and target interfaces (upstream and downstream) used for load balancing.
vdoc	(Optional) Displays information about the state of the video-over-DOCSIS (VDOC) LB for the particular LBG. Not supported on Cisco cBR Series Converged Broadband Router
rsc-cm-list	(Optional) Displays the cable modems used for load balancing within the RCS and the utilization of each wideband interface. Not supported on Cisco cBR Series Converged Broadband Router
wideband	(Optional) Displays the current wideband load, cable modem's associated to wideband interface in the DOCSIS 3.0 load balancing group, wideband target interface, and wideband interface statistics.
dbg	(Optional) Displays the potential target dynamic bonding group for each of the source bonding groups.

Command Default

Displays information of all load balancing groups for each cable interface with its current load and load balancing status.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
12.2(33)SCF	The output for this command is enhanced to include more load balancing statistics for cable modems (CMs) provisioned in the multiple receive channel (MRC) and multiple transmit channel (MTC) mode. The output for the load keyword includes information about narrowband and wideband CMs.
12.2(33)SCH	This command was modified. The primary-load keyword was added. The output for this command is enhanced to include a new field MUPFXLR that provides more status information for the modem-list keyword.
12.2(33)SCI	This command was modified. The rcs-cm-list keyword was added. The output for the statistics keyword was enhanced to support DOCSIS3.0 load balance.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The init-tech-ovr , primary-load , rcs-cm-list and vdcc keywords are not supported
IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The rfch-util and wideband keyword was added.
IOS-XE 16.7.1	The command was modified. The dbg keyword was added.
IOS-XE 17.6.1w	The command was modified. The option move-history was added.

Usage Guidelines

Use the **show cable load-balance docsis-group** command to display the current, real-time statistics for load balancing operations.

In Cisco IOS Release 12.2(33)SCH, the **primary-load** keyword was added to to display the primary channel load information. The **primary-load** keyword is optional and is used with *docsis-group-id*.

The **show cable load-balance docsis-group primary-load** command is associated with [Target RCS Selection for Static Load Balancing](#) feature.

Effective with Cisco IOS Release 12.2(33) SCI, the output of the **statistics** keyword was modified to display the following additional parameters:

- Failure statistics for Dynamic Bonding Change (DBC).
- Load balancing total attempts

Examples

Target RCS Selection for Static Load Balancing

The following is a sample output of the **show cable load-balance docsis-group** command:

```
Router# show cable load-balance docsis-group 1

Table 89: show cable load-balance docsis-group - Field Description for QAM channel utilization

Field	Description
Interface	Downstream channel interface name.
Pstate	For primary capable channel downstream, the following Pstate are present: <ul style="list-style-type: none"> • initial • up • down • disable • moving
Pending-In	The modem is moving in.
Pending-Out	The modem is moving out.
Throughput (Kbps)	The channel's current throughput.
Util	The channel's current utilization in percentage.

The following example shows the modified output of the **show cable load-balance docsis-group** command:

```
Router#show cable load-balance docsis-group

Table 90: show cable load-balance docsis-group - Field Description for MUPFXLR status field

Field	Description
MUPFXLR field descriptions	
Multicast (M)	Multicast session operating on the modem. It indicates a host behind a cable modem that has joined an IGMP group. Verify this status using the show cable modem verbose in Features Bitmask command.
UGS (U)	Indicates that a cable modem has UGS service flows. This configuration can be verified by show cable modem qos in UGS
Packetcable (P)	Indicates that a cable modem has one or more Packetcable gate. This status can be verified by show packetcable gate summary and show cable modem cpe commands.
max-Failures (F)	Indicates that a cable modem has reached maximum failure threshold. This status can be verified by the show cable modem internal load command.
eXcluded (X)	Indicates that a cable modem is listed in the list of excluded modems. This status can be verified by the show running-config begin load-balance exclude command.
L2VPN (L)	Indicates that a cable modem is provisioned in L2VPN service. This status can be verified by the show cable l2-vpn xconnect command.
RSVP (R)	Indicates that a cable modem has RSVP flows. This status can be verified by the show cable modem verbose in Features Mask command.

The following is a sample output of the **show cable load-balance docsis-group modem-list** command on the modular cable configuration:

```
Router# show cable load-balance docsis-group 23 modem-list

```

Table 91: show cable load-balance docsis-group – Field Description

Field	Description
Fields for the Default Display and all Option	
DOCSIS Group	Current number of DOCSIS groups created on the CMTS.
Group Index	Number of the load balancing group to which the cable interface has been assigned.
Status	Information about the DOCSIS LBG: <ul style="list-style-type: none"> • R—Restricted load balancing group (RLBG). • G—General load balancing group (GLBG). • E—The DOCSIS LBG is enabled. • D—The DOCSIS LBG is disabled.
Interval	Minimum time period configured when cable modems can be moved to load balance the interfaces. In Cisco IOS Release 12.2(33)SCE and earlier releases, the valid range is 1 to 1000 seconds, with a default value of 10. In Cisco IOS Release 12.2(33)SCE1 and later releases, the default value of <i>interval</i> is 30.
DCC mask/UCC	Downstream and upstream channel change masks associated with the DOCSIS group. For example, in the output '0x40(1)/Y', '0x40' indicates that the user configured the dynamic channel change (DCC) technique 1 for the DOCSIS LBG. Similarly, '0x80' indicates configured DCC technique 0 and '0x20' indicates configured DCC technique 2. '(1)' indicates the DCC technique 1 is used to move the cable modem (CM). '/Y' indicates that load balancing sends upstream channel change (UCC) for movement of US channel only.
Policy	DOCSIS policy associated with the load balancing group.
Method	Load balancing method used for the load balancing group. The following indicates what method is used for DS and US modems: <ul style="list-style-type: none"> • m = modem Uses the number of active cable modems on an interface. • s = service flow Uses the number of active Service Flow IDs (SFIDs) on an interface. • u = utilization Uses the current percent of utilization of an interface.

Field	Description
Threshold	<p>Thresholds configured for this load balancing group:</p> <ul style="list-style-type: none"> • M = Minimum <p>Minimum difference in the number of cable modems or service flows that can exist on two interfaces in the group before cable modems are moved between the interfaces. If the imbalance between interfaces is below this value, cable modems are not moved. This field contains a value only when the group is configured for the modems or service flows method of load balancing. (This value is configured using the load minimum option of the cable load-balance group threshold command.)</p> <ul style="list-style-type: none"> • S = Stability. <p>Minimum allowable percentage of good periodic ranging requests that is acceptable. When the channel has a lower percent of modems responding to the ranging requests in a one minute period, the Cisco CMTS begins moving modems. The valid range is 0 to 100 percent, with a default of 50 percent.</p> <ul style="list-style-type: none"> • E = Enforce <p>Minimum difference in the percentage of total load that must exist between interfaces in a load balancing group before the Cisco CMTS performs dynamic load balancing and begins moving cable modems that are currently online. When the difference in load between two interfaces falls below this value, the CMTS stops dynamic load balancing and performs static load balancing. (This value is configured using the enforce option of the cable load-balance group threshold command.)</p> <ul style="list-style-type: none"> • U = Ugs <p>Percentage of the bandwidth that is allocated for Unsolicited Grant Services (UGS) traffic, such as Voice-over-IP (VoIP), that is in use on an interface because the CMTS moves cable modems that are online with active UGS service flows. (This value is configured using the ugs option of the cable load-balance group threshold command.)</p> <ul style="list-style-type: none"> • P = PacketCable MultiMedia (PCMM) <p>Percentage of the reserved bandwidth threshold. Above this level, cable modems with active PCMM service flows participate in load balancing. The default threshold is 70%.</p>
Interface	Cable interface (downstream or upstream) that belongs to a load balancing group.
Utilization	<p>Long-term average of the upstream utilization. Displays the current load usage of the cable interface expressed as a percentage of the total bandwidth. For upstreams, this field shows a single percentage value, which is the average percentage of bandwidth being used on the upstream.</p> <p>For downstreams, this field shows a set of three percentage values:</p> <ul style="list-style-type: none"> • The percentage shows the load usage for the entire interface. • The first percentage, within the parentheses, shows the load for the downstream. • The second percentage, within the parentheses, shows the average load for all upstreams on the downstream. <p>For example, if this field shows “ 18%(18%/12%) ”, it indicates that downstream and upstream channels on the interface are running on an average load of 18 percent. The downstream is running on an average load of 18 percent and all upstreams for this downstream are running on an average load of 12 percent.</p> <p>Note To view the short-term average of the utilization, use the show interface cable mac-scheduler command.</p>

Field	Description
State	<p>Current state of the cable interface.</p> <p>The following states indicate normal operational states, depending on the configuration:</p> <ul style="list-style-type: none"> • down—Interface is shut down. The CMTS cannot use the interface for load balancing in this state. • initial—Interface is currently in the initialization phase. The CMTS uses the interface for load balancing after the initialization completes. • up—Interface is up and passing traffic. The CMTS actively uses the interface for load balancing. • testing—Interface is currently under a load balancing test. The CMTS is unable to use the interface for normal load balancing operations until the test completes. <p>The following states indicate abnormal states. The CMTS does not use interfaces in these states for load balancing operations, but continues to monitor and update the status every time the CMTS polls the interfaces for their current load usage:</p> <ul style="list-style-type: none"> • suspicious—Interface is in an unknown state. The interface might be up and passing traffic, but is not consistent enough to support load balancing operations. The CMTS attempts to reinitialize the interface after a time-out period. If the interface has failed initialization more than 10 times, the CMTS moves the interface to the disabled state. • disabled—Interface has been disabled because a load balancing test is in-progress or because the interface reinitialization failed after 10 attempts. • unstable—Interface has failed repeated initialization attempts. The CMTS will attempt to reinitialize the interface after a time-out period. If a load balance test is not in-progress and if reinitialization fails, the CMTS moves it to the unstable state.
Reserved	Percentage of bandwidth that is currently reserved by unsolicited grant service (UGS) service flows.
Modems	Number of cable modems currently online on this cable interface.
Weight	Interface bandwidth, in megabits per second (mbps), for the downstream or upstream. The system uses this value in calculating whether the loads on the interfaces are balanced. Changing a channel parameter, such as modulation profile or channel width, affects the channel bandwidth and weight value.
Additional Fields for the target Option	
Interface	<p>Source downstream or upstream interface that is part of a cable load balancing group. If the target field contains a value, it indicates that the source interface is currently oversubscribed.</p> <p>To reduce the cable load, the CMTS moves cable modems from the source interface to the target interface.</p>
Target	<p>Downstream or upstream interface to which cable modems on the source interface are being moved as part of load balancing operations. This field indicates the following:</p> <ul style="list-style-type: none"> • If it is a downstream interface, the display shows the center frequency of the downstream within parentheses. • If only a frequency is shown, it indicates that the CMTS is moving cable modems to a different center frequency on the same downstream interface. • When the display includes the words “enforce”, it indicates that the CMTS is performing dynamic load balancing on the interfaces. • If this field is blank, it indicates that the source interface is not oversubscribed.
Additional Fields for the statistics Option	

Field	Description
Target interface	Downstream or upstream interface. If this is a downstream interface, the display shows the center frequency of the downstream within parentheses.
Transfers	The following information is tracked for the indicated target interface: <ul style="list-style-type: none"> • complete—Number of cable modems successfully moved to the target interface. • pending—Number of cable modems in the process of being moved to the target interface. • retries—Number of times that the CMTS unsuccessfully tried to move the same cable modem to the target interface. This occurs when one or more MAC layer messages to the cable modem are dropped due to radio frequency (RF) noise or because the modem is not DOCSIS-compliant. If the number of retries exceeds five for a particular cable modem, the CMTS counts this as a failure. • failures—Number of times that the CMTS exceeded the maximum number of allowable retries (5) when trying to move a particular cable modem to the target interface. A large number of failures could indicate one or more possible problems: <ul style="list-style-type: none"> • The specific cable modems are not DOCSIS-compliant. • One or both interfaces are having problems passing traffic. • One or both interfaces are having persistent RF noise problems. • The source and target interfaces are not combined in the same node and do not share the same physical connectivity (which is required when interfaces are part the same load balancing group).
Additional Fields for the pending Option	
Modem	Hardware (MAC) address of the cable modem that is moved as part of load balancing operations.
Source interface	Downstream or upstream cable interface on which the cable modem is currently online.
Target interface	Downstream or upstream cable interface to which the CMTS is trying to move the cable modem to load balance the interfaces in this load balancing group. If the CMTS is moving the cable modem to a different frequency on the same downstream interface, this field shows only the new center frequency.
Retries	Number of times that the CMTS has attempted to move this cable modem to the target interface. The CMTS attempts to move the cable modem 5 times before counting this load balancing move as a failure.
Additional Fields for the modem-list option	
US	Upstream channels in the DOCSIS LBG.
MAC Address	Total number (in parentheses) and MAC addresses of the modems connected to the upstream channels.
Additional fields for the primary-load option	
MD	MAC Domain.
RCC-ID	RCC index per MAC domain.
Pending	Number of pending modems on the channel.
Additional Fields for the move-history option	
Modem	The mac address of the moved cable modem

Field	Description
Host Interface	The mac-domain of the cable modem.
Group ID	The load balance group ID of cable modem.
Primary RF/RCC Source	Old downstream information of the cable modem, including the primary downstream channel, RCC ID before moving.
Primary RF/RCC Target	New downstream information of the cable modem, including the new primary downstream channel, RCC ID after moving.
MD/TCS Source	Old upstream information of the cable modem including the index of mac-domain, the bitmap of the upstream channel before moving.
MD/TCS Target	New upstream information of the cable modem including the index of mac-domain, the bitmap of the upstream channel after moving.
Action	The action of the cable modem movement, such as DBC, DCC, UCC, REINIT(DCC with init-tech 0).
Trans-Start Time	The trigger of the cable modem movement, such as D2.0 LB, D3.0 static LB, D3.0 dynamic LB.
Elapse Time (ms)	The start time of the cable modem movement.
Client	The elapsed time - how long the cable modem movement spent.
Result	The result of the action on modem movement - success, failure, and the internal confirmation code.

The following is a sample output of the **show cable load-balance docsis-group rcs-cm-list** command in Cisco IOS Release 12.2(33)SCI and later releases:

```
Router# show cable load-balance docsis-group fn 11 md c7/0/0 rcs-cm-list

The following example shows the output of the **show cable load-balance docsis-group fn n md cable slot/subslot/controller-interface statistics wideband** command:

```

Router# show cable load-balance docsis-group fn 1 md c3/0/1 statistics wideband
Target interface      State      Transfers
                   Complete    Pending    Total      Failure
Disabled
Wi3/0/0:0             up         0          0          0          0
0
Wi3/0/0:1             up         3          0          3          0
0

```

- Note**
- The **show cable load-balance docsis-group target wide** and **show cable load-balance docsis-group fn n md cable slot/subslot/controller-interface statistics wideband** CLIs does not support LCHA and LCPR.
 - For the **show cable load-balance docsis-group target wide** and **show cable load-balance docsis-group fn n md cable slot/subslot/controller-interface statistics wideband** CLIs, the maximum number of modem movement entries per line card is 16000.

The following example shows the output of the **show cable modem x.x.x verbose** command in DCC|DBC:

```

Router# show cable modem c8fb.26a6.bf68 verbose |in DCC|DBC
DBC req/rsp/ack      : 1/1/1
DCC req/rsp/ack      : 0/0/0

```

Table 92: show cable load-balance docsis-group – Field Description

Field	Description
Fields for the Default Display and all Option	
DOCSIS Group	Current number of DOCSIS groups created on the CMTS.
Group Index	Number of the load balancing group to which the cable interface has been assigned.
Status	Information about the DOCSIS LBG: <ul style="list-style-type: none"> • R—Restricted load balancing group (RLBG). • G—General load balancing group (GLBG). • E—The DOCSIS LBG is enabled. • D—The DOCSIS LBG is disabled.

Field	Description
Interval	<p>Minimum time period configured when cable modems can be moved to load balance the interfaces.</p> <p>In Cisco IOS Release 12.2(33)SCE and earlier releases, the valid range is 1 to 1000 seconds, with a default value of 10. In Cisco IOS Release 12.2(33)SCE1 and later releases, the default value of <i>interval</i> is 30.</p>
DCC mask/UCC	<p>Downstream and upstream channel change masks associated with the DOCSIS group.</p> <p>For example, in the output '0x40(1)/Y', '0x40' indicates that the user configured the dynamic channel change (DCC) technique 1 for the DOCSIS LBG. Similarly, '0x80' indicates configured DCC technique 0 and '0x20' indicates configured DCC technique 2. '(1)' indicates the DCC technique 1 is used to move the cable modem (CM). '/Y' indicates that load balancing sends upstream channel change (UCC) for movement of US channel only.</p>
Policy	DOCSIS policy associated with the load balancing group.
Method	<p>Load balancing method used for the load balancing group. The following indicates what method is used for DS and US modems:</p> <ul style="list-style-type: none"> • m = modem <p>Uses the number of active cable modems on an interface.</p> <ul style="list-style-type: none"> • s = service flow <p>Uses the number of active Service Flow IDs (SFIDs) on an interface.</p> <ul style="list-style-type: none"> • u = utilization <p>Uses the current percent of utilization of an interface.</p>

Field	Description
Threshold	<p>Thresholds configured for this load balancing group:</p> <ul style="list-style-type: none"> • M = Minimum <p>Minimum difference in the number of cable modems or service flows that can exist on two interfaces in the group before cable modems are moved between the interfaces. If the imbalance between interfaces is below this value, cable modems are not moved. This field contains a value only when the group is configured for the modems or service flows method of load balancing. (This value is configured using the load minimum option of the cable load-balance group threshold command.)</p> <ul style="list-style-type: none"> • S = Stability. <p>Minimum allowable percentage of good periodic ranging requests that is acceptable. When the channel has a lower percent of modems responding to the ranging requests in a one minute period, the Cisco CMTS begins moving modems. The valid range is 0 to 100 percent, with a default of 50 percent.</p> <ul style="list-style-type: none"> • E = Enforce <p>Minimum difference in the percentage of total load that must exist between interfaces in a load balancing group before the Cisco CMTS performs dynamic load balancing and begins moving cable modems that are currently online. When the difference in load between two interfaces falls below this value, the CMTS stops dynamic load balancing and performs static load balancing. (This value is configured using the enforce option of the cable load-balance group threshold command.)</p> <ul style="list-style-type: none"> • U = Ugs <p>Percentage of the bandwidth that is allocated for Unsolicited Grant Services (UGS) traffic, such as Voice-over-IP (VoIP), that is in use on an interface because the CMTS moves cable modems that are online with active UGS service flows. (This value is configured using the ugs option of the cable load-balance group threshold command.)</p> <ul style="list-style-type: none"> • P = PacketCable MultiMedia (PCMM) <p>Percentage of the reserved bandwidth threshold. Above this level, cable modems with active PCMM service flows participate in load balancing. The default threshold is 70%.</p>
Interface	Cable interface (downstream or upstream) that belongs to a load balancing group.

Field	Description
Utilization	<p>Long-term average of the upstream utilization. Displays the current load usage of the cable interface expressed as a percentage of the total bandwidth. For upstreams, this field shows a single percentage value, which is the average percentage of bandwidth being used on the upstream.</p> <p>For downstreams, this field shows a set of three percentage values:</p> <ul style="list-style-type: none"> • The percentage shows the load usage for the entire interface. • The first percentage, within the parentheses, shows the load for the downstream. • The second percentage, within the parentheses, shows the average load for all upstreams on the downstream. <p>For example, if this field shows “ 18%(18%/12%) ”, it indicates that downstream and upstream channels on the interface are running on an average load of 18 percent. The downstream is running on an average load of 18 percent and all upstreams for this downstream are running on an average load of 12 percent.</p> <p>Note To view the short-term average of the utilization, use the show interface cable mac-scheduler command.</p>

Field	Description
State	<p>Current state of the cable interface.</p> <p>The following states indicate normal operational states, depending on the configuration:</p> <ul style="list-style-type: none"> • down—Interface is shut down. The CMTS cannot use the interface for load balancing in this state. • initial—Interface is currently in the initialization phase. The CMTS uses the interface for load balancing after the initialization completes. • up—Interface is up and passing traffic. The CMTS actively uses the interface for load balancing. • testing—Interface is currently under a load balancing test. The CMTS is unable to use the interface for normal load balancing operations until the test completes. <p>The following states indicate abnormal states. The CMTS does not use interfaces in these states for load balancing operations, but continues to monitor and update the status every time the CMTS polls the interfaces for their current load usage:</p> <ul style="list-style-type: none"> • suspicious—Interface is in an unknown state. The interface might be up and passing traffic, but is not consistent enough to support load balancing operations. The CMTS attempts to reinitialize the interface after a time-out period. If the interface has failed initialization more than 10 times, the CMTS moves the interface to the disabled state. • disabled—Interface has been disabled because a load balancing test is in-progress or because the interface reinitialization failed after 10 attempts. • unstable—Interface has failed repeated initialization attempts. The CMTS will attempt to reinitialize the interface after a time-out period. If a load balance test is not in-progress and if reinitialization fails, the CMTS moves it to the unstable state.
Reserved	Percentage of bandwidth that is currently reserved by unsolicited grant service (UGS) service flows.
Modems	Number of cable modems currently online on this cable interface.
Weight	Interface bandwidth, in megabits per second (mbps), for the downstream or upstream. The system uses this value in calculating whether the loads on the interfaces are balanced. Changing a channel parameter, such as modulation profile or channel width, affects the channel bandwidth and weight value.
Additional Fields for the target Option	
Interface	<p>Source downstream or upstream interface that is part of a cable load balancing group. If the target field contains a value, it indicates that the source interface is currently oversubscribed.</p> <p>To reduce the cable load, the CMTS moves cable modems from the source interface to the target interface.</p>

Field	Description
Target	<p>Downstream or upstream interface to which cable modems on the source interface are being moved as part of load balancing operations. This field indicates the following:</p> <ul style="list-style-type: none"> • If it is a downstream interface, the display shows the center frequency of the downstream within parentheses. • If only a frequency is shown, it indicates that the CMTS is moving cable modems to a different center frequency on the same downstream interface. • When the display includes the words “enforce”, it indicates that the CMTS is performing dynamic load balancing on the interfaces. • If this field is blank, it indicates that the source interface is not oversubscribed.
Additional Fields for the statistics Option	
Target interface	Downstream or upstream interface. If this is a downstream interface, the display shows the center frequency of the downstream within parentheses.
Transfers	<p>The following information is tracked for the indicated target interface:</p> <ul style="list-style-type: none"> • Cmple—Number of cable modems successfully moved to the target interface. • Pend—Number of cable modems in the process of being moved to the target interface. • Retry—Number of times that the CMTS unsuccessfully tried to move the same cable modem to the target interface. This occurs when one or more MAC layer messages to the cable modem are dropped due to radio frequency (RF) noise or because the modem is not DOCSIS-compliant. If the number of retries exceeds five for a particular cable modem, the CMTS counts this as a failure. • Fail (NB)—Number of cable modems failed to move to narrow band interface. • Fail (WB)—Number of cable modems failed to move to wideband interface. • Total Attem—Number of times that the CMTS tried to move the same cable modem to the target interface. • Max Fail—Number of times that the CMTS exceeded the maximum number of allowable retries (3) when trying to move a cable modem to the particular target interface. A large number of failures could indicate one or more possible problems: <ul style="list-style-type: none"> • The specific cable modems are not DOCSIS-compliant. • One or both interfaces are having problems passing traffic. • One or both interfaces are having persistent RF noise problems. • The source and target interfaces are not combined in the same node and do not share the same physical connectivity (which is required when interfaces are part the same load balancing group).

Field	Description
Additional Fields for the pending Option	
Modem	Hardware (MAC) address of the cable modem that is moved as part of load balancing operations.
Source interface	Downstream or upstream cable interface on which the cable modem is currently online.
Target interface	Downstream or upstream cable interface to which the CMTS is trying to move the cable modem to load balance the interfaces in this load balancing group. If the CMTS is moving the cable modem to a different frequency on the same downstream interface, this field shows only the new center frequency.
Retries	Number of times that the CMTS has attempted to move this cable modem to the target interface. The CMTS attempts to move the cable modem 5 times before counting this load balancing move as a failure.
Additional Fields for the modem-list option	
US	Upstream channels in the DOCSIS LBG.
MAC Address	Total number (in parentheses) and MAC addresses of the modems connected to the upstream channels.
Additional fields for the primary-load option	
MD	MAC Domain.
RCC-ID	RCC index per MAC domain.
Pending	Number of pending modems on the channel.

Related Commands

Command	Description
cable load-balance docsis-group	Creates a DOCSIS LBG on the Cisco CMTS.
cable load-balance docsis-policy	Creates a DOCSIS policy and associates an existing rule and tag with the policy.
cable load-balance docsis-enable	Enables or disables DOCSIS load balancing on the Cisco CMTS.
cable load-balancedocsis30-dynamic-enable	Enables the DOCSIS 3.0 dynamic load balancing on the Cisco CMTS.
cable load-balance rule	Creates a rule to prevent the CM from disabling or enabling load balancing.
cable tag	Creates a tag to associate it with DOCSIS policies and groups.
clear cable load-balance count	Clears all of the load balance movement count statistics.

show cable logging

To display the log of messages about bad IP source addresses, downstream indexes, or DOCSIS-layer events on the cable interfaces, use the **show cable logging** command in user EXEC or privileged EXEC mode.

```
show cable logging [{badipsource | downstream-index | layer2events | summary}] [slot]
```

Cisco cBR Series Converged Broadband Router

```
show cable logging [{badipsource | downstream-index | layer2events | overlapip | summary}]
```

Syntax Description

badipsource	Displays the contents of the error log buffer containing the error messages for bad IP source addresses.
downstream-index	Displays the contents of the message log buffer for downstream indexes.
layer2events	Displays the contents of the message log buffer for DOCSIS-layer (Layer-2) events.
overlapip	Displays the Cable OVERLAPIP messages on the Cisco cBR router.
summary	Displays the status of the logging feature and its buffer.
<i>slot</i>	(Optional) Slot of a particular cable interface on the Cisco uBR7200 series router. The <i>slot</i> parameter can range from 3 to 6, depending on the cable interface. Note This option is supported only on the Cisco uBR-MC16U/X, Cisco uBR10-MC5X20U, Cisco uBR10-MC5X20H, and Cisco uBR-MC28U/X cable interface line card. This variable is not supported on the Cisco cBR router.

Command Modes

User EXEC (>)

Privileged EXEC (#)

Command History

Release	Modification
12.1(13)EC	This command was introduced for the Cisco uBR7100 series and Cisco uBR7200 series universal broadband routers.
12.2(11)CY	Support was added for the Cisco uBR10012 universal broadband router.
12.2(11)BC2	Support was added to the Release 12.2 BC train for the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 routers.
12.2(15)CX	Support was added to display the log buffer on an individual Cisco uBR-MC28U/X cable interface line card on the Cisco uBR7200 series router.
12.2(15)BC2	Support was added for the Cisco uBR-MC16U/X, Cisco uBR10-MC5X20U, and Cisco uBR10-MC5X20H cable interface line cards.

Release	Modification
12.3(9a)BC	The layer2events keyword was added.
12.3(21)BC	This command was enhanced to support logging events tracked with the Cable Duplicate MAC Address Reject feature on the Cisco CMTS, when configured. This supports the detection of cloned cable modems.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.3(23)BC5	The command output was modified to display the CPU revision number of the line card.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB.
12.2(33)SCG	The downstream-index keyword was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

For additional information about the Cable Duplicate MAC Address Reject feature on the Cisco CMTS, or enforced DOCSIS 1.1 security, see the *Cable Duplicate MAC Address Reject for the Cisco CMTS*.

The **cable logging badipsource** command creates a circular buffer that contains the BADIPSOURCE error messages, which the Cisco CMTS generates when it discovers a CM or CPE device using an unauthorized IP address. Similarly, the **cable logging layer2events** command creates a buffer to contain the system messages that are generated for DOCSIS-layer (Layer2) events. If the BADIPSOURCE or DOCSIS-layer buffer becomes full, the oldest messages are deleted to make room for the newer messages.

Use the **show cable logging** command to display the current contents of the BADIPSOURCE, downstream-index, or DOCSIS-layer buffer. After you have viewed all of the error messages in the current buffer, use the **clear cable logging** command to clear out the buffer to make room for newer messages.

Use the **show cable logging summary** command to check if the logging feature is enabled and also to view the status of the logging buffer.

The Broadband Processing Engine (BPE) cable interface line cards (such as the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X) contain an onboard processor that also maintains its own log buffer. To display the contents of this log, add the card slot number after the **show cable logging** command.

Note The BADIPSOURCE, downstream-index, and DOCSIS-layer messages are stored in separate buffers. Enabling, clearing, or displaying one buffer does not affect the other buffer.

Examples

This example shows the output of the **show cable logging badipsource** command. The oldest messages are displayed first.

```
Router# show cable logging badipsource
00:01:19: %UBR10000-3-BADIPSOURCE: Interface Cable6/1/1, IP packet from invalid source.
IP=10.44.50.13, MAC=0050.0f02.1d15, Expected SID=1, Actual SID=1
00:01:26: %UBR10000-3-BADIPSOURCE: Interface Cable6/1/1, IP packet from invalid source.
IP=10.44.50.13, MAC=0050.0f02.1d15, Expected SID=1, Actual SID=1
01:49:33: %UBR10000-3-BADIPSOURCE: Interface Cable6/1/0, IP packet from invalid source.
IP=0.0.0.44, MAC=0030.eb00.029d, Expected Interface=Cable6/1/0 SID=2833
```

```
02:12:03: %UBR10000-3-BADIPSOURCE: Interface Cable6/1/0, IP packet from invalid source.
IP=0.0.0.44, MAC=0030.eb15.73bd, Expected Interface=Cable6/1/0 SID=2800
02:12:43: %UBR10000-3-BADIPSOURCE: Interface Cable6/1/0, IP packet from invalid source.
IP=0.0.0.44, MAC=00e0.ca01.287a, Expected Interface=Cable6/1/0 SID=3299
02:22:50: %UBR10000-3-BADIPSOURCE: Interface Cable6/1/0, IP packet from invalid source.
IP=0.0.0.44, MAC=0030.eb00.02a2, Expected Interface=Cable6/1/0 SID=394
```

This example shows the output of the **show cable logging badipsource** command when logging has not been enabled with the **cable logging badipsource** command:

```
Router# show cable logging badipsource
```

```
Cable logging: BADIPSOURCE Disabled
```

This example shows the output for the **downstream-index** option, showing whether logging is enabled, the total size of the buffer, how many bytes are currently used, and how many error messages have been logged since the buffer was last cleared.

```
Router# show cable logging summary
```

```
Cable logging: Enabled
                Total buffer size (bytes): 1000000
                Used buffer size (bytes) : 36968
                Logged messages          : 231
```

This example shows the output for the **summary** option, showing whether logging is enabled, the total size of the buffer, how many bytes are currently used, and how many error messages have been logged since the buffer was last cleared.

```
Router# show cable logging summary
```

```
Cable logging: BADIPSOURCE Enabled
                Total buffer size (bytes): 1000000
                Used buffer size (bytes) : 36968
                Logged messages          : 231
```

This example shows the output for the **summary** option, indicating the CPU revision number of the line card. The display given below is specific to the uBR7200 series routers.

```
Router# show cable logging summary slot 6
```

```

```

Examples for the Cisco cBR Series Converged Broadband Router

This example shows the output for the **show cable logging badipsource** command on the Cisco cBR router:

```

Router#show cable logging badipsource
Cable logging: BADIPSOURCE Enabled
                Total buffer size (bytes): 4096
                Used buffer size (bytes) : 0
                Logged messages      : 0
Cable logging: BADIPSOURCE Enabled Slot 3 Subslot 0
                Total buffer size (bytes): 4096
                Used buffer size (bytes) : 0
                Logged messages      : 0
Router#

```

This example shows the output for the **show cable logging downstream-index** command on the Cisco cBR router:

```

Router#show cable logging downstream-index
Cable logging: DS_IDX Enabled
                Total buffer size (bytes): 4096
                Used buffer size (bytes) : 0
                Logged messages      : 0
Cable logging: DS_IDX Enabled Slot 3 Subslot 0
                Total buffer size (bytes): 4096
                Used buffer size (bytes) : 0
                Logged messages      : 0

```

Router#

This example shows the output for the **show cable logging layer2events** command on the Cisco cBR router:

```
Router#show cable logging layer2events
Cable logging: LAYER2EVENTS Enabled
                Total buffer size (bytes): 4096
                Used buffer size (bytes) : 0
                Logged messages           : 0
Cable logging: LAYER2EVENTS Enabled Slot 3 Subslot 0
                Total buffer size (bytes): 4096
                Used buffer size (bytes) : 4096
                Logged messages           : 2380

show cable mac-domain cable forwarding

To display all the interfaces (wideband and modular) and statistics belonging to the Mac domain, use the **show cable mac-domain cable forwarding** command in privileged EXEC mode.

show cable mac-domain cable *slot/subslot/port* forwarding

Syntax Description	Parameter	Description
	<i>slot</i>	Specifies the chassis slot number of the cable interface line card. The range is from 5 to 8.
	<i>subslot</i>	Specifies the secondary slot number of the cable interface line card. The range is from 0 or 1.
	<i>port</i>	Specifies the port number. The range is from 0 to 4 (depending on the cable interface).
	forwarding	Displays the forwarding statistics for the cable line cards.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.3(23)BC	This command was introduced.
	12.2(33)SCA	This command is integrated in Cisco IOS Release 12.2(33)SCA.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines The **show cable mac-domain cable forwarding** command does not support wideband and modular interfaces. However, if wideband and modular interfaces belong to the Mac domain, the interfaces are listed in the output with the interface state.

Starting with Cisco IOS Release 12.2(33)SCF, for a chassis loaded with the UBR-MC20X20V or uBR-MC3GX60V line cards, and legacy uBR-MC5X20 line cards, the **show cable mac-domain cable forwarding** command shall not display the legacy downstream information for the UBR-MC20X20V and the uBR-MC3GX60V line cards.

Examples

The following is sample output of the **show cable mac-domain cable forwarding** command on the cable interface at 1/0/0:

```
Router# show cable mac-domain cable 1/0/0 forwarding
Interface          Output          Interface  Reserved/  Interface
Name              Packets         Rate       Reservable  State
                  (bytes)        (bits/sec) Bandwidth   Bandwidth
-----
Ca1/0/0           201358          0          26000      6500/19500  UP
Mo1/0/0:0         344340          0          4160       1040/3120   UP
Mo1/0/0:1         252132          0          7800       1950/5850   UP
Mo1/0/0:2         252132          0          7800       1950/5850   UP
Wi1/0/0:0         198916          0          7803       1951/5852   UP
Wi1/0/0:1         1152            0          10404      2601/7803   UP
```

Table below describes the significant fields shown in the display.

Table 93: show cable mac-domain cable forwarding Field Descriptions

Field	Description
Interface Name	The name of the interface belonging to Mac domain.
Output Packets/Rate	The cumulative packets output and output rate.
Interface Bandwidth	The total interface bandwidth allocated.
Reserved/Reservable Bandwidth	The total reserved and available bandwidth.
Interface State	Indicates whether the interface is up or down.

show cable mac-domain cable cgd-associations

To display a summary of the Channel Grouping Domain (CGD) associations for all cable MAC domains, use the **show cable mac-domain cgd-associations** command in privileged EXEC mode.

Cisco uBR10012 Router

show cable mac-domain cable slot /subslot /port cgd-associations

Cisco uBR7225VXR and Cisco uBR7246VXR Routers

show cable mac-domain cable slot /port cgd-associations

Cisco cBR Series Converged Broadband Router

show cable mac-domain cable slot /port cgd-associations

Syntax Description

cable slot /subslot /port	Identifies the cable interface on the Cisco uBR10012 router. <ul style="list-style-type: none"> <i>slot</i> —Slot where the line card resides. The range is from 5 to 8. <i>subslot</i> —Subslot where the line card resides. The range is from 0 or 1. <i>port</i> —Downstream controller number on the line card. The range is from 0 to 4.
cable slot /port	Identifies the cable interface on the Cisco uBR7246VXR or Cisco uBR7225VXR router. <ul style="list-style-type: none"> <i>slot</i> —Slot where the line card resides. <ul style="list-style-type: none"> Cisco uBR7246VXR router: The range is from 3 to 6. Cisco uBR7225VXR router: The range is from 1 to 2. <i>port</i> —Downstream port number on the line card. The range is from 0 or 1.
cable slot /subslot /cable-interface-index	Identifies the cable interface on the Cisco cBR-8 router. <ul style="list-style-type: none"> <i>slot</i> —Slot where the line card resides. The range is from 0 to 3 and 6 to 9. <i>subslot</i> —Subslot where the line card resides. The value is 0. <i>cable-interface-index</i> —Downstream cable interface index number on the line card. The range is from 0 to 15.

Command History

Release	Modification
12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. Added support for Cisco uBR7246VXR and Cisco uBR7225VXR routers.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

The **show cable mac-domain cgd-associations** command displays the following information for each cable MAC domain:

- Shared port adapter (SPA) downstream channels that have been added to each MAC domain.
- Upstream channels associated with each SPA downstream channel and the downstream channels of the integrated cable interface line card.

If the All column in the command output indicates Y, then this indicates that all upstream channels associated with the line card downstream channels or SPA downstream channels are configured using the **upstream cable connector** command. If all upstream channels are not configured, then this column will not be displayed.

- The SPA downstream channels that are currently active.

A SPA downstream channel is active when the corresponding modular cable interface, which represents the SPA downstream channel, and its line protocol are up. A SPA downstream channel that is considered active is an operational primary downstream channel in the cable MAC domain.

Note For more information on Channel Grouping Domains, refer to the *Cisco DOCSIS 3.0 Downstream Solution Design and Implementation Guide, Release 2.0*.

Cisco IOS Release 12.3(23)BC

This example shows the output of the **show cable mac-domain cgd-associations** command for the cable interface line card at slot 6, subslot 0, and port 0:

```
Router# show cable mac-domain cable 6/0/0 cgd-associations
CGD Host SPA DS Channels Upstreams (All) Active Remote DS
Ca6/0/0 Local 1 Y
1/0/0 0-1 0
```

Cisco IOS Release 12.2(33)SCB

This example shows the output of the **show cable mac-domain cgd-associations** command for the cable interface line card at slot 7, subslot 0, and port 0:

```
Router# show
cable mac-domain Cable7/0/0 cgd-associations
CGD Host Resource DS Channels Upstreams (AllUS) Active Remote DS
Ca7/0/0 7/0/0 0 0
3/1/0 0-2 0
0-2
```

Cisco IOS Release 12.2(33)SCG

This example shows the output of the **show cable mac-domain cgd-associations** command for the Cisco uBR-MC3GX60V cable interface line card sharing downstreams with the Cisco Wideband SPA, in Cisco IOS Release 12.2(33)SCG:

```
Router# show cable mac-domain cable 8/0/0 cgd-associations
```

show cable mac-domain cable cgd-associations

```
CGD Host   Resource   DS Channels   Upstreams (AllUS)   Active Remote DS
Ca8/0/0    1/1/0       0             0-3                 Yes
```

Table below describes the fields shown in the **show cable mac-domain cgd-associations** command display.

Table 94: show cable cgd-associations Field Descriptions

Field	Description
CGD Host	MAC domain interface for CGD.
Resource	Downstream cable interface line card.
DS Channels	Downstream RF channels.
Upstreams (AllUS)	Upstream channels in the MAC domain.
Active Remote DS	Active downstream channels.

Cisco cBR Series Converged Broadband Router

This example shows the output of the Cisco cBR-8 router

```
Router#show cable mac-domain c1/0/0 cgd-associations
CGD Host   Resource   DS Channels   Upstreams   (ALLUS)   Active DS
Ca1/0/0    1/0/0       8             0-1         Yes        8
           16         0-1         Yes        16
           24         0-1         Yes        24
           32-33      0-1         Yes        32-33
           40         0-1         Yes        40
```

MD US binding:

```
Host MD      Controller   US channel   State
Ca1/0/0     U0          1/0/0       0           UP
Ca1/0/0     U1          1/0/0       1           UP
```

Related Commands

Command	Description
show cable mac-domain downstream-service-group	Displays MAC Domain Downstream Service Group information for the primary downstream channel.

show cable mac-domain cable downstream-service-group

To display MAC Domain Downstream Service Group information for a primary downstream channel, use the **show cable mac-domain downstream-service-group** command in privileged EXEC mode.

Cisco uBR7225VXR and Cisco uBR7246VXR Universal Broadband Routers

show cable mac-domain cable slot /port downstream-service-group

Cisco uBR10012 Universal Broadband Router

show cable mac-domain cable slot /subslot /port downstream-service-group

Cisco cBR Series Converged Broadband Router

show cable mac-domain cable slot /subslot /cable-interface-index downstream-service-group

Syntax Description		
<i>slot</i>	Slot where the line card resides. Cisco uBR7246VXR router—The range is from 3 to 6. Cisco uBR7225VXR router—The range is from 1 to 2. Cisco uBR10012 router—The range is from 5 to 8. Cisco cBR-8 router— The range is from 0 to 3 and 6 to 9	
<i>subslot</i>	The subslot used for the cable interface line card. Cisco uBR10012 router—The range is from 0 or 1. Cisco cBR-8 router—The value is 0.	
<i>port</i>	The downstream port used as a primary downstream channel. Valid values are from 0 to 4 (depending on the cable interface).	
<i>cable-interface-index</i>	<i>cable-interface-index</i> —Downstream cable interface index number on the line card. Cisco cBR-8 router—The range is from 0 to 15.	

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
	12.3(23)BC	This command displays the MAC Domain Downstream Service Group information for primary downstream channels from the SPA as well as the Cisco uBR10-MC5X20 line card.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.

Release	Modification
12.2(33)SCD	This command was modified. Support was added for Cisco uBR7225VXR and Cisco uBR7246VXR routers.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

Use the **show cable mac-domain downstream-service-group** command to display MAC Domain Downstream Service Group (MD-DS-SG) information for the specified primary downstream channel.

For each fiber node, a traditional DOCSIS downstream channel on a Cisco uBR10-MC5X20 cable interface line card is used to carry MAC management and signaling messages, and the associated traditional DOCSIS upstream channel is used for return data traffic and signaling. The traditional DOCSIS downstream channel used in this way for a MAC domain is called the *primary downstream channel*.

Note Beginning in Cisco IOS Release 12.3(23)BC, either an RF channel from the SPA or a Cisco uBR10-MC5X20 downstream channel can serve as a primary channel in a fiber node. Changes in Cisco IOS Release 12.3(23)BC apply to Cisco IOS Release 12.2(33)SCB but do not apply to Cisco IOS Release 12.2(33)SCA.

Examples

The following two examples display **show cable mac-domain downstream-service-group** output for the primary downstream channel on the cable interface at slot/subslot/port 5/0/0:

Cisco IOS Release 12.3(21)BC

```
Router# show cable mac-domain cable5/0/0 downstream-service-group
Primary MD-DS-SG RF
IF Id SPA Chan
C5/0/0 1 1/0/0 0 - 1
```

Cisco IOS Release 12.3(23)BC

```
Router# show cable mac-domain cable5/0/0 downstream-service-group
Cable MD-DS-SG RF Local Remote
IF Id SPA Chan Primary Chan Primary Chan
C5/0/0 1 1/0/0 00-01 Yes
```

In the preceding examples, the MD-DS-SG with ID 1 is used for RF channels 0 and 1 on the Wideband SPA located in slot/subslot/bay 1/0/0.

Cisco IOS Release 12.2(33)SCB

This example shows the output of the **show cable mac-domain downstream-service-group** command for the primary downstream channel on the cable interface at slot/subslot/port 7/0/0:

```
Router# show cable mac-domain Cable7/0/0 downstream-service-group
Cable MD-DS-SG RF
IF Id Resource Chan Primary Chan
```

```

C7/0/0  1          3/1/0    00-02    0 1 2
          7/0/0    00        0

```

Cisco IOS Release 12.2(33)SCD

This example shows the output of the **show cable mac-domain downstream-service-group** command for the primary downstream channel on the cable interface at slot/port 5/0:

```

Router# show cable mac-domain cable 5/0 downstream-service-group
Cable   MD-DS-SG          RF
IF      Id              Resource   Chan      Primary Chan
C5/0    1                5/0       00-03     0

```

Cisco IOS Release 12.2(33)SCG

This example shows the output of the **show cable mac-domain downstream-service-group** command for the Cisco uBR-MC3GX60V cable interface line card with primary downstream channel hosted on the Cisco Wideband SPA, in Cisco IOS Release 12.2(33)SCG:

```

Router# show cable mac-domain cable 8/0/0 downstream-service-group
Cable   MD-DS-SG          RF
IF      Id              Resource   Chan      Primary Chan
C8/0/0  1                1/1/0     00-03     0
          1/3/0           00-03
          7/0/0           00-03
          8/0/2           00-03

```

Table below describes the fields shown in the **show cable mac-domain downstream-service-group** command display.

Table 95: show cable mac-domain downstream-service-group Field Descriptions

Field	Description
Cable IF	Cable interface.
MD-DS-SG	MAC Domain Downstream Service Group.
Resource	Downstream cable interface line card.
RF Chan	Downstream RF channel.
Primary Chan	Primary downstream channel.

Cisco cBR Series Converged Broadband Router

This example shows the output of the **show cable mac-domain downstream-service-group** command for the Cisco cBR Series Converged Broadband Router:

```

Router# show cable mac-domain c1/0/0 downstream-service-group
Cable   MD-DS-SG          RF
IF      Id              Resource   Chan      Primary Chan
C1/0/0

```

show cable mac-domain cable downstream-service-group**Related Commands**

Command	Description
show cable modem	Displays information for registered and unregistered cable modems (including wideband cable modems).
show cable modem wideband	Displays information for registered and unregistered wideband cable modems.

show cable mac-domain cable dpd ocd

To display the MAC domain's OCD or DPD messages, use the **show cable mac-domain dpd | ocd** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable mac-domain cable *slot /subslot /cable-interface-index* {**dpd | ocd**} [**integrated-cable slot/card/port ofdm_channel**]

Syntax Description	
<i>slot/subslot/cable-interface-index</i>	Identifies the cable interface on the Cisco cBR Series Converged Broadband Router.
<i>slot/card/port</i>	Specifies the integrated-cable interface.
<i>ofdm_channel</i>	Specifies the OFDM channel number.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Router.

Examples

The following is a sample output of the **show cable mac-domain dpd** command:

```
Router# show cable mac-domain cable 3/0/0 dpd integrated-cable 3/0/0 158

```

show cable mac-domain cable rcc

To display runtime receive channel configuration (RCC) on a cable line card interface, use the **show cable mac-domain rcc** command in privileged EXEC mode.

Cisco uBR7225VXR and Cisco uBR7246VXR Universal Broadband Routers

```
show cable mac-domain cable slot /port rcc
```

Cisco uBR10012 Universal Broadband Router

```
show cable mac-domain cable slot /subslot /port rcc
```

Cisco cBR Series Converged Broadband Router

```
show cable mac-domain cable slot /subslot /cable-interface-index rcc
```

Syntax Description		
<i>slot</i>	Slot where the line card resides.	<ul style="list-style-type: none"> • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR7225VXR router—The valid range is from 1 to 2. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8 router—The valid range is 0 to 3 and 6 to 9.
<i>subslot</i>	Specifies the secondary slot number of the cable interface line card.	Cisco uBR Series router—Valid subslots are 0 or 1. Cisco cBR-8 router—The valid value is 0.
<i>port</i>	Specifies the port number.	Cisco uBR Series router—Valid values are 0 to 4 (depending on the cable interface). Cisco cBR-8 router—The valid range is 0 to 7.
<i>cable-interface-index</i>	Downstream port on the Cisco cBR router. The valid range is 0 to 15.	

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	12.2(33)SCD	This command was modified. Support was added for Cisco uBR7225VXR and Cisco uBR7246VXR routers.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Release	Modification
IOS-XE 3.18.0SP	This command was modified to show which RCC encoding formats are supported by a particular RCC.

Examples

The following is a sample output of the **show cable mac-domain rcc** command on the cable interface with the DOCSIS 3.0 encoding support and DOCSIS 3.1 simplified encoding support columns:

```
Router# show cable mac-domain cable 7/0/0 rcc
```

```
RCC-ID  RCP                RCs MD-DS-SG CMs  WB/RCC-TMPL      D3.0 D3.1
4       00 00 00 00 00    16 0      1   WB (Wi7/0/0:0)  Y   Y
5       00 00 00 00 00    25 0      2   WB (Wi7/0/0:1)  N   Y
6       00 10 00 00 08    8  0      0   RCC-TMPL (3:1)  Y   N
7       00 00 00 00 00    4  0      0   WB (Wi7/0/0:4)  Y   Y
```

The following is a sample output of the **show cable mac-domain rcc** command on the cable interface of the cBR-8 router:

```
Router# show cable mac-domain cable 8/0/0 rcc
```

```
RCC-ID  RCP                RCs MD-DS-SG CMs  WB/RCC-TMPL
1       00 00 00 00 00    2  0      0   WB (101)
2       00 10 00 00 03    3  2      0   RCC-TMPL (1)
```

The following is a sample output of the **show cable mac-domain rcc** command on the cable interface of the uBR10012 router:

```
Router# show cable mac-domain cable 1/0 rcc
```

```
RCC-ID  RCP                RCs MD-DS-SG CMs  WB/RCC-TMPL
1       00 00 00 00 00    3  0      3   WB (25)
```

Table below describes the significant fields shown in the display.

Table 96: Field Descriptions for show cable mac-domain rcc Command

Field	Description
RCC-ID	RCC index per MAC domain. The RCC ID refers to the RCC ID output from the show cable modem wideband command.
RCP	The receive channel profile associated with the RCC object.
RCs	Total number of DS channels.
MD-DS-SG	Indicates the MAC domain DS service group for which the RCC is generated.
CM	Total number of CMs associated with the RCC object.
WB/RCC-TMPL	Indicates the wideband interface or the RCC template.
D3.0	DOCSIS 3.0 encoding support details.
D3.1	DOCSIS 3.1 simplified encoding support

Note A zero value in the RCP or MD-DS-SG field indicates that the RCC is generated directly through a wideband interface configuration and not through any RCC templates.

Note The channels in this command output are the subset of channels in the REG-RSP-MP.

Related Commands

12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

This command displays privacy information of a particular CM, identified by its IP address or MAC address.

Examples

The example shows the output of the **show cable mac-domain upstream-service-group** command on the cable interface line card at slot/subslot/port 7/1/0:

```
Router# show cable mac-domain cable 7/1/0 upstream-service-group
Cable MD 7/1/0
US-SG-ID : 1          US-Chan : U0,1,2,3,4
Primary-DS: 5/1/0:0  US-SG-ID: 1
  MDD US-List   : U0,1,2,3
  MDD Ambiguity : U0,1,2,3
Primary-DS: 3/0/0:0  US-SG-ID: 1
  MDD US-List   : U0,1,2,3,4
  MDD Ambiguity : U0,1,2,3,4
Primary-DS: 3/0/0:1  US-SG-ID: 1
  MDD US-List   : U0,1,2,3,4
```

```

MDD Ambiguity : U0,1,2,3,4
Primary-DS: 3/0/0:2   US-SG-ID: 1
MDD US-List   : U0,1,2,3,4
MDD Ambiguity : U0,1,2,3,4
Primary-DS: 3/0/0:3   US-SG-ID: 1
MDD US-List   : U0,1,2,3,4
MDD Ambiguity : U0,1,2,3,4

```

Table below describes the significant fields shown in the display.

Table 97: show cable mac-domain upstream-service-group Field Descriptions

Field	Description
US-SG-ID	Upstream service group ID.
US-chan	Total number of upstream channels on the cable interface line card.
Primary-DS	The primary downstream interface.
MDD US-List	MAC management message: MDD TLV type 7 content, upstream active channel list.
MDD Ambiguity	MAC management message: MDD TLV type 8 content, upstream ambiguity resolution channel list.

This example shows the output of the **show cable mac-domain upstream-service-group** command for the Cisco cBR Series Converged Broadband Router:

```

Router#show cable mac-domain c1/0/0 upstream-service-group
Cable MD 1/0/0

```

Related Commands

Command	Description
show interface rf-status	Displays the logical up and down states for each of the configured RF channels on a wideband interface.

show cable mac-domain fiber-node

To verify the interface associations, use the **show cable mac-domain fiber-node** command.

show cable mac-domain fiber-node *fiber-node id* **md** *mac-domain id* { **downstream-service-group** | **upstream-service-group** }

Syntax Description	
	<i>fiber-node id</i> Fiber node ID.
	<i>mac-domain id</i> MAC Domain ID in SG profile.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS-XE 3.17.0S	This command was introduced.

Usage Guidelines Use this command to verify the interface associations of a fiber node and MAC domain downstream or upstream service group.

```
Router#show cable mac-domain fiber-node 1 md 0 downstream-service-group
Cable MD-DS-SG RF
IF Id Resource Chan Primary Chan
C2/0/0 1 2/0/6 0-31 0-15
Router#
```

```

show cable mac-domain docsis-mode

To view detailed information about the DOCSIS mode on cBR-8 routers, use the **show cable mac-domain docsis-mode** command, in privileged EXEC mode.

show cable mac-domain { **cable** *slot / subslot / cable-interface-index* | **all** }

Syntax Description	Parameter	Description
	docsis-mode	DOCSIS Mode Information
	cable	CMTS Interface
	<i>slot</i>	Slot where the line card resides. The valid range is 0 to 3 and 6 to 9.
	<i>subslot</i>	Specifies the secondary slot number of the cable interface line card. The valid value is 0.
	<i>cable-interface-index</i>	Downstream port on the Cisco cBR-8 router. The valid range is 0 to 31.
	all	Displays DOCSIS Mode for all MAC Domains

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Dublin 17.12.1y	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use this command to view detailed information about the DOCSIS mode.

The following is a sample output of the **show cable mac-domain docsis-mode C1/0/0** command. This command displays the DOCSIS mode for the specified interface *C1/0/0*.

```
router#show cable mac-domain docsis-mode C1/0/0
Interface  MRC Mode  MTC Mode  D31 Config  D31 Mode  D40 Config  D40 Mode
Cable1/0/0  enabled   MTC_PERMIT_ALL  enabled     enabled    disabled    disabled
```

The following is a sample output of the **show cable mac-domain docsis-mode all** command which displays DOCSIS mode for all the interfaces.

```
router#show cable mac-domain docsis-mode all
Interface  MRC Mode  MTC Mode  D31 Config  D31 Mode  D40 Config  D40 Mode
Cable0/0/0  enabled   MTC_PERMIT_ALL  enabled     enabled    enabled     enabled
Cable0/0/1  enabled   MTC_PERMIT_ALL  enabled     enabled    enabled     enabled
Cable0/0/2  enabled   MTC_PERMIT_ALL  enabled     enabled    enabled     enabled
Cable0/0/3  enabled   MTC_PERMIT_ALL  enabled     enabled    enabled     enabled
Cable0/0/4  enabled   MTC_PERMIT_ALL  enabled     enabled    enabled     enabled
```

```

Cable0/0/5  enabled  MTC_PERMIT_ALL  enabled  enabled  enabled  enabled
Cable0/0/6  enabled  MTC_PERMIT_ALL  enabled  enabled  enabled  enabled
Cable0/0/7  enabled  MTC_PERMIT_ALL  enabled  enabled  enabled  enabled
Cable0/0/8  enabled  MTC_PERMIT_ALL  enabled  enabled  enabled  enabled
Cable0/0/9  enabled  MTC_PERMIT_ALL  enabled  enabled  enabled  enabled

Cable1/0/10 enabled  MTC_PERMIT_ALL  enabled  enabled  disabled disabled

```

Related Commands

Command	Description
show cable mac-domain fiber-node	Displays interface associations of a fiber node and MAC domain downstream or upstream service group.

show cable mcast-shadow

To display information about multicast dataplane shadow, use the **show cable mcast-shadow** command in privileged EXEC mode.

show cable mcast-shadow [{ **bundle** *bundle interface number* { *source ipv4 address group ipv4 address* } } | { *source ipv6 address group ipv6 address* } }]

Syntax Description

bundle <i>bundle interface number</i>	Specifies bundle interface number. The value ranges from 1 to 255.
<i>source ipv4 address</i>	The source ipv4 address.
<i>group ipv4 address</i>	The group ipv4 address.
<i>source ipv6 address</i>	The source ipv6 address.
<i>group ipv6 address</i>	The group ipv6 address.

Command Default

none

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on Cisco cBR8 Series Converged Broadband Routers.

Usage Guidelines

The **show cable mcast-shadow** command is used to display the contents of the multicast data plane shadow.

Examples

The following example shows a typical display for the **show cable mcast-shadow bundle** *bundle interface number* command for all cable interfaces:

```
Router# show cable mcast-shadow bundle 1 0.0.0.0 225.1.1.1
  Load for five secs: 2%/0%; one minute: 3%; five minutes: 3%
Time source is NTP, 15:49:24.928 CST Mon Mar 16 2015

Source          Group          Interface      VRF PathSetId  Adj-id
-----
0.0.0.0         225.1.1.1     Bu1           0 2          0x20000099

                000000060EE4EC000000000000000000000 (00 00 00 2204350779)
```

Related Commands

Command	Description
show cable multicast db	Displays the contents of the multicast explicit tracking database.

Command	Description
show interface IC multicast-sessions	Displays the contents of multicast sessions created on the interface.
show policy-map target	Displays the contents of policy-map for this multicast session..

show cable metering-status

To display information about the most recent successful usage-based billing operation, use the **show cable metering-status** command in privileged EXEC mode.

show cable metering-status [**verbose**]

Syntax Description

verbose	(Optional) Displays the information in a more readable format.
----------------	--

Command Modes

Privileged EXEC

Command History

Release	Modification
12.3(9a)BC	This command was introduced.
12.2(33)SCB	SAMIS over Internet Protocol Detail Record (IPDR) was introduced.

Usage Guidelines

The **show cable metering-status** command displays information about the most recent successful usage-based billing operation. If usage-based billing is configured for File mode, this command displays the device and file name for the record that was last written. If usage-based billing is configured for Streaming mode, this command displays the IP address and port number for the external server to which the billing record was sent.

Note This command displays the status of the last successful billing record operation. If a failure occurred, the CMTS sends an SNMP trap to the SNMP manager with that information.

Examples

This example shows a typical output for the **show cable metering-status** command when usage-based billing is configured to write the billing records to a local file system:

```
Router# show cable metering-status
destination                               complete-time   flow cpe  status
                                           aggr supp
disk0:R7519-UBR7246-200308-004428 Jun 12 09:33:05 No    No  success
```

This example shows a typical output for the **show cable metering-status** command when usage-based billing is configured to stream the billing records to an external server:

```
Router# show cable metering-status
destination                               complete-time   flow cpe  status
                                           aggr supp
10.11.37.2 :1234                          Jun 12 09:33:05 No    No  success
```

This example shows a typical output for the verbose form of the **show cable metering-status** command:

```
Router# show cable metering-status verbose
```

```

Destination          : disk0:R7519-UBR7246-20000308-004428
Complete Time       : Jun 12 09:33:05
Flow Aggregate      : Yes
Cpe list suppression : Yes
Status of last export : success

```

This example shows a typical output for the **show cable metering-status** command when usage-based billing is configured to use the Internet Protocol Detail Record (IPDR) Exporter to stream the billing records to an external server:

```

Router# show cable metering-status
destination          complete-time  flow cpe  status
                               aggr supp
IPDR_Session1       Jun 12 09:33:05  N/A N/A  success

```

This example shows a typical output for the verbose form of the **show cable metering-status** command when usage-based billing is configured to use the IPDR Exporter to stream the billing records to an external server:

```

Router# show cable metering-status
  verbose
Last export status
Destination          : IPDR_Session1
Complete Time       : Jun 12 09:36:05
Status of last export : success

```

This example shows the error message that is displayed when you enter the **show cable metering-status** command but not have enabled usage-based billing:

```

Router# show cable metering-status
CMTS Metering collection not enabled

```

This example shows if the SAMIS report failed, the output displays the details of the failure:

```

Router# show cable metering-status
  verbose
Load for five secs: 0%/0%; one minute: 1%; five minutes: 0%
Time source is NTP, .19:24:53.955 PDT Fri Jun 11 2010
Last export status
Destination          : 20.1.0.2:5959
Complete Time       : Jun11 19:24:40
Flow Aggregate      : No
Full records        : Yes
Cpe list suppression : No
Source interface    : GigabitEthernet0/1
Status of last export : write-error (bulk-data)

```

Table below describes the fields displayed by the **show cable metering-status** command.

Table 98: show cable metering-status Field Descriptions

Field	Description
destination, Destination	Destination for the billing records. This is a file system device name and file name, if records are being written to a local file system, or an IP address and TCP port number, if records are being streamed to an external server.

Field	Description
complete_time, Complete Time	Date and time when the last billing record was written to a local file or streamed to an external server.
flow aggr, Flow Aggregate	Indicates whether traffic counters are aggregated in the billing records, so that one total is recorded for the upstream service flows and downstream service flows for each CM.
cpe suppress, CPE list suppression	Indicates whether CPE IP addresses are included or suppressed in the billing records: <ul style="list-style-type: none"> • Yes — CPE addresses are suppressed and are not included in the billing records. • No— CPE addresses are included in the billing records.
status, Status of last export	Indicates the status of the last billing operation: <ul style="list-style-type: none"> • success—The billing records were successfully written to the filesystem (file mode) or transferred to the billing collection server (streaming mode). • connect-failed—The CMTS was able to open the proper socket connection to the server but could not connect to the server. • data-incomplete—A failure occurred during the file write or the streaming to the collection server, and the records that were written might be incomplete. • disk-full—The billing records could not be written because the filesystem does not have sufficient free space. • no-memory—The processor had insufficient memory to collect the billing records. • open-failure—The transfer failed because the CMTS could not open a new file on the filesystem (file mode) or open a socket to the destination IP address and port (streaming mode). • unknown—An unknown error occurred. • write-error (<i>data-type</i>)—The operating system reported an error when attempting to write the billing records (file mode), or the send to the destination socket failed (streaming mode). <ul style="list-style-type: none"> • The value of <i>data-type</i> could be <i>file-header</i> , <i>file-end</i> , <i>bulk-data</i> , <i>sflog</i> , <i>bulk-data</i> , <i>ipdr-data</i> , <i>ipdr-sflog</i> , or <i>ipdr-file</i> .

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show cable metering-status** command on the Cisco cBR router for Collector configuration—ipdr-d3, session 1, type 1 collecting full-records, as follows:

```
Router#show cable metering-status
destination                complete-time  flow  cpe  full  status
                           aggr  supp  rec
IPDR_Session1              May21 13:27:04 No    N/A  Yes  connect-failed

Router#
```

Related Commands

Command	Description
cable metering destination	Enables usage-based billing and streams the billing records to an external server.
cable metering filesystem	Enables usage-based billing and writes the billing records to a file on a local file system.
cable metering source-interface	Enables debugging of usage-based billing operations.
snmp-server enable traps cable	Enables the sending of Simple Network Management Protocol (SNMP) traps for cable-related events.

show cable modem

To display information for the registered and unregistered cable modems, use the **show cable modem** command in privileged EXEC mode.

```
show cable modem [{ip-address|mac-address | cable {slot / port | slot / subslot / port } ] [upstream port ]} ] queue [verbose] [cm-status]
```

Cisco IOS Release 12.2(33)SCE and later releases

```
show cable modem [{ip-address | mac-address | cable {slot / cable-interface-index | slot / subslot / cable-interface-index } ] [upstream port ]} ] [verbose] [cm-status]
```

Cisco cBR Series Converged Broadband Router

```
show cable modem [{ip-address | mac-address | cable {slot / subslot / cable-interface-index } ] [upstream port ]} ] [verbose] [cm-status]
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific cable modem to be displayed. If you specify the IP address for a CPE device behind a cable modem, information for that cable modem is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific cable modem to be displayed. If you specify the MAC address for a CPE device behind a cable modem, information for that cable modem is displayed.
cable	(Optional) Displays the modems on a specific cable interface.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR router—The valid range is 0 to 3 and 6 to 9.
<i>subslot</i>	Secondary slot number of the cable interface line card. Cisco uBR10012 only —The valid subslots are 0 or 1. Cisco cBR router—The valid value is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).

<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR router—The valid range is 0 to 15.
upstream port	(Optional) Displays information for all cable modems using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card. Cisco cBR router—The valid range of <i>port</i> is 0 to 7.
name fqdn	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router. This keyword is not supported on the Cisco cBR router.
verbose	Displays detailed information of the cable modems.
cm-status	Displays cable modem status events.
cm-status ack	Displays the modems to which cable modem status acknowledgement messages are sent.
queue	Displays the downstream hierarchical queueing framework (HQF) queue information for a cable modem. This keyword is not supported on the Cisco cBR router.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1. This keyword is not supported on the Cisco cBR router.

Command Modes

Privileged EXEC (#)

Command History

BC Release	Modification
12.2(15)BC1	Additional lines were added to the show cable modem verbose displays, for one or all cable modems, to show information about the dynamic shared-secret feature. Cable modems that fail the dynamic secret authentication checks and then come online are marked with an exclamation point (!), so that this situation can be investigated.
12.2(4)BC1	Support was added for the Cisco uBR10012 router.

BC Release	Modification
12.2(8)BC2	The output for the Online State field was updated for the cable tftp-enforce command. A pound sign (#) appears next to the state value when a cable modem was allowed to come online without attempting to download a DOCSIS configuration file through the cable interface with the Cisco CMTS.
12.2(15)BC1c	The verbose option displays whether dynamic service change requests (DSX) are allowed from cable modems.
12.2(15)BC2	Two new states—cc(r1) and cc(r2)—have been added to the cable modem MAC state field to indicate the cable modem status when it has been instructed to change channels and is ranging to obtain a new downstream or upstream channel. Also, three new states—online(pkd), online(ptd), and expire(pkd)—were added to clarify the BPI state when network access has been disabled in the cable modem's DOCSIS configuration file. In addition, the show cable modem verbose command now displays the total amount of time that a cable modem has been online since last registering.
12.3(13a)BC	New initialization states were added for the MAC State Field: <ul style="list-style-type: none"> • init(d)—The Cisco CMTS has seen DHCPDISCOVER • init(io)—The Cisco CMTS has seen DHCPOFFER • init(dr)—The Cisco CMTS has seen DHCPREQUEST • init(i)—The Cisco CMTS has seen DHCPACK • init(o)—The Cisco CMTS has seen first TFTP packet for TFTP request for cable modem configuration file • init(t)—The Cisco CMTS has seen the TOD request
12.3(21)BC	All cable bundles are now automatically converted and configured to be in a virtual bundle, and standalone cable interfaces must be manually configured to be in a virtual bundle to operate properly. Previously, new virtual interface bundles and bundle members required reconfiguration, and there could also be standalone interfaces not part of a bundle at all.
12.3(23)BC	The verbose option displays additional information about the cable modem. The following fields have been added to the output of this option: <ul style="list-style-type: none"> • Host Interface • Primary Downstream • Wideband Capable • Voice Enabled • DS Change Times
C Release	Modification

BC Release	Modification
12.1(4)CX	Support was added for the Cisco uBR10012 router.
12.2(15)CX	The verbose option displays the sysDescr field for each cable modem, when the cable modem remote-query command has been configured. Other fields have also been added to support DOCSIS 2.0 (ATDMA) operation.
E Release	Modification
12.1(10)EC1	Adds an exclamation point to cable modems that have exceeded the maximum delay/timing offset specified by the cable map-advance command.
12.1(11b)EC1	The output for the Online State field was updated for the cable tftp-enforce command. A pound sign (#) appears next to the state value when a cable modem was allowed to come online without attempting to download a DOCSIS configuration file through the cable interface with the Cisco CMTS.
12.1(20)EC1	The three new states—online(pkd), online(ptd), and expire(pkd)—were added to the Cisco IOS Release 12.1 EC train.
N Release	Modification
11.3(5)NA	The output was reorganized and the Receive Power field was added.
T Release	Modification
2.1(1a)T1	The output of this command was enhanced to show that the Cisco CMTS has detected an unstable return path for a particular cable modem and has compensated with a power adjustment. An asterisk (*) appears in the power adjustment field for a modem when a power adjustment has been made; an exclamation point (!) appears when the cable modem has reached its maximum power transmit level and cannot increase its power level further.
12.0(7)T	The detail option was replaced with the verbose option.
X Release	Modification
11.3XA	This command was introduced.
12.0(4)XI	The output was expanded to show the primary service identifier (SID) and the customer premises equipment (CPE) count.
12.0(7)XR	The output of this command was enhanced to show that the Cisco CMTS has detected an unstable return path for a particular cable modem and has compensated with a power adjustment. An asterisk (*) appears in the power adjustment field for a modem when a power adjustment has been made; an exclamation point (!) appears when the cable modem has reached its maximum power transmit level and cannot increase its power level further.
SC Release	Modification

BC Release	Modification
12.2(33)SCA	<p>This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes:</p> <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a cable modem or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a cable modem. • The output column spacing and headings were changed, including some of the following changes: <ul style="list-style-type: none"> • “BPI Enb” has been changed to “BPI” • “DIP” output field was added to indicate support of dual IP for both IPv4 and IPv6 addressing. • The following new initialization states were added to show initialization of cable modems and CPEs supporting IPv6: <ul style="list-style-type: none"> • init6(s)—CMTS router has seen SOLICIT message. • init6(a)—CMTS router has seen ADVERTISE message. • init6(r)—CMTS router has seen REQUEST message. • init6(i)—CMTS router has seen REPLY message. • init6(o)—CMTS router has seen version 6 TFTP request. • init6(t)—CMTS router has seen version 6 TOD request.
12.2(33)SCB	A new keyword, cm-status , was added to display cable modem status events.
12.2(33)SCC	<p>This command was modified with the following changes:</p> <ul style="list-style-type: none"> • The command output displays the cable modem attribute bitmasks. • The command output provides basic receive-statistics for all event code types of the specified cable modem.
12.2(33)SCD	This command was modified. The cm-status keyword was added to display the cable modem status events and the queue keyword was added to display downstream HQF queue information on the Cisco uBR7225VXR and Cisco uBR7246VXR routers.
12.2(33)SCD2	This command was modified. The command output was modified to display the cable modems that are in upstream and downstream partial service mode.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCE4	This command was modified. The command output displays online time of the modem since the last counter reset, along with the total time online.

BC Release	Modification
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added. The show cable modem verbose command output was modified to display the downstream channel information for the cable modems.
12.2(33)SCH	The show cable modem verbose command output was modified to display the ranging class ID of a cable modem.
12.2(33)SCG5	The output of the command with the verbose keyword was modified to display the status of the Upstream Drop Classifier (UDC) feature. The field “UDC Enabled” was added in the output.
12.2(33)SCH1	The output of the command with the verbose keyword was modified to display the following: <ul style="list-style-type: none"> • The channel IDs for 16 downstream channels and channel information for 4 upstream channels on the Cisco uBR10012 routers using PRE4 or versions later than PRE4, and Cisco uBR7200 series routers using NPE-G2. • The number of IPv6 addresses per cable modem and the maximum values.
12.2(33)SCH2	The output of the command with the verbose keyword was modified to display the channel IDs for 24 downstream channels and the channel information for 8 upstream channels on the Cisco uBR10012 routers using PRE4 or versions later than PRE4, and Cisco uBR7200 series routers using NPE-G2.
12.2(33)SCI2	This command was integrated into Cisco IOS Release 12.2(33)SCI2.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The name , queue keyword and the <i>logical-channel-index</i> variable were removed.
IOS-XE 3.16.0S	The output of the command was modified to display the battery backup mode for MAC state. The output of the command with verbose keyword was modified to display battery mode and battery mode status.
IOS-XE 3.18.0S	The output of the command was modified to display the energy management mode for MAC state. The output of the command with verbose keyword was modified to display energy management mode and energy management mode status.
IOS-XE 3.18.0SP	The output of the command with the verbose keyword was modified to display the new DOCSIS 3.1 Commanded Power levels per upstream.
IOS-XE 16.6.1	The output of the command with the verbose keyword was modified to display the cable modem’s CM-STATS-ACK capability. A new keyword, ack , was added to display cable modems to which cable modem status acknowledgement messages are sent.
IOS XE Amsterdam 17.3.1w	The output of the command was updated to include the partial mode description.
IOS XE Bengaluru 17.6.1x	The output of the command was updated to display more detailed CM-STATUS event history.

Usage Guidelines

This command displays information for all cable modems, for all cable modems attached to a specific CMTS cable interface, or for a particular cable modem, identified by its IP address, MAC address, or its domain name. The output is sorted by the cable interface and the cable modem's MAC address.

Note The upstream channel list displayed by **show cable modem ip-address/mac-address [verbose]** command is the subset of upstream service flow forwarding interface channel set of the cable modem.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Tip Several options in the **show cable modem** command do not pause the screen to display the information page by page, even if the **terminal length** command has been used to set the page size of your terminal. Paging and pausing the display could result in outdated or stale information for cable modems, and thus produce an incorrect snapshot of the current cable modem state of the system. To capture or review this information, use your terminal program's capture buffer to save the information to a file, and then review it offline.

Tip You can also specify the MAC address or IP address for a CPE device, and the Cisco CMTS will display the information for the cable modem that is associated with that CPE device in its internal database.

Note If the CPE IP address is no longer associated with a cable modem, the **show cable modem** command might not display information about the cable modem. To display the IP address of the CPE device for the cable modem, use the **clear cable host ip-address** command to clear the IP address of the modem from the router database, and then enter the **ping docsis mac-address** command, which resolves the MAC address by sending the DOCSIS ping to the CM.

Note When an IPv4 CPE is moved from one bundle interface to another bundle interface, the **show cable modem** command displays duplicate CPE device under the original modem and new modem. CPE ping may also fail. To prevent duplication, use the **clear cable host** command to manually remove the old CPE device entry before moving the IPv4 CPE from one bundle interface to another. Reload the CPE after moving it to another bundle interface.

Refer to the following document on Cisco.com for additional information about cable interface bundling and virtual interface bundling on the Cisco CMTS:

- *Cable Interface Bundling and Virtual Interface Bundling on the Cisco CMTS*

Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Operation of the show cable modem Commands with Different Cable Interface Line Cards

The **show cable modem** commands display the most current information for standard cable interface line cards. If the card itself is down, the **show cable modem** commands still show whatever information is appropriate (such as offline cable modems and flap list information).

The **show cable modem** commands function slightly different when used on routers that are using Broadband Processing Engine (BPE) cable interface line cards (such as the Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, or Cisco uBR10-MC5X20S/U/H). When BPE cards are the only cable interface cards installed, the **show cable modem** commands do not display any output until at least one BPE card is up and communicating with the router processor. If the BPE cards are not yet up, the **show cable modem** command does not display any output.

Note The **hccp** commands are not supported on the Cisco cBR router for Cisco IOS-XE 3.15.0S.

Example of the show cable modem Command Output for all cable modems

The following sample output from the **show cable modem** command shows the default cable modem displays for individual cable modems.

```
Router# show cable modem

Example of show cable modem verbose Command for a Specified MAC Address

The following example shows sample output for the **verbose** option for a particular CM:

```
Router# show cable modem 0010.7bb3.fcd1 verbose

MAC Address           : 00C0.7bb3.fcd1
IP Address            : 10.20.113.2
Prim Sid              : 1
QoS Profile Index     : 6
Interface             : C5/0/U5
sysDescr              : Vendor ABC DOCSIS 2.0 Cable Modem
Upstream Power        : 0 dBmV (SNR = 33.25 dBmV)
Downstream Power      : 0 dBmV (SNR = ----- dBmV)
Timing Offset         : 1624
Initial Timing Offset : 2812
Received Power        : 0.25
MAC Version           : DOC1.0
Qos Provisioned Mode  : DOC1.0
Enable DOCSIS2.0 Mode : Y
Phy Operating Mode    : atdma
Capabilities           : {Frag=N, Concat=N, PHS=N, Priv=BPI}
Sid/Said Limit        : {Max Us Sids=0, Max Ds Sids=0}
Optional Filtering Support : {802.1P=N, 802.1Q=N}
Transmit Equalizer Support : {Taps/Symbol= 0, Num of Taps= 0}
Number of CPE IPs     : 0 (Max CPEs = 1)
CFG Max-CPE           : 1
Flaps                 : 373 (Jun 1 13:11:01)
Errors                : 0 CRCs, 0 HCSes
Stn Mtn Failures      : 0 aborts, 3 exhausted
Total US Flows        : 1 (1 active)
Total DS Flows        : 1 (1 active)
Total US Data         : 1452082 packets, 171344434 bytes
Total US Throughput   : 0 bits/sec, 0 packets/sec
Total DS Data         : 1452073 packets, 171343858 bytes
Total DS Throughput   : 0 bits/sec, 0 packets/sec
Active Classifiers    : 0 (Max = NO LIMIT)
DSA/DSX messages      : reject all
Dynamic Secret         : A3D1028F36EBD54FDCC2F74719664D3F
Total Time Online     : 16:16
```

Note When a DCC occurs, the cable modem US and DS counters are reset. The US and DS counters include counters such as data and throughput seen in the **show cable modem (mac-address) verbose** command output and packets and bytes seen in the **show cable modem (mac-address) counters** command output.

Note The “Number of CPES” field shows the value set for the CM, not the value for the CMTS that is set by the **cable modem max-cpe** command. In Cisco IOS Release 12.2(15)BC1 and later releases, the **verbose** display also includes information about the dynamic shared-secret feature (see the **cable dynamic-secret** command).

Note An asterisk (*) in the Receive Power column indicates that a power adjustment has been made for that CM. An exclamation point (!) in the Receive Power column indicates that the cable modem has reached its maximum power transmit level and cannot increase its power level further. An exclamation point (!) in the Timing Offset column indicates that the cable modem has exceeded the maximum delay and timing offset specified by the **cable map-advance** command. A pound sign (#) in the MAC State column indicates that the **cable tftp-enforce mark-only** command has been used for the cable modem to attempt a TFTP download of the DOCSIS configuration file before registering, but the cable modem did not do so (Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases).

Tip The **show cable modem** command displays the cable modem timing offset in DOCSIS ticks, while other commands, such as **cable map-advance**, display the offset in microseconds. Use the following method to convert microseconds to DOCSIS ticks: ticks = microseconds*64/6.25 .

Example of the Updated show cable modem verbose Command for a Specified MAC Address in Cisco IOS Release 12.3(23)BC

The following example shows sample output for the **verbose** option for a particular cable modem for the Cisco IOS Release 12.3(23)BC with new output fields:

```
Router# show cable modem 0000.39b9.ac51 verbose

```

Note In Cisco IOS Release 12.3(23)BC, the output for this command does not display information about dynamic shared secret.

Example of show cable modem Command for a cable modem or CPE With a Specified IPv6 Address

The following example shows sample output for the **show cable modem** command for a cable modem with the IPv6 address of 2001:ODBA:4321:600:980D:E743:174F:1E48.

Note The IP Address field shows “---” because the IPv6 address is too long for the size of the output field. To view a complete IPv6 address for a device, use the **verbose** form of the command.

```

Router# show cable modem 2001:ODBA:4321:600:980D:E743:174F:1E48
MAC Address      IP Address      I/F      MAC      Prim  RxPwr  Timing Num P I
                State          C5/0/1/U0 w-online 38    0.00 1580  0  N
0019.474a.ccd0 ---

```

Example of the show cable modem verbose Command Output That Shows cable modem Attribute Masks in Cisco IOS Release 12.2(33)SCC

The following example shows the sample output for the **verbose** option for a particular cable modem in Cisco IOS Release 12.2(33)SCC:

```

Example of the show cable modem verbose Command in Cisco IOS Release 12.2(33)SCF

The following is a sample output of the **show cable modem verbose** command in Cisco IOS Release 12.2(33)SCF:

```

Router# show cable modem 10.1.0.2 verbose
MAC Address           : 001e.6bfb.0a60
IP Address            : 10.1.0.2
IPv6 Address          : ---
Dual IP              : N
Prim Sid             : 43
Host Interface       : C7/0/0/UB
MD-DS-SG / MD-US-SG : 1 / 1
MD-CM-SG             : 0x3C0101
Primary Wideband Channel ID : 897 (Wi7/0/0:0)
Primary Downstream   : In7/0/0:0 (RfId : 720)
Wideband Capable     : Y
RCP Index            : 3
RCP ID               : 00 10 00 00 04
Multi-Transmit Channel Mode : Y
Upstream Channel     : US0          US1          US2
Ranging Status      : sta          sta          sta
Upstream SNR (dB)   : 33.1          33.1          33.1
Upstream Data SNR (dB) : 22.78          22.78          22.78
Received Power (dBmV) : 0.50          0.00          0.00
Reported Transmit Power (dBmV) : 51.00          51.00          51.00
Peak Transmit Power (dBmV) : 51.00          51.00          51.00
Minimum Transmit Power (dBmV) : 24.00          24.00          24.00
Timing Offset       (97.6 ns): 1302          1303          1303

```

The following example is a sample output of the **show cable modem verbose** command that displays the downstream channel information for a specific cable modem identified by its IP address:

```

Router# show cable modem 80.62.0.4 verbose

Example of the show cable modem Command Output for upstream drop classifier (UDC) feature

Effective from Cisco IOS Release 12.2(33)SCG5, the **verbose** keyword displays the status of the Upstream Drop Classifier (UDC) feature for a specific cable modem. The “UDC Enabled” field displays ‘Y’ if it is enabled.

The following example shows the output of the **show cable modem** command with the **verbose** keyword for the UDC feature:

```

Router# show cable modem 4458.2945.3004 verbose

MAC Address                        : 4458.2945.3004

Table 99: show cable modem Field Descriptions

Field	Description
MAC Address	MAC address for the CM.
IP Address	IP address that the DHCP server has assigned to the CM.
IPv6 Address	IPv6 address that the DHCP server has assigned to the CM.
Dual IP	Support of dual IP for both IPv4 and IPv6 addressing.
I/F, Interface	Cable interface line card providing the upstream for this CM.
sysDescr	Vendor and model of the cable modem, as reported by the cable modem. This field displays a value only when the cable modem remote-query command is configured.

Field	Description
Upstream Power Downstream Power	Upstream and Downstream Power fields are displayed only if the CM remote-query feature has been enabled using the cable modem remote-query command. Upstream Power displays the cable modem transmit level in dBmV, and Downstream Power displays the dBmV level received at the CM, as measured by the CMTS.
MAC State	Current state of the MAC layer.
Prim SID	Primary SID assigned to this CM.
Host Interface	Host interface name.
Primary Wideband Channel ID	Bonding group ID of the wideband interface assigned to the CM.
MD-DS-SG	MAC Domain Downstream Service Group, the downstream channels of a single MAC domain that reach the cable modem.
DSID	Downstream Service Identifier.
Primary Downstream	Primary downstream channel assigned to the CM.
Wideband Capable	Cable modem is wideband-capable or not.
Downstream Channel DCID RF Channel	Downstream channel and channel ID used by a CM.
Multi-Transmit Channel Mode	Cable modem is in MTC mode or not.
UDC Enabled	Upstream Drop Classifier enabled or disabled. Displays 'Y' for enabled state and 'N' for disabled.
Upstream SNR	Upstream signal-to-noise ratio (SNR) for a particular cable modem (CM), in decibels (dB).
Upstream SM MER (dB)	Upstream station maintenance (SM) modulation error ratio (MER) for a particular cable modem, in decibels (dB).
Upstream Data MER (dB)	Upstream modulation error ratio (MER) for a particular cable modem, in decibels (dB). This field is displayed only when RF adaptation is enabled.

Field	Description
RxPwr, Received Power	<p>Average power in dBmV for the upstream channel symbol rate for the CM. With default settings, 0 dBmV is considered optimal, but a range of -1 to 1 dBmV is allowable. When cable modems exceed this range, older Cisco IOS releases supported a drop to as low as -2 dBmV. Recent Cisco IOS releases support a drop to as low as -4 dBmV.</p> <p>This field supports a resolution of 0.25 dBmV, but the dB resolution level for cable modems and for the Cisco CMTS are slightly higher—approximately 1.0 and 1.4 dB.</p> <p>Note An asterisk (*) in the RxPwr column indicates that a power adjustment has been made for that CM. An exclamation point (!) indicates that the cable modem has reached its maximum power transmit level and cannot increase its power level further.</p>
Timing Offset and Initial Timing Offset	<p>Timing offset for the CM, in ticks, as recognized on the CMTS. (A tick, as used here, is 6.25/64 microseconds.) This is the delay between when a particular cable modem is scheduled to make a transmission and when the CMTS actually receives it.</p> <p>Note An exclamation point (!) in the Timing Offset column indicates that the cable modem has exceeded the maximum delay and timing offset specified by the cable map-advance command.</p> <p>Note The timing offset shown here is typically smaller than the TX Time Offset value shown by the show cable modem remote-query command, because the latter value is the offset as recognized on the cable modem (which will include any internal delay between when the cable modem software begins the transmission and when the bits actually appear on the local cable interface).</p>
Reported Transmit Power (dBmV)	Reported Transmit Power level by the cable modem for each upstream channel. This applies only to the cable modems operating in the MTC mode.
Peak Transmit Power (dBmV)	This is the maximum transmit power level that the cable modem in the MTC mode could transmit at for the upstream channel.
Minimum Transmit Power (dBmV)	This is the minimum transmit power level that the cable modem in the MTC mode could transmit at for the upstream channel.
Rng Timing Adj Moving Avg(0.381 ns): Rng Timing Adj Lt Moving Avg: Rng Timing Adj Minimum: Rng Timing Adj Maximum:	A Cisco CMTS router tracking variables to see relative timing offset adjustments.

Field	Description
Pre-EQ Good : Pre-EQ Scaled : Pre-EQ Impulse: Pre-EQ Direct Loads	Equalizer statistics counter.
Good Codewords rx	Good code words for a particular upstream channel. This counter is reset during interface reset.
Corrected Codewords rx	Correctable code words for a particular upstream channel. This counter is reset during interface reset.
Uncorrectable Codewords rx	Uncorrectable code words for a particular upstream channel. This counter is reset during interface reset.
sysDescr	Identifies the vendor and model of the cable modem, as reported by the cable modem. This field displays a value only when the cable modem remote-query.
Num CPEs, CFG Max-CPE	Indicates the number of CPE devices for which the cable modem is providing services.
Number of CPE IPs	Indicates the maximum number of IP addresses assigned to CPE devices behind this CM, as configured by the cable max-hosts command.
Ver, MAC Version	Displays the maximum supported version of DOCSIS that the cable modem supports (DOCSIS 1.0, DOCSIS 1.1, DOCSIS 2.0).
QoS Prov, QoS Provisioned Mode	Displays the version of DOCSIS that the cable modem currently is provisioned for (DOCSIS 1.0, DOCSIS 1.1, DOCSIS 2.0).
Enable DOCSIS 2.0 Mode	Indicates that the cable modems are allowed to come online when in mixed-mode environments such as DOCSIS 1.0 TDMA, DOCSIS 1.1 TDMA and DOCSIS 2.0 ATDMA. This value is set to Y by default, unless the TLV 39 has been set to disabled (0) in the CM's Registration Request message or in the DOCSIS configuration file.
Phy Operating Mode	Indicates the type of PHY-layer modulation that the cable modem is using: tdma or atdma. Also indicates the TDMA/ATDMA/SCDA mode that the cable modem is operating on a specific channel.
Modem Status	Indicates the overall modem state and the security state of the primary SID.
BPI Enbld, BPI	Indicates whether or not Baseline Privacy Interface (BPI) or BPI Plus (BPI+) encryption is enabled for the CM.
DIP	Dual IP flag. Identifies whether or not ("Y" or "N") the cable modem or CPE supports both IPv4 and IPv6 addressing.
Capabilities	Indicates what the cable modem reported as its capabilities in its Registration Request message: DOCSIS fragmentation, concatenation, packet header suppression (PHS), and BPI encryption.

Field	Description
Security Capabilities	Indicates the privacy mode used by the cable modem (BPI or BPI+), early authentication and encryption (EAE) support, and the Key Length.
Optional Filtering Support	Indicates whether 802.1P or 802.1Q packet filtering is enabled for this CM.
Transmit Equalizer Support	Number of taps being used for transmit equalization.
Flaps	Number of flaps reported by this CM, with the date and time of the last flap within the parentheses.
Errors	Number of frame CRC and HCS errors reported for this CM.
Stn Mtn Failures	Number of station maintenance (cable keepalive) messages that the CMTS sent to this cable modem but did not receive any reply.
Total US Flows	Total number of upstream service flows, with the number of active service flows within the parentheses.
Total DS Flows	Total number of downstream service flows, with the number of active service flows within the parentheses.
Total US Data	Total data this cable modem has transmitted on the upstream, in packets and bytes.
Total US Throughput	Calculated throughput for this cable modem on the upstream, if available.
Total DS Data	Total data this cable modem has received on the downstream, in packets and bytes.
Total DS Throughput	Calculated throughput for this cable modem on the downstream, if available.
Active Classifiers	Current number of active classifiers for this CM, with the maximum number of allowable classifiers for this cable modem within the parentheses.
CM Required Attribute	Indicates the current required attribute-mask value.
CM Forbidden Attribute	Indicates the current forbidden attribute-mask value.
DSA/DSX messages	Indicates whether dynamic service changes (DSX) from the cable modem are permitted (permit all) or disallowed (reject all).
Voice Enabled	Indicates whether the cable modem is voice-enabled.
Number of Multicast DSIDs Support	Indicates the total number of supported multicast DSIDs.
FCType10 Forwarding Support	Indicates FCType10 Forwarding Support.

Field	Description
Dynamic Secret	<p>Dynamically-generated shared secret (a 16-byte hexadecimal value) that was used in the cable modem's previous registration cycle. If the cable modem is currently offline, this field shows all zeroes. If a cable modem has been excluded from being processed by the dynamic shared secret feature, using the cable dynamic-secret exclude command, this field shows "Excluded".</p> <p>Note This field displays a value only when the cable dynamic-secret command has been used on the CMTS interface.</p>
Total Time Online	Amount of time in days, hours, and minutes that this cable modem has been continuously online since it last registered with the CMTS. This field begins incrementing whenever the cable modem enters one of the online(x) MAC states, and is reset to 0 whenever the cable modem enters any other MAC state.
Event	Event type.
TID	Transaction identifier.
Count	Number of valid messages received.
Dups	Number of duplicate messages received.
Time	Time when last valid event was received.
Len/Limit Pkts	Queue length and limit in packets.
Deqs Pkts	Dequeue packets.
Drops Pkts	Dropped packets.
CIR Kbps	Committed information rate.
MIR/PR Kbps	Maximum information and peak rate.
Forwint	Forwarding interface.
SFID	Service flow identifier.
BE Queues	Best effort queues.
CIR Queues	Committed information rate queues.
Low Latency Queues	Low latency queues.
Ranging Class ID	Upstream ranging class ID.
Upstream SNR	Signal-to-noise ratio of the upstream signal (station maintenance).
Upstream Data SNR	Signal-to-noise ratio for actual data bursts.

The table below shows the possible values for the MAC state field.

Note The CM MAC state field can also be retrieved using SNMP by getting the value of the `cdxCmtsCableModemStatusValue` object in the CISCO-DOCS-EXT-MIB. The following symbols appended to the modem state indicate a special condition: An exclamation mark (!) indicates that the cable dynamic-secret command is used with either the `mark` or `reject` keyword and the cable modem has failed the dynamic secret authentication check. An ampersand (&) indicates that the cable modem has registered using a self-signed certificate. This is inherently not secure and can be avoided by negating the cable privacy `accept-self-signed-certificate` command. The asterisk (*) indicates that the cable modem does not satisfy the BPI+ policy and the data traffic is blocked. The cable privacy `bpi-plus-policy` command enforces this requirement. A hash sign (#) indicates that the cable modem is using an unknown configuration file. To solve this problem, use the cable dynamic-secret command with the `reject` keyword. This will reject registration for cable modems with DOCSIS configuration files. In Cisco IOS Releases 12.1(20)EC, 12.2(15)BC1, and earlier releases, when network access is disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows `online(d)` even if BPI encryption fails.

Table 100: Descriptions for the MAC State Field

MAC State Value	Description
Ranging Status Conditions for Devices Using IPv4 Addressing	
<code>init(r1)</code>	The cable modem sent initial ranging.
<code>init(r2)</code>	The cable modem is ranging. The CMTS received initial ranging from the cable modem and has sent RF power, timing offset, and frequency adjustments to the CM.
<code>init(rc)</code>	Ranging has completed. Note If a cable modem appears to be stuck in this state, it could be that the cable modem is able to communicate successfully on the cable network, but that the upstream is at capacity and does not have any additional bandwidth to allow the cable modem to finish registration and come online. Either manually move one or more cable modems to other upstreams, or enable load balancing on the upstream using the cable load-balance group commands.
Registration and Provisioning Status Conditions for Devices Using IPv4 Addressing	
If early authentication and encryption is used, the letter 's' is appended to these states to indicate secure registration.	
<code>init(d)</code>	The DHCP request was received, as DHCPDISCOVER. This also indicates that the first IP broadcast packet has been received from the CM.
<code>init(dr)</code>	The DHCP request has been sent to the cable modem.

MAC State Value	Description
init(i)	<p>The cable modem has received the DHCPOFFER reply (DHCPACK) from the DHCP server that has assigned an IP address to the modem, but the modem has not yet replied with a DHCPREQUEST message requesting that particular IP address, nor has it sent an IP packet with that IP address.</p> <p>Note If a cable modem appears to be stuck in this state, the cable modem has likely received the DHCPOFFER reply from the DHCP server, but this reply might have contained one or more invalid options for that particular CM.</p>
init(io)	The Cisco CMTS has seen the DHCP offer as sent to the cable modem from the DHCP server that has assigned an IP address to the modem.
init(o)	The cable modem has begun to download the option file (DOCSIS configuration file) using the Trivial File Transfer Protocol (TFTP), as specified in the DHCP response. If the cable modem remains in this state, it indicates that the download has failed.
init(t)	Time-of-day (TOD) exchange has started.
<p>Registration and Provisioning Status Conditions for Devices Using IPv6 Addressing</p> <p>If early authentication and encryption is used, the letter 's' is appended to these states to indicate secure registration.</p>	
init6(s)	The Cisco CMTS router has seen the DHCPv6 SOLICIT message from the CM.
init6(a)	The Cisco CMTS router has seen the ADVERTISE message from the DHCPv6 server to the CM.
init6(r)	The Cisco CMTS router has seen the REQUEST response from the cable modem to the DHCPv6 server.
init6(i)	The Cisco CMTS router has seen the REPLY message from the DHCPv6 server to the CM.
init6(o)	The Cisco CMTS router has seen the REQUEST message from the cable modem to the TFTP server.
init6(t)	The Cisco CMTS router has seen the REQUEST message from the cable modem to the TOD server.
<p>Non-error Status Conditions</p>	
cc(r1)	The cable modem had registered and was online, but has received a Downstream Channel Change (DCC) or Upstream Channel Change (UCC) request message from the CMTS. The cable modem has begun moving to the new channel, and the CMTS has received the CM's initial ranging on the new downstream or upstream channel. At the MAC layer, the cable modem is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.

MAC State Value	Description
cc(r2)	This state should normally follow cc(r1) and indicates that the cable modem has finished its initial ranging on the new channel, and is currently performing continuous ranging on the new channel. At the MAC layer, the cable modem is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.
offline	The cable modem is considered offline (disconnected or powered down).
resetting	The cable modem is being reset and will shortly restart the ranging and registration process.
online	The cable modem has registered and is enabled to pass data on the network.
online(d)	The cable modem registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. The cable modem does not forward traffic to or from the CPE devices, but the CMTS can continue to communicate with the cable modem using DOCSIS messages and IP traffic (such as SNMP commands). Note If BPI was enabled in the DOCSIS configuration file sent to the CM, assume that the cable modem is using BPI encryption, unless other messages show that the BPI negotiation and key assignments have failed.
online(pk)	The cable modem registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and KEK is assigned. Note This state is equivalent to the online(d) and online(pk) states.
online(pt)	The cable modem registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note This state is equivalent to the online(d) and online(pt) states.
online(pk)	The cable modem registered, BPI is enabled and KEK is assigned.
online(pt)	The cable modem registered, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note If network access was disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows online(d) instead of online(pt) even when BPI encryption is enabled and operational.
expire(pk)	The cable modem registered, BPI is enabled, KEK was assigned, but the current KEK expired before the cable modem could successfully renew a new KEK value.
expire(pk)	The cable modem registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, KEK was assigned, but the current KEK expired before the cable modem could successfully renew a new KEK value. Note This state is equivalent to the online(d) and expire(pk) states.

MAC State Value	Description
expire(pt)	The cable modem registered, BPI is enabled, TEK was assigned, but the current TEK expired before the cable modem could successfully renew a new KEK value.
expire(ptd)	The cable modem registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, TEK was assigned, but the current TEK expired before the cable modem could successfully renew a new KEK value. Note This state is equivalent to the online(d) and expire(pt) states.
Error Status Conditions	
reject(m)	The cable modem attempted to register but registration was refused due to a bad Message Integrity Check (MIC) value. This also could indicate that the shared secret in the DOCSIS configuration file does not match the value configured on the CMTS with the cable shared-secret command. In Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases, this could also indicate that the cable tftp-enforce command has been used to require that a cable modem attempt a TFTP download of the DOCSIS configuration file before registering, but the cable modem did not do so.
reject(c)	The cable modem attempted to register, but registration was refused due to a number of possible errors: <ul style="list-style-type: none"> • The cable modem attempted to register with a minimum guaranteed upstream bandwidth that would exceed the limits imposed by the cable upstream admission-control command. • The cable modem has been disabled because of a security violation. • A bad class of service (COS) value in the DOCSIS configuration file. • The cable modem attempted to create a new COS configuration but the CMTS is configured to not permit such changes. • The cable modem failed the timestamp check for its DOCSIS configuration file. (This could indicate a possible theft-of-service attempt, or a problem with the synchronization of the clocks on the cable modem and CMTS.)
reject(pk)	KEK key assignment is rejected, and the modem has not been authenticated.
reject(pkd)	The cable modem registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because KEK key assignment was rejected. Note This state is equivalent to the online(d) and reject(pk) states.
reject(pt)	TEK key assignment is rejected, BPI encryption has not been established.

MAC State Value	Description
reject(ptd)	The cable modem registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because TEK key assignment was rejected. Note This state is equivalent to the online(d) and reject(pt) states.
reject(ts)	The cable modem attempted to register, but registration failed because the TFTP server timestamp in the cable modem registration request did not match the timestamp maintained by the CMTS. This might indicate that the cable modem attempted to register by replaying an old DOCSIS configuration file used during a prior registration attempt.
reject(ip)	The cable modem attempted to register, but registration failed because the IP address in the cable modem request did not match the IP address that the TFTP server recorded when it sent the DOCSIS configuration file to the CM. IP spoofing could be occurring.
reject(na)	The cable modem attempted to register, but registration failed because the cable modem did not send a Registration-Acknowledgement (REG-ACK) message in reply to the Registration-Response (REG-RSP) message sent by the CMTS. A Registration-NonAcknowledgement (REG-NACK) is assumed.
Early Authentication and Encryption is Enabled	
assign(epk)	BPI is enabled and KEK is assigned.
assign(ept)	BPI is enabled and TEK is assigned. The registration messages will be encrypted.
expire(epk)	Early authentication and encryption is enabled, KEK was assigned, but the current KEK expired before the cable modem could successfully renew a new KEK value.
expire(ept)	Early authentication and encryption is enabled, TEK was assigned, but the current TEK expired before the cable modem could successfully renew a new KEK value.
reject(epk)	Early authentication and encryption is enabled, KEK key assignment is rejected, and the modem has not been authenticated.
reject(ept)	Early authentication and encryption is enabled, TEK key assignment is rejected, and BPI encryption has not been established.
sinit(d)	Early authentication and encryption is enabled, the DHCP request was received, as DHCPDISCOVER. This also indicates that the first IP broadcast packet has been received from the CM.
sinit6(s)	Early authentication and encryption is enabled, the Cisco CMTS router has seen the DHCPv6 SOLICIT message from the CM.
sinit(io)	Early authentication and encryption is enabled, the Cisco CMTS has seen the DHCP offer as sent to the cable modem from the DHCP server that has assigned an IP address to the modem.
sinit6(a)	Early authentication and encryption is enabled, the Cisco CMTS router has seen the ADVERTISE message from the DHCPv6 server to the CM.

MAC State Value	Description
sinit(dr)	Early authentication and encryption is enabled, the DHCP request has been sent to the cable modem.
sinit6(r)	Early authentication and encryption is enabled, the Cisco CMTS router has seen the REQUEST response from the cable modem to the DHCPv6 server.
sinit(i)	Early authentication and encryption is enabled, the cable modem has received the DHCPOFFER reply (DHCPACK) from the DHCP server that has assigned an IP address to the modem, but the modem has not yet replied with a DHCPREQUEST message requesting that particular IP address, nor has it sent an IP packet with that IP address.
sinit6(i)	Early authentication and encryption is enabled, the Cisco CMTS router has seen the REPLY message from the DHCPv6 server to the CM.
sinit(o)	Early authentication and encryption is enabled, the cable modem has begun to download the option file (DOCSIS configuration file) using the Trivial File Transfer Protocol (TFTP), as specified in the DHCP response. If the cable modem remains in this state, it indicates that the download has failed.
sinit6(o)	Early authentication and encryption is enabled, the Cisco CMTS router has seen the REQUEST message from the cable modem to the TFTP server.
sinit(t)	Early authentication and encryption is enabled, time-of-day (TOD) exchange has started.
sinit6(t)	Early authentication and encryption is enabled, the Cisco CMTS router has seen the REQUEST message from the cable modem to the TOD server.
sreject(m)	Early authentication and encryption is enabled, the cable modem attempted to register but registration was refused due to a bad Message Integrity Check (MIC) value. This also could indicate that the shared secret in the DOCSIS configuration file does not match the value configured on the CMTS with the cable shared-secret command.
sreject(ts)	Early authentication and encryption is enabled, the cable modem attempted to register, but registration failed because the TFTP server timestamp in the cable modem registration request did not match the timestamp maintained by the CMTS. This might indicate that the cable modem attempted to register by replaying an old DOCSIS configuration file used during a prior registration attempt.
sreject(ip)	Early authentication and encryption is enabled, the cable modem attempted to register, but registration failed because the IP address in the cable modem request did not match the IP address that the TFTP server recorded when it sent the DOCSIS configuration file to the CM. IP spoofing could be occurring.

MAC State Value	Description
sreject(c)	<p>Early authentication and encryption is enabled, the cable modem attempted to register, but registration was refused due to a number of possible errors:</p> <ul style="list-style-type: none"> • The CM attempted to register with a minimum guaranteed upstream bandwidth that would exceed the limits imposed by the cable upstream admission-control command. • The CM has been disabled because of a security violation. • A bad class of service (COS) value in the DOCSIS configuration file. • The CM attempted to create a new COS configuration but the CMTS is configured to not permit such changes. • The CM failed the timestamp check for its DOCSIS configuration file. (This could indicate a possible theft-of-service attempt, or a problem with the synchronization of the clocks on the CM and CMTS.)
sreject(na)	<p>Early authentication and encryption is enabled, the cable modem attempted to register, but registration failed because the cable modem did not send a Registration-Acknowledgement (REG-ACK) message in reply to the Registration-Response (REG-RSP) message sent by the CMTS. A Registration-NonAcknowledgement (REG-NACK) is assumed.</p>
Wideband Cable Modem	
w-online	The wideband cable modem has registered and is enabled to pass data on the network.
w-online(d)	The wideband cable modem is registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. The CM does not forward traffic to or from the CPE devices, but the WCMTS can continue to communicate with the WCM using DOCSIS messages and IP traffic (such as SNMP commands).
w-online(pkd)	The wideband cable modem is registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and KEK is assigned.
w-online(pt)	The wideband cable modem is registered, BPI is enabled and TEK is assigned. BPI encryption is now being performed.
w-online(ptd)	The wideband cable modem is registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and TEK is assigned. BPI encryption is now being performed.
w-online(pk)	The wideband cable modem is registered, BPI is enabled and KEK is assigned.
w-expire(pk)	The wideband cable modem is registered, BPI is enabled, KEK was assigned, but the current KEK expired before the WCM could successfully renew a new KEK value.

MAC State Value	Description
w-expire(pkd)	The wideband cable modem is registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value.
w-expire(pt)	The wideband cable modem is registered, BPI is enabled, TEK was assigned, but the current TEK expired before the WCM could successfully renew a new KEK value.
w-expire(ptd)	The wideband cable modem is registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, TEK was assigned, but the current TEK expired before the WCM could successfully renew a new KEK value.
w-reject(pk)	KEK key assignment is rejected, BPI encryption has not been established.
w-reject(pkd)	The wideband cable modem is registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because KEK key assignment was rejected.
w-reject(pt)	TEK key assignment is rejected, BPI encryption has not been established.
w-reject(ptd)	The wideband cable modem is registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because TEK key assignment was rejected.
Cable Modem is in DS Resiliency	
p-online	The cable modem is in DS resiliency, has registered and is enabled to pass data on the network.
p-reject(pk)	The cable modem is in DS resiliency, KEK key assignment is rejected, BPI encryption has not been established.
p-expire(pk)	The cable modem is in DS resiliency, has registered, BPI is enabled, KEK was assigned, but the current KEK expired before the cable modem could successfully renew a new KEK value.
p-online(pk)	The cable modem is in DS resiliency, has registered, BPI is enabled and KEK is assigned.
p-reject(pt)	The cable modem is in DS resiliency, TEK key assignment is rejected, BPI encryption has not been established.
p-expire(pt)	The cable modem is in DS resiliency, has registered, BPI is enabled, TEK was assigned, but the current TEK expired before the cable modem could successfully renew a new KEK value.
p-online(pt)	The cable modem is in DS resiliency, has registered, BPI is enabled and TEK is assigned. BPI encryption is now being performed.

MAC State Value	Description
p-online(d)	The cable modem is in DS resiliency, has registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. The cable modem does not forward traffic to or from the CPE devices, but the CMTS can continue to communicate with the cable modem using DOCSIS messages and IP traffic (such as SNMP commands).
p-reject(pkd)	The cable modem is in DS resiliency, has registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because KEK key assignment was rejected.
p-expire(pkd)	The cable modem is in DS resiliency, has registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, KEK was assigned, but the current KEK expired before the cable modem could successfully renew a new KEK value.
p-online(pkd)	The cable modem is in DS resiliency, has registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and KEK is assigned.
p-reject(ptd)	The cable modem is in DS resiliency, has registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because TEK key assignment was rejected.
p-expire(ptd)	The cable modem is in DS resiliency, has registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, TEK was assigned, but the current TEK expired before the cable modem could successfully renew a new KEK value.
p-online(ptd)	The cable modem is in DS resiliency, has registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and TEK is assigned. BPI encryption is now being performed.
Cable Modem is in Energy Management 1x1 mode	
w-online(em)	The cable modem is in energy management 1x1 mode, has registered and is enabled to pass data on the network.
w-reject(pk)(em)	The cable modem is in energy management 1x1 mode, KEK key assignment is rejected, BPI encryption has not been established.
w-expire(pk)(em)	The cable modem is in energy management 1x1 mode, has registered, BPI is enabled, KEK was assigned, but the current KEK expired before the WCM could successfully renew a new KEK value.
w-online(pk)(em)	The cable modem is in energy management 1x1 mode, has registered, BPI is enabled and KEK is assigned.
w-reject(pt)(em)	The cable modem is in energy management 1x1 mode, TEK key assignment is rejected, BPI encryption has not been established.

MAC State Value	Description
w-expire(pt)(em)	The cable modem is in energy management 1x1 mode, has registered, BPI is enabled, TEK was assigned, but the current TEK expired before the WCM could successfully renew a new KEK value.
w-online(pt)(em)	The cable modem is in energy management 1x1 mode, has registered, BPI is enabled and TEK is assigned. BPI encryption is now being performed.
w-online(d)(em)	The cable modem is in energy management 1x1 mode, has registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. The CM does not forward traffic to or from the CPE devices, but the WCMTS can continue to communicate with the WCM using DOCSIS messages and IP traffic (such as SNMP commands).
w-reject(pkd)(em)	The cable modem is in energy management 1x1 mode, has registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because KEK key assignment was rejected.
w-expire(pkd)(em)	The cable modem is in energy management 1x1 mode, has registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value.
w-online(pkd)(em)	The cable modem is in energy management 1x1 mode, has registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and KEK is assigned.
w-reject(ptd)(em)	The cable modem is in energy management 1x1 mode, has registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because TEK key assignment was rejected.
w-expire(ptd)(em)	The cable modem is in energy management 1x1 mode, has registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, TEK was assigned, but the current TEK expired before the WCM could successfully renew a new KEK value.
w-online(ptd)(em)	The cable modem is in energy management 1x1 mode, has registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and TEK is assigned. BPI encryption is now being performed.

Related Commands

Command	Description
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
show cable modem access-group	Displays the access groups for the cable modems on a particular cable interface.

Command	Description
show cable modem calls	Displays displays voice call information for a particular CM, identified either by its IP address or MAC address.
show cable modem classifiers	Displays information about the classifiers for a particular CM.
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.
show cable modem connectivity	Displays connectivity statistics for one or more cable modems.
show cable modem counters	Displays downstream and upstream traffic counters for one or more cable modems.
show cable modem cpe	Displays the CPE devices accessing the cable interface through a particular CM.
show cable modem domain-name	Updates the cable-specific DNS cache and display the domain name for specified cable modems and CPE behind a cable modem on a Cisco CMTS router.
show cable modem errors	Displays error statistics for one or more cable modems.
show cable modem flap	Displays flap list statistics for one or more cable modems.
show cable modem ipv6	Displays IPv6 information for specified cable modems and CPE behind a cable modem on a Cisco CMTS router.
show cable modem mac	Displays MAC layer information for one or more cable modems.
show cable modem maintenance	Displays station maintenance (SM) error statistics for one or more cable modems.
show cable modem offline	Displays a list of the cable modems that are marked as offline with the Cisco CMTS.
show cable modem partial-mode	Displays information about the cable modems that are in upstream and downstream partial service mode.
show cable modem phy	Displays the DOCSIS PHY layer information for one or more cable modems.
show cable modem qos	Displays quality of service (QoS) and service flow information for a particular CM.
show cable modem registered	Displays a list of the cable modems that are marked as registered with the Cisco CMTS.
show cable modem remote-query	Displays information collected by the remote-query feature.
show cable modem summary	Displays a summary of cable modems on one or more cable interfaces.
show cable modem unregistered	Displays a list of the cable modems that are marked as unregistered with the Cisco CMTS.

Command	Description
show cable modem vendor	Displays the vendor name or Organizational Unique Identifier (OUI) for the cable modems on each cable interface.
show cable modulation-profile	Displays modulation profile group information.
show interface cable modem	Displays information about the cable modems connected to a particular cable interface.
show interface cable sid	Displays cable interface information.

show cable modem access-group

To display the access groups for the CMs on a particular cable interface, use the **show cable modem access-group** command in privileged EXEC mode.

Cisco uBR7100 series and Cisco uBR7200 series routers:

```
show cable modem [{ip-address | cable {slot / subslot | slot / cable-interface-index} [upstream port
[logical-channel-index]]mac-address}] access-group
```

Cisco uBR10012 routers:

```
show cable modem cable {slot / subslot / subslot | slot / subslot / cable-interface-index} [upstream
port [logical-channel-index]] access-group
```

Syntax Description	
<i>ip-address</i>	(Optional) Access-group information displayed for the CM with the specified IP address. (Cisco uBR7100 series and Cisco uBR7200 series routers only.)
<i>mac-address</i>	(Optional) Access-group information displayed for the CM with the specified MAC address. (Cisco uBR7100 series and Cisco uBR7200 series routers only.)
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.
upstream port	(Optional) Displays information for all CMs using this specific upstream. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports on the cable interface line card.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1.

access-group	Displays the access groups for the CMs and their associated hosts and other customer premises equipment (CPE) devices.
---------------------	--

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
11.3XA	This command was introduced.
12.2(4)BC1	Support for this command was added for the Cisco uBR10012 router, but only to display access groups on a per-interface basis.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.

Usage Guidelines

This command displays information only for CMs. To display information for both CMs and their associated hosts and other customer premises equipment (CPE) devices, use the **show cable device access-group** command. To display information only for hosts, use the **show cable host access-group** command.

If an SNMP manager is requesting information about CM or CPE devices at the same time that this command is given, the command displays the following error message:

```
No information is available, please try later.
```

Wait until the SNMP retrieval is done and retry the CLI command.

Note Also see the information about this command's behavior in a Hot Standby Connection-to-Connection Protocol (HCCP) configuration.

Examples

The following example shows sample output for the show cable modem access-group command on a Cisco uBR7200 series router for a particular CM:

```
Router# show cable modem 0010.7bb3.fcd1 access-group

MAC Address      IP Address      Access-group
0010.7bb3.fcd1  10.20.113.2     34
Upstream Power   : 42 dBmV (SNR = 10 dBmV)
Downstream Power : 15 dBmV (SNR = 15 dBmV)
Router#
```

Note The upstream and downstream power fields will be displayed only if the CM remote-query feature has been enabled using the **cable modem remote-query** command.

The following example shows sample output for the **show cable modem access-group** command for a particular cable interface on a Cisco uBR10012 router:

show cable modem access-group

```
Router# show cable modem c8/1/0 access-group

MAC Address      IP Address      Access-group
0050.7366.1243  22.1.1.11      1
0002.b970.0027  23.1.1.10      1
0006.5314.858d  22.1.1.10      N/A
Router#
```

Table below describes the fields that are shown in the **show cable modem access-group** display:

Table 101: Descriptions for the show cable modem access-group Fields

Field	Description
MAC Address	The MAC address for the CM.
IP Address	The IP address that the DHCP server has assigned to the CM.
Access-group	Displays the access group name or number in use (if any) for this CM.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
show cable device access-group	Displays a list of CMs and their CPE devices, along with their access groups.
show cable host access-group	Displays a list of hosts and other CPE devices, along with their access groups.
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem calls	Displays displays voice call information for a particular CM, identified either by its IP address or MAC address.
show cable modem classifiers	Displays information about the classifiers for a particular CM.
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.
show cable modem connectivity	Displays connectivity statistics for one or more CMs.
show cable modem cpe	Displays the CPE devices accessing the cable interface through a particular CM.
show cable modem errors	Displays error statistics for one or more CMs.

Command	Description
show cable modem flap	Displays flap list statistics for one or more cable modems.
show cable modem maintenance	Displays station maintenance (SM) error statistics for one or more cable modems.
show cable modem remote-query	Displays information collected by the remote-query feature.
show cable modulation-profile	Displays modulation profile group information.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.
show interface cable sid	Displays cable interface information.

show cable modem asf

To display the Aggregate SF details, use the **show cable modem *mac-address* asf** command in privileged EXEC mode.

show cable modem *mac-address* asf

Syntax Description

<i>mac-address</i>	(Optional) MAC address of a CM that is displayed. You can also specify the MAC address for a CPE device behind a CM, and information for that CM will be displayed.
asf	Displays the Aggregate SF details.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Cupertino 17.9.1x	This command is introduced.

show cable modem asf sup

To display the Aggregate SF details, use the **show cable modem *mac-address* asf sup** command in privileged EXEC mode.

show cable modem *mac-address* asf sup

Syntax Description	
<i>mac-address</i>	(Optional) MAC address of a CM that is displayed. You can also specify the MAC address for a CPE device behind a CM, and information for that CM will be displayed.
asf	Displays the Aggregate SF details.
asf sup	Displays the Aggregate SF details on Sup.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Cupertino 17.9.1x	This command is introduced.

Examples

The following is a sample output of the **show cable modem *mac-address* asf sup** command.

```
Router# show cable modem 206a.9454.30a4 asf sup
```

```

show cable modem auth-profile

To display the multicast authorization profile, and profile group information for a particular IP address or MAC address, use the **show cable modem auth-profile** command in privileged EXEC mode.

show cable modem [*{ip-addressmac-address}*] [**auth-profile**]

Syntax Description	
<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a CM that is displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a CM that is displayed. You can also specify the MAC address for a CPE device behind a CM, and information for that CM will be displayed.
auth-profile	(Optional) Displays the multicast authorization profile, and profile group information.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines Use this command to display the multicast authorization profile, and the profile group information.

Examples

The following sample output of the **show cable modem auth-profile** command shows the multicast authorization profile and profile group display for a particular ip-address or mac-address.

```
Router# show cable modem 30.17.2.23 auth-profile
Multicast Profile Information for 0025.2e34.4377
IP: 30.17.2.121
Multicast Profile Group #           : default
Router#
```

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show cable modem auth-profile** command:

```
Router#show cable modem 209.165.200.225 auth-profile
Multicast Profile Information for 0025.2eaf.8302
IP: 100.1.2.6
Multicast Profile Group #           : default
Router#
```

Related Commands

Command	Description
show cable multicast authorization	Displays the list of defined multicast authorization profiles and all CMs associated with corresponding profiles.
show cable multicast dsid	Displays the entire multicast downstream service identifier (DSID) database content.
show cable multicast qos	Displays the configuration information for MQoS (Group-Config, Group-QoS-Config, Group-Encryption-Config).

show cable modem calls

To display voice call information for a particular CM, use the **show cable modem calls** command in privileged EXEC mode.

Cisco uBR7100 Series and Cisco uBR7200 Series Routers

```
show cable modem [{ip-address|mac-address} cable {slot / port | slot / cable-interface-index} [upstream
port [logical-channel-index]] | name fqdn} ] calls
```

Cisco uBR10012 Router

```
show cable modem [{ip-address|mac-address} cable {slot / subslot / port | slot / subslot
/ cable-interface-index} [upstream port [logical-channel-index]] | name fqdn} ] calls
```

Cisco cBR Series Converged Broadband Router

```
show cable modem [{ip-address|mac-address} cable slot / subslot / cable-interface-index } ] calls
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR router—The valid range is 0 to 3 and 6 to 9.
<i>subslot</i>	Secondary slot number of the cable interface line card. <p>Cisco uBR10012 only —The valid subslots are 0 or 1.</p> <p>Cisco cBR router—The valid value is 0.</p>
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR router—The valid range is 0 to 15.

upstream port	(Optional) Displays information for all CMs using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card. This keyword is not supported on the Cisco cBR router.
logical-channel-index	(Optional) Logical channel index. The valid values are 0 or 1. This keyword is not supported on the Cisco cBR router.
name fqdn	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router. This keyword is not supported on the Cisco cBR router.
calls	Display voice call information for a CM.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(13a)BC1	Support for voice call information was added to the show cable modem command.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The upstreamname , queue keyword and the <i>logical-channel-index</i> variable were removed.

Usage Guidelines

Using the keyword options, you can display IPv6 information by IP address (IPv4 or IPv6) of a particular CM, for all CMs associated with a specified cable interface, by MAC address of a CM, or by domain name of a CM.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

This command supports PacketCable and PacketCable MultiMedia (PCMM) information. Additional information for voice call support with PacketCable and PacketCable MultiMedia (PCMM) is available in

the feature document [PacketCable and PacketCable Multimedia for the Cisco CMTS](#) available on Cisco.com. See the [Cisco cBR Series Converged Broadband Routers PacketCable and PacketCable Multimedia Configuration Guide](#) for Cisco cBR Series Converged Broadband Router.

Examples

This example shows the output for the default **calls** option for a particular CM:

```
Router# show cable modem calls

Cable Modem Call Status Flags:
H: Active high priority calls
R: Recent high priority calls
V: Active voice calls (including high priority)
MAC Address      IP Address      I/F      Prim  CMCallStatus  LatestHiPriCall
                IP Address      I/F      Sid   Sid           (min:sec)
000f.66f8.a121  10.8.130.63    C1/0/U0  175   HV            -
```

Related Commands

Command	Description
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
show cable calls	Displays voice call history information and status for the PacketCable Emergency 911 Services Listing and History feature.
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem classifiers	Displays information about the classifiers for a particular CM.
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.
show cable modem connectivity	Displays connectivity statistics for one or more CMs.
show cable modem errors	Displays error statistics for one or more CMs.
show cable modem flap	Displays flap list statistics for one or more cable modems.
show cable modem maintenance	Displays station maintenance (SM) error statistics for one or more cable modems.
show cable modem remote-query	Displays information collected by the remote-query feature.
show cable modulation-profile	Displays modulation profile group information.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.
show interface cable sid	Displays cable interface information.

show cable modem classifiers

To display information about the classifiers for a particular CM, use the **show cable modem classifiers** command in privileged EXEC mode.

Cisco uBR Series Router

```
show cable modem {ip-address|mac-address} [name fqdn] classifiers [{cache | verbose}]
```

Cisco cBR Series Router

```
show cable modem {ip-address|mac-address} classifiers [{cache | verbose}]
```

Syntax Description

<i>ip-address</i>	Specifies the IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, classifier information for that CM is displayed.
<i>mac-address</i>	Displays classifier information for the CM with the specified MAC address. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
name fqdn	(Optional) For Cisco uBR series router, specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router.
cache	(Optional) Displays the classifiers in the cache maintained for each CM. (This cache is based on IP header field values and speeds up classifier lookups and reduces per-packet processing overhead.)
verbose	(Optional) Displays detailed information for the CM classifiers.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
11.3 NA	This command was introduced.
12.1(4)CX and 12.2(4)BC1	The number of matches field was added to this command, and the command was restricted to display information for a single CM at a time.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The name keyword was removed.

Release	Modification
cBR 17.3.1z	From Cisco IOS XE Amsterdam 17.3.1z, support for static classifiers increased from 16 downstream and 16 upstream per modem to 32 downstream and 32 upstream per modem. You can view information about the classifiers for a particular Cable Modem, using the show cable modem classifiers command in privileged EXEC mode.

Usage Guidelines

This command displays classifier information for a particular CM, identified either by its IP address, MAC address, or domain name.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Note For information about this command's behavior in a Hot Standby Connection-to-Connection Protocol (HCCP) configuration, see the "Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration" section of the **show cable modem** command.

Note From Cisco IOS XE Amsterdam 17.3.1z and later, support for static classifiers increased from 16 downstream and 16 upstream per modem to 32 downstream and 32 upstream per modem. However, there are no changes to the *static service flows* per modem or the *dynamic classifiers* per modem.

For a full configuration, there are 32 service flows (16 downstream and 16 upstream) and 64 classifiers (32 downstream and 32 upstream). The registration request (REG-REQ) size would exceed 1518 bytes. For *wideband modems*, there would not be issues as they will send REG-REQ-MP fragments. However, for *narrowband modems*, they will be stuck at init(t) because the REG-REQ size is large, and no REG-REQ is received by CMTS. Hence, when increasing the classifiers in modem configuration file of narrowband modems, you need to ensure that the REG-REQ size does not exceed 1518 bytes.

Examples

The following example shows sample output for the default **classifiers** option for a particular CM:

```
Router# show cable modem 10.4.0.81 classifiers

CfrId  SFID      CM Mac Address  Direction  State   Priority  Matches
6431   26120      0000.399f.a44f  upstream   active  128      -
6429   26054      0000.399f.a44f  upstream   active  128      -
6432   26121      0000.399f.a44f  downstream active  128      1182
6430   26055      0000.399f.a44f  downstream active  128      3934
Router#
```

Table below describes the fields that are shown in the **show cable modem classifiers** display:

Table 102: Descriptions for the show cable modem classifiers Fields

Field	Description
CfrID	Classifier ID for the classifier that is being displayed.
SFID	Service flow ID (SFID) for this classifier.
CM MAC Address	MAC address for the CM.
Direction	Identifies whether this classifier applies to the downstream or the upstream direction.
State	Classifier activation state: active or inactive.
Priority	Classifier rule priority value for this classifier.
Matches	Number of packets that have been matched to this service flow.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description

show cable modem cnr

To display information about the upstream carrier-to-noise ratio (CNR) or signal-to-noise ratio (SNR) for a particular cable modem (CM), use the **show cable modem** command in privileged EXEC mode.

```
show cable modem {ip-address|mac-address | name fqdn} cnr
```

Cisco cBR Series Converged Broadband Router

```
show cable modem {ip-address|mac-address} cnr
```

Syntax Description

<i>ip-address</i>	IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a customer premise equipment (CPE) device behind a CM, classifier information for that CM is displayed.
<i>mac-address</i>	Classifier information for the CM with the specified MAC address. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
<i>name fqdn</i>	Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable domain name system (DNS) cache on the Cisco CMTS router. This keyword is not supported on the Cisco cBR-8 router.

Command History

BC Release	Modification
12.2(4)BC2	The command was changed to its current form of show cable modem cnr .
12.2(8)BC2	Support was added for the Cisco uBR-LCP2-MC16S cable interface line card on the Cisco uBR10012 router.
12.2(11)BC3	Support was added for the Cisco uBR10-MC5X20S cable interface line cards on the Cisco uBR10012 router.
12.2(15)BC1	If a cable modem is offline, its CNR value is now shown as “-----”.
12.2(15)BC2	Support was added for the Cisco uBR-MC16U/X and Cisco uBR-MC5X20U cable interface line cards.
12.3(17a)BC2	Support was added for the Cisco uBR-MC5X20H cable interface line card.
CX Release	Modification
12.1(7)CX1	This command was introduced (in the form of show cable modem snr) for Cisco uBR7200 series routers using the Cisco uBR-MC16S cable interface line card.
12.2(15)CX	Support was added for the Cisco uBR-MC28U/X cable interface line cards on the Cisco uBR7246VXR router.

BC Release	Modification
SC Release	Modification
12.2(33)SCA	<p>This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes:</p> <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM. • The following new initialization states were added to show initialization of CMs and CPEs supporting IPv6: <ul style="list-style-type: none"> • init6(s)—Cisco CMTS router has seen SOLICIT message. • init6(a)—Cisco CMTS router has seen ADVERTISE message. • init6(r)—Cisco CMTS router has seen REQUEST message. • init6(i)—Cisco CMTS router has seen REPLY message. • init6(o)—Cisco CMTS router has seen version 6 TFTP request. • init6(t)—Cisco CMTS router has seen version 6 TOD request.
12.2(33)SCC	The output of this command was modified to show the CNR and SNR information for multiple upstream connections providing service to a single CM.
12.2(33)SCF	The output of this command was modified to show expected power level, received carrier power level, and CNR information for all the upstream channels providing services to a CM. The SNR information is no longer displayed in the output of this command.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The name is removed.

Usage Guidelines

The **show cable modem cnr** command displays information on the current CNR value for cable modems that are using interfaces on the following cable line cards:

- Cisco uBR-MC16U/X
- Cisco uBR-MC28U/X
- Cisco uBR10-MC5X20S/U/H
- Cisco uBR-E-28U
- Cisco uBR-E-16U
- Cisco cBR-8 CCAP line cards

For cable modems on all other interfaces, this command displays information about the current SNR value of the modem.

In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the Cisco CMTS router before any domain name can be used as part of a cable command.

Starting Cisco IOS Release 12.2(33)SCF, carrier-to-noise plus interference ratio (CNI_R [CNR]) can be measured for all upstream channels irrespective of whether spectrum management is enabled or not for the upstream channels. Therefore, the output of the **show cable modem cnr** command displays only the CNR (CNI_R) values for all the upstream channels for a specific cable modem.

Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address cnr** command might not show a particular cable modem until the Cisco CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address cnr** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when the HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond with a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Tip In Cisco IOS Release 12.1(12)EC, Cisco IOS Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Examples

This example shows the output of the **show cable modem cnr** command for a CM:

```
Router# show cable modem 10.20.114.34 cnr

MAC Address      IP Address      I/F           MAC           Prim  snr/cnr
                State          (db)
00d0.ba77.7595  10.20.114.34   Cable3/0/U5  online        1     45.00
```

This example shows the output of the **show cable modem cnr** command after an HCCP switchover. The CNR value is missing until traffic is sent to the cable modem (in this case using the **ping** command).

```
Router# show cable modem 10.10.10.46 cnr

MAC Address      IP Address      I/F           MAC           Prim  snr/cnr
                State          (db)
0002.fd22.aadf  10.10.10.46   C5/1/0/U5    online        1970  -----
Router# ping 10.10.10.46
```

```
Router# show cable modem 10.10.10.46 cnr

MAC Address      IP Address      I/F           MAC           Prim  snr/cnr
                State          (db)
0002.fd22.aadf  10.10.10.46   C5/1/0/U5    online        1970  42.00
```

This example shows the output of the **show cable modem cnr** command for all upstream ports providing service to a specified cable modem in Cisco IOS Release 12.2(33)SCC:

```
Router# show cable modem 0014.f8c1.fd1a cnr
MAC Address      IP Address      I/F           MAC           SID    snr/cnr
```

```

                                State           (dB)
0014.f8c1.fd1a 10.10.4.1      C5/0/1/U0  online      1          33
001e.6bfb.119a 9.9.9.2      C5/0/1/U1  online      2          33
001e.6bfb.0f9e 9.9.9.3      C5/0/1/U2  online      3          33
0019.474a.d4c4 9.9.9.4      C5/0/1/U3  online      4          33

```

This example shows the output of the **show cable modem cnr** command for an upstream port providing service to a specified cable modem in Cisco IOS Release 12.2(33)SCF:

```

Router# show cable modem 0022.cea4.f0fa cnr
MAC Address      IP Address      I/F           MAC           State         Prim  ExPwr  RxPwr  cnr
                (dBm)          (dBm)         (dB)
0022.cea4.f0fa 10.10.1.62     C8/1/14/U3   w-online      78           0.0    -0.50  23

```

Table below describes the significant fields shown in the display:

Table 103: show cable modem cnr Field Descriptions

Field	Description
MAC Address	MAC address of the CM.
IP Address	IP address that the DHCP server has assigned to the CM.
I/F	Cable interface line card providing the upstream for this CM.
MAC State	Current state of the MAC layer.
Prim Sid	Primary Sid assigned to this CM. In Cisco IOS Release 12.2(33)SCC, this field is renamed to SID and represents multiple upstream connections with unique SIDs providing service to a single CM.
ExPwr (dBmV)	Expected carrier power level, in decibel millivolts (dBmV).
RxPwr (dBmV)	Received carrier power level, in decibel millivolts (dBmV).
snr/cnr (db)	The current upstream CNR or SNR for this particular CM, in decibels (dB). In Cisco IOS Release 12.2(15)BC1 and later releases, this field shows “-----” for offline cable modems. Note You can also use the show controllers cable command to display the SNR or CNR for a cable interface line card, but this value is only an estimate because it uses a random sampling of modems to determine the average for the card at any particular time. The CNR value shown by the show controllers cable command can therefore appear to fluctuate compared to the individual values shown by the show cable modem cnr command.

Table below shows the possible values for the MAC state field.

Table 104: MAC State Field Descriptions

MAC State Value ¹³	Description
Registration and Provisioning Status Conditions for Devices Using IPv4 Addressing	
init(r1)	CM sent initial ranging.

MAC State Value ¹³	Description
init(r2)	CM is ranging. The Cisco CMTS received initial ranging from the CM and has sent RF power, timing offset, and frequency adjustments to the CM.
init(rc)	Ranging has completed. Note If a CM appears to be stuck in this state, it could be that the CM is able to communicate successfully on the cable network, but that the upstream is at capacity and does not have any additional bandwidth to allow the CM to finish registration and come online. Either manually move one or more CMs to other upstreams, or enable load balancing on the upstream using the cable load-balance group commands.
init(d)	DHCP request was received, as DHCPDISCOVER. This also indicates that the first IP broadcast packet has been received from the CM.
init(dr)	Cable modem has broadcast a DHCP REQUEST packet back to the DHCP server.
init(i)	Cable modem has received the DHCP OFFER reply (DHCPACK) from the DHCP server that has assigned an IP address to the modem, but the modem has not yet replied with a DHCPREQUEST message requesting that particular IP address, nor has it sent an IP packet with that IP address. Note If a CM appears to be stuck in this state, the CM has likely received the DHCP OFFER reply from the DHCP server, but this reply might have contained one or more invalid options for that particular CM.
init(io)	Cisco CMTS learns the DHCP offer that is sent to the cable modem from the DHCP server, which has assigned an IP address to the modem.
init(o)	CM has begun to download the option file (DOCSIS configuration file) using the Trivial File Transfer Protocol (TFTP), as specified in the DHCP response. If the CM remains in this state, it indicates that the download has failed.
init(t)	Time-of-day (ToD) exchange has started.
resetting	CM is being reset and will shortly restart the registration process.
Registration and Provisioning Status Conditions for Devices Using IPv6 Addressing	
init6(s)	Cisco CMTS router learns the DHCPv6 SOLICIT message from the CM.
init6(a)	Cisco CMTS router learns the ADVERTISE message from the DHCPv6 server to the CM.
init6(r)	Cisco CMTS router learns the REQUEST response from the CM to the DHCPv6 server.
init6(i)	Cisco CMTS router learns the REPLY message from the DHCPv6 server to the CM.
init6(o)	Cisco CMTS router learns the REQUEST message from the CM to the TFTP server.

MAC State Value ¹³	Description
init6(t)	Cisco CMTS router learns the REQUEST message from the CM to the ToD server.
Non-error Status Conditions	
cc(r1)	CM had registered and was online, but has received a Downstream Channel Change (DCC) or Upstream Channel Change (UCC) request message from the Cisco CMTS. The CM has begun moving to the new channel, and the Cisco CMTS has received the initial ranging of the CM on the new downstream or upstream channel. At the MAC layer, the CM is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.
cc(r2)	This state should normally follow cc(r1) and indicates that the CM has finished its initial ranging on the new channel, and is currently performing continuous ranging on the new channel. At the MAC layer, the CM is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.
offline	CM is considered offline (disconnected or powered down).
online	CM has registered and is enabled to pass data on the network.
online(d)	CM is registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. The CM does not forward traffic to or from the CPE devices, but the Cisco CMTS can continue to communicate with the CM using DOCSIS messages and IP traffic (such as SNMP commands). Note If BPI was enabled in the DOCSIS configuration file sent to the CM, assume that the CM is using BPI encryption unless other messages show that the BPI negotiation and key assignments have failed.
online(pkd)	CM is registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and KEK is assigned. Note This state is equivalent to the online(d) and online(pk) states.
online(ptd)	CM is registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note This state is equivalent to the online(d) and online(pt) states.
online(pk)	CM is registered, BPI is enabled and KEK is assigned.
online(pt)	CM is registered, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note If network access was disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows online(d) instead of online(pt) even when BPI encryption is enabled and operational.

MAC State Value ¹³	Description
Note	If an exclamation point (!) appears in front of one of the online states, it indicates that the cable dynamic-secret command has been used with either the mark or reject option, and that the cable modem has failed the dynamic secret authentication check.
expire(pk)	CM is registered, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value.
expire(pkd)	CM is registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value. Note This state is equivalent to the online(d) and expire(pk) states.
expire(pt)	CM is registered, BPI is enabled, TEK was assigned, but the current TEK expired before the CM could successfully renew a new KEK value.
expire(ptd)	CM is registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, TEK was assigned, but the current TEK expired before the CM could successfully renew a new KEK value. Note This state is equivalent to the online(d) and expire(pt) states.
Error Status Conditions	
reject(m)	CM attempted to register but registration was refused due to a bad Message Integrity Check (MIC) value. This also could indicate that the shared secret in the DOCSIS configuration file does not match the value configured on the Cisco CMTS with the cable shared-secret command. In Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases, this could also indicate that the cable tftp-enforce command has been used to require that a CM attempt a TFTP download of the DOCSIS configuration file before registering, but the CM did not do so.
reject(c)	CM attempted to register, but registration was refused due to a a number of possible errors: <ul style="list-style-type: none"> • CM attempted to register with a minimum guaranteed upstream bandwidth that would exceed the limits imposed by the cable upstream admission-control command. • CM has been disabled because of a security violation. • Bad class of service (CoS) value in the DOCSIS configuration file. • CM attempted to create a new CoS configuration but the Cisco CMTS is configured to not permit such changes. • CM failed the timestamp check for its DOCSIS configuration file. (This could indicate a possible theft-of-service attempt, or a problem with the synchronization of the clocks on the CM and Cisco CMTS.)
reject(pk)	KEK key assignment is rejected, BPI encryption has not been established.

MAC State Value ¹³	Description
reject(pkd)	CM is registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because KEK key assignment was rejected. Note This state is equivalent to the online(d) and reject(pk) states.
reject(pt)	TEK key assignment is rejected, BPI encryption has not been established.
reject(ptd)	CM is registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because TEK key assignment was rejected. Note This state is equivalent to the online(d) and reject(pt) states.
Note	In Cisco IOS Release 12.1(20)EC, Cisco IOS Release 12.2(15)BC1, and earlier releases, when network access is disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows online(d) even if BPI encryption fails. Use the show cable modem mac-address command to confirm whether BPI is enabled or disabled for a particular cable modem.
reject(ts)	CM attempted to register, but registration failed because the TFTP server timestamp in the CM registration request did not match the timestamp maintained by the CMTS. This might indicate that the CM attempted to register by replaying an old DOCSIS configuration file used during a prior registration attempt.
reject(ip)	CM attempted to register, but registration failed because the IP address in the CM request did not match the IP address that the TFTP server recorded when it sent the DOCSIS configuration file to the CM. IP spoofing could be occurring.
reject(na)	CM attempted to register, but registration failed because the CM did not send a Registration-Acknowledgement (REG-ACK) message in reply to the Registration-Response (REG-RSP) message sent by the Cisco CMTS. A Registration-NonAcknowledgement (REG-NACK) is assumed.

¹³ The CM MAC state field can also be retrieved using SNMP by getting the value of the cdxCmtsCmStatusValue object in the CISCO-DOCS-EXT-MIB.

Note For the complete list of the cable modem status, see [Table 100: Descriptions for the MAC State Field](#), on page 1888.

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show cable modem cnr** command on the Cisco cBR-8 router:

```
Router#show cable modem 10.10.2.8 cnr
MAC Address      IP Address      I/F           MAC           Prim ExpPwr  RxPwr  cnr
State           Sid  (dBmv)  (dBmv)  (dB)
0025.2eaf.82e4  100.1.2.8      C1/0/0/U0    online        50   -1.0   -1.00  40
```

Router#

Related Commands

Command	Description
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
show cable modem	Displays information for the registered and unregistered CMs.
show cable modulation-profile	Displays modulation profile group information.
show cable modem remote-query	Displays information collected by the remote-query feature.
show controllers cable	Displays information about the interface controllers for a cable interface on the Cisco CMTS router.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.
show interface cable sid	Displays cable interface information.

show cable modem connectivity

To display connectivity statistics for one or more cable modems, use the **show cable modem connectivity** command in privileged EXEC mode.

Cisco uBR7100 Series and Cisco uBR7200 Series Routers

```
show cable modem [{ip-address|mac-address} | cable {slot / port | slot / cable-interface-index} [upstream
port [logical-channel-index]] | name fqdn}] connectivity
```

Cisco uBR10012 Router

```
show cable modem [{ip-address|mac-address} | cable {slot / subslot / port | slot
/subslot / cable-interface-index} [upstream port [logical-channel-index]] | name fqdn}] connectivity
```

Cisco cBR Series Converged Broadband Router

```
show cable modem [{ip-address|mac-address} | cable slot / subslot / cable-interface-index } ] connectivity
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8 router—The valid range is from 0 to 3 and 6 to 9.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. (Cisco cBR-8 router—) The valid subslot is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8 router— The valid range is from 0 to 15.

upstream port	(Optional) Displays information for all cable modems using this specific upstream. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports on the cable interface line card.
logical-channel-index	(Optional) Logical channel index. The valid values are 0 or 1.
name fqdn	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.1(4)CX and 12.2(4)BC1	This command was introduced (and the connectivity option was removed from the show interface cable sid command).
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The upstream and name keywords and <i>logical-channel-index</i> variable were removed.

Usage Guidelines

This command displays connectivity information for all cable modems, for all cable modems attached to a specific CMTS cable interface, or for a particular CM, as identified by its IP address or MAC address.

Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time

a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Note The **show cable modem connectivity** command replaces the **connectivity** option for the **show interface cable sid** command, because the connectivity statistics are better managed on a per-modem basis than on a per-SID basis.

Examples

The following example shows sample output for the **show cable modem connectivity** command for all online cable modems :

```
Router# show cable modem connectivity

Prim 1st time    Times %online   Online time           Offline time
Sid  online      Online          min   avg     max       min   avg     max
1    Apr 28 2003 1          99.67  00:00  1d1h9m  1d1h9m  05:38  04:58  05:38
2    Apr 28 2003 1          99.66  00:00  1d1h8m  1d1h8m  05:46  05:02  05:46
3    Apr 28 2003 1          99.69  00:00  1d1h7m  1d1h7m  05:18  04:34  05:18
```

The following example shows sample output for the **show cable modem connectivity** command for all online cable modems for a particular cable interface:

```
Router# show cable modem c8/1/0 connectivity

Prim 1st time    Times %online   Online time           Offline time
Sid  online      Online          min   avg     max       min   avg     max
1    Apr 28 2003 1          99.67  00:00  1d1h12m  1d1h12m  05:38  04:58  05:38
2    Apr 28 2003 1          99.66  00:00  1d1h11m  1d1h11m  05:46  05:02  05:46
3    Apr 28 2003 1          99.69  00:00  1d1h11m  1d1h11m  05:18  04:34  05:18
```

The following example shows sample output for the **show cable modem connectivity** command for a particular CM:

```
Router# show cable modem 0010.7bb3.fcd1 connectivity

Prim 1st time    Times %online   Online time           Offline time
Sid  online      Online          min   avg     max       min   avg     max
1    May 30 2000 4          99.85  48:20  11h34m  1d2h23m  00:01  00:59  03:00
```

Table below describes the information shown in the **show cable modem connectivity** displays:

Table 105: Descriptions for the show cable modem connectivity Fields

Field	Description
Prim SID	The primary SID assigned to this CM.
1st time online	First time at which the modem with this SID connected.
Times online	Number of times the modem with this SID connected.
% online	Percentage of time the modem with this SID has been connected.
Online time	The minimum, average, and maximum number of days, hours, and minutes the modem with this SID has been connected. Note A CM is considered online when it has completed the registration process and has communicated with the DHCP, TFTP, and TOD servers.
Offline time	The minimum, average, and maximum number of days, hours, and minutes the modem with this SID has been disconnected. Note A CM is considered offline after it has missed 16 consecutive station maintenance messages.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
show cable modem	Displays information for the registered and unregistered cable modems.
show cable modem calls	Displays voice call information for a particular CM, identified either by its IP address or MAC address.
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.
show cable modem flap	Displays flap list statistics for one or more cable modems.
show cable modem maintenance	Displays station maintenance (SM) error statistics for one or more cable modems.
show cable modem remote-query	Displays information collected by the remote-query feature.
show cable modulation-profile	Displays modulation profile group information.
show interface cable modem	Displays information about the cable modems connected to a particular cable interface.

Command	Description
show interface cable sid	Displays cable interface information.

show cable modem counters

To display downstream and upstream traffic counters for one or more cable modems (CMs), use the **show cable modem counters** command in privileged EXEC mode.

Cisco uBR7100 Series and Cisco uBR7200 Series Routers

```
show cable modem [{ip-address|mac-address} | cable {slot / port | slot / cable-interface-index}] [upstream
port [logical-channel-index]] | name fqdn} counters
```

Cisco uBR10012 Router

```
show cable modem [{ip-address|mac-address} | cable {slot / subslot / port | slot / subslot
/ cable-interface-index}] [upstream port [logical-channel-index]] | name fqdn} counters
```

Cisco cBR Series Converged Broadband Router

```
show cable modem [{ip-address|mac-address} | cable slot / subslot / cable-interface-index } ] counters
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8 router—The valid range is from 0 to 3 and 6 to 9.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. (Cisco cBR-8 router—) The valid subslot is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8 router— The valid range is from 0 to 15.

upstream <i>port</i>	(Optional) Displays information for all CMs using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1.
name <i>fqdn</i>	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router.
counters	Displays downstream and upstream traffic counters for one or more cable modems.

Command Default

Displays counter information for all CMs.

Command History

Release	Modification
12.1(4)CX and 12.2(4)BC1	This command was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The upstream and name keywords and <i>logical-channel-index</i> variable were removed.

Usage Guidelines**Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration**

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time

a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Examples

The following example shows sample output for the **show cable modems counters** command for all CMs:

```
Router# show cable modem counters
MAC Address      US Packets  US Bytes  DS Packets  DS Bytes
0050.7366.1243  29          2126     29          2126
0002.b970.0027  1811       116174   29          2126
0006.5314.858d  329154     21071059 134607     9961268
Router#
```

The following example shows sample output for the **show cable modems counters** command for all CMs on a particular cable interface:

```
Router# show cable modem c8/1/0 counters
MAC Address      US Packets  US Bytes  DS Packets  DS Bytes
0050.7366.1243  29          2126     29          2126
0002.b970.0027  1811       116174   29          2126
0006.5314.858d  329154     21071059 134607     9961268
Router#
```

The following example shows sample output for the **show cable modems counters** command for a particular CM, as identified by its MAC address:

```
Router# show cable modem 0010.7bb3.fcd1 counters
MAC Address      US Packets  US Bytes  DS Packets  DS Bytes
0010.7bb3.fcd1  1452082    171344434 1452073     171343858
Router#
```

The following example shows sample output for the **show cable modems counters** command for a particular CM, as identified by its IP address:

```
Router# show cable modem 23.1.1.10 counters
MAC Address      US Packets  US Bytes  DS Packets  DS Bytes
0002.b970.0027  1811       116174   29          2126
Router#
```

Note When a DCC occurs, the cable modem US and DS counters are reset. The US and DS counters include counters such as data and throughput seen in the **show cable modem (mac-address)** verbose command output and packets and bytes seen in the **show cable modem (mac-address) counters** command output.

Table below describes the fields shown in the **show cable modem counters** displays:

Table 106: Descriptions for the show cable modem counters Fields

Field	Description
MAC Address	MAC address for the CM.
US Packets	Number of packets this CM has transmitted on the upstream.
US Bytes	Number of bytes this CM has transmitted on the upstream.
DS Packets	Number of packets this CM has received on the downstream.
DS Bytes	Number of byte this CM has received on the downstream.

Related Commands

Command	Description
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem access-group	Displays the access groups for the CMs on a particular cable interface.
show cable modem calls	Displays voice call information for a particular CM, identified either by its IP address or MAC address.
show cable modem classifiers	Displays information about the classifiers for a particular CM.
show cable modem connectivity	Displays connectivity statistics for one or more CMs.
show cable modem cpe	Displays the CPE devices accessing the cable interface through a particular CM.
show cable modem qos	Displays quality of service (QoS) and service flow information for a particular CM.
show cable modem registered	Displays a list of the CMs that are marked as registered with the Cisco CMTS.
show cable modem remote-query	Displays information collected by the remote-query feature.
show cable modem unregistered	Displays a list of the CMs that are marked as unregistered with the Cisco CMTS.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.

Command	Description
show interface cable sid	Displays cable interface information.

show cable modem cpe

To display the customer premise equipment (CPE) devices accessing the cable interface through a particular cable modem (CM), use the **show cable modem cpe** command in privileged EXEC mode.

```
show cable modem {ip-address|mac-address | name fqdn} cpe
```

Cisco cBR Series Converged Broadband Router

```
show cable modem {ip-address|mac-address} cpe
```

Syntax Description

<i>ip-address</i>	Displays the CPE devices for the CM with the specified IPv4 or IPv6 address.
<i>mac-address</i>	Displays the CPE devices for the CM with the specified MAC address.
name fqdn	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router. This keyword is not supported on the Cisco cBR-8 router.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
11.3XA	This command was introduced.
12.1(4)CX and 12.2(4)BC1	The command was simplified to display only the IP and MAC addresses for the CPE devices.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM.
12.2(33)SCI1	The output of the command is modified. The command output displays the device class information for IPv6 devices.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The name is removed.

Usage Guidelines

This command lists the CPE devices that are accessing the cable network through a particular CM. You can identify the CM either by its IP address or by its MAC address.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Examples

This example shows sample output for the **show cable modem cpe** command, listing the CPE devices by their MAC and IP addresses:

```
Router# show cable modem 0019.474a.c14a cpe

IP address      MAC address      Dual IP
50.3.37.3       0005.0052.2c1d  Y
```

Table 107: show cable modem cpe Field Descriptions

Field	Description
IP Address	IP address acquired by the CPE.
MAC Address	MAC address of the CPE.
Dual IP	Dual IP flag. Identifies whether or not (“Y” or “N”) the CPE supports both IPv4 and IPv6 addressing.

Effective with Cisco IOS Release 12.2(33)SCI1, the output for the **show cable modem cpe** command lists the device class details as shown by this example:

```
Router#show cable modem 54d4.6ffb.2ddf cpe
IP address      MAC address      Dual IP      Device Class
---            -
0000.0475.1702  N               MTA
0000.0475.1701  N               Host
0000.0475.1703  N               Host
```

This example shows the output of the **show cable modem cpe** on the Cisco cBR-8 router:

```
Router#show cable modem 0025.2eaf.7f38 cpe
MAC address      IP address      Dual IP      Device Class
b8c7.5dcd.04cd  192.0.2.10     Y            Host
```

Table 108: show cable modem cpe Field Descriptions

Field	Description
IP Address	IP address acquired by the CPE.
MAC Address	MAC address of the CPE.
Dual IP	Dual IP flag. Identifies whether or not (“Y” or “N”) the CPE supports both IPv4 and IPv6 addressing.
Device Class	Device class of the CPE.

Related Commands

Command	Description
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem calls	Displays voice call information for a particular CM, identified either by its IP address or MAC address.
show cable modem classifiers	Displays information about the classifiers for a particular CM.
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.
show cable modem connectivity	Displays connectivity statistics for one or more CMs.
show cable modem errors	Displays error statistics for one or more CMs.
show cable modem flap	Displays flap list statistics for one or more cable modems.
show cable modem maintenance	Displays station maintenance (SM) error statistics for one or more cable modems.
show cable modem remote-query	Displays information collected by the remote-query feature.
show cable modulation-profile	Displays modulation profile group information.

Command	Description
show interface cable modem	Displays information about the CMs connected to a particular cable interface.
show interface cable sid	Displays cable interface information.

show cable modem docsis device-class

To display the DOCSIS device-class information for cable modems (CMs) on all or specified cable interfaces and upstreams, use the **show cable modem docsis device-class** command in privileged EXEC configuration mode.

Cisco uBR7100 Series and Cisco uBR7200 Series Routers

```
show cable modem docsis device-class [summary [cable slot/subslot [cable slot/subslot ]
[upstream port1 port2]]] [total]
show cable modem cable slot/subslot docsis device-class summary
```

Cisco uBR10012 Router

```
show cable modem docsis device-class [summary [cable slot/subslot /port [cable slot/subslot
/port] [upstream port1 port2]]] [total]
show cable modem cable slot/subslot /port docsis device-class summary
```

Cisco cBR Series Converged Broadband Router

```
show cable modem docsis device-class [summary [cable slot/subslot /cable-interface-index [cable
slot/subslot /cable-interface-index]]] [total]
show cable modem docsis device-class {withip}
show cable modem cable slot /subslot /cable-interface-index docsis device-class [{summary}]
```

Syntax Description

summary	(Optional) Displays a summary of DOCSIS device class information for cable modems on all or specified cable interfaces on the CMTS router.
cable slot/subslot [cable slot /subslot]	(Optional) Specifies a single cable interface, or a range of cable interfaces on a Cisco uBR7100 or Cisco uBR7200 series router, whose cable modems you want to display information about, where: <ul style="list-style-type: none"> • <i>slot</i>—Specifies the chassis slot number of the cable interface line card. • <i>subslot</i>—Specifies the downstream port number. Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering.
cable slot /subslot /port [cable slot /subslot /port]	(Optional) Specifies a single cable interface, or a range of cable interfaces on a Cisco uBR10012 router, whose cable modems you want to display information about, where: <ul style="list-style-type: none"> • <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8. • <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1. • <i>port</i>—Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.

cable <i>slot /subslot /cable-interface-index</i>	(Optional) Specifies a single cable interface, or a range of cable interfaces on a Cisco cBR Series Converged Broadband Router, whose cable modems you want to display information about, where: <ul style="list-style-type: none"> • <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 0 to 3 and 6 to 9. • <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots is 0. • <i>cable-interface-index</i>—Specifies the MAC domain index . Valid index numbers are 0 to 15.
upstream <i>port1 port2</i>	(Optional) Specifies a specific upstream port, or a range of upstream ports on the specified cable interface(s), whose cable modems you want to display information about, where: <ul style="list-style-type: none"> • <i>port1</i>—Specify only <i>port1</i> if you want to display information about a single upstream. When used with the <i>port2</i> argument, specifies the beginning of a range of upstream ports, and <i>port1</i> must be a lower-numbered port than <i>port2</i>. • <i>port2</i>—Specifies the end of a range of upstream ports, and <i>port2</i> must be a higher-numbered port than <i>port1</i>.
upstream <i>chan1 chan2</i>	(Optional for Cisco cBR-8router) Specifies a specific upstream channel, or a range of upstream channels on the specified cable interface(s), whose cable modems you want to display information about, for a Cisco cBR Series Converged Broadband Router where: <ul style="list-style-type: none"> • <i>chan1</i>—Specify only <i>chan1</i> if you want to display information about a single upstream. When used with the <i>chan2</i> argument, specifies the beginning of a range of upstream ports, and <i>chan1</i> must be a lower-numbered port than <i>chan2</i>. • <i>chan2</i>—Specifies the end of a range of upstream channels, and <i>chan2</i> must be a higher-numbered channel than <i>chan1</i>.
total	(Optional) Displays a total of DOCSIS device-class information for the cable modems connected to all interfaces, or to the specified cable interfaces.
withip	(Optional) Displays docsis device-class with IP addresses of the cable modems. The following two columns are displayed in the output: <ul style="list-style-type: none"> • DIP—Displays whether the CM is configured with IPv6 and IPv4 <ul style="list-style-type: none"> • Y—CM is configured to dual IP • N—CM is configured with either IPv4 or IPv6 • IP Address—Displays the IPv6 address if the CM is configured with only IPv6. Otherwise, it displays IPv4 address.

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(21)BC	This command was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCI1	The output of this command is modified. The output displays the device class of IPv6 single stack cable modems.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.
IOS-XE 3.18.1SP	This command was modified. The <i>withip</i> keyword argument was added in this release.

Usage Guidelines

This command displays a summary of DOCSIS device-class information for all cable modems for a single cable interface, or for a range of cable interfaces, and optionally specified upstreams on those cable interfaces.

Examples

The following example shows typical output for the default form of the **show cable modem docsis device-class** command on a Cisco uBR100012 router:

```
Router# show cable modem docsis device-class

Table 109: show cable modem docsis device-class Field Descriptions

Field	Description
MAC Address	The MAC address of the CM.
I/F	The cable interface line card providing the upstream for this CM.
MAC State	The current state of the MAC layer.
Prim Sid	The primary SID assigned to this CM.
Reg Ver	Displays the maximum supported version of DOCSIS that the CM supports. The possible values are: DOCSIS 1.0, DOCSIS 1.1, DOCSIS 2.0, and DOCSIS 3.0. Shows “n/a” if the modem is not online.

Field	Description
Device Class	Displays the device-class information for the PacketCable device. The modem can report its device-class type during registration. The possible values are: <ul style="list-style-type: none"> • CM or eCM—A standalone cable modem or embedded CM. • ePS—Embedded Portal Services • eMTA—Embedded Multimedia Terminal Adapter • eSTB—Embedded Set Top Box • unavailable—The CM has not reported its device class.
Reg Priv	Indicates whether Baseline Privacy Interface (BPI) or BPI Plus (BPI+) encryption is enabled for the CM.

Examples for Summary and Total Options

The following example shows the corresponding display for the **show cable modem docsis device-class total** command:

```
Router# show cable modem docsis device-class total

                Online  unrep CM    eCM  eMTA  eSTB  ePS
Total:          13      2    4     7    4     3     3
```

The following example shows sample output for the **show cable modem docsis device-class summary** form of the command on a Cisco CMTS router:

```
Router# show cable modem docsis device-class summary
                DOCSIS Device Class
-----
Interface      Online  unrep CM    eCM  eMTA  eSTB  ePS

Table 110: show cable modem docsis device-class summary Field Descriptions

Field	Description
Interface	Name of the cable interface and associated upstreams on the Cisco CMTS router.
Online	Total number of cable modems currently online on this cable interface.
unrep	Total number of cable modems on this interface for which the device-class information is unreported or unavailable.
CM	Total number of cable modems on this interface that have a reported device class as a standalone cable modem.
eCM	Total number of cable modems on this interface that have reported the device class as an embedded cable modem.
eMTA	Total number of cable modems on this interface that have reported the device class as an embedded multimedia terminal adapter.
eSTB	Total number of cable modems on this interface that have reported the device class as an embedded set-top box.
ePS	Total number of cable modems on this interface that have reported the device class as embedded portal services.
eRTR	Total number of cable modems on this interface that have reported the device class as an embedded router.
Total	The total number of all cable modems reported online and for a given DOCSIS device class across all cable interfaces on the Cisco CMTS router.

Effective from Cisco IOS Release 12.2(33)SCI1, the output of the **show cable modem docsis device-class** command displays the device class details for IPv6 single stack cable modems as shown by this example:

```
Router# show cable modem docsis device-class
MAC Address      I/F          MAC          Prim Reg      Device Class  Reg

Related Commands

Command	Description
show cable modem docsis version	Displays the DOCSIS version information for cable modems on one or more cable interfaces and upstreams.

show cable modem docsis version

To display the DOCSIS version information for cable modems (CMs) on one or more cable interfaces and upstreams, use the **show cable modem docsis version** command in privileged EXEC configuration mode.

Cisco uBR7100 Series and Cisco uBR7200 Series Routers

```
show cable modem docsis version [summary [cable {slot / port | slot / cable-interface-index} [cable
{slot / port | slot / cable-interface-index}] [upstream port1 port2 [logical-channel-index]]] [total]
show cable modem cable {slot / port | slot / cable-interface-index} docsis version summary
```

Cisco uBR10012 Router

```
show cable modem docsis version [summary [cable {slot / subslot / port | slot / subslot
/ cable-interface-index} [cable {slot / subslot / port | slot / subslot / cable-interface-index}] [upstream
port1 port2 [logical-channel-index]]] [total]
show cable modem cable {slot / subslot / port | slot / subslot / cable-interface-index} docsis version
summary
```

Cisco cBR Series Converged Broadband Routers

```
show cable modem docsis version [summary [cable slot / subslot / cable-interface-index] [upstream
chan1 chan2 ]] [total]
show cable modem cable slot / subslot / cable-interface-index docsis version [summary]
```

Syntax Description

summary	(Optional) Displays a summary of DOCSIS device class information for CMs on all or specified cable interfaces on the CMTS router.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8—The valid range is from 0 to 3 and 6 to 9.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. (Cisco cBR-8) The valid subslot is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).

<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8—The valid range is 0 to 15.
upstream <i>port1</i> <i>port2</i>	(Optional) Specifies a specific upstream port, or a range of upstream ports on the specified cable interface(s), whose cable modems you want to display information about, where: <ul style="list-style-type: none"> • <i>port1</i>—Specify only <i>port1</i> if you want to display information about a single upstream. When used with the <i>port2</i> argument, specifies the beginning of a range of upstream ports, and <i>port1</i> must be a lower-numbered port than <i>port2</i>. • <i>port2</i>—Specifies the end of a range of upstream ports, and <i>port2</i> must be a higher-numbered port than <i>port1</i>.
upstream <i>chan1</i> <i>chan2</i>	(Optional for Cisco cBR-8) Specifies a specific upstream channel, or a range of upstream channels on the specified cable interface(s), whose cable modems you want to display information about, where: <ul style="list-style-type: none"> • <i>chan1</i>—Specify only <i>chan1</i> if you want to display information about a single upstream. When used with the <i>chan2</i> argument, specifies the beginning of a range of upstream channels, and <i>chan1</i> must be a lower-numbered channel than <i>chan2</i>. • <i>chan2</i>—Specifies the end of a range of upstream channels, and <i>chan2</i> must be a higher-numbered channel than <i>chan1</i>.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1. Not available for Cisco cBR-8
total	(Optional) Displays a total of DOCSIS device-class information for the CMs connected to all interfaces, or to the specified cable interfaces.
docsis version summary	Displays the DOCSIS device class or version information for cable modems on one or more cable interfaces and upstreams.

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(23)BC	This command was introduced.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB.

Release	Modification
12.3(23)BC7	The output for the show cable modem docsis version summary total forms of the command were modified.
12.2(33)SCD2	This command was modified. The command output was modified to display the cable modems that are in upstream and downstream partial service mode.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

This command displays a summary of DOCSIS version information for all cable modems for a single cable interface or upstream, or for a range of cable interfaces or upstreams.

Use the **device-class** option on Cisco cBR Series Converged Broadband Router to display a summary of the device class information of the devices.

Examples: show cable modem docsis version Command

The following example shows typical output for the default form of the **show cable modem docsis version** command on a Cisco uBR10012 router:

```
Router# show cable modem docsis version
MAC Address      I/F          MAC          Prim  Reg  QoS  US  Phy  DS  Chl
                  State
0018.6852.800a   C5/1/0/U3   w-online(pt) 166   2.0  1.1  tdma  WB

```

Table below describes the significant fields shown in the display.

Table 111: show cable modem docsis version Field Descriptions

Field	Description
MAC Address	The MAC address of the CM.
I/F	The cable interface line card providing the upstream for this CM.
MAC State	The current state of the MAC layer.
Prim Sid	The primary SID assigned to this CM.
Reg Ver	Displays the maximum supported version of DOCSIS that the CM supports. The possible values are: 1.0, 1.1, 2.0, and 3.0. Shows “n/a” if the modem is not online.
QoS Prov	Displays the version of DOCSIS that the CM currently is provisioned and registered for. The possible values are: 1.0 or 1.1. Shows “n/a” if the modem is not online.
US Phy Mode	Displays the DOCSIS operating mode for the CM, with the following possible values: <ul style="list-style-type: none"> • tdma—DOCSIS 1.X, Time Division Multiple Access (TDMA)-only mode • atdma—DOCSIS 2.0 Advanced Time Division Multiple Access (A-TDMA) mode • scdma—DOCSIS 2.0 Synchronous Code Division Multiple Access (SCDMA) mode <p>Note This field is the same as that returned by the docsIfCmtsCmStatusModulationType object in the DOCS-IF-MIB.</p>
DS Chl Mode	Displays the downstream channel mode for the CM, with the following possible values: <ul style="list-style-type: none"> • NB—Narrowband • WB—Wideband

Examples: show cable modem version docsis version total Command

The following example shows the corresponding display for the **show cable modem docsis version total** command:

```

Router# show cable modem docsis version total
Total Registered CMs: 15
Total Unregistered CMs: 0
Total DOCSIS 3.0 Operating/Capable/Registered CMs: 0/0/0
Total DOCSIS 2.0 Operating/Capable/Registered CMs: 0/14/14
Total DOCSIS 1.1 Operating/Capable/Registered CMs: 15/15/1
Total DOCSIS 1.0 Operating/Capable/Registered CMs: 0/15/0
Total v1.1 US QoS operating CMs: 15
Total V1.0 US QoS operating CMs: 0
Total Wide Band US operating CMs: 0
Total scdma US Phy operating CMs: 0
Total atdma US Phy operating CMs: 0

```

```
Total tdma US Phy operating CMs: 15
Total Wide Band DS operating CMs: 11
Total Narrow Band DS operating CMs: 4
```

Beginning in Cisco IOS Release 12.2(33)SCD2, the output of the **show cable modem docsis version total** command was modified to display the cable modems that are in partial service mode as shown in the following example:

```
Router# show cable modem docsis version total
Total Registered CMs: 35
Total Unregistered CMs: 1
Total DOCSIS 3.0 Operating/Capable/Registered CMs: 21/22/22
Total DOCSIS 2.0 Operating/Capable/Registered CMs: 0/34/12
Total DOCSIS 1.1 Operating/Capable/Registered CMs: 35/35/1
Total DOCSIS 1.0 Operating/Capable/Registered CMs: 0/35/0
Total v1.1 US QoS operating CMs: 35
Total V1.0 US QoS operating CMs: 0
Total Wide Band US operating CMs: 21
Total Wide Band US partial-mode CMs: 9
Total scdma US Phy operating CMs: 0
Total atdma US Phy operating CMs: 0
Total tdma US Phy operating CMs: 14
Total Wide Band DS operating CMs: 22
Total Wide Band DS partial-mode CMs: 12
Total Narrow Band DS operating CMs: 13
```

Table below describes the fields shown in the show cable modem docsis version total command display.

Table 112: show cable modem docsis version total Field Descriptions

Field	Description
Total Registered CMs	Total number of cable modems currently online in a CMTS router.
Total Unregistered CMs	Total number of cable modems that are either offline and not currently communicating with the CMTS router, or that are attempting to come online but are not yet registered.
Total DOCSIS x.y Operating/Capable/Registered CMs: a/b/c	Total number of cable modems (in a/b/c format) for the specified DOCSIS version (x.y) that have the following status: <ul style="list-style-type: none"> • Operating—Total number (a) of CMs currently operating in the specified DOCSIS version. • Capable—Total number (b) of CMs that can operate in the specified DOCSIS version, but might not be operating in that version. • Registered—Total number (c) of CMs that are currently registered in the specified DOCSIS version.
Total Vx.y US QoS operating CMs	Total number of cable modems whose upstreams are currently operating in a specified DOCSIS version (x.y) quality of service (QoS).
Total Wide Band US operating CMs	Total number of cable modems with upstreams currently operating in wideband channel mode.
Total Wide Band US partial-mode CMs	Total number of cable modems with upstreams currently operating in partial wideband channel mode.

Field	Description
Total <i>mode</i> US Phy operating CMs	Total number of cable modems with upstreams currently operating in a particular wideband channel mode, where <i>mode</i> is: <ul style="list-style-type: none"> • <i>scdma</i>—DOCSIS 2.0 Synchronous Code Division Multiple Access (SCDMA) mode • <i>atdma</i>—DOCSIS 2.0 Advanced Time Division Multiple Access (A-TDMA) mode • <i>tdma</i>—DOCSIS 1.X, Time Division Multiple Access (TDMA) mode <p>Note The US Phy Mode counters (<i>scdma</i>, <i>atdma</i>, and <i>tdma</i>) remain 0 on the UB interfaces.</p>
Total Wide Band DS operating CMs	Total number of cable modems with downstreams operating in wideband channel mode.
Total Wide Band DS partial-mode CMs	Total number of cable modems with downstreams operating in partial wideband channel mode.
Total Narrow Band DS operating CMs	Total number of cable modems with downstreams operating in narrowband channel mode.

Examples: show cable modem docsis version summary Command

The following example shows typical output for the default form of the **show cable modem docsis version summary** command on a Cisco uBR10012 router:

```
Router# show cable modem docsis version summary
                                Cable Modem DOCSIS Version Summary
                                DOCSIS Registered   US QoS           US Phy Mode      DS Mode
                                -----
Interface Online v3.0 v2.0 v1.1 v1.0 v1.1 v1.0 WB  scdm atdm tdma WB  NB
C5/1/0/U0 2      0  2  0  0      2  0  0  0  0  2  2  0
C5/1/0/U1 3      0  3  0  0      3  0  0  0  0  3  3  0
C5/1/0/U2 2      0  2  0  0      2  0  0  0  0  2  2  0
C5/1/0/U3 2      0  2  0  0      2  0  0  0  0  2  2  0
C5/1/1/U0 4      0  3  1  0      4  0  0  0  0  4  2  2
C5/1/3/U0 2      0  2  0  0      2  0  0  0  0  2  0  2
```

Beginning in Cisco IOS Release 12.2(33)SCD2, the output of the **show cable modem docsis version summary** command was modified to display the cable modems that are in full or partial service mode as shown in the following example:

```
Router# show cable modem docsis version summary
                                Cable Modem DOCSIS Version Summary
                                DOCSIS Registered   US QoS           US Phy Mode      DOCSIS Mode
                                -----
Interface Online v3.0 v2.0 v1.1 v1.0 v1.1 v1.0 scdm atdm tdma UP  WB  WP  NB
C7/0/0/UB 12     12  0  0  0      12  0  0  0  0  9  12  12  0
C7/0/0/U0 2      0  2  0  0      2  0  0  0  2  0  0  0  2
C7/0/0/U1 1      0  1  0  0      1  0  0  0  1  0  0  0  1
C7/0/0/U3 4      0  4  0  0      4  0  0  0  4  0  0  0  4
C8/0/0/UB 9      9  0  0  0      9  0  0  0  0  0  9  0  0
C8/0/0/U0 1      1  0  0  0      1  0  0  0  1  0  1  0  0
```

```
C8/0/0/U1 5    0  4  1  0  5  0  0  0  5  0  0  0  5
C8/0/0/U3 1    0  1  0  0  1  0  0  0  1  0  0  0  1
```

The following example shows typical output for the **show cable modem docsis version summary** command with the **total** option on a Cisco uBR10012 router:

```
Router# show cable modem docsis version summary total
                Cable Modem DOCSIS Version Summary
                DOCSIS Registered    US QoS        US Phy Mode    DS Mode
-----

```

Table below describes the significant fields shown in the display.

Table 113: show cable modem docsis version summary Field Descriptions

Field	Description
Interface	The cable interface line card providing the upstream for this cable modem.
Online	Total number of cable modems currently online on this cable interface.
DOCSIS Registered	Total number of cable modems registered on this cable interface with the specified DOCSIS version (x.y) capabilities.
US QoS	Total number of cable modems whose upstreams are currently operating in a specified DOCSIS version (x.y) quality of service (QoS).
US Phy Mode	Total number of cable modems on this cable interface with upstreams currently operating in a particular wideband channel mode, where: <ul style="list-style-type: none"> WB—Total number of upstreams on this cable interface operating in any wideband channel mode. ofdma—Total number of upstreams on this cable interface operating in DOCSIS 3.1 Orthogonal Frequency Division Multiple Access (OFDMA) mode. atdma—Total number of upstreams on this cable interface operating in DOCSIS 2.0 Advanced Time Division Multiple Access (A-TDMA) mode. tdma—Total number of upstreams on this cable interface operating in DOCSIS 1.X, Time Division Multiple Access (TDMA) mode. <p>Note The US Phy Mode counters (scdma, atdma, and tdma) remain 0 on the UB interfaces.</p>
DS Mode	Total number of cable modems on this cable interface whose downstreams are operating in the following modes: <ul style="list-style-type: none"> WB—Total number of downstreams on this cable interface operating in wideband channel mode. NB—Total number of downstreams on this cable interface operating in narrowband channel mode.

Field	Description
DOCSIS Mode	<ul style="list-style-type: none"> • UP—Total number of cable modems in upstream bonding partial service mode (p). • WB—Total number of cable modems in downstream bonding fully-operational mode (w-online). • WP—Total number of cable modems in downstream bonding partial service mode (p-online). • NB—Total number of cable modems in narrowband online mode (online).

Related Commands

Command	Description
show cable modem docsis device-class	Displays the DOCSIS device-class information for cable modems (CMs) on all or specified cable interfaces and upstreams.
show cable modem partial-mode	Displays information about the cable modems that are in upstream and downstream partial service mode.

show cable modem docsis version d31-capable

To display the DOCSIS 3.1 version information for cable modems (CMs) on one or more cable interfaces and upstreams, use the **show cable modem docsis version d31-capable** command in privileged EXEC configuration mode.

show cable modem docsis version d31-capable

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Dublin 17.12.1x	The MRC/MTC column is added to the command output.
Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

This command displays a summary of DOCSIS 3.1 version information for all cable modems for a single cable interface or upstream, or for a range of cable interfaces or upstreams.

Examples: show cable modem docsis version d31-capable command

The following example shows output for the **show cable modem docsis version d31-capable** command on a Cisco cBR Series Converged Broadband Router (Cisco IOS XE Dublin 17.12.1x or later):

```
Router# show cable modem docsis version d31-capable

MAC Address      I/F                MAC              Reg Oper DSxUS DS   RCC   US   MRC/
                  I/F                State            Ver Ver   DS   OFDM ID  OFDMA MTC
4800.33ef.4b66 C1/0/0/UB         w-online(pt)     3.1 3.1  36x6 4    2    2    5/8
4800.33ef.5e4a C1/0/0/UB         w-online(pt)     3.1 3.1  35x6 3    3    2    5/8
4800.33ee.e971 C1/0/0/UB         w-online(pt)     3.1 3.1  32x2 0    5    0    2/2
4800.33e5.f746 C1/0/0/UB         w-online(pt)     3.1 3.1  34x2 4    7    0    2/2
```

Note D4.0 modems registering in D3.1 mode show up in the d31-capable list.

MRC/MTC information can help the operator distinguish these D4.0 modems from traditional D3.1 modems. MRC/MTC is greater than 2/2 for D4.0 modems.

The following example shows output for the **show cable modem docsis version d31-capable** command on a Cisco cBR Series Converged Broadband Router (Releases before Cisco IOS XE Dublin 17.12.1x):

```
Router# show cable modem docsis version d31-capable
```

show cable modem docsis version d31-capable

```

MAC Address      I/F          MAC          Reg   Oper  DSxUS  DS    RCC    US
                  State        Ver          Ver          Ver          OFDM  ID    OFDMA
4800.33ea.7012  C1/0/0/UB   w-online(pt) 3.1    3.1   33x4   1     5     1
203d.66ae.4169 C1/0/0/UB   w-online(pt) 3.1    3.1   33x4   1     5     1

```

Table below describes the significant fields that are shown in the display.

Table 114: show cable modem docsis version Field Descriptions

Field	Description
MAC Address	The MAC address of the CM.
I/F	The cable interface line card providing the upstream for this CM.
MAC State	The current state of the MAC layer.
Reg Ver	Displays the maximum supported version of DOCSIS 3.1 that the cable modem supports. Shows n/a if the modem is not online.
Oper Ver	Displays the actual version of DOCSIS protocol that the CM is currently using. Depending upon CMTS capabilities and configuration, this could be lower than the Reg Ver.
DSxUS	State of the downstream and upstream channels on the cable modem.
DS OFDM	Displays the number downstream OFDM channels being actively used by the CM.
RCC ID	Receive channel configuration (RCC) ID of the cable modem.
US OFDMA	Displays the number of upstream OFDMA channels being actively used by the CM. The current CMTS implementation limit is 2 upstream OFDMA channels, so the value could be 0, 1, or 2.
MRC/MTC	Displays Multiple Receive Channel (MRC) and Multiple Transmit Channel (MTC) capabilities of the modems. For D4.0 modems registering in D3.1 mode, the MRC and MTC values is greater than 2 OFDM and OFDMA channels. The first set of D4.0 modems based on Broadcom chipset advertise a value of 5/8 for MRC/MTC. Traditional D3.1 modems, advertise a MRC/MTC value of 2/2.

Related Commands

Command	Description
show cable modem phy	Displays the DOCSIS PHY layer information for one or more cable modems.
show interface cable mac-scheduler	Displays the OFDMA channel capacity and utilization.

show cable modem docsis version d40-capable

Use the **show cable modem docsis version d40-capable** command in privileged EXEC configuration mode to display the DOCSIS 4.0 version information for cable modems (CMs) on one or more cable interfaces and upstreams.

show cable modem docsis version d40-capable [**operational** | **not-operational**]

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Dublin 17.12.1x	This command was introduced on the Cisco cBR Series Converged Broadband Router.

Syntax Description

operational Displays a list of DOCSIS 4.0 operational modems.

not-operational Displays a list of DOCSIS 4.0 capable modems not D4.0 operational.

Usage Guidelines

This command displays a summary of DOCSIS 4.0 version information for all cable modems for a single cable interface or upstream, or for a range of cable interfaces or upstreams.

show cable modem docsis version d40-capable command

The table below describes the significant fields that are shown in the command output:

Table 115: show cable modem docsis version Field Descriptions

Field	Description
MAC Address	The MAC address of the CM.
I/F	The cable interface line card providing the upstream for this CM.
MAC State	The current state of the MAC layer.
Reg Ver	Displays the maximum supported version of DOCSIS 4.0 that the cable modem supports. Shows n/a if the modem is not online.
Oper Ver	Displays the actual version of the DOCSIS protocol that the CM is currently using. Depending upon CMTS capabilities and configuration, this could be lower than the Reg Ver.
DSxUS	State of the downstream and upstream channels on the cable modem.
DS OFDM	Displays the number downstream OFDM channels being actively used by the CM.
RCC ID	Receive channel configuration (RCC) ID of the cable modem.
US OFDMA	Displays the number of upstream OFDMA channels being actively used by the CM. Current CMTS implementation limit is 2 upstream OFDMA channels, so the value could be 0, 1, or 2.
MRC/MTC	Displays Multiple Receive Channel (MRC) and Multiple Transmit Channel (MTC) capabilities of the modems.

Related Commands

Command	Description
show cable modem phy	Displays the DOCSIS PHY layer information for one or more cable modems.
show interface cable mac-scheduler	Displays the OFDMA channel capacity and utilization.

show cable modem domain-name

To update the cable-specific Domain Name System (DNS) cache and display the domain name for specified cable modems (CMs) and customer premise equipment (CPE) behind a CM on a Cisco CMTS router, use the **show cable modem domain-name** command in privileged EXEC mode.

Cisco uBR7246VXR Router and Cisco uBR7225VXR Router

show cable modem [*{ip-address*mac-address | **cable** {slot/port | slot/cable-interface-index} [**upstream** port [*logical-channel-index*]] | **name** fqdn }] **domain-name**

Cisco uBR10012 Router

show cable modem [*{ip-address*mac-address | **cable** {slot/subslot /port | slot/subslot /cable-interface-index} [**upstream** port [*logical-channel-index*]] | **name** fqdn }] **domain-name**

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.
upstream port	(Optional) Displays information for all CMs using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1.

show cable modem domain-name

name <i>fqdn</i>	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router.
-------------------------	---

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCA	This command was introduced.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

Use the **show cable modem domain-name** command without any options to initiate an update to the cable-specific DNS cache on the CMTS router and to enable use of domain names in other CMTS router **cable modem** commands that support a name option.

Note In Cisco IOS Release 12.2(33)SCA, although the **show cable modem domain-name** command accepts an IPv4 address format for a CM, DNS for IPv4-managed cable devices is not supported.

Examples

The following example shows sample output for all CMs and CPE behind a CM for the **show cable modem domain-name** command, listing the devices by their MAC and IP addresses and displaying the associated domain name:

```
Router# show cable modem domain-name
MAC Address      IP Address                               Domain Name
0018.6835.27b3  10.3.37.76                               cisco-test-cm1.cisco.com
0019.474a.c14a  2001:0DB8:3800:809:A896:1431:75EA:5EA1  cisco-test-cm1.cisco.com
0007.0e03.6851  10.3.37.36                               cisco-test-cm1.cisco.com
0007.0e01.b085  10.3.37.34                               cisco-test-cm1.cisco.com
0018.6835.27aa  2001:0DB8:3800:809:E97D:2986:9F37:FFE  cisco-test-cm2.cisco.com
```

Related Commands

Command	Description
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem calls	Displays voice call information for a particular CM, identified either by its IP address or MAC address.
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.

Command	Description
show cable modem flap	Displays flap list statistics for one or more cable modems.
show cable modem maintenance	Displays station maintenance (SM) error statistics for one or more cable modems.
show cable modem remote-query	Displays information collected by the remote-query feature.
show cable modulation-profile	Displays modulation profile group information.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.
show interface cable sid	Displays cable interface information.

show cable modem errors

To display packet header error statistics for one or more cable modems, use the **show cable modem errors** command in privileged EXEC mode.

Cisco uBR7100 Series and Cisco uBR7200 Series Routers

show cable modem [{*ip-address* | *mac-address* | **cable** {*slot* / *port* | *slot* / *cable-interface-index*} [**upstream** *port* [*logical-channel-index*]] | **name** *fqdn*}] **errors**

Cisco uBR10012 Router

show cable modem [{*ip-address* | *mac-address* | **cable** {*slot* / *subslot* / *port* | *slot* / *subslot* / *cable-interface-index*} [**upstream** *port* [*logical-channel-index*]] | **name** *fqdn*}] **errors**

Cisco cBR Series Converged Broadband Router

show cable modem [{*ip-address* | *mac-address* | **cable** *slot* / *subslot* / *cable-interface-index* [**upstream** *port*]}] **errors**

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8 router—The valid range is from 0 to 3 and 6 to 9.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. (Cisco cBR-8 router—) The valid subslot is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8 router— The valid range is from 0 to 15.

upstream <i>port</i>	(Optional) Displays information for all cable modems using this specific upstream. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports on the cable interface line card.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1. Not available on the Cisco cBR-8 router.
name <i>fqdn</i>	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router. Not available on the Cisco cBR-8 router.
errors	Displays packet header error statistics for one or more cable modems .

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.1(4)CX, 12.2(1)XF, and 12.2(4)BC1	This command was introduced for the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The upstream and name keywords and <i>logical-channel-index</i> variable were removed.

Usage Guidelines

This command displays packet header error information for all cable modems , for all cable modems attached to a specific CMTS cable interface, or for a particular CM, as identified by its IP address or MAC address.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Tip In Cisco IOS Release 12.2(15)BC1 and later releases, use the **clear cable modem flap-counters** command to clear these counters.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Examples

The following example shows sample output for the **show cable modem errors** command for all cable modems on a particular cable interface.

```
Router# show cable modem c8/1/0 errors

MAC Address      I/F          CRC          HCS
0050.7366.1243  C8/1/0/U1    0            1
0002.b970.0027  C8/1/0/U4    0            0
0006.5314.858d  C8/1/0/U4    8            3
Router#
```

Table below describes the fields shown in the **show cable modem errors** displays:

Table 116: Descriptions for the show cable modem errors Fields

Field	Description
MAC Address	The MAC address for the CM.
I/F	The cable interface line card, including the upstream, for this CM.
CRC	Number of times the CMTS upstream receiver flagged a packet with a cyclic redundancy check (CRC) error from this CM. CRC errors usually indicate downstream signal interruption or interference noise on a plant. Occasional CRC errors can always be expected, but a high number of CRC errors could indicate plant problems such as intermittent upstream problems, laster clipping, common-path distortion, or impulsive noise or interference.

Field	Description
HCS	Number of times the CMTS upstream receiver flagged a packet with a header checksum (HCS) error from this CM. HCS errors could indicate the same sort of plant problems as CRC errors.

Related Commands

Command	Description
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
show cable modem	Displays information for the registered and unregistered cable modems .
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.
show cable modem connectivity	Displays connectivity statistics for one or more cable modems .
show cable modem flap	Displays flap list statistics for one or more cable modems.
show cable modem maintenance	Displays station maintenance (SM) error statistics for one or more cable modems.
show interface cable modem	Displays information about the cable modems connected to a particular cable interface.

show cable modem extended-power

To display the list of cable modems that are transmitting upstream data at extended power level, use the **show cable modem extended-power** command in privilege EXEC mode.

show cable modem extended-power

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCF2	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Examples

This example shows the output of the **show cable modem extended-power** command that displays all the cable modems that are transmitting upstream data at extended power level:

```
Router# show cable modem extended-power
MAC Address      IP Address      I/F           MAC State      Prim Sid  Report Power  ECN
001e.6bfb.3382  10.50.0.3      C1/0/0/UB    w-online      3        57.00      Y
0022.cea5.0214  10.50.1.102   C1/0/0/UB    w-online      5        54.00      Y
001e.6bfb.1378  10.50.6.83    C1/0/0/UB    w-online      6        54.00      Y
```

Table below describes significant fields shown in the display.

Table 117: show cable modem extended-power Field Descriptions

Field	Description
MAC Address	MAC address of the cable modem.
IP Address	IP address that the DHCP server has assigned to the cable modem.
I/F	Cable interface line card providing the upstream for the cable modem.
MAC State	Current state of the MAC layer.
Prim Sid	Primary Service ID (SID) assigned to the cable modem.
Report Power	Power (in dB) at which cable modems are transmitting upstream data.
ECN	Extended high power at which the CM is operating.

Related Commands

Command	Description
cable upstream ext-power	Enables or disables the DOCSIS extended transmit power support on the Cisco CMTS.

show cable modem fiber-node mac-domain

To display all modems that are available in a specified fiber-node and mac domain in a service group profile, use the **show cablemodem fiber-node mac-domain** command in the privileged EXEC mode.

show cable modem fiber-node *fiber-node id* **mac-domain** *mac-domain id*

Syntax Description	fiber-node	Fiber-node profile information.
	<i>fiber-node id</i>	Fiber node ID.
	mac-domain	DOCSIS MAC version/capabilities.
	<i>mac-domain id</i>	Summary total/active/registered modems with DOCSIS information per interface.
Command Default	None	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS-XE 3.17.0S	This command was introduced.

Example:

show cable modem flap

To display flap list statistics for one or more cable modems, use the **show cable modem flap** command in privileged EXEC mode.

Cisco uBR7100 Series and Cisco uBR7200 Series Routers

```
show cable modem [{ip-address|mac-address} | cable {slot / cable-interface-index} [upstream port
logical-channel-index] | name fqdn}] flap
```

Cisco uBR10012 Router

```
show cable modem [{ip-address|mac-address} | cable {slot / subslot / cable-interface-index} [upstream
port logical-channel-index] | name fqdn}] flap mtc
```

Cisco cBR Series Converged Broadband Router

```
show cable modem [{ip-address|mac-address} | cable {slot / subslot / cable-interface-index} [upstream
port]]] flap
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific cable modem to be displayed. If you specify the IP address for a CPE device behind a cable modem, information for that cable modem is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific cable modem to be displayed. If you specify the MAC address for a CPE device behind a cable modem, information for that cable modem is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8 router— The valid range is from 0 to 3 and 6 to 9
<i>subslot</i>	Secondary slot number of the cable interface line card. <ul style="list-style-type: none"> • Cisco uBR10012 —The valid subslots are 0 or 1. • Cisco cBR-8 router— The valid subslot is 0.
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8 router—The valid range is 0 to 15.

upstream port	(Optional) Displays information for all cable modems using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card. Cisco cBR-8 router— The valid range is from 0 to 7
logical-channel-index	(Optional) Logical channel index. The valid values are 0 or 1. This variable is not supported on the Cisco cBR-8 router.
name fqdn	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router. This keyword is not supported on the Cisco cBR-8 router.
flap mtc	Displays aggregate data across all upstream channels for each flap detector for cable modems in MTC mode. Displays per channel flap information for a single cable modem in MTC mode. The mtc keyword is not supported on the Cisco cBR-8 router.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.1(4)CX, 12.2(1)XF, and 12.2(4)BC1	This command was introduced for the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 routers.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a cable modem or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a cable modem.
12.2(33)SCC	A new keyword, mtc , was added to provide multiple transmit channel (MTC) information for cable modems in the MTC mode. <ul style="list-style-type: none"> • The mtc keyword displays aggregate data across all upstream channels for each flap detector for cable modems in the MTC mode. • The show cable modem flap command remains unchanged for non-MTC mode cable modems.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.

Release	Modification
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The name keyword and <i>logical-channel-index</i> variable are removed.

Usage Guidelines

This command displays information about the flap list activity for one or more cable modems. Unlike the **show cable flap-list** command, the **show cable modem flap** command displays flap counters of a cable modem irrespective of the plant condition.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Note In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

For cable modems in MTC mode, the **show cable modem flap** command will display aggregate data across all upstream channels for each flap detector. However, for a single MTC cable modem, the **show cable modem flap** command will display per channel flap information.

Note The output of the **show cable modem flap** command will remain unchanged for non-MTC mode cable modems.

Examples

This example shows the output for the **show cable modem flap** command on a Cisco CMTS router:

```
Router# show cable modem flap
```

show cable modem flap

```

MAC Address      I/F              Ins   Hit   Miss  CRC   P-Adj   Flap   Time

Router#

This example shows the output for the **show cable modem flap** command for a particular cable modem on the Cisco cBR-8 router:

```

Router#show cable modem c8fb.26a5.5598 flap
MAC Address    I/F           Ins  Hit  Miss  CRC   P-Adj  Flap  Time
c8fb.26a5.5598 C3/0/3/U0    0    2525  4    0     0     0

```

Router#

Table below describes the significant fields shown in the display:

Table 118: show cable modem flap Field Descriptions

Field	Description
MAC Address	The MAC address for the CM.
I/F	The cable interface line card, including upstream, for this cable modem.
Ins	The number of times the cable modem comes up and inserts itself into the network. It can indicate intermittent downstream sync loss or DHCP or modem registration problems.

Field	Description
Hit	The number of times the cable modem responds to MAC layer keepalive messages. (The minimum hit rate is once per 30 seconds. It can indicate intermittent upstream, laser clipping, or common-path distortion.
Miss	The number of times the cable modem misses the MAC layer keepalive message. An 8 percent miss rate is normal for the Cisco cable interface line cards. It can indicate intermittent upstream, laser clipping, or common-path distortion.
CRC	The number of cyclic redundancy check (CRC) errors from this cable modem. It can indicate intermittent upstream, laser clipping, or common-path distortion.
P-Adj	The number of times the headend instructed the cable modem to adjust transmit (TX) power more than 3 dB. It can indicate amplifier degradation, poor connections, or thermal sensitivity.
Flap	The sum of P-Adj and Ins values. cable modems with high flap counts have high SIDs and might not register.
Time	The most recent time that the cable modem dropped the connection. The value displayed in the brackets indicates the duration (milliseconds) between the cable interface to become active and the first ranging success after a line card switchover (cable modem recovery time).

Related Commands

Command	Description
cable flap-list aging	Specifies the number of days to keep a cable modem in the flap-list table before aging it out of the table.
cable flap-list insertion-time	Sets the insertion time interval that determines whether a cable modem is placed in the flap list.
cable flap-list miss-threshold	Configures the threshold for recording a flap-list event, in terms of missed Station Maintenance messages.
cable flap-list power-adjust threshold	Specifies the power-adjust threshold for recording a cable modem flap-list event.
cable flap-list size	Specifies the maximum number of cable modems that can be listed in the flap-list table.
clear cable flap-list	Clears all the entries in the flap-list table.
show cable flap-list	Displays the current contents of the flap list.
show cable modem	Displays information for the registered and unregistered cable modems.
show interface cable modem	Displays information about the cable modems connected to a particular cable interface.

show cable modem internal load-balance

To display the load balance debug information for a cable modem, use the **show cable modem internal load-balance** command in privileged EXEC mode.

showcablemodem*mac-address***internal load-balance**

Syntax Description

<i>mac-address</i>	MAC address of a specific cable modem to be displayed.
--------------------	--

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE Fuji 16.8.1	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Examples

This example shows the output for the **show cable modem internal load-balance** command for a particular cable modem:

```
Router# show cable modem c8fb.26a6.c49c internal load-balance

```

show cable modem ipv6

To display IPv6 information for specified cable modems (CMs) and customer premise equipment (CPE) behind a CM on a Cisco CMTS router, use the **show cable modem ipv6** command in privileged EXEC mode.

Cisco uBR7246VXR Router and Cisco uBR7225VXR Router

```
show cable modem [{ip-address|mac-address} | cable {slot/port | slot/cable-interface-index} [upstream
port [logical-channel-index]] | name fqdn}] ipv6 [{cpe | prefix | registered | unregistered}]
```

Cisco uBR10012 Router

```
show cable modem [{ip-address|mac-address} | cable {slot/subslot/port |
slot/subslot/cable-interface-index} [upstream port [logical-channel-index]] | name fqdn}] ipv6 [{cpe
| prefix | registered | unregistered}]
```

Cisco cBR-8 Converged Broadband Router

```
show cable modem [{ip-address|mac-address} | cable slot/subslot/cable-interface-index }] ipv6 [{prefix
| registered | summary | unregistered}]
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
cable	Identifies the cable interface on the Cisco router.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8—The valid range is from 0 to 3 and 6 to 9.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. (Cisco cBR-8) The valid subslot is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).

<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8—The valid range is from 0 to 15.
upstream port	(Optional) Displays information for all CMs using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1.
name fqdn	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router.
cpe	(Optional) Displays IPv6 information for the CPE devices behind the CM with the specified IPv4 or IPv6 address.
prefix	(Optional) Displays the IPv6 prefix of the network.
registered	(Optional) Displays IPv6 information for registered CMs.
summary	(Optional) Displays the summary of the IPv6 information on Cisco cBR-8 Converged Broadband Router.
unregistered	(Optional) Displays IPv6 information for unregistered CMs.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCA	This command was introduced.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
12.2(33)SCG1	The output for the show cable modem mac-address ipv6 cpe has been modified.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. The upstream , name and cpe keywords were and <i>logical-channel-index</i> variable was removed.

Usage Guidelines

Use the **show cable modem ipv6** command without any options to display IPv6 information for all CMs on the CMTS router.

Using the keyword options, you can display IPv6 information by IP address (IPv4 or IPv6) of a particular CM, for all CMs associated with a specified cable interface, by MAC address of a CM, or by domain name of a CM.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the Cisco CMTS router before any domain name can be used as part of a cable command.

To display the number of CPEs behind a CM, use the **show cable modem ipv6 registered** command.

To display CPE information behind a specific CM, use the **show cable modem mac-address ipv6 cpe** command.

Examples**IPv6 Information for all CMs**

The following example shows sample output for the **show cable modem ipv6** command for all CMs on the Cisco CMTS routers, listing the devices by their MAC and IP addresses and displaying the associated domain name:

```
Router# show cable modem ipv6
MAC Address      Type Interface  Mac State   D/IP IP Address
0004.27a5.b761  B/D  C6/0/2/U1   online      N    ---
0007.0e01.d9a1  B/D  C6/0/2/U0   online      N    ---
0006.2854.7275  R/D  C6/0/2/U1   online      Y    2001:0DB8:3800:80B:7565:5B87:1D7D:5AD5
```

IPv6 prefix information for all CMs

The following example shows sample output for the **show cable modem ipv6 prefix** command for all CMs on the Cisco CMTS routers:

```
Router# show cable modem ipv6 prefix
Device Type: B - CM Bridge, R - CM Router
IP Assignment Method: D - DHCP
MAC Address      Type D/IP IPv6 prefix
0006.2854.7275  R/D  Y    2001:0DB8:3800:80C::/64
```

Starting with Cisco IOS Release 12.2(33)SCG1, the output for the **show cable modem ipv6 prefix** command displays multiple IPv6 prefix assigned. The D/IP field is not supported. The following example shows the sample output for the **show cable modem ipv6 prefix** command for all CMs on the Cisco CMTS router:

```
Router#
show cable modem ipv6 prefix
Load for five secs: 1%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:36:53.075 UTC Thu Aug 2 2012
Device Type: B - CM Bridge, R - CM Router
IP Assignment Method: D - DHCP
MAC Address      Type IPv6 prefix
0023.bed9.4c91  R/D  2001:40:1012::/64
                   R/D  2001:40:2012:1::/64
0000.002e.074c  R/D  2001:40:1012:8::/64
                   R/D  2001:40:2012:1D::/64
```

show cable modem ipv6

```

0000.002e.074b R/D 2001:40:1012:23::/64
                R/D 2001:40:2012:1C::/64
0000.002e.074a R/D 2001:40:1012:22::/64
                R/D 2001:40:2012:1B::/64

```

Starting with Cisco IOS Release 12.2(33)SCG1, the following example shows sample output for the **show cable modem mac-address ipv6 prefix** command for multiple IPv6 prefixes assigned to CPEs behind a CM with a specific MAC address on the Cisco CMTS router:

```

Router#
show cable modem 0023.bed9.4c8e ipv6 prefix
Load for five secs: 0%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:37:22.335 UTC Thu Aug 2 2012
Device Type: B - CM Bridge, R - CM Router
IP Assignment Method: D - DHCP
MAC Address      Type IPv6 prefix
0023.bed9.4c91  R/D 2001:40:1012::/64
                R/D 2001:40:2012:1::/64

```

Example of the show cable modem ipv6 Command for all Registered CMs

The following example shows sample output for the **show cable modem ipv6 registered** command for all registered CMs on the Cisco CMTS router:

```

Router# show cable modem ipv6 registered
Interface Prim Online      CPE IP Address      MAC Address
          Sid  State
C4/0/U2   1   online      0   ---              0018.6835.27b3
C4/0/U2   2   online      0   2001:0DB8:3800:809:A896:1431:75EA:5EA1 0019.474a.c14a
C4/1/U1   2   online      0   ---              0007.0e03.6851
C4/1/U1   3   online      0   ---              0007.0e01.b085
C4/1/U1   4   online      0   2001:0DB8:3800:809:E97D:2986:9F37:FFE 0018.6835.27aa

```

Example of the show cable modem ipv6 cpe Command for all CMs

The following example shows sample output for the **show cable modem ipv6 cpe** command for all CMs on the Cisco CMTS router:

```

Router# show cable modem 0019.474a.c14a ipv6 cpe
MAC Address      IP Address      Domain Name
0005.0052.2c1d 2001:420:3800:809:48F7:3C33:B774:9185

```

Starting with Cisco IOS Release 12.2(33)SCG1, the following example shows sample output for the **show cable modem mac-address ipv6 cpe** command for registered CMs on the Cisco CMTS router:

```

Router# show cable modem 0023.bed9.4c8e ipv6 cpe
Load for five secs: 0%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:37:20.439 UTC Thu Aug 2 2012
MAC Address      IP Address
0023.bed9.4c91 2001:40:3:4:200:5EB7:BB6:C759
                2001:40:3:4:210:D73B:7A50:2D05

```

Table below describes the significant fields shown in the display.

Table 119: show cable modem ipv6 Field Descriptions

Field	Description
MAC Address	MAC address of this CM.

Field	Description
Type	Type of device that this CM is functioning as, with the following possible values: <ul style="list-style-type: none"> • B/D—CM as bridge using DHCP address assignment. • G/D—CPE router using DHCP address assignment. • C/A—CPE using Stateless Address Auto-Configuration (SLAAC) address assignment. <p>Note In Cisco IOS Release 12.2(33)SCA, the Cisco CMTS router does not support SLAAC.</p>
Interface	Cable line card interface and upstream associated with this CM.
Mac State	The current state of the MAC layer for this CM .
D/IP	Dual IP flag. Identifies whether or not (“Y” or “N”) the CM or CPE supports both IPv4 and IPv6 addressing. Starting from Cisco IOS Release 12.2(33)SCG1, D/IP field is not supported.
IP Address	IP address acquired by the CM. Prior to acquisition of the IP address, or if the CM fails registration, the following output is shown: <ul style="list-style-type: none"> • IPv4 address not yet acquired—”0.0.0.0” • IPv6 address not yet acquired—“:.” • CM fails IPv6 registration, but online with IPv4 address or CM fails IPv4 registration, but online with IPv6 address: “---” • IPv6 address of IPv4-only CM, or IPv4 address of an IPv6-only CM: “---”
Domain Name	Domain name for the CM.

Table below shows the possible values for the MAC state field:

Table 120: Descriptions for the MAC State Field

MAC State Value	Description
14	
Registration and Provisioning Status Conditions for Devices Using IPv4 Addressing	
init(r1)	The CM sent initial ranging.
init(r2)	The CM is ranging. The CMTS received initial ranging from the CM and has sent RF power, timing offset, and frequency adjustments to the CM.
init(rc)	Ranging has completed. <p>Note If a CM appears to be stuck in this state, it could be that the CM is able to communicate successfully on the cable network, but that the upstream is at capacity and does not have any additional bandwidth to allow the CM to finish registration and come online. Either manually move one or more CMs to other upstreams, or enable load balancing on the upstream using the cable load-balance group commands.</p>

MAC State Value	Description
14	
init(d)	The DHCP request was received, as DHCPDISCOVER. This also indicates that the first IP broadcast packet has been received from the CM.
init(dr)	The DHCP request has been sent to the cable modem.
init(i)	<p>The cable modem has received the DHCPOFFER reply (DHCPACK) from the DHCP server that has assigned an IP address to the modem, but the modem has not yet replied with a DHCPREQUEST message requesting that particular IP address, nor has it sent an IP packet with that IP address.</p> <p>Note If a CM appears to be stuck in this state, the CM has likely received the DHCPOFFER reply from the DHCP server, but this reply might have contained one or more invalid options for that particular CM.</p>
init(io)	The Cisco CMTS has seen the DHCP offer as sent to the cable modem from the DHCP server that has assigned an IP address to the modem.
init(o)	The CM has begun to download the option file (DOCSIS configuration file) using the Trivial File Transfer Protocol (TFTP), as specified in the DHCP response. If the CM remains in this state, it indicates that the download has failed.
init(t)	Time-of-day (TOD) exchange has started.
resetting	The CM is being reset and will shortly restart the registration process.
Registration and Provisioning Status Conditions for Devices Using IPv6 Addressing	
init6(s)	The Cisco CMTS router has seen the DHCPv6 SOLICIT message from the CM.
init6(a)	The Cisco CMTS router has seen the ADVERTISE message from the DHCPv6 server to the CM.
init6(r)	The Cisco CMTS router has seen the REQUEST response from the CM to the DHCPv6 server.
init6(i)	The Cisco CMTS router has seen the REPLY message from the DHCPv6 server to the CM.
init6(o)	The Cisco CMTS router has seen the REQUEST message from the CM to the TFTP server.
init6(t)	The Cisco CMTS router has seen the REQUEST message from the CM to the TOD server.
Non-error Status Conditions	
cc(r1)	The CM had registered and was online, but has received a Downstream Channel Change (DCC) or Upstream Channel Change (UCC) request message from the CMTS. The CM has begun moving to the new channel, and the CMTS has received the CM's initial ranging on the new downstream or upstream channel. At the MAC layer, the CM is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.

MAC State Value 14	Description
cc(r2)	This state should normally follow cc(r1) and indicates that the CM has finished its initial ranging on the new channel, and is currently performing continuous ranging on the new channel. At the MAC layer, the CM is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.
offline	The CM is considered offline (disconnected or powered down).
online	The CM has registered and is enabled to pass data on the network.
online(d)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. The CM does not forward traffic to or from the CPE devices, but the CMTS can continue to communicate with the CM using DOCSIS messages and IP traffic (such as SNMP commands). Note If BPI was enabled in the DOCSIS configuration file sent to the CM, assume that the CM is using BPI encryption, unless other messages show that the BPI negotiation and key assignments have failed.
online(pkd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and KEK is assigned. Note This state is equivalent to the online(d) and online(pk) states.
online(ptd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note This state is equivalent to the online(d) and online(pt) states.
online(pk)	The CM registered, BPI is enabled and KEK is assigned.
online(pt)	The CM registered, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note If network access was disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows online(d) instead of online(pt) even when BPI encryption is enabled and operational.
Note	If an exclamation point (!) appears in front of one of the online states, it indicates that the cable dynamic-secret command has been used with either the mark or reject option, and that the cable modem has failed the dynamic secret authentication check.
expire(pk)	The CM registered, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value.

MAC State Value	Description
14	
expire(pkd)	<p>The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value.</p> <p>Note This state is equivalent to the online(d) and expire(pk) states.</p>
expire(pt)	<p>The CM registered, BPI is enabled, TEK was assigned, but the current TEK expired before the CM could successfully renew a new KEK value.</p>
expire(ptd)	<p>The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, TEK was assigned, but the current TEK expired before the CM could successfully renew a new KEK value.</p> <p>Note This state is equivalent to the online(d) and expire(pt) states.</p>
Error Status Conditions	
reject(m)	<p>The CM attempted to register but registration was refused due to a bad Message Integrity Check (MIC) value. This also could indicate that the shared secret in the DOCSIS configuration file does not match the value configured on the CMTS with the cable shared-secret command.</p> <p>In Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases, this could also indicate that the cable tftp-enforce command has been used to require that a CM attempt a TFTP download of the DOCSIS configuration file before registering, but the CM did not do so.</p>
reject(c)	<p>The CM attempted to register, but registration was refused due to a a number of possible errors:</p> <ul style="list-style-type: none"> • The CM attempted to register with a minimum guaranteed upstream bandwidth that would exceed the limits imposed by the cable upstream admission-control command. • The CM has been disabled because of a security violation. • A bad class of service (COS) value in the DOCSIS configuration file. • The CM attempted to create a new COS configuration but the CMTS is configured to not permit such changes. • The CM failed the timestamp check for its DOCSIS configuration file. (This could indicate a possible theft-of-service attempt, or a problem with the synchronization of the clocks on the CM and CMTS.)
reject(pk)	<p>KEK key assignment is rejected, BPI encryption has not been established.</p>
reject(pkd)	<p>The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because KEK key assignment was rejected.</p> <p>Note This state is equivalent to the online(d) and reject(pk) states.</p>
reject(pt)	<p>TEK key assignment is rejected, BPI encryption has not been established.</p>

MAC State Value	Description
14	
reject(ptd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because TEK key assignment was rejected. Note This state is equivalent to the online(d) and reject(pt) states.
Note	In Cisco IOS Release 12.1(20)EC, Cisco IOS Release 12.2(15)BC1, and earlier releases, when network access is disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows online(d) even if BPI encryption fails. Use the show cable modem mac-address command to confirm whether BPI is enabled or disabled for a particular cable modem.
reject(ts)	The CM attempted to register, but registration failed because the TFTP server timestamp in the CM registration request did not match the timestamp maintained by the CMTS. This might indicate that the CM attempted to register by replaying an old DOCSIS configuration file used during a prior registration attempt.
reject(ip)	The CM attempted to register, but registration failed because the IP address in the CM request did not match the IP address that the TFTP server recorded when it sent the DOCSIS configuration file to the CM. IP spoofing could be occurring.
reject(na)	The CM attempted to register, but registration failed because the CM did not send a Registration-Acknowledgement (REG-ACK) message in reply to the Registration-Response (REG-RSP) message sent by the CMTS. A Registration-NonAcknowledgement (REG-NACK) is assumed.

¹⁴ The CM MAC state field can also be retrieved using SNMP by getting the value of the cdxCmtsCmStatusValue object in the CISCO-DOCS-EXT-MIB.

Note For the complete list of the cable modem status, see [Table 100: Descriptions for the MAC State Field](#), on page 1888.

Related Commands	Command	Description
	cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
	show cable modem	Displays information for the registered and unregistered CMs.
	show interface cable modem	Displays information about the CMs connected to a particular cable interface.

show cable modem ipv6 summary

To display the summary of IPv6 information on Cisco cBR Series Converged Broadband Routers, use the **show cable modem ipv6 summary** command in privileged EXEC mode.

show cable modem ipv6 [**prefix** | **registered** | **summary** | **unregistered**]

Syntax Description	Option	Description
	prefix	(Optional) Displays the IPv6 prefix of the network.
	registered	(Optional) Displays IPv6 information for registered CMs.
	summary	(Optional) Displays the summary of the IPv6 information on Cisco cBR Series Converged Broadband Routers.
	unregistered	(Optional) Displays IPv6 information for unregistered CMs.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **show cable modem ipv6 summary** command displays IPv6 summary information for all IPv6 CM's on the CMTS router. The summary information includes the total number of online IPv6 modems and total number of modems in each different state like init6(s), init6(a), init6(o) and so on.

Examples

The following example shows sample output for the **show cable modem ipv6summary** command for all CMs on the Cisco cBR Series Converged Broadband Routers:

```
Router# show cable modem ipv6 summary
Interface                               Cable Modem                               Description
Total Reg Oper Unreg Offline Wideband initRC init6S init6A init6O
Ca3/0/0      7   6   6   1   1   0   0   0   0   0
Ca3/0/1     16  16  16   0   0   0   0   0   0   0
Ca3/0/3     16  16  16   0   0   0   0   0   0   0
Total:      39  38  38   1   1   0   0   0   0   0
```

Related Commands

Command	Description
show cable modem summary	Displays a summary of CMs on one or more cable interfaces.
show cable modem summary total	Displays a summary and a total for all CMs on the chasis.

show cable load-balance move-history cable x/y/z

To display detailed information of every cable modem movement triggered through load balance, use the **show cable load-balance move-history cable x/y/z** command in privileged EXEC mode.

The detailed information of the modem movement are:

- The mac address of the cable modem that was moved.
- The mac-domain of the cable modem.
- The load balance group ID of cable modem.
- Old downstream information of the cable modem, including the primary downstream channel, RCC ID before moving.
- New downstream information of the cable modem, including the new primary downstream channel, RCC ID after moving.
- Old upstream information of the cable modem including the index of mac-domain, the bitmap of the upstream channel before moving.
- New upstream information of the cable modem including the index of mac-domain, the bitmap of the upstream channel after moving.
- The action of the cable modem movement, such as DBC, DCC, UCC, REINIT(DCC with init-tech 0).
- The trigger of the cable modem movement, such as D2.0 LB, D3.0 static LB, D3.0 dynamic LB.
- The start time of the cable modem movement.
- The elapsed time - how long the cable modem movement spent.
- The result of the action on modem movement - success, failure, and the internal confirmation code.

```

show cable modem mac

To display MAC layer information for one or more CMs, use the **show cable modem mac** command in privileged EXEC mode.

Cisco uBR7100 Series and Cisco uBR7200 Series Routers

```
show cable modem [{ip-address|mac-address} cable {slot/port|slot/cable-interface-index} [upstream
port [logical-channel-index]] | name fqdn }] mac [summary [total]]
```

Cisco uBR10012 Router

```
show cable modem [{ip-address|mac-address} cable {slot/subslot/port |
slot/subslot/cable-interface-index} [upstream port [logical-channel-index]] | name fqdn }] mac
[summary [total]]
```

Cisco cBR Series Converged Broadband Router

```
show cable modem [{ip-address|mac-address} cable slot/subslot/cable-interface-index }] mac
[summary [total]]
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8—The valid range is from 0 to 3 and 6 to 9.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. (Cisco cBR-8) The valid subslot is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).

<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8—The valid range is from 0 to 15.
upstream port	(Optional) Displays information for all CMs using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1.
name fqdn	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router.
summary [total]	(Optional) Displays a summary of MAC layer information for each cable interface. If you add the optional total keyword, the display includes a total of CMs that are included in each of the displayed fields.

Command Default Displays MAC layer information for all CMs.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.1(4)CX and 12.2(4)BC1	This command was introduced for the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 routers.
	12.2(8)BC2	This command was enhanced to show whether a CM is capable of operating in DOCSIS 1.0 or DOCSIS 1.1 mode, and the version for which it is currently provisioned.
	12.2(11)BC1	The mac option was enhanced to support the summary and summary total options.
	12.2(15)CX	This command was enhanced to support DOCSIS 2.0 CMs using Advanced Time Division Multiple Access (A-TDMA) modulation profiles.
	12.3(17a)BC	Introduced revised information that is displayed for the following two versions of the show cable modem mac command: show cable modem mac summary Refer to “Usage Guidelines.”

Release	Modification
12.2(33)SCA	<p>This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes:</p> <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM. • The following new initialization states were added to show initialization of CMs and CPEs supporting IPv6: <ul style="list-style-type: none"> • init6(s)—CMTS router has seen SOLICIT message. • init6(a)—CMTS router has seen ADVERTISE message. • init6(r)—CMTS router has seen REQUEST message. • init6(i)—CMTS router has seen REPLY message. • init6(o)—CMTS router has seen version 6 TFTP request. • init6(t)—CMTS router has seen version 6 TOD request.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. The upstream and name keywords were and <i>logical-channel-index</i> variable was removed.

Usage Guidelines

Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Cisco IOS Release 12.3(17a)BC introduces changes for two versions of the show cable modem mac command.

- **show cable modem mac summary**

The information displayed with this command is revised. The DOCSIS 2.0 column in the Quality of Service (QoS) Provision Mode field has been removed, as this field is not applicable to QoS provisioning in DOCSIS 2.0.

Command Output in Cisco IOS Release 12.3(17a)BC and Later Releases

```
Router# show cable modem mac summary
                          Cable Modem Summary
                          -----
                          Mac Version
Interface      Total  DOC2.0  DOC1.1  DOC1.0  QoS Provision Mode
Cable5/1/0/U0  10     0       2       8       Reg/Online  DOC1.1  DOC1.0
                                     10       0       10
```

Command Output in Cisco IOS Release 12.3(13a)BC and Earlier Releases

```
Router# scm mac sum
                          Cable Modem Summary
                          -----
                          Mac Version
Interface      Total  DOC2.0  DOC1.1  DOC1.0  QoS Provision Mode
Cable8/0/0/U0  8     0       5       3       Reg/Online  DOC2.0  DOC1.1  DOC1.0
                                     5       0       5       0
```

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Examples

This section contains examples for the different forms of the **show cable modem mac** command.

Default Displays

The following example shows typical output for the default form of the **show cable modem mac** command:

```
Router# show cable modem mac

MAC Address      MAC      Prim Ver   QoS      Frag Concat PHS Priv  DS   US
                  State   Sid     Prov
0050.7366.1243  online  1     DOC1.0 DOC1.0  no   no    no  BPI  0   0
0002.b970.0027  online  2     DOC1.1 DOC1.0  no   yes   yes BPI+ 0   4
0006.5314.858d  online  3     DOC1.1 DOC1.1  yes  yes   yes BPI+ 0   4

0010.f025.1bd9  init(rc) 2     DOC1.0 DOC1.0  no   no    no  BPI  0   0
0010.9659.4447  online(pt) 3     DOC1.0 DOC1.0  no   yes   no  BPI  0   0
0010.9659.4461  online(pt) 4     DOC1.0 DOC1.0  no   yes   no  BPI  0   0
0010.64ff.e459  online  5     DOC1.0 DOC1.0  no   yes   no  BPI  0   0
```

show cable modem mac

```

0020.4089.7ed6 online      6      DOC1.0 DOC1.0 no no no BPI 0 0
0090.9607.3831 online(pt) 7      DOC1.0 DOC1.0 no no no BPI 0 0
0090.9607.3830 online(pt) 1      DOC1.0 DOC1.0 no no no BPI 0 0
0050.7366.12fb init(i)    2      DOC1.0 DOC1.0 no no no BPI 0 0
0010.fdfa.0a35 online(pt) 3      DOC1.1 DOC1.1 yes yes yes BPI+ 0 4

```

The following example shows sample output for the **show cable modem mac** command for a particular cable interface:

```
Router# show cable modem c3/0 mac
```

```

MAC Address      MAC          Prim Ver   QoS      Frag Concat PHS Priv  DS   US
                  State       Sid      Prov
0050.7366.1243 online      1      DOC1.0 DOC1.0 no no no BPI 0 0
0002.b970.0027 online      2      DOC1.1 DOC1.0 no yes yes BPI+ 0 4
0006.5314.858d online      3      DOC1.1 DOC1.1 yes yes yes BPI+ 0 4

```

The following example shows sample output for the **show cable modem mac** command for a particular CM, as identified by its MAC address:

```
Router# show cable modem 0010.7bb3.fcd1 mac
```

```

MAC Address      MAC          Prim Ver   QoS      Frag Concat PHS Priv  DS   US
                  State       Sid      Prov
0010.7bb3.fcd1 online      91      DOC1.1 DOC1.1 yes yes yes BPI+ 1 4

```

The following example shows a sample output for the **show cable modem mac** command for a CM, as identified by its MAC address:

```
Router# show cable modem xxxx.xxxx.xxxx mac
```

```

MAC Address      IP Address      I/F          MAC          Prim RxPwr  Timing Num I
                  State          Sid          Prov
xxxx.xxxx.xxxx x.x.x.x C6/0/2/U0    *
online          3087 0.50    1037 0 N

```

Note The * in front of the MAC state indicates that the CM did not satisfy the bpi-plus-policy and the data traffic is blocked. The **cable privacy bpi-plus-policy** command enforces this requirement.

Note The ! in front of the MAC state indicates that the CM has attempted to register with a modified cm configuration file. This is possibly a non-compliant CM trying to modify the service it is receiving.

The following example shows sample output for the **show cable modem mac** command for a particular CM, as identified by its IP address:

```
Router# show cable modem 10.1.1.10 mac
```

```

MAC Address      MAC          Prim Ver   QoS      Frag Concat PHS Priv  DS   US
                  State       Sid      Prov
0002.b970.0027 online      2      DOC1.1 DOC1.0 no yes yes BPI+ 0 4

```

Table below describes the fields shown in the default forms of the **show cable modem mac** displays:

Table 121: Descriptions for the Default show cable modem mac Fields

Field	Description
MAC Address	The MAC address for the CM.
MAC State	The current state of the MAC layer.
Prim SID	The primary SID assigned to this CM.
Ver	Displays the maximum supported version of DOCSIS that the CM supports (DOCSIS 1.0, DOCSIS 1.1, DOCSIS 2.0).
QoS Prov	Displays the version of DOCSIS that the CM currently is provisioned and registered for (DOCSIS 1.0 and DOCSIS 1.1).
Frag	Indicates whether DOCSIS 1.1 or 2.0 MAC-layer fragmentation is enabled for this CM.
Concat	Indicates whether DOCSIS 1.1 or 2.0 MAC-layer concatenation is enabled for this CM.
PHS	Indicates whether DOCSIS 1.1 or 2.0 packet header suppression (PHS) is enabled for this CM.
Priv	Indicates whether Baseline Privacy Interface (BPI) or BPI Plus (BPI+) encryption is enabled for the CM.
DS Saids	Number of downstream security association IDs (Saids) used by this CM.
US Sids	Number of upstream service IDs (SIDs) used by this CM.

Table below shows the possible values for the MAC state field:

Table 122: Descriptions for the MAC State Field

MAC State Value ¹⁵	Description
Registration and Provisioning Status Conditions for Devices Using IPv4 Addressing	
init(r1)	The CM sent initial ranging.
init(r2)	The CM is ranging. The CMTS received initial ranging from the Cm and has sent RF power, timing offset, and frequency adjustments to the CM.

MAC State Value ¹⁵	Description
init(rc)	Ranging has completed. Note If a CM appears to be stuck in this state, it could be that the CM is able to communicate successfully on the cable network, but that the upstream is at capacity and does not have any additional bandwidth to allow the CM to finish registration and come online. Either manually move one or more CMs to other upstreams, or enable load balancing on the upstream using the cable load-balance group commands.
init(d)	The DHCP request was received, as DHCPDISCOVER. This also indicates that the first IP broadcast packet has been received from the CM.
init(dr)	The DHCP request has been sent to the cable modem.
init(i)	The cable modem has received the DHCPOFFER reply (DHCPACK) from the DHCP server that has assigned an IP address to the modem, but the modem has not yet replied with a DHCPREQUEST message requesting that particular IP address, nor has it sent an IP packet with that IP address. Note If a CM appears to be stuck in this state, the CM has likely received the DHCPOFFER reply from the DHCP server, but this reply might have contained one or more invalid options for that particular CM.
init(io)	The Cisco CMTS has seen the DHCP offer as sent to the cable modem from the DHCP server that has assigned an IP address to the modem.
init(o)	The CM has begun to download the option file (DOCSIS configuration file) using the Trivial File Transfer Protocol (TFTP), as specified in the DHCP response. If the CM remains in this state, it indicates that the download has failed.
init(t)	Time-of-day (TOD) exchange has started.
resetting	The CM is being reset and will shortly restart the registration process.
Registration and Provisioning Status Conditions for Devices Using IPv6 Addressing	
init6(s)	The Cisco CMTS router has seen the DHCPv6 SOLICIT message from the CM.
init6(a)	The Cisco CMTS router has seen the ADVERTISE message from the DHCPv6 server to the CM.
init6(r)	The Cisco CMTS router has seen the REQUEST response from the CM to the DHCPv6 server.
init6(i)	The Cisco CMTS router has seen the REPLY message from the DHCPv6 server to the CM.
init6(o)	The Cisco CMTS router has seen the REQUEST message from the CM to the TFTP server.
init6(t)	The Cisco CMTS router has seen the REQUEST message from the CM to the TOD server.

MAC State Value ¹⁵	Description
Non-error Status Conditions	
cc(r1)	The CM had registered and was online, but has received a Downstream Channel Change (DCC) or Upstream Channel Change (UCC) request message from the CMTS. The CM has begun moving to the new channel, and the CMTS has received the CM's initial ranging on the new downstream or upstream channel. At the MAC layer, the CM is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.
cc(r2)	This state should normally follow cc(r1) and indicates that the CM has finished its initial ranging on the new channel, and is currently performing continuous ranging on the new channel. At the MAC layer, the CM is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.
offline	The CM is considered offline (disconnected or powered down).
online	The CM has registered and is enabled to pass data on the network.
online(d)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. The CM does not forward traffic to or from the CPE devices, but the CMTS can continue to communicate with the CM using DOCSIS messages and IP traffic (such as SNMP commands). Note If BPI was enabled in the DOCSIS configuration file sent to the CM, assume that the CM is using BPI encryption, unless other messages show that the BPI negotiation and key assignments have failed.
online(pkd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and KEK is assigned. Note This state is equivalent to the online(d) and online(pk) states.
online(ptd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note This state is equivalent to the online(d) and online(pt) states.
online(pk)	The CM registered, BPI is enabled and KEK is assigned.
online(pt)	The CM registered, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note If network access was disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows online(d) instead of online(pt) even when BPI encryption is enabled and operational.
Note	If an exclamation point (!) appears in front of one of the online states, it indicates that the cable dynamic-secret command has been used with either the mark or reject option, and that the cable modem has failed the dynamic secret authentication check.

MAC State Value ¹⁵	Description
expire(pk)	The CM registered, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value.
expire(pkd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value. Note This state is equivalent to the online(d) and expire(pk) states.
expire(pt)	The CM registered, BPI is enabled, TEK was assigned, but the current TEK expired before the CM could successfully renew a new KEK value.
expire(ptd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, TEK was assigned, but the current TEK expired before the CM could successfully renew a new KEK value. Note This state is equivalent to the online(d) and expire(pt) states.
Error Status Conditions	
reject(m)	The CM attempted to register but registration was refused due to a bad Message Integrity Check (MIC) value. This also could indicate that the shared secret in the DOCSIS configuration file does not match the value configured on the CMTS with the cable shared-secret command. In Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases, this could also indicate that the cable tftp-enforce command has been used to require that a CM attempt a TFTP download of the DOCSIS configuration file before registering, but the CM did not do so.
reject(c)	The CM attempted to register, but registration was refused due to a a number of possible errors: <ul style="list-style-type: none"> • The CM attempted to register with a minimum guaranteed upstream bandwidth that would exceed the limits imposed by the cable upstream admission-control command. • The CM has been disabled because of a security violation. • A bad class of service (COS) value in the DOCSIS configuration file. • The CM attempted to create a new COS configuration but the CMTS is configured to not permit such changes. • The CM failed the timestamp check for its DOCSIS configuration file. (This could indicate a possible theft-of-service attempt, or a problem with the synchronization of the clocks on the CM and CMTS.)
reject(pk)	KEK key assignment is rejected, BPI encryption has not been established.

MAC State Value ¹⁵	Description
reject(pkd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because KEK key assignment was rejected. Note This state is equivalent to the online(d) and reject(pk) states.
reject(pt)	TEK key assignment is rejected, BPI encryption has not been established.
reject(ptd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because TEK key assignment was rejected. Note This state is equivalent to the online(d) and reject(pt) states.
Note	In Cisco IOS Release 12.1(20)EC, Cisco IOS Release 12.2(15)BC1, and earlier releases, when network access is disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows online(d) even if BPI encryption fails. Use the show cable modemmac-address command to confirm whether BPI is enabled or disabled for a particular cable modem.
reject(ts)	The CM attempted to register, but registration failed because the TFTP server timestamp in the CM registration request did not match the timestamp maintained by the CMTS. This might indicate that the CM attempted to register by replaying an old DOCSIS configuration file used during a prior registration attempt.
reject(ip)	The CM attempted to register, but registration failed because the IP address in the CM request did not match the IP address that the TFTP server recorded when it sent the DOCSIS configuration file to the CM. IP spoofing could be occurring.
reject(na)	The CM attempted to register, but registration failed because the CM did not send a Registration-Acknowledgement (REG-ACK) message in reply to the Registration-Response (REG-RSP) message sent by the CMTS. A Registration-NonAcknowledgement (REG-NACK) is assumed.

¹⁵ The CM MAC state field can also be retrieved using SNMP by getting the value of the cdxCmtsCmStatusValue object in the CISCO-DOCS-EXT-MIB.

Note For the complete list of the cable modem status, see [Table 100: Descriptions for the MAC State Field](#), on page 1888.

Summary and Total Options

The following example shows the same display for the **show cable modem mac summary** command:

```
Router# show cable modem mac summary
```

```

                                Cable Modem Summary
                                -----
                                Mac Version
Interface      Total  DOC2.0  DOC1.1  DOC1.0  Reg/Online  QoS Provision Mode
                                DOC2.0  DOC1.1  DOC1.0
Cable8/1/0/U1  1      1       0       0       1           0       0       1

```

show cable modem mac

```
Cable8/1/0/U4  2    2    0    2    2    1    1    0
Router#
```

The following example shows the summary display when the **total** option is added:

```
Router# show cable modem mac summary total

                Cable Modem Summary
                -----
                Mac Version
Interface      Total  DOC2.0  DOC1.1  DOC1.0  Reg/Online  QoS Provision Mode

Table below describes the fields shown in the **show cable modem mac summary** displays:

Table 123: Descriptions for the show cable modem mac summary Fields

Field	Description
I/F	The cable interface line card providing the upstream for this CM.
Total	Total number of CMs currently active on this cable interface.
MAC Version DOC 2.0	Total number of CMs on this interface that reported in their registration request as having DOCSIS 2.0 capabilities.
MAC Version DOC 1.1	Total number of CMs on this interface that reported in their registration request as having DOCSIS 1.1 capabilities.
MAC Version DOC 1.0	Total number of CMs on this interface that reported in their registration request as having DOCSIS 1.0 capabilities.
Reg/Online	Total number of CMs on this interface that have completed registration and are currently online.
QoS Provisioned Mode DOC 2.0	Total number of CMs on this interface that have been provisioned and registered for DOCSIS 2.0 operations.
QoS Provisioned Mode DOC 1.1	Total number of CMs on this interface that have been provisioned and registered for DOCSIS 1.1 operations.
QoS Provisioned Mode DOC 1.0	Total number of CMs on this interface that have been provisioned and registered for DOCSIS 1.0 operations.

Related Commands

Command	Description
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).

Command	Description
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.
show cable modem connectivity	Displays connectivity statistics for one or more CMs.
show cable modem errors	Displays error statistics for one or more CMs.
show cable modem flap	Displays flap list statistics for one or more CMs.
show cable modem maintenance	Displays station maintenance (SM) error statistics for one or more CMs.
show cable modem phy	Displays the DOCSIS PHY layer information for one or more CMs.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.
show interface cable sid	Displays cable interface information.

show cable modem maintenance

To display station maintenance (SM) error statistics for one or more cable modems, use the **show cable modem maintenance** command in privileged EXEC mode.

Cisco uBR7100 Series and Cisco uBR7200 Series Routers

```
show cable modem [{ip-address|mac-address} | cable {slot/cable-interface-index} [upstream port
[logical-channel-index]] | name fqdn } ] maintenance
```

Cisco uBR10012 Router

```
show cable modem [{ip-address|mac-address} | cable {slot/subslot/cable-interface-index} [upstream
port [logical-channel-index]] | name fqdn } ] maintenance
```

Cisco cBR Series Converged Broadband Router

```
show cable modem [{ip-address|mac-address} | cable {slot/subslot/cable-interface-index} [upstream
port ]}] maintenance
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8 router— The valid range is from 0 to 3 and 6 to 9
<i>subslot</i>	Secondary slot number of the cable interface line card. <ul style="list-style-type: none"> • Cisco uBR10012 —The valid subslots are 0 or 1. • Cisco cBR-8 router— The valid subslot is 0.
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8 router—The valid range is 0 to 15.

upstream port	(Optional) Displays information for all CMs using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card. Cisco cBR-8 router—The valid range is 0 to 7.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1. This variable is not supported on the Cisco cBR-8 router.
name fqdn	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router. This keyword is not supported on the Cisco cBR-8 router.
maintenance	Displays station maintenance (SM) error statistics for one or more cable modems.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
11.3XA	This command was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The name keyword and <i>logical-channel-index</i> variable are removed.

Usage Guidelines

This command displays information about the number of times that a CM has exhausted its maximum retry attempts to respond to a Station Maintenance (SM) request, as well as the number of times that the CMTS has canceled ranging with a CM during a Station Maintenance interval. This information can be used to determine whether a particular cable modem or interface is experiencing plant or network difficulties.

You can display this information for all online cable modems, all online cable modems for a specific cable interface, or for one particular cable modem.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Examples

This example shows the output for the **show cable modem maintenance** command for all online cable modems:

```
Router# show cable modem maintenance
```

MAC Address	I/F	Prim Sid	SM Exhausted Count	Time	SM Aborted Count	Time

Router#

Table below describes the fields shown in the **show cable modem maintenance** displays:

Table 124: Descriptions for the show cable modem maintenance Fields

Field	Description
MAC Address	The MAC address for the CM.
I/F	The cable interface line card, including upstream, for this CM.
Prim SID	The primary SID assigned to this CM.
SM Exhausted Count	Number of times this CM has repeatedly timed out and exhausted the maximum allowable retry attempts when it was sent a Station Maintenance request. The CMTS responds by taking the CM offline, forcing the CM to reinitialize and reregister.

Field	Description
SM Exhausted Time	The last time that this CM repeatedly timed out and exhausted the maximum allowable retry attempts when it was sent a Station Maintenance request.
SM Aborted Count	Number of times the CMTS has canceled ranging for a CM during a Station Maintenance period, typically because the CM has been reset.
SM Aborted Time	The last time the CMTS canceled ranging for a CM during a Station Maintenance period, typically because the CM has been reset.

Related Commands

Command	Description
cable flap-list miss-threshold	Configures the threshold for recording a flap-list event, in terms of missed Station Maintenance messages.
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem calls	Displays displays voice call information for a particular CM, identified either by its IP address or MAC address.
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.
show cable modem domain-name	Updates the cable-specific DNS cache and display the domain name for specified CMs and CPE behind a CM on a Cisco CMTS router.
show cable modem remote-query	Displays information collected by the remote-query feature.
show cable modulation-profile	Displays modulation profile group information.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.
show interface cable sid	Displays cable interface information.

show cable modem offline

To display a list of the cable modems (CMs) that are marked as offline with the Cisco CMTS router, use the **show cable modem offline** command in privileged EXEC mode.

Cisco uBR7100 Series and Cisco uBR7200 Series Routers

```
show cable modem [{ip-address|mac-address} cable {slot/port|slot/cable-interface-index} [upstream
port [logical-channel-index]] | name fqdn}] offline
```

Cisco uBR10012 Router

```
show cable modem [{ip-address|mac-address} cable {slot/subslot/port |
slot/subslot/cable-interface-index} [upstream port [logical-channel-index]] | name fqdn}] offline
```

Cisco cBR-8 Converged Broadband Router

```
show cable modem offline
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.

upstream <i>port</i>	(Optional) Displays information for all CMs using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1.
name <i>fqdn</i>	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router.
offline	Displays a list of the cable modems that are marked as offline.

Command Default

Displays a list of all offline CMs known by the Cisco CMTS router.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.0(7)XR and 12.1(1a)T1	This command was introduced.
12.2(4)BC1	Support for the Cisco uBR10012 router was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM. • The following new initialization states were added to show initialization of CMs and CPEs supporting IPv6: <ul style="list-style-type: none"> • init6(s)—CMTS router has seen SOLICIT message. • init6(a)—CMTS router has seen ADVERTISE message. • init6(r)—CMTS router has seen REQUEST message. • init6(i)—CMTS router has seen REPLY message. • init6(o)—CMTS router has seen version 6 TFTP request. • init6(t)—CMTS router has seen version 6 TOD request.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. All the keywords and variables were removed.

Usage Guidelines

This command displays a list of CMs that had either been online previously or had attempted to register with the CMTS, but that are now considered offline. Offline cable modems remain in the CMTS databases for 24 hours and then are deleted.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Examples

The following example shows sample output for the default form of the **show cable modem offline** command.

```
Router# show cable modem offline

Interface  MAC address  Prim Previous  Offline      Rx    Rx    SM
           Sid     State   Time         Power   SNR   Exhaust
                                     Count
Cable5/0/U0 0030.946a.5d61 1   init(i)   Jun 14 21:31:57  0.00  31.86 162
Cable5/0/U0 0030.946a.5d85 2   init(i)   Jun 14 22:47:39 -0.25  31.26 156
Cable5/0/U0 0030.946a.5b6d 3   init(i)   Jun 14 14:20:11  1.00  30.56 166
```

The following example shows sample output for the **show cable modem offline** command for a particular upstream on a cable interface:

```
Router# show cable modem c3/0 upstream 0 offline

Interface MAC address  Prim Previous  Offline      Rx    Rx    SM
           Sid     State   Time         Power   SNR   Exhaust
                                     Count
C3/0/U0   0050.7366.1c69 58  init(rc)   Jan 7 16:46:49  4.50  26.72 2
```

```

C3/0/U0 0050.7366.1c53 59  init(rc)  Jan 7 16:47:09  5.25 25.10 1
C3/0/U0 0050.7366.1ca7 60  init(rc)  Jan 7 16:47:11  5.00 25.57 1
C3/0/U0 0050.7366.1c45 61  init(rc)  Jan 7 16:49:27  5.00 26.74 2
C3/0/U0 0050.7366.1c95 62  init(rc)  Jan 7 16:51:29  5.50 31.82 1
C3/0/U0 0050.7366.1c99 64  init(rc)  Jan 7 16:52:55  5.25 26.76 2

```

The following example shows sample output for the **show cable modem offline** command for a single CM, as identified by its IP address:

```
Router# show cable modem 22.1.1.10 offline
```

```

Interface  MAC address  Prim Previous  Offline  Rx  Rx  SM
           MAC address  Sid  State  Time  Power  SNR  Exhaust
                                           Count
Cable5/0/U0 0030.946a.5b6d 3  init(i)  Jun 14 14:20:11  1.00 30.56 166

```

The following example shows sample output for the **show cable modem offline** command for a single CM, as identified by its MAC address:

```
Router# show cable modem 0030.946a.5d61 offline
```

```

Interface  MAC address  Prim Previous  Offline  Rx  Rx  SM
           MAC address  Sid  State  Time  Power  SNR  Exhaust
                                           Count
Cable5/0/U0 0030.946a.5d61 1  init(i)  Jun 14 21:31:57  0.00 31.86 162

```

Table below describes the major fields shown in the **show cable modem offline** displays:

Table 125: Descriptions for the show cable modem offline Fields

Field	Description
Interface	The cable interface line card that this CM last used when it was online.
MAC address	Hardware MAC address for this CM.
Prim SID	The primary SID that had been last assigned to this CM before it went offline.
Previous State	The last known state of the MAC layer for this CM before it went offline. Note A pound sign (#) in the Previous State column indicates that the cable tftp-enforce mark-only command has been used to require that a CM attempt a TFTP download of the DOCSIS configuration file before registering, but the CM did not do so (Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases).
Offline Time	The time and date that this CM last went offline.

Field	Description
Rx Power	The last known received power level (in dB) for the CM before it went offline. Note An asterisk (*) in the Rx Power column indicates that a power adjustment was made for that CM. An exclamation point (!) indicates that the CM had reached its maximum power transmit level and could not increase its power level further.
Rx SNR	The last known signal-to-noise ratio (SNR) value for this CM before it went offline.
SM Exhaust Count	Number of times that this CM has exhausted the maximum allowable retries for not responding to the regular Station Maintenance (SM) messages sent to it by the CMTS.
Note	Using the clear counters command to reset a cable interface's counters also resets the SM Exhaust Count field for all offline CMs to zero and resets the Offline Time field for all offline CMs to the current time.

Table below shows the possible values for the Previous State field:

Table 126: Descriptions for the Previous State Field

MAC State Value ¹⁶	Description
Registration and Provisioning Status Conditions for Devices Using IPv4 Addressing	
init(r1)	The CM sent initial ranging.
init(r2)	The CM is ranging. The CMTS received initial ranging from the Cm and has sent RF power, timing offset, and frequency adjustments to the CM.
init(rc)	Ranging has completed. Note If a CM appears to be stuck in this state, it could be that the CM is able to communicate successfully on the cable network, but that the upstream is at capacity and does not have any additional bandwidth to allow the CM to finish registration and come online. Either manually move one or more CMs to other upstreams, or enable load balancing on the upstream using the cable load-balance group commands.

MAC State Value ¹⁶	Description
init(d)	The DHCP request was received, as DHCPDISCOVER. This also indicates that the first IP broadcast packet has been received from the CM.
init(dr)	The DHCP request has been sent to the cable modem.
init(i)	The cable modem has received the DHCPOFFER reply (DHCPACK) from the DHCP server that has assigned an IP address to the modem, but the modem has not yet replied with a DHCPREQUEST message requesting that particular IP address, nor has it sent an IP packet with that IP address. Note If a CM appears to be stuck in this state, the CM has likely received the DHCPOFFER reply from the DHCP server, but this reply might have contained one or more invalid options for that particular CM.
init(io)	The Cisco CMTS has seen the DHCP offer as sent to the cable modem from the DHCP server that has assigned an IP address to the modem.
init(o)	The CM has begun to download the option file (DOCSIS configuration file) using the Trivial File Transfer Protocol (TFTP), as specified in the DHCP response. If the CM remains in this state, it indicates that the download has failed.
init(t)	Time-of-day (TOD) exchange has started.
resetting	The CM is being reset and will shortly restart the registration process.
Registration and Provisioning Status Conditions for Devices Using IPv6 Addressing	
init6(s)	The Cisco CMTS router has seen the DHCPv6 SOLICIT message from the CM.
init6(a)	The Cisco CMTS router has seen the ADVERTISE message from the DHCPv6 server to the CM.
init6(r)	The Cisco CMTS router has seen the REQUEST response from the CM to the DHCPv6 server.
init6(i)	The Cisco CMTS router has seen the REPLY message from the DHCPv6 server to the CM.
init6(o)	The Cisco CMTS router has seen the REQUEST message from the CM to the TFTP server.
init6(t)	The Cisco CMTS router has seen the REQUEST message from the CM to the TOD server.
Non-error Status Conditions	
cc(r1)	The CM had registered and was online, but has received a Downstream Channel Change (DCC) or Upstream Channel Change (UCC) request message from the CMTS. The CM has begun moving to the new channel, and the CMTS has received the CM's initial ranging on the new downstream or upstream channel. At the MAC layer, the CM is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.

MAC State Value ¹⁶	Description
cc(r2)	This state should normally follow cc(r1) and indicates that the CM has finished its initial ranging on the new channel, and is currently performing continuous ranging on the new channel. At the MAC layer, the CM is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.
offline	The CM is considered offline (disconnected or powered down).
online	The CM has registered and is enabled to pass data on the network.
online(d)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. The CM does not forward traffic to or from the CPE devices, but the CMTS can continue to communicate with the CM using DOCSIS messages and IP traffic (such as SNMP commands). Note If BPI was enabled in the DOCSIS configuration file sent to the CM, assume that the CM is using BPI encryption, unless other messages show that the BPI negotiation and key assignments have failed.
online(pkd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and KEK is assigned. Note This state is equivalent to the online(d) and online(pk) states.
online(ptd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note This state is equivalent to the online(d) and online(pt) states.
online(pk)	The CM registered, BPI is enabled and KEK is assigned.
online(pt)	The CM registered, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note If network access was disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows online(d) instead of online(pt) even when BPI encryption is enabled and operational.
Note	If an exclamation point (!) appears in front of one of the online states, it indicates that the dynamic-secret command has been used with either the mark or reject option, and that the cable modem has failed the dynamic secret authentication check.
expire(pk)	The CM registered, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value.

MAC State Value ¹⁶	Description
expire(pkd)	<p>The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value.</p> <p>Note This state is equivalent to the online(d) and expire(pk) states.</p>
expire(pt)	<p>The CM registered, BPI is enabled, TEK was assigned, but the current TEK expired before the CM could successfully renew a new KEK value.</p>
expire(ptd)	<p>The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, TEK was assigned, but the current TEK expired before the CM could successfully renew a new KEK value.</p> <p>Note This state is equivalent to the online(d) and expire(pt) states.</p>
Error Status Conditions	
reject(m)	<p>The CM attempted to register but registration was refused due to a bad Message Integrity Check (MIC) value. This also could indicate that the shared secret in the DOCSIS configuration file does not match the value configured on the CMTS with the cablecable shared-secret command.</p> <p>In Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases, this could also indicate that the cable tftp-enforce command has been used to require that a CM attempt a TFTP download of the DOCSIS configuration file before registering, but the CM did not do so.</p>
reject(c)	<p>The CM attempted to register, but registration was refused due to a a number of possible errors:</p> <ul style="list-style-type: none"> • The CM attempted to register with a minimum guaranteed upstream bandwidth that would exceed the limits imposed by the cable upstream admission-control command. • The CM has been disabled because of a security violation. • A bad class of service (COS) value in the DOCSIS configuration file. • The CM attempted to create a new COS configuration but the CMTS is configured to not permit such changes. • The CM failed the timestamp check for its DOCSIS configuration file. (This could indicate a possible theft-of-service attempt, or a problem with the synchronization of the clocks on the CM and CMTS.)
reject(pk)	<p>KEK key assignment is rejected, BPI encryption has not been established.</p>
reject(pkd)	<p>The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because KEK key assignment was rejected.</p> <p>Note This state is equivalent to the online(d) and reject(pk) states.</p>
reject(pt)	<p>TEK key assignment is rejected, BPI encryption has not been established.</p>

MAC State Value ¹⁶	Description
reject(ptd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because TEK key assignment was rejected. Note This state is equivalent to the online(d) and reject(pt) states.
Note	In Cisco IOS Release 12.1(20)EC, Cisco IOS Release 12.2(15)BC1, and earlier releases, when network access is disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows online(d) even if BPI encryption fails. Use the show cable modem mac-address command to confirm whether BPI is enabled or disabled for a particular cable modem.
reject(ts)	The CM attempted to register, but registration failed because the TFTP server timestamp in the CM registration request did not match the timestamp maintained by the CMTS. This might indicate that the CM attempted to register by replaying an old DOCSIS configuration file used during a prior registration attempt.
reject(ip)	The CM attempted to register, but registration failed because the IP address in the CM request did not match the IP address that the TFTP server recorded when it sent the DOCSIS configuration file to the CM. IP spoofing could be occurring.
reject(na)	The CM attempted to register, but registration failed because the CM did not send a Registration-Acknowledgement (REG-ACK) message in reply to the Registration-Response (REG-RSP) message sent by the CMTS. A Registration-NonAcknowledgement (REG-NACK) is assumed.

¹⁶ The CM MAC state field can also be retrieved using SNMP by getting the value of the cdxCmtsCmStatusValue object in the CISCO-DOCS-EXT-MIB.

Note For the complete list of the cable modem status, see [Table 100: Descriptions for the MAC State Field](#), on page 1888.

Related Commands

Command	Description
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
clear counters	Clears counters for one or all interfaces.
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem access-group	Displays the access groups for the CMs on a particular cable interface.
show cable modem classifiers	Displays information about the classifiers for a particular CM.
show cable modem connectivity	Displays connectivity statistics for one or more CMs.

Command	Description
show cable modem cpe	Displays the CPE devices accessing the cable interface through a particular CM.
show cable modem registered	Displays a list of the CMs that are marked as registered with the Cisco CMTS.
show cable modem unregistered	Displays a list of the CMs that are marked as unregistered with the Cisco CMTS.
show cable modem vendor	Displays the vendor name or Organizational Unique Identifier (OUI) for the CMs on each cable interface.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.
show interface cable sid	Displays cable interface information.

show cable modem partial-mode

To display information about cable modems that are in upstream and downstream partial service mode, use the **show cable modem partial-mode** command in privileged EXEC mode.

show cable modem partial-mode

Cisco cBR-8 Converged Broadband Router

show cable modem partial-mode [ofdma]

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCD2	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router.
Cisco IOS XE Amsterdam 17.3.1w	This command was updated to include the new partial mode reason.

Usage Guidelines

If all cable modems are in full service mode (all downstream and upstream channels of the cable modems are online and operational), then the **show cable modem partial-mode** command does not provide any output. This command provides output only when the cable modems register in partial service mode (one or more downstream or upstream channels of the downstream or upstream bonded cable modems are not operational).

Examples

The following is a sample output of the **show cable modem partial-mode** command that displays all the cable modems in partial service mode:

```
Router# show cable modem partial-mode
MAC Address      IP Address      I/F           MAC           Prim  RCC  UP-reason/
State           Sid   ID   Failed-tcs
001e.6bfb.33a0  2.99.81.14     C7/0/0/p     p-online(pt)  3     2    0x1 / 0x4
0022.cef4.3d9a  2.99.81.23     C7/0/0/p     p-online(pt)  4     2    0x1 / 0x4
001e.6bfb.194e  2.99.81.32     C7/0/0/p     p-online(pt)  6     2    0x1 / 0x4
001e.6bfb.1538  2.99.81.38     C7/0/0/p     p-online(pt)  8     2    0x1 / 0x4
001e.6bfb.0d22  2.99.81.29     C7/0/0/p     p-online(pt)  9     1    0x1 / 0x4

0025.2e2d.748c  2.99.81.26     C7/0/0/UB    p-online(pt)  18    2    N/A
```

Table below describes the significant fields shown in the display.

Table 127: show cable modem partial-mode Field Descriptions

Field	Description
MAC Address	MAC address of the cable modem.
IP Address	IP address that the DHCP server has assigned to the cable modem.
I/F	Cable interface line card providing the upstream for the cable modem.
MAC State	Current state of the MAC layer.
Prim Sid	Primary Service ID (SID) assigned to the cable modem.
RCC ID	Receive channel configuration (RCC) ID of the cable modem.
UP-reason/Failed-tcs	<ul style="list-style-type: none"> UP-reason—Upstream partial service reason. This is a bitmap defined in upstream resiliency. Failed-tcs—Transmit channel set (TCS) bitmap of the cable modem, which is not available.

This example shows the output of the **show cable modem partial-mode** command on the Cisco cBR-8 router:

```
Router# show cable modem partial-mode
MAC Address      IP Address      I/F           MAC           Prim  RCC  UP-reason/
State           Sid   ID   Failed-tcs
001e.6bfb.33a0  2.99.81.14     C7/0/0/p     p-online(pt)  3     2    0x1 / 0x4
0022.cef4.3d9a  2.99.81.23     C7/0/0/p     p-online(pt)  4     2    0x1 / 0x4
001e.6bfb.194e  2.99.81.32     C7/0/0/p     p-online(pt)  6     2    0x1 / 0x4
001e.6bfb.1538  2.99.81.38     C7/0/0/p     p-online(pt)  8     2    0x1 / 0x4
001e.6bfb.0d22  2.99.81.29     C7/0/0/p     p-online(pt)  9     1    0x1 / 0x4
001e.6bfb.1a7e  2.99.81.30     C7/0/0/p     p-online(pt)  10    1    0x1 / 0x4
001e.6bfa.f58a  2.99.81.9      C7/0/0/p     p-online(pt)  12    1    0x1 / 0x4

```

This example shows the output of the **show cable modem partial-mode** command on the Cisco cBR-8 router:

```
Router#show cable modem partial-mode
MAC Address      IP Address      I/F           MAC           Prim  RCC  UP-reason/
State           Sid   ID   Failed-tcs
f81d.0f01.1e10  9.2.0.46       C1/0/0/p     w-online      1     1    0x21/0x20 (RNG,
RxMER)
4800.33ef.0cca  9.2.0.35       C1/0/0/p     w-online      41    1    0x20/0x20 (RxMER)

Router#show cable modem f81d.0f01.1e10 partial-mode
MAC Address      IP Address      I/F           MAC           Prim  RCC  UP-reason/
State           Sid   ID   Failed-tcsf
81d.0f01.1e10  9.2.0.46       C1/0/0/p     w-online      1     1    0x20 / 0x20

0x01 = Ranging
```

show cable modem partial-mode

```

0x10 = CWErr Partial Mode
0x20 = RxMER downgrade
0x21 = Rng, RxMER

```

This example shows the output of the **show cable modem partial-mode ofdma** command on the Cisco cBR-8 router:

```

Router#show cable modem partial-mode ofdma
MAC Address      IP Address      I/F           MAC           Prim  RCC  UP-reason/
State           Sid  ID  Failed-tcs
f81d.0f01.1e10  9.2.0.46       C1/0/0/p     w-online      1    1    0x21/0x20  (RNG,
RxMER)
4800.33ef.0cca  9.2.0.35       C1/0/0/p     w-online      41   1    0x20/0x20  (RxMER)

```

Related Commands

Command	Description
show cable modem	Displays information about the registered and unregistered cable modems.
show cable modem docsis-version	Displays information about the DOCSIS version of cable modems on one or more cable interfaces.

show cable modem partial-service

To display the impaired state of the cable modems on the Cisco CMTS router, use the **show cable modem partial-service** command in privileged EXEC mode.

```
show cable modem [ interface ] partial-service [ us-partial ] [ ds-partial ] [ ds-suspended ]
```

Cisco cBR-8 Converged Broadband Router

```
show cable modem [ interface ] partial-service [ us-partial ] [ ds-partial ] [ ds-suspended ]
```

Syntax Description

(Optional) <i>interface</i>	The cable mac-domain interface.
(Optional) us-partial	Show only CMs in DS partial-service.
(Optional) ds-partial	Show only CMs in US partial-service.
(Optional) ds-suspended	List all CMs that include one or more suspended channels in their RCC. This includes both p-online and w-online CMs. Also, a list of suspended channels is printed for each CM.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router.
Cisco IOS XE Cupertino 17.9.1w	The us-partial , ds-partial , and ds-suspended options are introduced.

Examples

The following is a sample output of the **show cable modem partial-service** :

```
Router#show cable modem partial-service

Router#

The following table below describes the significant fields shown in the display:

Table 128: show cable modem partial-service Field Descriptions

Field	Description
MAC Address	MAC address of the cable modem.
IP Address	IP address of the cable modem.
I/F	Interface on the cable modem.
MAC State	State of the cable modem.
DSxUS State	State of the downstream and upstream channels on the cable modem.
Impaired DS	Name of the impaired downstream RF channel.
Impaired US	Port number of the impaired upstream RF channel.
Forwarding Interface	DS SF forwarding interface

Related Commands

Command	Description
show cable modem	Displays information for the registered and unregistered cable modems.
show interface cable modem	Displays information about the cable modems connected to a particular cable interface.

show cable modem path-sel

To display the path selection status of a cable modem, use the **show cable modem path-sel** command in the privileged EXEC mode.

show cable modem [*ip address* | *mac address*] **path-sel** [**verbose**]

Syntax Description	
<i>ip address</i>	(Mandatory if there is no MAC address specified) IPv4 or IPv6 address of a CM that is displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac address</i>	(Mandatory if there is no IP address specified) MAC address of a CM that is displayed. You can also specify the MAC address for a CPE device behind a CM, and information for that CM is displayed.
verbose	(Optional) Displays detailed information for the CM classifiers.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS-XE Release 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use this command to display the path selection status of a cable modem.

The following example shows a sample output for the **path-sel** option for a particular cable modem:

```
router#show cable modem 38c8.5cfe.efa6 path-sel

Related Commands

Command	Description
clear cable modem path-sel	Clears the path selection status of a cable modem.
show cable mac-domain rcc	Displays runtime receive channel configuration (RCC) on a cable line card interface.
show cable mac domain rcc simplified	Shows detailed information for DOCSIS 3.1 capable RCC.

show cable modem phy normalized

To display DOCSIS PHY layer information for one or more cable modems (CMs), use the **show cable modem phy normalized** command in privileged EXEC mode.

The **show cable modem phy normalized** command is only supported on cBR-8.

Cisco cBR-8 Converged Broadband Router

```
show cable modem [{ ip-address | mac-address | cable slot / subslot / cable-interface-index }]  
phy normalized
```

```
show cable modem phy normalized
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8 router—The valid range is from 0 to 3 and 6 to 9.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. Cisco cBR-8 router—The valid subslot is 0.
phy normalized	Shows the power level normalized to the actual channel width to provide for an equal comparison between DOCSIS 3.1 SC-QAMs and DOCSIS 3.0 or earlier SC-QAMs. <p>Note By default, DOCSIS 3.1 modems report transmit power for 1.6 Mhz equivalent bandwidth for both SC-QAM and OFDMA channels. In comparison, DOCSIS 3.0 and earlier modems report transmit power based on the actual channel width. To compare equivalent reported power levels between DOCSIS 3.1 and legacy modems, ensure that the show cable modem <> phy normalized command is used.</p>

Command Default

Displays PHY information for all CMs.

Command Modes

Privileged EXEC (#)

Command History

This table includes the following release-specific history entries:

- [CX and BC Releases](#)
- [SC Release](#)

CX and BC Releases	Modification
12.2(15)BC2	The service ID (SID) and Mode fields were added to the default display.
12.3(17a)BC	Enhanced the show cable modem phy normalized command. The MicroReflec column (MicroReflections) has been removed, and the DOCSIS Prov (DOCSIS Provider) column has been added in its place. This new column contains DOCSIS version information. See updated examples.
SC Release	Modification
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM.
12.2(33)SCC	For DOCSIS 3.0-certified cable modems with multiple upstream channels, the command output was modified to display PHY layer details of each upstream channel. In this case, the output may contain multiple results for the same MAC address. The asterisk (*) that appears beside the DOCSIS operating mode under the Mode column identifies that the CM is operating in the MTC mode.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
Cisco cBR-8 Converged Broadband Router	
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. The upstream and name keywords were removed. The <i>logical-channel-index</i> is removed.
Cisco IOS XE Everest 16.6.1	This command was modified. The ofdma keyword was added.

Usage Guidelines

This command displays information about the DOCSIS PHY layer for one or more CMs. You can display information for all CMs, for all CMs on a particular cable interface, or for a particular CM, as identified by its IP or MAC address.

Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Examples

The following is a sample output of the **show cable modem phy normalized** command:

```

Table below describes the fields shown in the **show cable modem phy normalized** displays:

Table 129: Descriptions for the show cable modem phy normalized fields

Field	Description
MAC Address	The MAC address for the CM.
I/F	The cable interface on the CMTS that is providing services for this CM.
SID	Service ID that this CM is using.

Field	Description
USPwr (dBmV)	Displays the CM transmit level in dBmV, as measured by the CMTS.
USSNR (dBmV)	<p>Upstream signal-to-noise ratio (SNR) or carrier-to-noise ratio (CNR), in dB, as measured by the CMTS. This field shows the CNR value for cable interfaces that support onboard hardware-based spectrum management, such as the Cisco uBR-MC16S card, and shows the SNR value for other cable interfaces.</p> <p>Note Although the field name shows the value as being given in dBmV, the actual value should be interpreted in dB.</p>
Timing Offset	<p>The timing offset for the CM, in ticks, as recognized on the CMTS. (A tick, as used here, is 6.25/64 microseconds.) This is the delay between when a particular cable modem is scheduled to make a transmission and when the CMTS actually receives it.</p> <p>Note An exclamation point (!) in the Timing Offset column indicates that the CM has exceeded the maximum delay and timing offset specified by the cable map-advance command.</p> <p>Note The timing offset shown here is typically smaller than the TX Time Offset value shown by the show cable modem remote-query command, because the latter value is the offset as recognized on the CM (which will include any internal delay between when the CM software begins the transmission and when the bits actually appear on the local cable interface).</p>

Field	Description
Microreflec (dBc)	<p>The approximate value of microreflections on the downstream, measured in dBc below the signal level, as seen by the CM. Microreflections are a type of impairment that is caused by impedance mismatches between amplifiers, couples, cables, and other equipment in the cable plant. Microreflections create copies of a signal that arrive at the receiver with different amounts of delay and attenuation, generating intersymbol interference (ISI) that can cause the receiver to improperly detect the amplitude and phase of the incoming signal.</p> <p>Note This value is not exact but provides an approximate indication of the microreflections that have been received.</p>
DSPwr (dBmV)	Downstream receive power level, in dBmV, as reported by the CM.
DSSNR (dBmV)	Downstream signal-to-noise ratio (SNR), in dB, as reported by the CM.
Note	This command displays values for the downstream power and SNR values only if you have configured the cable modem remote-query command on the CMTS, and if the CM supports providing those options.
Mode	<p>DOCSIS operating mode for the CM:</p> <ul style="list-style-type: none"> • tdma=DOCSIS 1.X, TDMA-only mode • atdma=DOCSIS 2.0 A-TDMA mode <p>A hyphen (-) indicates the mode is unknown or the CM has not yet registered.</p> <p>For DOCSIS 3.0-certified cable modems with multiple upstream channels, the output may contain multiple results for the same MAC address. In Cisco IOS Release 12.2(33)SCC, the asterisk (*) that appears beside the DOCSIS operating mode under the Mode column identifies that the CM is operating in the MTC mode.</p> <p>Note This field is the same as that returned by the docsIfCmtsCmStatusModulationType object in the DOCS-IF-MIB.</p>

Router#

Related Commands

Command	Description
cable modem remote-query	Enables and configures the remote-query feature to gather CM performance statistics on the CMTS.
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.
show cable modem connectivity	Displays connectivity statistics for one or more CMs.
show cable modem cpe	Displays the CPE devices accessing the cable interface through a particular CM.
show cable modem errors	Displays error statistics for one or more CMs.

Command	Description
show cable modem flap	Displays flap list statistics for one or more cable modems.
show cable modem mac	Displays MAC layer information for one or more CMs.
show cable modem maintenance	Displays station maintenance (SM) error statistics for one or more cable modems.
show cable modem remote-query	Displays information collected by the remote-query feature.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.
show interface cable sid	Displays cable interface information.

show cable modem phy

To display DOCSIS PHY layer information for one or more cable modems (CMs), use the **show cable modem phy** command in privileged EXEC mode.

Cisco uBR7100 Series and Cisco uBR7200 Series Routers

```
show cable modem [{ip-address|mac-address} | cable {slot/port | slot/cable-interface-index} [upstream
port [logical-channel-index]] | name fqdn } ] phy
```

Cisco uBR10012 Router

```
show cable modem [{ip-address|mac-address} | cable {slot/subslot/port |
slot/subslot/cable-interface-index} [upstream port [logical-channel-index]] | name fqdn } ] phy
```

Cisco cBR-8 Converged Broadband Router

```
show cable modem [{ip-address|mac-address} | cable slot/subslot/cable-interface-index}]phy
show cable modem phy | include ofdma
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8 router—The valid range is from 0 to 3 and 6 to 9.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. Cisco cBR-8 router—The valid subslot is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface). This option is not supported on the Cisco cBR-8 router.

<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8 router—The valid range is from 0 to 15.
upstream port	(Optional) Displays information for all CMs using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card. This option is not supported on the Cisco cBR-8 router.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1. This option is not supported on the Cisco cBR-8 router.
name fqdn	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router. This option is not supported on the Cisco cBR-8 router.
phy	Displays DOCSIS PHY layer information for one or more cable modems.

Command Default

Displays PHY information for all CMs.

Command Modes

Privileged EXEC (#)

Command History

This table includes the following release-specific history entries:

- [CX and BC Releases](#)
- [SC Release](#)

CX and BC Releases	Modification
12.1(4)CX and 12.2(4)BC1	This command was introduced for the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 routers.
12.2(15)BC2	The service ID (SID) and Mode fields were added to the default display.
12.3(17a)BC	Enhanced the show cable modem phy command. The MicroReflec column (MicroReflections) has been removed, and the DOCSIS Prov (DOCSIS Provider) column has been added in its place. This new column contains DOCSIS version information. See updated examples.
SC Release	Modification

CX and BC Releases	Modification
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM.
12.2(33)SCC	For DOCSIS 3.0-certified cable modems with multiple upstream channels, the command output was modified to display PHY layer details of each upstream channel. In this case, the output may contain multiple results for the same MAC address. The asterisk (*) that appears beside the DOCSIS operating mode under the Mode column identifies that the CM is operating in the MTC mode.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
Cisco cBR-8 Converged Broadband Router	
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. The upstream and name keywords were removed. The <i>logical-channel-index</i> is removed.
Cisco IOS XE Everest 16.6.1	This command was modified. The ofdma keyword was added.

Usage Guidelines

This command displays information about the DOCSIS PHY layer for one or more CMs. You can display information for all CMs, for all CMs on a particular cable interface, or for a particular CM, as identified by its IP or MAC address.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands

might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Examples

The following is a sample output of the **show cable modem phy** command with the **ofdma** keyword.

```
Router# show cable modem phy | include ofdma
5039.5584.5bbe C1/0/0/U0 15 38.75 ----- 2282 0.00 ----- ofdma 1.1
0895.2a9b.26f1 C1/0/0/U0 16 28.00 ----- 2146 0.00 ----- ofdma 1.1
```

Examples from Cisco IOS Release 12.3(13a)BC and Earlier Releases

```
Router# show cable modem phy
MAC Address      I/F          Sid  USPwr  USSNR  Timing  MicroReflec  DSPwr  DSSNR  Mode

0006.5314.81d9  C8/0/0/U0   7    0.00   30.36  2745    0           0.00   -----  tdma
0003.6b1b.ee63  C8/0/0/U0   8    0.00   31.26  2745    0           0.00   -----  tdma
0030.eb15.84e7  C8/0/0/U0  12    0.00   30.36  1157    0           0.00   -----  tdma
```

The following example shows sample output for the **show cable modem phy** command for all CMs on the Cisco CMTS router:

```
Router# show cable modem phy
MAC Address      I/F          Sid  USPwr  USSNR  Timing  MicroReflec  DSPwr  DSSNR  Mode
                (dBmV)      (dBmV)  Offset (dBc)      (dBmV)      (dBmV)
0008.0e09.81f8  C3/0         1    50.00  28.40  1705    26          -3.4   36.02  tdma
0003.6b3c.1aa7  C3/0         2    0.00   28.27  3643    0           0.00   -----  tdma
0008.0e09.7fe2  C4/0         3    35.00  28.44  1760    27          12.00  35.03  tdma
```

The following example shows sample output for the **show cable modem phy** command for all CMs on a particular cable interface:

```
Router# show cable modem cable 3/0
phy
MAC Address      I/F          Sid  USPwr  USSNR  Timing  MicroReflec  DSPwr  DSSNR  Mode
                (dBmV)      (dBmV)  Offset (dBc)      (dBmV)      (dBmV)
0008.0e09.81f8  C3/0         1    50.00  28.40  1705    26          -3.4   36.02  tdma
0003.6b3c.1aa7  C3/0         2    0.00   28.27  3643    0           0.00   -----  tdma
```

The following example shows sample output for the **show cable modem phy** command for a particular CM:

```
Router# show cable modem 0050.7366.1243 phy
MAC Address      I/F          Sid  USPwr  USSNR  Timing  MicroReflec  DSPwr  DSSNR  Mode
                (dBmV)      (dBmV)  Offset  (dBc)      (dBmV)  (dBmV)
0050.6736.4124  C3/0        14   38.00  24.58  1651    0           8.00  35.41  tdma
```

Example from Cisco IOS Release 12.2(33)SCD

The following example shows a sample output of the **show cable modem phy** command for all CMs on the Cisco CMTS router:

```
Router# show cable modem phy
MAC Address      I/F          Sid  USPwr  USMER  Timing  DSPwr  DSMER  Mode  DOCSIS
                (dBmV)      (SNR)  Offset  (dBmV)  (SNR)  (dB)  (dB)  Prov

```

Table below describes the fields shown in the **show cable modem phy** displays:

Table 130: Descriptions for the show cable modem phy fields

Field	Description
MAC Address	The MAC address for the CM.
I/F	The cable interface on the CMTS that is providing services for this CM.
SID	Service ID that this CM is using.
USPwr (dBmV)	Displays the CM transmit level in dBmV, as measured by the CMTS.
USSNR (dBmV)	Upstream signal-to-noise ratio (SNR) or carrier-to-noise ratio (CNR), in dB, as measured by the CMTS. This field shows the CNR value for cable interfaces that support onboard hardware-based spectrum management, such as the Cisco uBR-MC16S card, and shows the SNR value for other cable interfaces. Note Although the field name shows the value as being given in dBmV, the actual value should be interpreted in dB.

Field	Description
Timing Offset	<p>The timing offset for the CM, in ticks, as recognized on the CMTS. (A tick, as used here, is 6.25/64 microseconds.) This is the delay between when a particular cable modem is scheduled to make a transmission and when the CMTS actually receives it.</p> <p>Note An exclamation point (!) in the Timing Offset column indicates that the CM has exceeded the maximum delay and timing offset specified by the cable map-advance command.</p> <p>Note The timing offset shown here is typically smaller than the TX Time Offset value shown by the show cable modem remote-query command, because the latter value is the offset as recognized on the CM (which will include any internal delay between when the CM software begins the transmission and when the bits actually appear on the local cable interface).</p>
Microreflec (dBc)	<p>The approximate value of microreflections on the downstream, measured in dBc below the signal level, as seen by the CM. Microreflections are a type of impairment that is caused by impedance mismatches between amplifiers, couples, cables, and other equipment in the cable plant. Microreflections create copies of a signal that arrive at the receiver with different amounts of delay and attenuation, generating intersymbol interference (ISI) that can cause the receiver to improperly detect the amplitude and phase of the incoming signal.</p> <p>Note This value is not exact but provides an approximate indication of the microreflections that have been received.</p>
DSPwr (dBmV)	Downstream receive power level, in dBmV, as reported by the CM.
DSSNR (dBmV)	<p>Downstream signal-to-noise ratio (SNR), in dB, as reported by the CM.</p> <p>Note This command displays values for the downstream power and SNR values only if you have configured the cable modem remote-query command on the CMTS, and if the CM supports providing those options.</p>

Field	Description
Mode	<p>DOCSIS operating mode for the CM:</p> <ul style="list-style-type: none"> • tdma=DOCSIS 1.X, TDMA-only mode • atdma=DOCSIS 2.0 A-TDMA mode <p>A hyphen (-) indicates the mode is unknown or the CM has not yet registered.</p> <p>For DOCSIS 3.0-certified cable modems with multiple upstream channels, the output may contain multiple results for the same MAC address. In Cisco IOS Release 12.2(33)SCC, the asterisk (*) that appears beside the DOCSIS operating mode under the Mode column identifies that the CM is operating in the MTC mode.</p> <p>Note This field is the same as that returned by the docsIfCmtsCmStatusModulationType object in the DOCS-IF-MIB.</p>

Cisco cBR-8 Converged Broadband Router

This example shows the output of the **show cable modem phy** command:

```

Router#show cable modem phy

Related Commands

Command	Description
cable modem remote-query	Enables and configures the remote-query feature to gather CM performance statistics on the CMTS.
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.
show cable modem connectivity	Displays connectivity statistics for one or more CMs.
show cable modem cpe	Displays the CPE devices accessing the cable interface through a particular CM.
show cable modem errors	Displays error statistics for one or more CMs.
show cable modem flap	Displays flap list statistics for one or more cable modems.
show cable modem mac	Displays MAC layer information for one or more CMs.
show cable modem maintenance	Displays station maintenance (SM) error statistics for one or more cable modems.
show cable modem remote-query	Displays information collected by the remote-query feature.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.
show interface cable sid	Displays cable interface information.

show cable modem phy us-pwr

The cBR-8 routers display all the upstream channel attributes with reference to 1.6MHz, 6.4MHz and channel width by using the command **show cable modem phy us-pwr reference** in privileged EXEC mode.

This command is helpful in filtering out the references 1.6MHz, 6.4MHz, and channel width values with their specific attributes from the **show cable modem verbose** command.

```
show cable modem [{ ip-address | mac-address }] phy us-pwr <ref>
```

Cisco cBR-8 Converged Broadband Router

This example shows the output for a specific mac domain for the **show cable modem phy verbose** command before normalization without basepower:

```

show cable modem phy ofdm

To display the CM count per downstream or upstream profile, use the **show cable modem phy ofdm** command in privileged EXEC mode.

show cable modem phy ofdm [{ downstream prof-count | upstream iuc-count }]

Syntax Description	downstream prof-count	Displays the CM count per downstream channel and profile.
	upstream iuc-count	Displays the CM count per upstream port and IUC.

Command Modes Privileged EXEC (#)

Command History

Command History	Release	Modification
	Cisco IOS XE Bengaluru 17.6.1x	This command was introduced on the Cisco cBR Series Converged Broadband Router.

Examples

The following example shows sample output for the **show cable modem phy ofdm** command for Cisco cBR Series Converged Broadband Routers:

```
Router#show cable modem phy ofdm upstream iuc-count

show cable modem phy ofdm-profile

To display the OFDM profiles associated with the cable modems (CMs), use the **show cable modem phy ofdm-profile** command in privileged EXEC mode.

Cisco cBR-8 Converged Broadband Router

show cable modem [*ip-address* | *mac-address* | **Cable** {*slot* / *subslot* / *cable-interface-index*}] **phy ofdm-profile**[{*downstream**upstream*}]

Syntax Description		
<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.	
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.	
<i>slot</i>	(Optional) Slot where the line card resides. For Cisco cBR-8 Converged Broadband Router, the valid range is from 0 to 3 and 6 to 9.	
<i>subslot</i>	(Optional) Secondary slot number of the cable interface line card. The valid subslot is 0.	
<i>cable-interface-index</i>	(Optional) Downstream port or MAC domain index of the line cards. For Cisco cBR-8 Converged Broadband Router, the valid range is from 0 to 15.	
<i>upstream</i>	Displays the OFDM profiles associated with a CM for upstream channel.	
<i>downstream</i>	Displays the OFDM profiles associated with a CM for downstream channel.	

Command Default Displays the profile information for all CMs.

Command Modes Privileged EXEC (#)

Command History

Command History	Release	Modification
	IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
	IOS-XE 3.18.1SP	This command was modified. The output format was updated.
	Cisco IOS XE Everest 16.6.1	This command was modified. The upstream and downstream keywords were added.
	Cisco IOS XE Amsterdam 17.3.1w	This command was modified. The output format was updated.

Examples

The following example shows sample output for the **show cable modem phy ofdm-profile upstream** command for Cisco cBR Series Converged Broadband Routers:

Table 131: Descriptions for the show cable modem phy ofdm-profile fields

Field	Description
MAC Address	The MAC address for the CM.
I/F	The cable interface on the CMTS that is providing services for this CM.
Chan	Downstream channel assigned to the CM.
UCID	Upstream channel ID used by a CM.
DCID	Downstream channel ID used by a CM.
Curr Prof	Current profile ID.
Recm Prof	Recommended profile ID.

show cable modem phy ofdm-profile

Field	Description
Unfit Prof	Unfit profile ID.
Dwngd Prof	Downgrade profile ID.
Curr IUC	Indicates the Interval Usage Code (IUC) that is currently in use.
Recm IUC	Indicates the IUC that is recommended for use based on the channel MER data.
Assigned IUCs	Indicates the IUCs that have been assigned to the cable modem. Up to two IUCs can be assigned.
Update cnt	Indicates the number of times an IUC update has occurred.
Last Update	Indicates the time of the last IUC update.

Related Commands

Command	Description
show controllers integrated-Cable rf-channel prof-order	Displays information about the profile downgrade ordering on a given OFDM channel.
show cable modem prof-mgmt	Displays detailed profile management data associated with each cable modem.

show cable modem primary-channel

To display the primary-channel and host interface for all modems or for modems on a MAC domain host interface, use the **show cable modem primary-channel** command.

```
show cable modem [cable {slot / subslot / port | slot/subslot / cable-interface-index} [upstream port
[logical-channel-index]]] primary-channel [non-bonding-capable [legacy-ranging]] [wideband
[registered-traditional-docsis]]
```

Cisco cBR-8 Converged Broadband Router

```
show cable modem [cable slot/subslot / cable-interface-index] primary-channel
show cable modem primary-channel [non-bonding-capable [legacy-ranging]] [wideband
[registered-traditional-docsis]]
```

Syntax Description

<i>slot</i>	Slot where the line card resides. The valid range is from 5 to 8. Cisco cBR-8 router—The valid range is 0.
<i>subslot</i>	Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. Cisco cBR-8 router—The valid value is from 0 to 3 and 6 to 9.
<i>port</i>	Downstream port number. The valid range is from 0 to 4 (depending on the cable interface). This interface is not supported on the Cisco cBR-8 router.
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8 router—The valid range is from 0 to 15.
upstream port	(Optional) Displays information for all CMs using this specific upstream. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports on the cable interface line card. This option is not supported on the Cisco cBR-8 router.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1. This option is not supported on the Cisco cBR-8 router.
non-bonding-capable	Displays the cable modems and primary downstreams of the cable modems that are not capable of bonding.
legacy-initial-ranging	Displays modems that access with legacy INIT-RNG-REQ.
wideband	Displays wideband online modems.

show cable modem primary-channel

registered-traditional-docsis	Displays wideband cable modems registered in traditional pre-DOCSIS3.0 mode.
--------------------------------------	--

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. The upstream keyword was removed. The <i>logical-channel-index</i> is removed.

Usage Guidelines

Use this command to display the primary downstream channel information of modems for different modem categories in terms of bonding capability, such as, non-bonding-capable modems accessed with legacy initial ranging or wideband cable modems registered via traditional DOCSIS.

Examples

The following **show cable modem primary-channel non-bonding-capable** command shows the individual cable modems displays and the primary downstream channel for each cable modem.

```
Router# show cable modem primary-channel non-bonding-capable
MAC Address IP Address Host MAC Prim Num Primary DS
Interface State Sid CPE Downstream RfId
000f.66f9.aa73 80.17.1.3 C6/0/0/U0 online(pt) 1 0 C6/0/0 255

0013.10bb.23d1 80.17.1.5 C6/0/1/U1 online(pt) 5 0 C6/0/1 255
```

Related Commands

Command	Description
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem voice	Displays detected voice-enabled modems.
show cable service-voice downstream type	Shows the current enforced downstream type on the uBR10-MC5x20 line card.

show cable modem primary-channel summary total

To display the number of cable modems grouped by primary downstream channels information under a Channel Grouping Domain (CGD), use the **show cable modem primary-channel summary total** command in privileged EXEC mode.

show cable modem primary-channel [*cable slot /subslot /port*] **summary total**

Cisco cBR-8 Converged Broadband Router

show cable modem primary-channel [*cable slot /subslot /cable-interface-index*] **summary total**

Syntax Description

<i>slot</i>	The slot used for the cable interface line card. Valid values are 5 to 8.
<i>subslot</i>	The subslot used for the cable interface line card. Valid values are 0 to 1.
<i>port</i>	The downstream port used as a MAC domain host interface port. Valid values are 0 to 4.
<i>cable-interface-index</i>	MAC domain host interface. The valid range is from 0 to 15. This option is supported on the Cisco cBR-8 router.

Command History

Release	Modification
12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router.

Usage Guidelines

Use the **show cable modem primary-channel summary total** command to display the number of cable modems grouped by primary downstream channels. You can also use this command to display information for narrowband and wideband modems and group the information based on a SPA or a uBR10-MC 5x20 primary downstream. You can also display information on modems based on a specific cable MAC domain.

Examples

The following example shows attributes of the primary channels to which the various modems are hosted under the CGD domain c6/0/0.

```
Router#show cable modem primary-channel
MAC Address      IP Address      Host           MAC           Prim  Num  Primary  DS

```

The following example shows modems grouped according to their capability, indicating whether they are wideband or narrowband modems. The command also displays the local of the primary downstreams of the modem, indicating whether the primary downstream is a SPA downstream (Remote) or a uBR10-MC 5x20 downstream (Local). The Wideband column indicates if the status of the modem is online or wideband-online.

```

Related Commands

Command	Description
show cable modem	Displays information for the registered and unregistered cable modems.

show cable modem privacy

To display the privacy information for the registered and unregistered CMs, use the **show cable modem privacy** command in privileged EXEC mode.

Cisco uBR7200 Series Routers

show cable modem {*ip-address**mac-address*} **privacy** [**verbose**]

Cisco uBR10012 Router

show cable modem {*ip-address**mac-address*} **privacy** [**verbose**]

Cisco cBR-8 Converged Broadband Router

show cable modem {*ip-address**mac-address*} **privacy** [**verbose**]

Syntax Description

<i>ip-address</i>	IPv4 or IPv6 address of a specific cable modem to be displayed. If you specify the IP address for a CPE device behind a cable modem, information for that cable modem is displayed.
<i>mac-address</i>	MAC address of a specific cable modem to be displayed. If you specify the MAC address for a CPE device behind a cable modem, information for that cable modem is displayed.
privacy	Displays the privacy information for the CMs.
verbose	Displays detailed information for the CMs.

Command Modes

Table below describes the major fields shown in the **show cable modem privacy** command display:

Table 132: show cable modem privacy Field Descriptions

Field	Description
MAC Address	MAC address for the CM.
Prim SID	Primary SID assigned to the CM.
BPI Mode	Baseline Privacy Interface (BPI) mode used.

Field	Description
BPI State	Displays the BPI state.
Security Capabilities	Security capabilities of the modem like encryption algorithm and Early Authentication and Encryption (EAE).
Encryption	Encryption method used.
EAE	EAE support.
Latest Key Sequence	Latest key sequence number.
Key Status	Status of the key; whether active or not.
Remaining Lifetime	Remaining lifetime of the key in seconds.
Key Gracetime	Grace time available for the key in seconds.
Authorization Key	Authorization key code.
Key Encryption Key	Key used to encrypt the traffic key.
Upstream HMAC Key	Upstream Hashed Message Authentication Code (HMAC) key.
Downstream HMAC Key	Downstream Hashed Message Authentication Code (HMAC) key.
Current Key Sequence	Current key sequence number.
Authorization Counters	Authorization counter information.
Authorization Infos	Authorization information.
Authorization Requests	Number of authorized requests.
Authorization Replies	Number of authorized replies.
Authorization Rejects	Rejected authorization.
Authorization Invalids	Invalid authorization.
Traffic Key Counters	Traffic key counter informayion.
Traffic Key Requests	Number of traffic key requests.
Traffic Key Replies	Number of traffic key replies.
Traffic Key Rejects	Number of traffic key rejects.
Traffic Key Invalids	Number of invalid traffic keys.
Certificate Counters	Certificate counter information.
Untrusted Manufacturer	Count of untrusted manufacturers.
Untrusted cable modem Certificate	Count of untrusted cable modem certificates.

Field	Description
Issuer Not Found	Count of certificate issuers not found in the database.
Invalid Signature	Count of invalid signatures.
Expired Certificate	Number of expired certificates.
Certificate Not Activated	Count of certificates not activated.
Certificate in Hotlist	Number of certificates in hotlist.
Public Key Mismatch	Number of public key mismatch.
Invalid MAC	Number of invalid MACs.
Invalid cable modem Certificate	Number of invalid cable modem certificates.
CA Certificate Details	CA certificate information.
Certificate Serial	CA certificate serial number.
Certificate Self-Signed	Self-signed CA certificate.
Certificate State	Current state of the CA certificate.
CM Certificate Details	CM certificate information.
CM Certificate Serial	CM certificate serial number.
CM Certificate State	Current state of the cable modem certificate.
KEK Reject Code	Key Encryption Key (KEK) reject code.
KEK Reject Reason	KEK reject reason.
KEK Invalid Code	KEK invalid code.
KEK Invalid Reason	Reason for the invalid KEK.
Primary SID Information	Primary SID assigned to this CM.
SID	SID used by the CM.
Encryption Algorithm	Encryption algorithm used.
Latest Sequence Number	Latest sequence number.
Current Sequence Number	Current sequence number.
Hardware Keys Match	Hardware key match.
DES Key	Data Encryption Standard (DES) key number.
DES IV	Initialization vector. This can be AES or DES.
TEK Requests	Displays the number of Traffic Exchange Key (TEK) requests.

Field	Description
TEK Replies	Number of TEK requests.
TEK Rejects	Number of TEK rejects.
TEK Invalids	Number of invalid TEKs.
TEK Receive Errors	Number of TEK receive errors.
TEK Reject Code	TEK reject code.
TEK Reject Reason	TEK reject reason.
TEK Invalid Code	TEK invalid code.
TEK Invalid Reason	TEK invalid reason.

Related Commands

Command	Description
cable privacy	Enables and configures BPI+ encryption on a cable interface.
cable privacy kek	Sets KEK and timeout periods.
cable privacy tek	Sets TEK and timeout periods.
show cable privacy	Displays information about BPI status and operation.

show cable modem prof-mgmt

To display detailed profile management data associated with a specific cable modem, use the **show cable modem prof-mgmt** command in privileged EXEC mode.

Cisco cBR-8 Converged Broadband Router

```
show cable modem [{ ip-address mac-address }] prof-mgmt [{ upstream | graph | counts |
downstream }] [{ ignored | verbose }]
```

Syntax Description	
<i>ip-address</i>	(Optional) IPv4 or IPv6 address of the cable modem (CM). If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
upstream	Displays upstream OFDM profile management data.
downstream	Displays downstream OFDM profile management data.
graph	Displays the DOCSIS 3.1 upstream OFDMA RxMER data in graphical format. The x-axis represents the subcarrier frequency in megahertz (MHz) and the y-axis represents decibels (dB). The standard graph (without the CLI count option) shows all data points as +. As the number of subcarriers per frequency column is more, there can be range of data points. The + symbol is used to indicate that one or more subcarriers has RxMER dB at that level. The vertical bar () indicates range where no subcarrier has that specific dB level, but there are subcarriers with dB values high and low.
counts	Displays the graph with the actual number of subcarriers at that dB level. The <code>counts</code> option displays one of the following values: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, *, where * indicates any value more than 10.
ignored	Displays the <code>ping docsis pnm</code> data without the results affecting the DOCSIS upstream OFDMA profile management IUC selection.

Command Default None

Command Modes Privileged EXEC (#)

Command History

Command History

Release	Modification
IOS-XE 3.18.0SP	This command is introduced on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.18.1SP	This command is modified. The output of the command with the verbose keyword is modified to display detailed profile information.
Cisco IOS XE Everest 16.6.1	This command is modified. The upstream keyword is added.
Cisco IOS XE Gibraltar 16.10.1c	This command is modified. The ignored , count , graph , and verbose keywords are added.
Cisco IOS XE Amsterdam 17.3.1w	This command is modified. New modulation is added to the recommended, current, and downgrade IUC.
Cisco IOS XE Cupertino 17.9.1y	The output for show cable modem prof-mgmt upstream [graph verb raw] command is updated so that the output begins at the starting subcarrier. In releases before Cisco IOS XE Cupertino 17.9.1y, the output begins at subcarrier 0.

The following example shows output for the **show cable modem 4800.33ef.0d2a prof-mgmt upstream graph** command for Cisco cBR Series Converged Broadband Routers starting from Cisco IOS XE Cupertino 17.9.1y.

```

router#show cable modem XXXX.XXXX.XXXX prof-mgmt upstream graph

Examples

The following example shows sample output for the **show cable modem prof-mgmt upstream verbose** command for Cisco cBR Series Converged Broadband Routers. This command shows the results of both periodic RxMER probes and RxMER probes that are triggered via **ping docsis pnm** or **ping docsis pnm upstream** command.

```

router# show cable modem XXXX.XXXX.XXXX prof-mgmt upstream verbose
Upstream Profile Management Data (Verbose):

Examples

The following example shows sample output for the **show cable modem prof-mgmt upstream ignored** command for Cisco cBR Series Converged Broadband Routers. This command is used along with the **ping docsis pnm ignore** command. The **verbose** version of the command shows the collected RxMER data for the modem. Using the **ping docsis pnm ignore** command to collect a new set of RxMER data without using **verbose** in the profile management and the **show cable modem prof-mgmt upstream ignored** command displays the collected RxMER data.

```

router# show cable modem XXXX.XXXX.XXXX prof-mgmt upstream ignored
Upstream Profile Management Data (Ignored):
MAC Address           : XXXX.XXXX.XXXX
Number of US Chan     : 1

Ucid                  : 6
RxMer Exempt Percent  : 0
RxMer Margin qDB      : 0
RxMer Threshold Percent : 2
Start Sc               : 148
End Sc                : 3307

```

show cable modem prof-mgmt

```

Related Commands

Command	Description
show controllers integrated-cable rf-channel prof-order	Displays information about the profile downgrade ordering on a given OFDM channel.
show cable modem phy ofdm-profile	Displays information about the profiles that are associated with the cable modems (CMs).

show cable modem qos

To display the quality of service (QoS) and service flow information for a particular cable modem (CM), use the **show cable modem qos** command in privileged EXEC mode.

```
show cable modem {ip-address|mac-address} name fqdn} qos [{service-class | verbose}]
```

Cisco cBR-8 Converged Broadband Router

```
show cable modem {ip-address|mac-address} qos [{service-class | verbose}]
```

Syntax Description

<i>ip-address</i>	IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
name fqdn	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router. This option is not supported on the Cisco cBR-8 router.
service-class	(Optional) Displays the service class names associated with each service flow for a specific cable modem.
verbose	(Optional) Displays detailed information for each service flow ID (SFID) for the CM.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
11.3XA	This command was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM.
12.2(33)SCC	The command output was modified to display the traffic peak rate value for a specific service flow.
12.2(33)SCF	This command was modified. The service-class keyword was added to display the service class names for each service flow for a specific cable modem.
12.2(33)SCG	The command output was modified to display the scheduling type as “N/A” for all downstream service flows.

Release	Modification
12.2(33)SC11	The command output was modified to display the IP ToS Overwrite [AND-mask, OR-mask] for the downstream service flow.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. The name variable was removed.

Usage Guidelines

This command displays the service flows currently in use by a CM. The default form of the display shows one service flow per line, while the **verbose** keyword displays complete information for each flow.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Note Starting with Cisco IOS Release 12.2(33)SCG, the output of the **show cable modem qos** command displays the scheduling type of all downstream service flows (DS-SF) as "N/A" to indicate that the DS-SFs do not have any scheduling type.

Examples

The following example is a sample output of the **show cable modem qos** command for a specific CM identified by its MAC address:

```
Router# show cable modem 0010.7bb3.fcd1 qos
```

show cable modem qos

Sfid	Dir	Curr State	Sid	Sched Type	Prio	MaxSusRate	MaxBrst	MinRsvRate	Throughput
3	US	act	1	BE	7	2000000	1522	100000	0
4	DS	act	N/A	BE	0	4000000	1522	0	0

Example of the show cable modem qos Command for a Cable Modem Specified by IP Address

The following example is a sample output of the **show cable modem qos** command for a specific CM identified by its IP address:

```
Router# show cable modem 22.1.1.10 qos
```

Sfid	Dir	Curr State	Sid	Sched Type	Prio	MaxSusRate	MaxBrst	MinRsvRate	Throughput
7	US	act	3	BE	0	0	3044	0	0
9	US	act	4	BE	0	1000000	65224	0	0
10	US	act	5	BE	0	1000000	65224	0	0
8	DS	act	N/A	BE	0	0	3044	0	0

Example of the show cable modem qos verbose Command for a Cable Modem Specified by IP Address

The following example is a sample output for the **verbose** form of the **show cable modem qos** command for a specific CM identified by its IP address:

```
Router# show cable modem 22.1.1.10 qos verbose
```

```
Sfid                               : 7

Current Throughput             : 0 bits/sec, 0 packets/sec

```

Example of the show cable modem qos service-class Command for a Cable Modem in Cisco IOS Release 12.2(33)SCF

Effective from Cisco IOS Release 12.2(33)SCF, the **service-class** keyword is supported.

The following example is a sample output of the **service-class** option of the **show cable modem qos** command for a specific CM identified by its IP address:

```

Router# show cable modem 22.1.1.10 qos service-class
Sfid Dir Sched MaxSusRate MaxBrst   MinRsvRate SrvClassName
      Type

```

show cable modem qos

```

33   US  BE   0           3044      0           us_srvclass_ts1
35   US  BE   0           3044      0           us_srvclass_ts2
34   DS  BE   0           3044      0           ds_srvclass_ts1
36   DS  BE   0           3044      0           ds_srvclass_ts2

```

Table below describes the major fields shown in the **show cable modem qos** displays:

Table 133: Descriptions for the show cable modem qos Fields

Field	Description
Sfid	Identifies the Service Flow ID (SFID) for this service flow.
Dir	Identifies whether the service flow applies to the downstream (DS) or upstream (US) direction.
Curr State	Current State—Identifies the current state of the service flow: Active or Inactive.
Sid	Identifies the Service ID (SID) associated with this SFID.
Sched Type	Identifies this service flow's scheduling type: <ul style="list-style-type: none"> • BE—Best-Effort • NRTPS—Non-Real-Time Polling Service • N/A—Scheduling type is not applicable to a service flow. • RTPS—Real-Time Polling Service • RSVD—Reserved but not yet in use • UGS_AD—Unsolicited Grant Service with Activity Detection • UGS—Unsolicited Grant Service • UNDEF—Not yet defined.
Prio	Traffic priority (0 to 7) given to this service flow.
MaxSusRate	Maximum sustained rate value, in bits per second.
MaxBrst	Maximum burst value, in bytes.
MinRsvRate	Minimum reserved rate, in bits per second.
Throughput	Current Throughput for this service flow, in packets per second.
SrvClassName	Service class name associated with this service flow.
Minimum Packet Size	Assumed minimum reserved rate packet size on this service flow, in bytes.
Admitted QoS Timeout	Timeout for admitted QoS parameters, in seconds, which specifies the length of time that the CMTS must reserve resources for a service flow's admitted QoS parameter set, when they exceed the resources allowed by the active QoS parameter set.
Active QoS Timeout	Timeout for active QoS parameters, in seconds, which specifies the maximum amount of time that resources can remain unused on an active service flow.
Maximum Latency	Maximum downstream latency allowed for packets using this service flow, in microseconds.

Examples for Cisco cBR-8 Converged Broadband Router

This example shows the output of the `show cable modem qos service-class` command on the Cisco cBR-8 router:

```
Router#show cable modem 209.165.200.227 qos service-class
Load for five secs: 1%/0%; one minute: 1%; five minutes: 1%
Time source is NTP, 12:54:01.136 PST Thu May 7 2015

Sfid  Dir Sched  MaxSusRate  MaxBrst      MinRsvRate  SrvClassName
      Type
 7    US  BE      0            3044         0
 8    DS  N/A     0            3044         0

Router#
```

This example shows the output of the `show cable modem qos verbose` command on the Cisco cBR-8 router:

```
Router#show cable modem 209.165.200.227 qos verbose
Load for five secs: 1%/0%; one minute: 1%; five minutes: 1%

Related Commands

Command	Description
cable qos permission	Specifies permission for updating the cable router QoS table.
cable qos profile	Configures a QoS profiles.
cable service-flow inactivity-timeout	Sets the amount of time a dynamic service flow can be present in the system without any activity.
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem access-group	Displays the access groups for the CMs on a particular cable interface.
show cable modem calls	Displays displays voice call information for a particular CM, identified either by its IP address or MAC address.
show cable modem classifiers	Displays information about the classifiers for a particular CM.
show cable modem connectivity	Displays connectivity statistics for one or more CMs.
show cable modem registered	Displays a list of the CMs that are marked as registered with the Cisco CMTS router.
show cable modem remote-query	Displays information collected by the remote-query feature.
show cable modem unregistered	Displays a list of the CMs that are marked as unregistered with the Cisco CMTS router.
show cable modulation-profile	Displays modulation profile group information.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.
show interface cable qos paramset	Displays the DOCSIS 1.1 QoS parameter sets.
show interface cable sid	Displays cable interface information.
show cable qos profile	Displays quality-of-service (QoS) profiles for a Cisco CMTS router.

show cable modem reduction-mode energy-management-mode

To verify which CM is in EM mode and to get the original wideband and upstream channel information, use the **show cable modem reduction-mode energy-management-mode** command in the privileged EXEC mode.

```
show cable modem reduction-mode energy-management-mode
```

Syntax Description This command has no arguments or keywords.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **show cable modem reduction-mode energy-management-mode** command shows which CM is in energy management mode and provides the original wideband and upstream channel information.

```
show cable modem reduction-mode energy-management-mode
```

I/F	MAC Address	ID	Orig BG I/F	Orig US bitmap	RFs	ID	Curr BG I/F	Upstream
C7/0/0	0025.2eaf.843e	897	Wi7/0/0:0	0x3B	4	252	Wi7/0/0:1	US0
C7/0/0	0025.2eaf.8356	897	Wi7/0/0:0	0x3B	4	252	Wi7/0/0:1	US0
C7/0/0	0015.d176.5199	897	Wi7/0/0:0	0x3B	4	252	Wi7/0/0:1	US0

show cable modem reduction-mode energy-management-param

To verify the configuration parameters used in the CM configuration file, use the **show cable modem reduction-mode energy-management-param** command.

show cable modem *mac_address* reduction-mode energy-management-param

Syntax Description	<i>mac_address</i> MAC address of the cable modem.
---------------------------	--

Command Default	None.
------------------------	-------

Command Modes	Privileged EXEC (#).
----------------------	----------------------

Command History	Release	Modification
	IOS-XE 3.18.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

Usage Guidelines	The show cable modem reduction-mode energy-management-param command is used to verify the configuration parameters used in the cable modem configuration file.
-------------------------	---

show cable modem 54d4.6ffb.2e21 reduction-mode energy-management-param

```

Energy Management feature enable : Y

US entry time threshold(s)       : 120
US exit bitrate threshold(bps)   : 200000
US exit time threshold(s)        : 2
cycle period(s)                  : 300

```

show cable modem reduction-mode energy-management-status

To view the basic statistics for all energy management receive request events for a specific cable modem, use the **show cable modem reduction-mode energy-management-status** command.

show cable modem { *cable if* | *mac_address* | *ip_address* } **reduction-mode energy-management-status**

Syntax Description

<i>cable if</i>	I/F of the cable modem.
<i>mac address</i>	MAC address of the cable modem.
<i>ip address</i>	IP address of the cable modem.

Command Default

None.

Command Modes

Privileged EXEC (#).

Command History

Release	Modification
IOS-XE 3.18.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **show cable modem reduction-mode energy-management-status** command shows the basic statistics for all energy management receive request events for a specific cable modem.

show cable modem c8/0/0 reduction-mode energy-management-status

I/F	MAC Address	Event	TID	Count	Error	Dups	Time

		Exit EM mode	1	1	0	0	Jul 16 21:38:39
C8/0/0	602a.d07c.4ec6	Enter EM mode	1	1	0	0	Jul 16 21:40:57
		Exit EM mode	1	1	0	0	Jul 16 21:41:17

show cable modem reduction-mode mta-battery

To display the channel bonding downgrade information for cable modems in battery backup mode, use **show cable modem reduction-mode mta-battery** command in privileged EXEC mode.

show cable modem reduction-mode mta-battery

Syntax Description This command has no arguments or keywords.

Command Default None.

Command Modes Privileged EXEC(#)

Command History	Release	Modification
	12.2(33)SCI2	This command was introduced.
	IOS-XE 3.16.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use the **show cable modem reduction-mode mta-battery** command to verify the configuration for channel bonding downgrade in battery backup mode. This command will display channel bonding downgrade information for cable modems in battery backup mode.

Examples The following example displays the channel bonding downgrade information for cable modems in battery backup mode:

```
Router# show cable modem reduction-mode mta-battery
Load for five secs: 2%/0%; one minute: 3%; five minutes: 2%
Time source is NTP, *13:36:15.619 CST Thu Jul 16 2015
Orig BG Curr BG
I/F MAC Address ID I/F RFs ID I/F Upstream
-----
C8/0/1 7cb2.1b0f.ea58 6146 Wi8/0/0:1 8 6165 Wi8/0/0:20 US0
C8/0/1 7cb2.1b9c.8ed4 6146 Wi8/0/0:1 8 6173 Wi8/0/0:28 US1
C8/0/1 0025.2eaf.6f44 6146 Wi8/0/0:1 8 6173 Wi8/0/0:28 US0

Router#
```

Related Commands	Command	Description
	cable reduction-mode mta-battery	Configures channel bonding downgrade for cable modems in battery backup mode.

show cable modem registered

To display a list of the cable modems (CMs) that have registered with the Cisco CMTS, use the **show cable modem registered** command in privileged EXEC mode.

Cisco uBR7100 Series and Cisco uBR7200 Series Routers

```
show cable modem [{ip-address|mac-address} | cable {slot/port | slot/cable-interface-index} [upstream
port [logical-channel-index]] | name fqdn } ] registered
```

Cisco uBR10012 Router

```
show cable modem [{ip-address|mac-address} | cable {slot/subslot/port |
slot/subslot/cable-interface-index} [upstream port [logical-channel-index]] | name fqdn } ] registered
```

Cisco cBR-8 Converged Broadband Router

```
show cable modem [{ip-address|mac-address} | cable slot/subslot/cable-interface-index } ] registered
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8 router—The valid range is from 0 to 3 and 6 to 9.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. For Cisco cBR-8 router—The valid subslot is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8 router—The valid range is from 0 to 15.

show cable modem registered

upstream port	(Optional) Displays information for all CMs using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card. This option is not supported on the Cisco cBR-8 router.
logical-channel-index	(Optional) Displays the logical channel index. Valid values are 0 and 1. This option is not supported on the Cisco cBR-8 router.
name fqdn	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router. This option is not supported on the Cisco cBR-8 router.
registered	Displays a list of the cable modems that have registered with the Cisco CMTS.

Command Default

Displays a list of all registered CMs on the Cisco CMTS router.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
11.3 NA	This command was introduced.
12.2(4)BC1	Support for the Cisco uBR10012 router was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM. • The alignment of output fields has been changed.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. The upstream and upstream keywords were removed. The <i>logical-channel-index</i> is removed.

Usage Guidelines**Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration**

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address**

command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Examples

The following example shows sample output for the default form of the **show cable modem registered** command in Cisco IOS Release 12.2(33)SCA:

```
Router# show cable modem registered
Interface Prim Online      Timing Rec   QoS CPE IP address      MAC address
          Sid  State      Offset Power
C3/0/U0   1   online(pt)  2024   0.00  5  0   10.74.1.60      0000.cadb.0bae
C3/0/U0   2   online(pt)  2032   0.00  5  0   10.74.1.58      0000.cadb.0512
C3/0/U0   3   online(pt)  2024   0.50  5  0   10.74.1.61      0000.cadb.04b2
C3/0/U0   4   online(pt)  3079   0.00  5  0   10.74.1.48      0003.e3a6.7f71
C3/0/U0   5   online(pt)  2558  -1.00  5  0   10.74.1.50      0010.7b6b.77ed
C3/0/U0   6   online(pt)  3083  -0.50  5  0   10.74.1.42      0030.80bc.22b9
```

The following example shows sample output for the default form of the **show cable modem registered** command for Cisco IOS Release 12.2(33)BC.

```
Router# show cable modem registered
Interface Prim Online      Timing Rec   QoS CPE IP address      MAC address
          Sid  State      Offset Power
Cable3/0/U0 1   online      2812  -0.25  5  1   10.18.1.5      0030.80bc.2303
Cable3/0/U0 2   online      2804   0.50  5  0   10.18.1.9      0006.2854.73f5
```

The following example shows sample output for the **show cable modem registered** command for a particular cable interface:

```
Router# show cable modem c8/1/0 registered
Interface Prim Online      Timing Rec   QoS CPE IP address      MAC address
          Sid  State      Offset Power
C8/1/0/U1 1   online      1548   0.00  5  0   10.1.1.11      0050.7366.1243
```

show cable modem registered

```
C8/1/0/U4 2   online      1925   0.00   5   0   10.1.1.10   0002.b970.0027
C8/1/0/U4 3   online      1918  -0.50   2   0   10.1.1.10   0006.5314.858d
```

The following example shows sample output for the **show cable modem registered** command for a single CM, as identified by its IP address:

```
Router# show cable modem 22.1.1.10 registered
```

```
Interface Prim Online      Timing Rec      QoS CPE IP address      MAC address
         Sid  State      Offset Power
C8/1/0/U4 3   online      1918  -0.75   2   0   10.1.1.10      0006.5314.858d
```

The following example shows sample output for the **show cable modem registered** command for a single CM, as identified by its MAC address:

```
Router# show cable modem 0006.5314.858d registered
```

```
Interface Prim Online      Timing Rec      QoS CPE IP address      MAC address
         Sid  State      Offset Power
C8/1/0/U4 3   online      1918  -0.25   2   0   10.1.1.10      0006.5314.858d
```

Note An asterisk (*) in the Receive Power column indicates that a power adjustment has been made for that CM. An exclamation point (!) in the Receive Power column indicates that the CM has reached its maximum power transmit level and cannot increase its power level further. An exclamation point (!) in the Timing Offset column indicates that the CM has exceeded the maximum delay and timing offset specified by the **cable map-advance** command. A pound sign (#) in the MAC State column indicates that the **cable tftp-enforce mark-only** command has been used to require that a CM attempt a TFTP download of the DOCSIS configuration file before registering, but the CM did not do so (Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases).

Tip The **show cable modem** command displays the CM timing offset in DOCSIS ticks, while other commands, such as **cable map-advance**, display the offset in microseconds. Use the following method to convert microseconds to DOCSIS ticks: ticks = microseconds*64/6.25 .

Table below describes the major fields shown in the **show cable modem registered** displays:

Table 134: Descriptions for the show cable modem registered Fields

Field	Description
Interface	The cable interface line card providing the upstream for this CM.
Prim SID	The primary SID assigned to this CM.
Online State	The current state of the MAC layer. Should show "online" for registered CMs.

Field	Description
Timing Offset	<p>The timing offset for the CM, in ticks, as recognized on the CMTS. (A tick, as used here, is 6.25/64 microseconds.) This is the delay between when a particular cable modem is scheduled to make a transmission and when the CMTS actually receives it.</p> <p>Note An exclamation point (!) in the Timing Offset column indicates that the CM has exceeded the maximum delay and timing offset specified by the cable map-advance command.</p> <p>Note The timing offset shown here is typically smaller than the TX Time Offset value shown by the show cable modem remote-query command, because the latter value is the offset as recognized on the CM (which will include any internal delay between when the CM software begins the transmission and when the bits actually appear on the local cable interface).</p>
Rec Power	<p>The received power level (in dB) for the CM.</p> <p>Note An asterisk (*) in the RxPwr column indicates that a power adjustment has been made for that CM. An exclamation point (!) indicates that the CM has reached its maximum power transmit level and cannot increase its power level further.</p>
QoS	Displays the QoS profile assigned to the CM (DOCSIS 1.1 and DOCSIS 2.0 CMs only).
CPE	Indicates the number of CPE devices for which the CM is providing services.
IP Address	The IP address that the DHCP server has assigned to the CM.
MAC Address	The MAC address for the CM.

The following examples show the output of the **show cable modem registered** command with specific IP Address, MAC Address and cable interface.

```

Router#

Related Commands	Command	Description
	cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
	show cable modem	Displays information for the registered and unregistered CMs.
	show cable modem access-group	Displays the access groups for the CMs on a particular cable interface.
	show cable modem calls	Displays displays voice call information for a particular CM, identified either by its IP address or MAC address.
	show cable modem classifiers	Displays information about the classifiers for a particular CM.
	show cable modem connectivity	Displays connectivity statistics for one or more CMs.
	show cable modem cpe	Displays the CPE devices accessing the cable interface through a particular CM.
	show cable modem offline	Displays a list of the CMs that are marked as offline with the Cisco CMTS.
	show cable modem unregistered	Displays a list of the CMs that are marked as unregistered with the Cisco CMTS.
	show cable modem vendor	Displays the vendor name or Organizational Unique Identifier (OUI) for the CMs on each cable interface.
	show interface cable modem	Displays information about the CMs connected to a particular cable interface.
	show interface cable sid	Displays cable interface information.

show cable modem remote-query

To display information collected by the remote-query feature, use the **show cable modem remote-query** command in privileged EXEC mode.

show cable modem remote-query

Release	Modification
12.0(7)XR, 12.1(2)T	This command was introduced.
12.1(2)EC1	Support for this command was added to the 12.1 EC train.
12.2(4)BC1b	Support for this command was added to the 12.2 BC train.
12.3(23)BC	Support was added for displaying status of modems during an SNMP request.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command shows the statistics collected when the remote-query feature has been enabled and configured by the **cable modem remote-query** command.

Note In Cisco IOS Release 12.1 CX, Cisco IOS Release 12.2 BC, and later, use the **show cable modem phy** command instead of the **show cable modem remote-query** command.

Tip The information shown by this command can also be displayed by querying the attributes in the CISCO-DOCS-REMOTE-QUERY-MIB.

Note Also see the information about this command's behavior in a Hot Standby Connection-to-Connection Protocol (HCCP) configuration.

Examples

The following example shows typical output from the **show cable modem remote-query** command. In this example, the final CM (IP address of 10.200.71.2) has not been configured with an SNMP community string that allows access to the remote-query feature.

```
Router# show cable modem remote-query
Remote Query Polling State : Active
```

```

IP address      MAC address      S/N      US      DS      Tx Time  Micro (dB)  Modem
                  Ratio  Power  Power  Offset  Reflection  State
10.200.71.8     0001.9659.47af  36.6    31.0    0.0    12352     17          online
10.200.71.4     0001.9659.47c7  36.6    37.0    0.0    12352     17          online
10.200.71.6     0001.9611.b9a3  36.6    37.0    0.0    12353     15          online
10.200.71.3     0001.9659.47a9  36.6    37.0    0.0    12351     16          online
10.200.71.2     0001.9659.47c1  0.0     0.0     0.0     0         0          online

```

In the following example, the SNMP Request column shows cable modems being offline when an SNMP request using the cable modem remote query command is not received. The modems are either offline or are not responding to the SNMP request.

```

Router# show cable modem remote-query
Remote Query Polling State : Inactive
IP address      MAC address      S/N      US      DS      Tx Time  SNMP
                  Ratio  Power  Power  Offset  Request
80.51.1.4       0018.f826.3453  0.0     0.0     0.0     0         CM offline
80.51.1.2       000c.e5f6.0c40  0.0     0.0     0.0     0         CM offline
80.51.1.8       0019.474a.d4fe  0.0     0.0     0.0     0         CM offline
80.51.1.3       0018.6852.82fa  0.0     0.0     0.0     0         CM offline
80.51.1.5       0019.474a.c1ae  0.0     0.0     0.0     0         CM offline

```

Table below shows the fields displayed by the **show cable modem remote-query** command.

Table 135: Descriptions for the show cable modem remote-query Fields

Field	Description
IP Address	The IP address that the DHCP server has assigned to the CM.
MAC Address	The MAC address for the CM.
S/N Ratio	The current signal-to-noise ratio (SNR) on the downstream, as seen by the CM.
US Power	The current operational transmit power level, in dBmV, as seen by the CM.
DS Power	The received power level, in dBmV, as seen by the CM. This field is set to zero if the CM does not support power level measurements.
TX Time Offset	<p>The timing offset for the CM, in ticks, as recognized on the CM. (A tick, as used here, is 6.25/64 microseconds.) This is the delay between when a particular cable modem is scheduled to make a transmission and when the CMTS actually receives it. The CM value includes any internal delay between when the CM software begins the transmission and when the bits actually appear on the local cable interface.</p> <p>Note The timing offset shown here is typically larger than the Time Offset value shown by the show cable modem command, because the latter value is the offset as recognized on the CMTS (which does not include the internal delay on the CM).</p>

Field	Description
Micro (dB) Reflection	<p>The approximate number of total microreflections (including in-channel responses) on the downstream, measured in dBc below the signal level, as seen by the CM. Microreflections are a type of impairment that is caused by impedance mismatches between amplifiers, couples, cables, and other equipment in the cable plant. Microreflections create copies of a signal that arrive at the receiver with different amounts of delay and attenuation, generating intersymbol interference (ISI) that can cause the receiver to improperly detect the amplitude and phase of the incoming signal.</p> <p>Note This value is not exact but provides an approximate indication of the microreflections that have been received.</p>
Modem State	The current state of the MAC layer for the CM.

The following example shows typical output from the **show cable modem remote-query** command.

```
Router# show cable modem remote-query

IP address      MAC address      S/N    US    DS    Tx Time  Micro (dB)  Modem
                  Ratio  Power  Power  Offset  Reflection  State
10.118.4.194    0007.0e04.5ba9  33.4   42.3  - 1.0  8794     1            online
10.118.4.156    0003.6b1b.e8c9  34.0   44.0  - 1.0  8795     3            online (d)
Router#
```

The following example shows typical output from the **show cable modem remote-query** command when the remote-query feature has not been configured.

```
Router# show cable modem remote-query

Remote Query Polling State : Inactive
IP address      MAC address      S/N    US    DS    Tx Time  Micro (dB)  Modem
                  Ratio  Power  Power  Offset  Reflection  State
10.200.71.8     0001.9659.47af   0.0    0.0   0.0   0        0            online
10.200.71.4     0001.9659.47c7   0.0    0.0   0.0   0        0            online
10.200.71.6     0001.9611.b9a3   0.0    0.0   0.0   0        0            online
10.200.71.3     0001.9659.47a9   0.0    0.0   0.0   0        0            online
10.200.71.2     0001.9659.47c1   0.0    0.0   0.0   0        0            online
10.200.71.10    00d0.5904.5321   0.0    0.0   0.0   0        0            offline
10.200.71.11    0050.f112.5123   0.0    0.0   0.0   0        0            offline
Router#
```

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Examples for Cisco cBR-8 Converged Broadband Router

This example shows the output of the **show cable modem remote-query** command:

```
Router#show cable modem remote-query
Remote Query Polling State : Inactive
```

Related Commands

Command	Description
cable modem remote-query	Enables and configures the remote-query feature to gather CM performance statistics on the CMTS.
debug cable remote-query	Turns on debugging to gather information from remote CMs.
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.
snmp-server enable traps cable	Enables traps that are sent when the remote polling of CMs has been completed.

show cable modem resiliency

To display the resiliency status of the cable modems in resiliency mode on the Cisco CMTS router, use the **show cable modem resiliency** command in privileged EXEC mode.

show cable modem resiliency

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCG	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router.

Examples

The following example shows a sample output of the **show cable modem resiliency** command:

```
Router# show cable modem resiliency
              Orig BG
I/F      MAC Address  ID   I/F      RFs ID   Curr BG   RFs
-----
C7/0/0   0025.2eaf.843e  897  Wi7/0/0:0  4  898  Wi7/0/0:1  3
C7/0/0   0025.2eaf.8356  897  Wi7/0/0:0  4  899  Wi7/0/0:2  3
C7/0/0   0015.d176.5199  897  Wi7/0/0:0  4  720  In7/0/0:0
```

Table below describes the significant fields shown in the display.

Table 136: show cable modem resiliency Field Descriptions

Field	Description
I/F	Modem host interface.
MAC Address	MAC address of the cable modem.
Orig BG ID	Original wideband (WB) interface bonding group ID.
I/F	Original bonding group (BG) WB interface.
RFs	Number of RFs originally assigned.
Curr BG ID	Currently assigned bonding group ID.
I/F	Assigned interface (dynamic WB or narrowband).
RFs	Number of RFs in the interface (if assigned to a WB interface).

This example shows the output of the **show cable modem resiliency** command on the Cisco cBR router:

```
Router# show cable modem resiliency
          Orig BG
I/F      MAC Address  ID   I/F      RFs ID   Curr BG   RFs
-----
c1/0/0   0025.2eaf.843e  897  Wi7/0/0:0  4   898  Wi7/0/0:1  3
C1/0/0   0025.2eaf.8356  897  Wi7/0/0:0  4   899  Wi7/0/0:2  3
C1/0/0   0015.d176.5199  897  Wi7/0/0:0  4   720  In7/0/0:0
```

Related Commands

Command	Description
cable resiliency ds-bonding	Enables the Downstream Resiliency Bonding Group feature on the Cisco CMTS router.
cable ds-resiliency	Reserves a resiliency bonding group for a line card on the Cisco CMTS router.
show cable resiliency	Displays all information about resiliency bonding groups on the Cisco CMTS router.

show cable modem rogue

To display a list of cable modems that have been marked, locked, or rejected because they failed the dynamic shared-secret authentication checks, use the **show cable modem rogue** command in privileged EXEC mode.

Cisco uBR7100 Series and Cisco uBR7200 Series Routers

```
show cable modem [{ip-address|mac-address} | cable {slot/port | slot/cable-interface-index} [upstream
port [logical-channel-index]] | name fqdn } ] rogue
```

Cisco uBR10012 Router

```
show cable modem [{ip-address|mac-address} | cable {slot/subslot/port |
slot/subslot/cable-interface-index} [upstream port [logical-channel-index]] | name fqdn } ] rogue
```

Cisco cBR Series Converged Broadband Router

```
show cable modem [{ip-address|mac-address} | cable slot/subslot/cable-interface-index } ] rogue
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8 router—The valid range is from 0 to 3 and 6 to 9.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. Cisco cBR-8 router—The valid subslot is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8 router—The valid range is from 0 to 15.

upstream port	(Optional) Displays information for all CMs using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card. This option is not supported on the Cisco cBR-8 router.
logical-channel-index	(Optional) Logical channel index. The valid values are 0 or 1. This option is not supported on the Cisco cBR-8 router.
name fqdn	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router. This option is not supported on the Cisco cBR-8 router.
rogue	Displays a list of cable modems that have been marked, locked, or rejected.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(15)BC1	This command was introduced for Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 routers.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a CM or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. The upstream and name keywords, and the <i>logical-channel-index</i> variable were removed.

Usage Guidelines

This command displays a list of cable modems that attempted to register with a DOCSIS configuration file that does not pass the authentication required by the **cable dynamic-secret** command. After a cable modem is added to the rogue list, it remains in the rogue list until one of the following occurs:

- The cable modem remains offline, without attempting to reregister, for 24 hours. It is then removed from all of the CMTS internal databases, including the rogue list.
- An administrator manually deletes the cable modem from the CMTS internal databases, using the **clear cable modem delete** command.
- An administrator unlocks the cable modem using the **clear cable modem lock** command.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Examples

The following sample output from the **show cable modem rogue** command.

```
Router# show cable modem rogue
MAC Address      Vendor      Interface    Spoof  TFTP
Count  Dnld  Dynamic  Secret
AAAA.7b43.aa7f  Vendor1    C4/0/U5      2    Yes  45494DC933F8F47A398F69EE6361B017

Router#
```

Table below describes the fields shown by the **show cable modem rogue** command.

Table 137: show cable modem Field Descriptions

Field	Description
MAC Address	The MAC address for the CM.
Vendor	Vendor name for this cable modem, as configured using the cable modem vendor command.

Field	Description
Interface	The cable interface line card providing the upstream for this CM.
Spoof Count	Number of times that this cable modem has attempted to register with an invalid dynamic shared-secret value. Note To account for possible network problems, such as loss of packets and congestion, the Cisco CMTS will allow a cable modem to attempt to register twice before marking it as having failed the dynamic shared-secret authentication checks.
TFTP Dnld	Whether TFTP downloads are enforced, as configured by the cable tftp-enforce command.
Dynamic Secret	The dynamic shared-secret for this cable modem.

Related Commands

Command	Description
cable dynamic-secret	Enables the Dynamic Shared Secret feature, so that DOCSIS configuration files are verified with a Message Integrity Check (MIC) that has been created with a dynamically generated shared secret.
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
cable shared-secondary-secret	Configures one or more secondary shared secret keys that CMs can use to successfully process the DOCSIS configuration file and register with the CMTS.
cable shared-secret	Configures an authentication shared secret key that CMs must use to successfully process the DOCSIS configuration file and register with the CMTS.
cable tftp-enforce	Requires that all CMs on a cable interface attempt to download a DOCSIS configuration file using the Trivial File Transfer Protocol (TFTP) through the cable interface before being allowed to register and come online.
clear cable modem lock	Resets the lock on one or more CMs, and reinitializes them, so that they can reregister with a valid DOCSIS configuration file.
show cable modem	Displays information for the registered and unregistered CMs.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.
show interface cable sid	Displays the SID information for a CM.

show cable modem rbg-activity

To view CM RBG usage statistics, use the **show cable modem rbg-activity** command in privileged EXEC mode.

```
show cable modem ip-address mac-address cable { slot / subslot / cable-interface-index } rbg-activity
{ max | sort-by-move-count | sort-by-create-count }
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific cable modem. If you specify the IP address for a CPE behind a cable modem, the output displays information for that cable modem.
<i>mac-address</i>	(Optional) MAC address of a specific cable modem. If you specify the MAC address for a CPE behind a cable modem, the output displays information for that cable modem.
cable	(Optional) Displays the modems on a specific cable interface.
<i>slot</i>	Slot where the line card resides. The valid range is 0–3 and 6–9.
<i>subslot</i>	Secondary slot number of the cable interface line card. The valid value is 0.
<i>port</i>	Downstream port number. The valid range is 0–4 (depending on the cable interface).
<i>cable-interface-index</i>	The downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. The valid range is 0–15.
rbg-activity	Displays CM RBG usage statistics. The following information is shown: <ul style="list-style-type: none"> • Total number of times CM are moved to any RBG. • Number of RBGs that are created for this CM. • Recent RBG move history with timestamps. • Indication if CM has currently reached cm-max-rbg-moves limit.
max	Sort the command output information by number of cm-max-rbg-moves .
sort-by-move-count	Sort the command output information by number of times CM are moved to any RBG.
sort-by-create-count	Sort the command output information by number of RBGs that are created for this CM.

Command Modes

Privileged EXEC (#)

Release	Modification
Cisco IOS XE Dublin 17.12.1w	This command is introduced for the Cisco cBR Series Converged Broadband routers.

Example

The following example shows sample output of the **show cable modem Cable1/0/0 rbg-activity** command:

```
Router#show cable modem Cable1/0/0 rbg-activity
      Number of          CM At
      Number of Times    RBG Created    cm-max-rbg-moves
I/F      MAC Address      Moved to RBG      For This CM      Limit
-----
C1/0/0  206a.9454.30a4      2                   1                   no
C1/0/0  0025.2e2d.7648         2                   1                   no
C1/0/0  a84e.3f37.0e9a         3                   2                   no
C1/0/0  0025.2e2d.76f4         3                   1                   no
```

Related Commands

Command	Description
cable resiliency cm-max-rbg-moves	Configure the maximum number of times a CM can be moved to any RBG within the configured interval.

show cable modem rpd

To display the cable modem information associated with a specific Cisco Remote PHY Devices (RPD), use the **show cable modem rpd** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

```
show cable modem rpd { mac-address ip-address | id identifier | name name } { docsis { device-class
{ withip } | version { d31-capable { not-operational | operational } } } | flap | offline | partial-service
| phy { normalized | ofdm-profile { upstream | downstream } } | primary-channel { non-bondng-capable
{ legacy-ranging } | sup | wideband { registered-traditional-docsis } } | registered | unregistered |
verbose { normalized | sup } | wideband { channel | forwarding-summary | phy |
registered-traditional-docsis } } [ { all | { summary | [ { total } ] } ] }
```

Syntax	Description
<i>mac-address</i>	(Optional) MAC address of the RPD.
<i>ip-address</i>	(Optional) IP address of the RPD.
id <i>identifier</i>	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.
name <i>name</i>	(Optional) Name of the RPD.
all	(Optional) Displays all information on cable modems associated with a specific RPD.
summary	(Optional) Displays the summary information of cable modems associated with a specific RPD.
summary total	(Optional) Displays the summary and total information of cable modems associated with a specific RPD.
docsis version	(Optional) Displays the DOCSIS version information for cable modems.
docsis version d31-capable	(Optional) Displays the DOCSIS 3.1 version information for cable modems.
docsis device-class	(Optional) Displays the DOCSIS device-class information for cable modems.
docsis device-class withip	(Optional) Displays docsis device-class with IP addresses of the cable modems. The following two columns are displayed in the output: <ul style="list-style-type: none"> • DIP—Displays IP version configuration <ul style="list-style-type: none"> • Y—CM is configured to dual IP. • N—CM is configured with either IPv4 or IPv6. • IP Address—Displays the IPv6 address if the CM is configured with only IPv6. Otherwise, it displays IPv4 address.
flap	(Optional) Displays the flap list statistics for cable modems.
offline	(Optional) Displays a list of cable modems (CMs) marked as offline.

partial-service	(Optional) Displays a list of cable modems (CMs) in partial service.
phy	(Optional) Displays the DOCSIS PHY layer information for cable modems.
phy normalized	(Optional) Displays the normalized DOCSIS PHY layer information for cable modems.
phy ofdm-profile upstream	(Optional) Displays the upstream channel OFDM profiles associated with the cable modems (CMs).
phy ofdm-profile downstream	(Optional) Displays the downstream channel OFDM profiles associated with the cable modems (CMs).
primary-channel	(Optional) Display the primary-channel and host interface for cable modems (CMs).
non-bonding-capable	(Optional) Displays the cable modems and primary downstreams of the cable modems that aren't capable of bonding.
legacy-ranging	(Optional) Displays modems that access with legacy INIT-RNG-REQ.
registered-traditional-docsis	(Optional) Displays wideband cable modems registered in traditional pre DOCSIS3.0 mode.
registered	(Optional) Displays a list of cable modems (CMs) marked as registered.
unregistered	(Optional) Displays a list of the cable modems marked as unregistered.
wideband	(Optional) Displays the information for registered and unregistered wideband cable modems (CMs).
channel	(Optional) Displays the number of downstream (DS) and upstream (US) channels used by a cable modem.
forwarding-summary	(Optional) Displays the following details: <ul style="list-style-type: none"> • FrwdIF—The wideband interface that each modem is using. • BG DS Config—Number of downstreams in the wideband interface • Bonded State—Number of downstreams the modem is currently bonded on. • CM DS Capab—Number of downstreams the modem is capable of bonding on.
verbose	(Optional) Displays detailed information of the cable modems (CMs).

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1	This command was introduced.

Release	Modification
Cisco IOS XE Gibraltar 16.12.1z	The docsis , flap , offline , partial-service , phy , primary-channel , registered , unregistered , verbose , and wideband keywords were added to the command.

Usage Guidelines

Use this command to verify the cable modem information associated with a specific RPD.

The following example shows the sample output for the **show cable modem rpd mac-address** command:

```
Router# show cable modem rpd 0000.5e00.0091
```

MAC Address	IP Address	I/F	MAC State	Prim Sid	RxPwr (dBmv)	Timing Offset	Num CPE	D I P
0000.5e00.1522	192.0.2.102	C9/0/0/UB	w-online	21	-0.50	1327	0	N
0000.5e00.14ba	192.0.2.108	C9/0/0/UB	w-online	22	0.00	1264	0	N
0000.5e00.14e2	192.0.2.99	C9/0/0/UB	w-online	23	0.00	1264	0	N

show cable modem rpd all summary

To display a summary of cable modems with the per RPD us port description on one or more cable interfaces, use the **show cable modem rpd all summary** command in privileged EXEC mode.

show cable modem rpd all summary [total]

Command History

Release	Modification
Cisco IOS-XE 4.1.0	This command was introduced.

Usage Guidelines

This command displays a summary of cable modems with the per RPD us port description on one or more cable interfaces:

- **show cable modem rpd summary total**—Displays a summary and a total for all CMs with the per RPD us port description on the chassis.

Note The length of the configurable limitation is 20 characters while there are 80 characters reserved.

show cable modem select

This command is a SQL query string for a faster search, filtering, ordering, grouping, and some calculation of the available records.

show cable modem select [**mac** | **ip**]

Syntax Description

ip	Specifies the IPv4 address of a specific CM to be displayed.
mac	Identifies the MAC address of a specific CM to be displayed.
<i>ipv6</i>	IPv6 address of the cable modem to be displayed.
<i>intf</i>	Name of the host interface.
<i>dip</i>	Dual IP Support of dual IP for both IPv4 and IPv6 addressing.
<i>sid</i>	Primary SID assigned to this CM.
<i>st</i>	Displays cable modem status events.
<i>dssg</i>	MD-DS-SG for cable modem.
<i>ussg</i>	MD-US-SG for cable modem.
<i>cmsg</i>	MD-CM-SG for cable modem.
<i>mtc</i>	Multi-Transmit Channel Mode. Cable modem is in MTC mode or not.
<i>macver</i>	Displays the maximum supported version of DOCSIS that the cable modem supports (DOCSIS 1.0, DOCSIS 1.1, DOCSIS 2.0, DOCSIS 3.01).
<i>opver</i>	Operational mode.
<i>qos</i>	Displays the version of DOCSIS that the CM currently is provisioned and registered for (DOCSIS 1.0 and DOCSIS 1.1).

<i>timing</i>	<p>Timing offset for the CM, in ticks, as recognized on the CMTS. (A tick, as used here, is 6.25/64 microseconds.) This is the delay between when a particular cable modem is scheduled to make a transmission and when the CMTS actually receives it.</p> <p>Note An exclamation point (!) in the Timing Offset column indicates that the cable modem has exceeded the maximum delay and timing offset specified by the cable map-advance command.</p> <p>Note The timing offset shown here is typically smaller than the TX Time Offset value shown by the show cable modem remote-query command. This is because the latter value is the offset as recognized on the cable modem (which will include any internal delay between when the cable modem software begins the transmission and when the bits actually appear on the local cable interface).</p>
<i>cpe</i>	CPE number.
<i>rxpwr</i>	Receive power (dBmV).
<i>voicena</i>	Voice enabled.
<i>primds</i>	Primary downstream.
<i>tag</i>	<p>Shows various states of the CM. By default, the value is null.</p> <ul style="list-style-type: none"> • *—Modem has failed the BPI-plus-policy. • #—Modem did not use TFTP downloaded CM config file. • !—Modem failed DMIC calculation multiple times. • &—Modem uses self-signed certificate to authenticate itself.
<i>impds</i>	Impaired downstream.
<i>impus</i>	Impaired upstream.
<i>dsxus</i>	Downstream and upstream.
<i>rcc</i>	RCC ID.
<i>usphy</i>	Phy operating mode.
<i>rpdid</i>	RPD ID if this modem is on the RPD.
<i>sysdes</i>	System description
<i>txpwr</i>	The reported Tx power.
<i>cpev4</i>	CPE IPv4 address

show cable modem select

<i>cpev6</i>	CPE IPv6 address
--------------	------------------

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Bengaluru 17.6.1z	The show cable modem select usphy command is enhanced such that if a modem is assigned with multiple upstream bonded channel, the best operating mode is used in usphy. The priority order for usphy operating mode of bonded upstreams is ofdma, atdma, and tdma.
Cisco IOS XE Everest 16.12.1	Four new fields—sysdes, txpwr, cpev4, and cpev6 are introduced on the Cisco cBR Series Converged Broadband Routers.
Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **show cable modem select** is updated. Four new fields—sysdes, txpwr, cpev4, and cpev6 are added. This is a sample output of the **show cable modem select mac, cpev4, txpwr, cpev6** command:

```
Router#show cable modem select mac,cpev4,cpev6,ip,txpwr where mac='7cb2.1b0b.e742'
Load for five secs: 10%/0%; one minute: 15%; five minutes: 15%
Time source is NTP, *12:24:52.397 CST Tue Jul 2 2019
 mac                | cpev4                | cpev6                | ip
 | txpwr
-----|-----|-----|-----|
7cb2.1b0b.e742 | 198.51.100.1        | 2001:100:113:0:41C8:1B36:9979:D490 | 209.165.200.225
 | 52.00  51.50  51.75  50.25
 |
 |
 |                | 2001:100:113:0:DC6F:B35:AD34:39B4 |
```

This is a sample output of the **show cable modem select mac, ip, sysdes** command:

```
Router#scm select mac, ip, sysdes where mac='34bd.fa0f.4946'
Load for five secs: 5%/0%; one minute: 8%; five minutes: 7%
No time source, 12:29:48.632 PDT Thu Sep 27 2018
 mac                | ip                | sysdes
=====|=====|=====
 34bd.fa0f.4946 | 209.165.200.225 | Cisco DPC3008 DOCSIS 3.0 Cable Modem <<HW_REV: 1.0;
VENDOR: Cisco; BOOTR: 2.3.1_R3; SW_R
```

Usage Guidelines

The **show cable modem select** command shows the details filtered by a SQL query statement. The output displays the following columns:

- MacAddress

- IPV6Address
- IPV4Address
- HostIF
- DualIP
- CMTransPower
- ChanTransPower

These parameters show the value from modems that satisfy the following two conditions at the same time. The ChanTransPower values are displayed in an ascending order:

- MacAddress ending with 46a or having dual IP
- CMTransPower larger than 40

Examples

The following is a sample output of the **show cable modem select ip,mac** command:

```
Router#show cable modem select ip,mac
ip          | mac

show cable modem service-type-id

To display the modems having the service type id, use the **show cable modem service-type-id** command in privileged EXEC mode.

show cable modem service-type-id [*service-type-id*]

Syntax Description

<i>service-type-id</i>	Specifies the name of the service type identifier.
------------------------	--

Command Default

If no service type identifier is specified, this command will show all the CMs with their respective service-type-id.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command shows CMs having specified service-type-id.

Examples

The following example shows sample output for the **show cable modem service-type-id** command:

```
Router# show cable modem service-type-id
MAC Address      IP Address      I/F      MAC      Prim Service-type-id  B D
                  State          State
0018.6812.29ae  41.42.2.212    C6/1/4/U2  offline  3838 commercial        N N

0018.6812.2f20  41.42.0.100    C6/1/4/U2  offline  3544 commercial        N N
```

Table below describes the significant fields shown in the display.

Table 138: show cable modem service-type-id Field Descriptions

Field	Description
MAC Address	Hardware (MAC-layer) address of the cable modem or CPE device.
IP Address	IP address of the cable modem or CPE device.
I/F	The cable interface line card providing the upstream for this CM.

Field	Description
MAC State	The current state of the MAC layer.
Prim Sid	Primary Service ID (SID) of the device.
Service Type Id	Service Type identifier.
BPI	Indicates whether or not Baseline Privacy Interface (BPI) or BPI Plus (BPI+) encryption is enabled for the CM.
DIP	Dual IP flag. Identifies whether or not (“Y” or “N”) the CM or CPE supports both IPv4 and IPv6 addressing.

Related Commands

Command	Description
clear cable modem service-type-id	This command clears the cable modem service type id.

show cable modem service-flow

To display information about all service flows associated with a particular modem, use the **show cable modem service-flow** command in privileged EXEC mode.

```
show cable modem {ip-address|mac-address} service-flow [{verbose | ds-hardware}]
```

Cisco cBR-8 Converged Broadband Router

```
show cable modem {ip-address|mac-address} service-flow [{verbose | ds-hardware | upstream}]
```

Syntax Description

<i>ip-address</i>	Specifies the IPv4 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	Identifies the MAC address of a specific CM to be displayed. You can also specify the MAC address for a CPE device behind a CM, and information for that CM will be displayed.
service-flow	Displays summary of relevant parameters and statistics for all service flows associated with a particular modem.
verbose	(Optional) Displays comprehensive details for all service flows associated with a particular modem. In addition, it displays the active cable-filter group for the cable modem.
ds-hardware	(Optional) Displays details of Baseline Privacy Interface (BPI), Payload Header Suppression (PHS), Downstream Service Identifier (DSID) and other statistical data.
upstream	Displays summary of relevant parameters and statistics for upstream service flows with a particular modem for a Cisco cBR-8 router.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCB1	This command is introduced for Cisco uBR7200 series and Cisco uBR10012 routers in Cisco IOS Release 12.2(33)SCB1.
12.3(23)BC7	This command is integrated into Cisco IOS Release 12.3(23)BC7.
12.2(33)SCE	This command is modified. The ds-hardware keyword is added.
12.2(33)SCF2	This command is modified. The command output is enhanced to display upstream buffer control parameters.
IOS-XE 3.15.0S	This command is implemented on the Cisco cBR-8 Converged Broadband Router. The upstream keyword is added.
IOS-XE 3.18.1SP	This command is modified. The command output for the verbose option is enhanced to display the active cable filter groups for the cable modem.
Cisco IOS XE Cupertino 17.9.1x	This command is modified to support Low Latency DOCSIS Capable information.

Usage Guidelines

The **show cable modem service-flow** command has a verbose and a non-verbose option. The non-verbose command supports live debugging and provides a summary of relevant parameters and statistics for all service flows of a particular modem. The verbose option of the command provides comprehensive details for all service flows associated with a particular modem.

The optional **ds-hardware** keyword is used to display per service flow BPI, PHS, DSID and stats data obtained directly from the hardware on the line card or SPA.

Note The output data for unconfigured or non applicable features are not always displayed.

The following is a sample output of the **show cable modem service-flow** command without the verbose option:

```
Router# show cable modem 40.30.0.5 service-flow

Table below describes the significant fields shown in the output.

Table 139: show cable mode service-flow Field Descriptions

Field	Description
MAC Address	Hardware (MAC-layer) address of the cable modem or CPE device.
IP Address	IP address of the cable modem or CPE device.
Host Interface	Host interface name.

Field	Description
MAC State	Current state of the MAC layer.
Prim Sid	Primary SID assigned to this CM.
Num CPE	Number of CPE devices for which the CM is providing services.
Primary Downstream	Primary downstream channel assigned to the CM.
DS RfId	Downstream RF identifier.
SFID	Service flow identifier.
SID	Service ID (SID) of the device.
Requests	Number of requests.
Polls	Number of polls.
Grants	Number of grants.
Delayed Grants	Number of delayed grants.
Dropped Grants	Number of dropped grants.
Packets	Number of packets.
RP_SFID	Route processor SFID.
QID	Link queue identification number.
Flg	Indicates whether the queue is low latency or CIR.
Policer Xmits	Packets transmitted out of the policer.
Drops	Packets dropped by the policer.
Scheduler Xmits	Packets transmitted out of the scheduler.
Drops	Packets dropped by the scheduler.
FrwdIF	Forwarding interface.
LC SFID	Line card SFID.
KeyIndex	Per flow index to BPI data.
PHSIndex	Per flow index to PHS data.
TX Pkts	Number of packets the router has transmitted on this service flow.
TX Bytes	Number of bytes the router has transmitted on this service flow.
BPI	Indicates whether or not Baseline Privacy Interface (BPI) encryption is enabled for the CM.

Field	Description
Said	Security association identifier.
KeySeq	Downstream traffic key sequence number.
Even Key	Even traffic encryption key (TEK) value.
Even Iv	Value of the even Initialization Vector (IV).
Odd Key	Odd TEK key value.
Odd Iv	Odd IV value.
PHS	Payload header suppression.
PHSM	PHS Mask. 5-bit PHS mask that defines the header bytes that should be suppressed.
Ctrl	Control block.
PHSI	PHS Index. Number that uniquely references the PHS rule.
PHSS	PHS Size. 8-bit value specifying the number of header bytes to be suppressed.
Count	PHS rule usage count.

Examples for Cisco cBR-8 Converged Broadband Router

This example shows the output of the **show cable modem service-flow** command.

```

Related Commands

Command	Description
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem access-group	Displays the access groups for the CMs on a particular cable interface.
show cable modem calls	Displays displays voice call information for a particular CM, identified either by its IP address or MAC address.
show cable modem classifiers	Displays information about the classifiers for a particular CM.
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.
show cable modem connectivity	Displays connectivity statistics for one or more CMs.
show cable modem counters	Displays downstream and upstream traffic counters for one or more CMs.
show cable modem cpe	Displays the CPE devices accessing the cable interface through a particular CM.
show cable modem domain-name	Updates the cable-specific DNS cache and display the domain name for specified CMs and CPE behind a CM on a Cisco CMTS router.
show cable modem errors	Displays error statistics for one or more CMs.
show cable modem flap	Displays flap list statistics for one or more CMs.
show cable modem ipv6	Displays IPv6 information for specified CMs and CPE behind a CM on a Cisco CMTS router.
show cable modem mac	Displays MAC layer information for one or more CMs.
show cable modem maintenance	Displays station maintenance (SM) error statistics for one or more CMs.

Command	Description
show cable modem offline	Displays a list of the CMs that are marked as offline with the Cisco CMTS.
show cable modem phy	Displays the DOCSIS PHY layer information for one or more CMs.
show cable modem qos	Displays quality of service (QoS) and service flow information for a particular CM.
show cable modem registered	Displays a list of the CMs that are marked as registered with the Cisco CMTS.
show cable modem remote-query	Displays information collected by the remote-query feature.

show cable modem smp

To display detailed subscriber management information of cable modems, use the **show cable modem *mac-address* smp** command in privileged EXEC mode.

show cable modem *mac-address* smp

Syntax Description	
<i>mac-address</i>	MAC address of a specific cable modem. If you specify the MAC address for a CPE behind a cable modem, the output displays information for that cable modem.
smp	Display detailed subscriber management information of cable modems.

Command Modes	
	Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Dublin 17.12.1z	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Example

This example shows the output of the **show cable modem *mac-address* smp** command:

```

show cable modem summary

To display a summary of CMs on one or more cable interfaces, use the **show cable modem summary** command in privileged EXEC mode.

show cable modem summary [**total**]

show cable modem summary *interface1* [*interface2*] **total**

show cable modem summary *interface1* [*interface2*] **upstream** *port1 port2 total*

show cable modem cable {*slot/port* | *slot/cable-interface-index*} [**upstream** *port* [*logical-channel-index*]] **summary**

show cable modem cable {*slot/subslot/port* | *slot/subslot/cable-interface-index*} [**upstream** *port* [*logical-channel-index*]] **summary**

Cisco cBR-8 Converged Broadband Router

show cable modem summary *interface1* [*interface2*] **total**

Syntax Description

total	(Optional) Displays a footer line showing the totals for each column.
--------------	---

<i>interface1</i>	<p>(Optional) Cable interface to be summarized. The <i>interface1</i> parameter can take the following forms:</p> <ul style="list-style-type: none"> • cable {<i>slot</i> /<i>port</i> <i>slot</i> /<i>cable-interface-index</i> } • cable {<i>slot</i> /<i>subslot</i> /<i>port</i> <i>slot</i> /<i>subslot</i> /<i>cable-interface-index</i> } <p>where,</p> <ul style="list-style-type: none"> • <i>slot</i> —Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8 router—The valid range is from 0 to 3 and 6 to 9. • <i>subslot</i> — <ul style="list-style-type: none"> • (Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. • Cisco cBR-8 router—The valid subslot is 0. • <i>port</i> —Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface). • <i>cable-interface-index</i>—Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20, Cisco uBR-MC3GX60V and Cisco cBR-8 line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8 router—The valid range is from 0 to 15.
<i>interface2</i>	<p>(Optional) Second cable interface, specifying a range of cable interfaces to be summarized. The <i>interface2</i> parameter has the same form as <i>interface1</i>.</p> <p>Note When specifying a range of cable interfaces, <i>interface1</i> must be the lower-numbered interface and <i>interface2</i> must be the higher-numbered interface.</p>
upstream <i>port1 port2</i>	<p>(Optional) Specifies a range of upstream ports on the cable interfaces to be summarized. The <i>port1</i> and <i>port2</i> parameters can start at 0, and <i>port2</i> must be a higher-numbered port than <i>port1</i>.</p>

show cable modem summary

upstream <i>upstream-channel-ID 1 upstream-channel-ID 2</i>	(Optional) For Cisco cBR-8 router—Specifies a range of upstream channel IDs on the cable interfaces to be summarized. The <i>upstream-channel-ID 1</i> and <i>upstream-channel-ID 2</i> parameters can start at 0, and <i>upstream-channel-ID 2</i> must be a higher-numbered port than <i>upstream-channel-ID 1</i> . The valid range is from 0 to 15.
upstream <i>port</i>	(Optional) Specifies a specific upstream port to be summarized. This option can be specified only when summarizing a single cable interface. This option is not supported on the Cisco cBR-8 router.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1. This option is not supported on the Cisco cBR-8 router.
summary	Displays a summary of CMs on one or more cable interfaces.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
11.3XA	This command was introduced.
12.1(4)CX and 12.2(4)BC1	Support was added for the Cisco uBR10012 router.
12.1(6)EC	The total option was supported for the Cisco uBR7100 series and Cisco uBR7200 series routers.
12.1(11b)EC	The upstream Description field was added to the show cable modem summary display in Cisco IOS Release 12.1 EC.
12.2(8)BC1	The total option was supported for the Cisco uBR10012 universal broadband router.
12.2(15)BC2	The upstream Description field was added to the show cable modem summary display in Cisco IOS Release 12.2 BC.
12.3(21)BC	Support was added for wideband cable modem output.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. The <i>upstream-channel-id</i> variable was added. The <i>logical-channel-index</i> is removed.

Usage Guidelines

This command displays a summary of CMs for a single cable interface or upstream, or for a range of cable interfaces or upstreams. The following possible combinations are possible for this command:

- **show cable modem summary total**—Displays a summary and a total for all CMs on the chassis.
- **show cable modem summary cable x/0 total**—Displays a summary of CMs on a specified card.
- **show cable modem summary cable x/0 upstream port1 port2 total**—Displays a summary of CMs on the specified card and specified range of ports. The *port1* value must be less than the *port2* value.
- **show cable modem summary cable x/0 cable y/0 total**—Displays a summary of CMs on the specified range of cards.
- **show cable modem summary cable x/0 cable y/0 upstream port1 port2 total**—Displays a summary of CMs on the specified range of ports on the specified range of cards.

Note Also see the information about this command's behavior in a Hot Standby Connection-to-Connection Protocol (HCCP) configuration, see the "Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration" in the [Cisco IOS CMTS Cable Command Reference](#).

Examples

The following example shows typical output for the default form of the **show cable modem summary** command on a Cisco uBR7200 series router:

```
Router# show cable modem summary

Interface      Total      Active      Registered  Description
              Modems    Modems      Modems
Cable3/0/U0    165        141         141         Line 32/1
Cable3/0/U1    209        172         170         Line 32/2
Cable3/0/U2    262        207         203         Line 32/3
Cable3/0/U3    256        194         188         Line 32/4
Cable5/0/U0    746        714         711         Line 41/1
Cable6/0/U0    806        764         759         Line 42/2
Router#
```

Note The Description field appears in Cisco IOS Release 12.1(11b)EC, 12.2(15)BC2, and later releases, and shows the string configured for the upstream using the **cable upstream description** command.

The following example shows typical output for the **show cable modem summary** command with the **total** option on a Cisco uBR7200 series router:

```
Router# show cable modem summary total

Interface      Total      Active      Registered  Description
              Modems    Modems      Modems
Cable5/0/U0    746        714         711         Node1
Cable6/0/U1    806        764         759         Node3
Total:         1552       1478        1470
Router#
```

The following example shows sample output for the **show cable modem summary** command with the **total** option for a Cisco uBR10012 router:

```
Router# show cable modem summary total
```

show cable modem summary

```

Interface                               Cable Modem                               Description
      Total Reg  Unreg Offline Wideband initRC  initD  initIO  initO
C5/0/0/U0  84   84   0   0     84     0     0     0     0
C5/0/0/U1  84   84   0   0     84     0     0     0     0
C5/0/0/U2  83   83   0   0     83     0     0     0     0
C5/0/0/U3  83   83   0   0     83     0     0     0     0
<<output omitted>>
Total:      8020 8020 0   0     8016   0     0     0     0
Router#

```

The following example shows sample output for the **show cable modem summary total** command for a range of interfaces on the Cisco uBR10012 router:

```

Router# show cable modem summary c5/1/1 c5/1/2 total
Interface                               Cable Modem                               Description
      Total Reg  Unreg Offline Wideband initRC  initD  initIO  initO
C5/1/1/U0  84   84   0   0     84     0     0     0     0
C5/1/1/U1  84   84   0   0     83     0     0     0     0
C5/1/1/U2  83   83   0   0     83     0     0     0     0
C5/1/1/U3  83   83   0   0     83     0     0     0     0
C5/1/2/U0  84   84   0   0     84     0     0     0     0
C5/1/2/U1  84   84   0   0     84     0     0     0     0
C5/1/2/U2  83   83   0   0     83     0     0     0     0
C5/1/2/U3  83   83   0   0     83     0     0     0     0
Total:      668  668   0   0     667   0     0     0     0
Router#

```

The following example shows sample output for the **show cable modem summary total** command for a range of interfaces and upstreams on the Cisco uBR10012 router:

```

Router# show cable modem summary c5/1/1 c5/1/2 upstream 0 1 total
Interface                               Cable Modem                               Description
      Total Reg  Unreg Offline Wideband initRC  initD  initIO  initO
C5/1/1/U0  84   84   0   0     84     0     0     0     0
C5/1/1/U1  84   84   0   0     83     0     0     0     0
C5/1/2/U0  84   84   0   0     84     0     0     0     0
C5/1/2/U1  84   84   0   0     84     0     0     0     0
Total:      336  336   0   0     335   0     0     0     0
Router#

```

Note When displaying a summary for a range of ports or cable interfaces, the first port or cable interface (for example, u0 or c4/0) must be lower-numbered than the second port or interface (for example, u6 or c6/0). If you specify the higher-numbered port or interface first, the display shows no CMs connected.

Table below describes the fields shown in the **show cable modem summary** displays:

Table 140: Descriptions for the show cable modem summary Fields

Field	Description
Interface	The cable interface line card providing the upstream for the CMs.
Total Modems or Total	Total number of CMs, registered, unregistered, and offline for this interface.

Field	Description
Registered Modems or Reg	Total number of CMs that have registered and are online on this interface. This number might be different from the Total Modems number if some modems are offline or not fully registered.
Unregistered Modems	Total number of CMs that are either offline and not currently communicating with the CMTS, or attempting to come online but are not yet registered.
Offline	Total number of CMs that were online or attempted to register but are no longer communicating with the CMTS.
Wideband	CM is registered as a wideband CM.
init(rc)	MAC state of CM is init(rc).
init(d)	MAC state of CM is init(d).
init(io)	MAC state of CM is init(io).
init(o)	MAC state of CM is init(o).
Description	Description entered for this upstream using the cable upstream description command.

Note For information on MAC states, see the show cable modem command.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem access-group	Displays the access groups for the CMs on a particular cable interface.
show cable modem calls	Displays voice call information for a particular CM, identified either by its IP address or MAC address.
show cable modem connectivity	Displays connectivity statistics for one or more CMs.
show cable modem counters	Displays downstream and upstream traffic counters for one or more CMs.
show cable modem cpe	Displays the CPE devices accessing the cable interface through a particular CM.

Command	Description
show cable modem offline	Displays a list of the CMs that are marked as offline with the Cisco CMTS.
show cable modem registered	Displays a list of the CMs that are marked as registered with the Cisco CMTS.
show cable modem remote-query	Displays information collected by the remote-query feature.
show cable modem unregistered	Displays a list of the CMs that are marked as unregistered with the Cisco CMTS.
show cable modem vendor	Displays the vendor name or Organizational Unique Identifier (OUI) for the CMs on each cable interface.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.
show interface cable sid	Displays cable interface information.
show cable modem wideband	Displays information for a wideband CMs.

show cable modem summary scn

To display the summary of cable modem interfaces by a service class name, use the **show cable modem summary scn** command in privileged EXEC mode. Maximum of four service class names are listed.

```
show cable modem summary scn {service class name list}
```

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCJ1	This command was introduced in Cisco uBR Series router.
	3.18.1SP	This command was introduced in Cisco cBR Series Converged Broadband Routers.

Examples

The following is a sample output of the **show cable modem summary scn** command:

```
Router# show cable modem summary scn ds1 ds2 us1 us2
Interface ds1 ds2 us1 us2
C7/0/0/UB 8 8 8 8
C7/0/0/U2 1 1 1 1
```

Related Commands	Command	Description
	show cable modem summary	Displays a summary of CMs on one or more cable interfaces.

show cable modem summary wb-rf

To display the number of RF channels that are down on a cable interface, use the **show cable modem summary wb-rf** command in privileged EXEC mode.

```
show cable modem [cable slot / subslot / port ] summary wb-rf [modular-cable slot / bay / port
: nb-channel-number ]
```

Cisco cBR-8 Converged Broadband Router

```
show cable modem [cable slot / subslot / port ]summary wb-rfs slot
/ subslot / portWB-RF-channel-number
```

Syntax Description	
cable slot /subslot /port	<p>(Optional) Specifies the cable interface. The following are the valid values:</p> <ul style="list-style-type: none"> • <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid values are 5 to 8. • <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1. • <i>port</i>—Specifies the port number. Valid values are 0 to 4 (depending on the cable interface). <p>This option is not supported on the Cisco cBR-8 router.</p>
slot /subslot /port	<p>(Optional) Specifies the cable interface on the Cisco cBR-8 router. The following are the valid values:</p> <ul style="list-style-type: none"> • <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid values are 0 to 3 and 6 to 9. • <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslot is 0. • <i>port</i>—Specifies the port number. Valid values are 0 to 7.
WB-RF-channel-number	<p>(Optional) Specifies the cable interface on the Cisco cBR-8 router. The valid values 0 to 163.</p>
modular-cable slot/bay/port:nb-channel-number	<p>(Optional) Specifies the modular cable interface. The following are the valid values:</p> <ul style="list-style-type: none"> • <i>slot</i>—The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs. • <i>bay</i>—The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay). • <i>port</i>—Specifies the interface number on the SPA. • <i>nb-channel-number</i>—Specifies the narrowband channel number. <p>This option is not supported on the Cisco cBR-8 router.</p>

Command Default None

Command Modes Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. The modular-cable keyword and the <i>port</i> variable were removed.

Examples

The following is a sample output of the **show cable modem summary wb-rf** command on the cable interface at slot/subslot/port 8/0/0:

```
Router# show cable modem cable 8/0/0 summary wb-rfs
Total      Total      Percent
RF         w-online  RF down   RF down
-----
1/0/0 0    4          0         0
      1    6          0         0
      2    7          0         0
```

The following is a sample output of the **show cable modem summary wb-rf** command on the modular cable interface at slot/bay/port and narrowband channel 1/0/0 18:

```
Router# show cable modem c8/0/0 summary wb-rfs modular-cable 1/0/0 18
Total      Total      Percent
RF         w-online  RF down   RF down
-----
1/0/0 18   0          0         0
```

Example for Cisco cBR-8 Converged Broadband Router

This example shows the output of the **show cable modem summary wb-rf** command:

```
Router#show cable modem summary wb-rfs

RF         Total      Total      Percent
         w-online  RF down   RF down
-----
1/0/1 0    7          0         0
      1    6          0         0
      2    7          0         0
      3    1          0         0
      32   1          0         0
      33   1          0         0

Related Commands

Command	Description
show cable modem summary	Displays a summary of CMs on one or more cable interfaces.

show cable modem sysDescr

To display the system description of a particular cable modem (CM) on the Cisco CMTS router, use the **show cable modem sysDescr** command in privileged EXEC mode.

```
show cable modem {ip-address|ipv6-address|mac-address} sysDescr [community community-name]
```

Syntax Description		
	<i>ip-address</i>	IPv4 address of the cable modem to be displayed.
	<i>ipv6-address</i>	IPv6 address of the cable modem to be displayed.
	<i>mac-address</i>	MAC address of the cable modem to be displayed.
	sysDescr	Displays cable modem system description.
	community <i>community-name</i>	(Optional) Specifies the cable modem community name provided in the cable modem configuration file. The <i>community-name</i> should match the cable modem's community name in cable modem configuration file.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCG2	This command was introduced.
12.2(33)SCH 12.2(33)SCG5	This command is supported for IPv6 cable modems.
12.2(33)SCH	This command was modified. The variable <i>ipv6-address</i> was added for IPv6 support.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router.

Usage Guidelines

You must enable the Simple Network Management Protocol (SNMP) manager process using the **snmp-server manager** command in global configuration mode before using the **show cable modem sysDescr** command. The **show cable modem sysDescr** command displays result for IPv4 cable modems only.

Note Effective with Cisco IOS Release 12.2(33)SCH and 12.2(33)SCG5, the **show cable modem sysDescr** command displays results for IPv6 cable modems.

In Cisco IOS Release 12.2(33)SCG1 and earlier, you cannot view the system description of a single cable modem. Instead, you can view system descriptions of all the cable modems connected to the Cisco CMTS router. To view the system descriptions of all cable modems, enable the **remote-query** functionality on the Cisco CMTS router using the **cable modem remote-query** command in global configuration mode. Then, run the **show cable modem verbose | include sysDescr** command.

Note The **remote-query** functionality might impact system performance because it queries all the cable modems connected to the Cisco CMTS router.

A community name string is configured in the CMTS for the cable modems using the **snmp-server community** *community-string* command or by enabling the cable modem remote-query feature using the **cable modem remote-query** *community-string* command.

The CMTS uses the default community name *public* if you do not specify the **community** option when you use the **show cable modem sysDescr** command.

Note Ensure that the *community-name* specified in the **show cable modem sysDescr** command matches the community name configured in the cable modem's configuration file. Also ensure that *public* is configured as a community name in the cable modem configuration file in case you do not specify the **community** string in this **show** command.

If the community name specified in this **show** command does not match the community names configured in the cable modem's configuration file, then the **show cable modem sysDescr** command output does not provide any system description and the output is as follows:

```
Router#show cable modem 602a.d001.faa0 sysdescr
Querying remote CM...
Timeout
```

Examples

The following is a sample output of the **show cable modem sysDescr** command that displays system description of the specified cable modem:

```
Router# show cable modem 001c.ea37.9b52 sysDescr
Querying remote CM...

Related Commands

Command	Description
cable modem remote-query	Enables the remote query functionality on the Cisco CMTS router to gather cable modem performance statistics.
snmp-server manager	Enables the SNMP manager process.

show cable modem tcs summary

To display transmit channel set (TCS) information on the Cisco CMTS router, use the **show cable modem tcs summary** command in privileged EXEC mode.

show cable modem tcs summary

Syntax Description

There are no keywords or arguments.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router.

Examples

This example is the output of the **show cable modem tcs summary** command:

```
Router# show cable modem tcs summary

Interface                               Cable Modem
Total Reg Oper Unreg Offline Wideband TCS  USCB
C7/0/0/U0-3                             8      8      8      0      0      8      3840  1,2
C7/0/0/U0                                3      3      3      0      0      2
C7/0/0/U1                                2      2      2      0      0      2
C7/0/0/U3                                5      5      5      0      0      0
C7/1/0/U3                                1      1      1      0      0      0
C7/1/1/U0                                1      0      0      1      1      0
C8/0/0/U0-1,2,0,3                       3      3      3      0      0      3      3840  1,2,3,4,5,6,7,8
Total:                                   23     22     22      1      1     15
```

Note In the above example, the interface value indicates the upstream channels of the TCS. The interface is displayed as *U0-1 3 5-7* when the TCS is U0, U1, U3, U5, U6, U7 and if it is a logical channel, the interface is displayed as *U0.0,1.0,3.0*.

Table below describes the significant fields shown in the display:

Table 142: show cable modem tcs summary Field Descriptions

Field	Description
Interface	Cable interface line card providing the upstream for the CMs.
Total Modems or Total	Total number of CMs, registered, unregistered, and offline for this interface.

Field	Description
Registered Modems or Reg	Total number of CMs that have registered and are online on this interface. This number might be different from the Total Modems number if some modems are offline or not fully registered.
Oper	Total number of CMs that are operational.
Unregistered Modems or Unreg	Total number of CMs that are either offline and not currently communicating with the Cisco CMTS, or attempting to come online but are not yet registered.
Offline	Total number of CMs that were online or attempted to register but are no longer communicating with the Cisco CMTS.
Wideband	CM is registered as a wideband CM.
TCS	TCS ID.
USCB	Upstream bonding group ID.

Related Commands

Command	Description
show cable modem	Displays information for the registered and unregistered CMs on the Cisco CMTS router.
show interface cable modem	Displays information about the CMs connected to a particular cable interface on the Cisco CMTS router.
show cable modem wideband	Displays information for a wideband CM on the Cisco CMTS router.

show cable modem tftp

To display a single CM's configuration file related information by MAC/IPv4 address /IPv6 address, use the **show cable modem tftp** command in privileged EXEC configuration mode.

show cable modem [*cm-mac/cm-ip/cm-ipv6*] **tftp**

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS XE Gibraltar 16.12.1	This command was introduced in Cisco cBR Series Converged Broadband Routers.

Examples

The following is a sample output of the **show cable modem tftp** command, it displays a CM's configuration file related information by IPv6 address.

```
Router# show cable modem 34bd.fa0f.4418 tftp
Host Interface : C1/0/0
MAC Address : 34bd.fa0f.4418
IP Address : 50.13.0.4
IPv6 Address : 2001:50:13:0:74E3:4197:E2F2:8162
Modem Status : w-online(pt)
TFTP Server Address : 2001:1:38::25:3
Modem Configuration File Name : cbr8/cm.bin
Timestamp : 02:16:02 CST Tue May 21 2019
```

If no MAC/IPv4 address /IPv6 address is specified, it will display configuration file related information for all CMs on the CMTS.

```
Router#show cable modem tftp
Host Interface : C1/0/0
MAC Address : 34bd.fa0f.4418
IP Address : 50.13.0.4
IPv6 Address : 2001:50:13:0:74E3:4197:E2F2:8162
Modem Status : w-online(pt)
TFTP Server Address : 2001:1:38::25:3
Modem Configuration File Name : cbr8/cm.bin
Timestamp : 02:16:02 CST Tue May 21 2019
Host Interface : C1/0/0
MAC Address : 34bd.fa0f.3850
IP Address : 50.13.0.38
IPv6 Address : 2001:50:13:0:7DF4:56AD:6F3A:231B
Modem Status : w-online(pt)
TFTP Server Address : 2001:1:38::25:3

show cable modem type

To display cable modem (CM) provisioning information for all CMs, such as boot mode configuration and MAC and IP address information, use the **show cable modem type** command in privileged EXEC configuration mode.

Cisco uBR7246VXR Router and Cisco uBR7225VXR Router

```
show cable modem [{ip-addressmac-address | cable {slot / port | slot / cable-interface-index } [upstream
port [logical-channel-index]] | name fqdn } ] type
```

Cisco uBR10012 Router

```
show cable modem [{ip-addressmac-address | cable {slot / subslot / port | slot / subslot
/ cable-interface-index } [upstream port [logical-channel-index]] | name fqdn } ] type
```

Cisco cBR Series Converged Broadband Router

```
show cable modem [{ip-addressmac-address | cable slot / subslot / cable-interface-index [upstream
port] } ] type
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific CM to be displayed. If you specify the MAC address for a CPE device behind a CM, information for that CM is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8 router—The valid range is from 0 to 3 and 6 to 9.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. Cisco cBR-8 router—The valid subslot is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).

<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8 router—The valid range is from 0 to 15.
upstream port	(Optional) Displays information for all CMs using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for port begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1. This option is not supported on the Cisco cBR-8 router.
name fqdn	(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router. This option is not supported on the Cisco cBR-8 router.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCA	This command was introduced.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. The name keyword and the <i>logical-channel-index</i> variable were removed.

Usage Guidelines

In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Examples

The following example shows sample output for the **show cable modem type** command :

```
Router# show cable modem type
Boot Mode configuration:
P - Primary Boot mode (IPv6 or IPv4)
D - Dual Stack (Yes/No)
A - Alternative Provisioning Mode (Yes/No)
MAC Address      Interface P/D/A  IPv4 address    IPv6 Address
0004.27a5.b761  C6/0/2/U1  v6/N/N  10.7.0.161     ---
```

show cable modem type

```

0007.0e01.d9a1 C6/0/2/U0 v6/N/N 10.7.0.162 ---
0006.2854.7275 C6/0/2/U1 v6/Y/N 10.7.0.3 2001:0DB8:3800:80B:7565:5B87:1D7D:5AD5
0018.6835.27dd C6/0/U0 v6/N/N --- 2001:0DB8:3800:803:41D7:DECC:F15D:133

```

Table below describes the significant fields shown in the display.

Table 143: show cable modem type Field Descriptions

Field	Description
MAC Address	MAC address of this CM.
Interface	Cable line card interface and upstream associated with this CM.
P/D/A	String of 3 values representing the boot mode configuration of the CM as follows: <ul style="list-style-type: none"> • P—Primary Boot Mode, where “v4” or “v6” indicates IPv4 or IPv6 as the primary addressing mode. • D—Dual Stack, where “Y” or “N” indicates whether or not both IPv4 and IPv6 addressing modes are supported. • A—Alternative Provisioning Mode (APM), where “Y” or “N” indicates whether or not APM is supported. <p>Note APM is not supported by the Cisco CMTS routers in Cisco IOS Release 12.2(33)SCA.</p>
IPv4 address	IPv4 address acquired by the CM. Prior to acquisition of the IP address, or if the CM fails IPv4 registration, the following output is shown: <ul style="list-style-type: none"> • IPv4 address not yet acquired—“0.0.0.0” • CM fails IPv4 registration, but online with IPv6 address: “---” • IPv4 address of an IPv6-only CM: “---”
IPv6 Address	IPv6 address acquired by the CM. Prior to acquisition of the IP address, or if the CM fails IPv6 registration, the following output is shown: <ul style="list-style-type: none"> • IPv6 address not yet acquired—“::” • CM fails IPv6 registration, but online with IPv4 address “---” • IPv6 address of IPv4-only CM: “---”

This example shows the output of the **show cable modem type** command on the Cisco cBR Series Converged Broadband Router router:

```

Router#show cable modem type
Boot Mode configuration:
P - Primary Boot mode (IPv6 or IPv4)
D - Dual Stack (Yes/No)
A - Alternative Provisioning Mode (Yes/No)

Related Commands

Command	Description
show cable modem	Displays information for the registered and unregistered CMs.

show cable modem unregistered

To display a list of the cable modems (CMs) that are marked as unregistered with the Cisco CMTS, use the **show cable modem unregistered** command in privileged EXEC mode.

Cisco uBR7100 Series and Cisco uBR7200 Series Routers

```
show cable modem [{ip-address|mac-address} | cable {slot / port | slot / cable-interface-index} ] [upstream
port [logical-channel-index]] | name fqdn } unregistered
```

Cisco uBR10012 Router

```
show cable modem [{ip-address|mac-address} | cable {slot / subslot / port | slot / subslot
/ cable-interface-index} ] [upstream port [logical-channel-index]] | name fqdn } unregistered
```

Cisco cBR-8 Converged Broadband Router

```
show cable modem [{ip-address|mac-address} | cable slot / subslot / cable-interface-index } ] unregistered
```

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific cable modem to be displayed. If you specify the IP address for a CPE device behind a cable modem, information for that cable modem is displayed.
<i>mac-address</i>	(Optional) MAC address of a specific cable modem to be displayed. If you specify the MAC address for a CPE device behind a cable modem, information for that CM is displayed.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR-8 router—The valid range is from 0 to 3 and 6 to 9.
<i>subslot</i>	Secondary slot number of the cable interface line card. For the Cisco uBR10012 router—The valid subslots are 0 or 1. Cisco cBR-8 router—The valid subslot is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface). <p>This option is not supported on the Cisco cBR-8 router.</p>

<i>cable-interface-index</i>	<p>Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards.</p> <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8 router—The valid range is from 0 to 15.
upstream port	<p>(Optional) Displays information for all CMs using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card.</p> <p>This option is not supported on the Cisco cBR-8 router.</p>
<i>logical-channel-index</i>	<p>(Optional) Logical channel index. The valid values are 0 or 1.</p> <p>This option is not supported on the Cisco cBR-8 router.</p>
name fqdn	<p>(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the show cable modem domain-name command has been run for the first time to update the cable DNS cache on the CMTS router.</p> <p>This option is not supported on the Cisco cBR-8 router.</p>

Command Default

Displays a list of all unregistered CMs on the Cisco CMTS router.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
11.3 NA	This command was introduced.
12.2(4)BC1	This command was introduced on the Cisco uBR10012 router.

Release	Modification
12.2(33)SCA	<p>This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes:</p> <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • Support for specifying the IPv6 address of a cable modem or CPE device was added. • The name keyword option was added for specifying the fully-qualified domain name of a CM. • The following new initialization states were added to show initialization of CMs and CPEs supporting IPv6: <ul style="list-style-type: none"> • init6(s)—CMTS router has seen SOLICIT message. • init6(a)—CMTS router has seen ADVERTISE message. • init6(r)—CMTS router has seen REQUEST message. • init6(i)—CMTS router has seen REPLY message. • init6(o)—CMTS router has seen version 6 TFTP request. • init6(t)—CMTS router has seen version 6 TOD request.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. The upstream and name keywords and the <i>logical-channel-index</i> variable were removed.

Usage Guidelines

Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Note In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

Examples

The following example shows sample output for the default form of the **show cable modem unregistered** command.

```
Router# show cable modem unregistered

Interface  Prim Online   Timing Rec    QoS CPE IP address   MAC address
         Sid  State      Offset Power
Cable3/0/U0 1   online     2812  -0.25  5   1   3.18.1.5     0030.80bc.2303
Cable3/0/U0 2   online     2804   0.50  5   0   3.18.1.9     0006.2854.73f5
C6/0/U0     6   init6(i)  1532  -0.50  2   0   0.0.0.0     0018.6835.27dd
```

The following example shows sample output for the **show cable modem unregistered** command for a particular cable interface:

```
Router# show cable modem c8/1/0 unregistered

Interface Prim Online   Timing Rec    QoS CPE IP address   MAC address
         Sid  State      Offset Power
C8/1/0/U1 1   online     1548   0.00  5   0   22.1.1.11    0050.7366.1243
C8/1/0/U4 2   online     1925   0.00  5   0   23.1.1.10    0002.b970.0027
C8/1/0/U4 3   online     1918  -0.50  2   0   22.1.1.10    0006.5314.858d
```

The following example shows sample output for the **show cable modem unregistered** command for a single cable modem, as identified by its IP address:

```
Router# show cable modem 22.1.1.10 unregistered

Interface Prim Online   Timing Rec    QoS CPE IP address   MAC address
         Sid  State      Offset Power
C8/1/0/U4 3   online     1918  -0.75  2   0   22.1.1.10    0006.5314.858d
```

The following example shows sample output for the **show cable modem unregistered** command for a single cable modem, as identified by its MAC address:

```
Router# show cable modem 0006.5314.858d unregistered

Interface Prim Online   Timing Rec    QoS CPE IP address   MAC address
         Sid  State      Offset Power
C8/1/0/U4 3   online     1918  -0.25  2   0   22.1.1.10    0006.5314.858d
```

Note An asterisk (*) in the Receive Power column indicates that a power adjustment has been made for that CM. An exclamation point (!) in the Receive Power column indicates that the cable modem has reached its maximum power transmit level and cannot increase its power level further. An exclamation point (!) in the Timing Offset column indicates that the cable modem has exceeded the maximum delay and timing offset specified by the **cable map-advance** command. A pound sign (#) in the MAC State column indicates that the **cable tftp-enforce mark-only** command has been used to require that a cable modem attempt a TFTP download of the DOCSIS configuration file before registering, but the cable modem did not do so (Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases).

Tip The **show cable modem** command displays the cable modem timing offset in DOCSIS ticks, while other commands, such as **cable map-advance**, display the offset in microseconds. Use the following method to convert microseconds to DOCSIS ticks: ticks = microseconds*64/6.25 .

Table below describes the major fields shown in the **show cable modem unregistered** displays:

Table 144: Descriptions for the show cable modem unregistered Fields

Field	Description
Interface	The cable interface line card providing the upstream for this CM.
Prim SID	The primary SID assigned to this CM.
Online State	The current state of the MAC layer.
Timing Offset	<p>The timing offset for the cable modem, in ticks, as recognized on the CMTS. (A tick, as used here, is 6.25/64 microseconds.) This is the delay between when a particular cable modem is scheduled to make a transmission and when the CMTS actually receives it.</p> <p>Note An exclamation point (!) in the Timing Offset column indicates that the cable modem has exceeded the maximum delay and timing offset specified by the cable map-advance command.</p> <p>Note The timing offset shown here is typically smaller than the TX Time Offset value shown by the show cable modem remote-query command, because the latter value is the offset as recognized on the cable modem (which will include any internal delay between when the cable modem software begins the transmission and when the bits actually appear on the local cable interface).</p>
Rec Power	<p>The received power level (in dB) for the CM.</p> <p>Note An asterisk (*) in the RxPwr column indicates that a power adjustment has been made for that CM. An exclamation point (!) indicates that the cable modem has reached its maximum power transmit level and cannot increase its power level further.</p>
QoS	Displays the QoS profile assigned to the cable modem (DOCSIS 1.1 and DOCSIS 2.0 CMs only).

Field	Description
CPE	Indicates the number of CPE devices for which the cable modem is providing services.
IP Address	The IP address that the DHCP server has assigned to the CM.
MAC Address	The MAC address for the CM.

Table below shows the possible values for the Online State field:

Table 145: Descriptions for the Online State Field

MAC State Value ¹⁷	Description
Registration and Provisioning Status Conditions for Devices Using IPv4 Addressing	
init(r1)	The cable modem sent initial ranging.
init(r2)	The cable modem is ranging. The CMTS received initial ranging from the cable modem and has sent RF power, timing offset, and frequency adjustments to the CM.
init(rc)	Ranging has completed. Note If a cable modem appears to be stuck in this state, it could be that the cable modem is able to communicate successfully on the cable network, but that the upstream is at capacity and does not have any additional bandwidth to allow the cable modem to finish registration and come online. Either manually move one or more CMs to other upstreams, or enable load balancing on the upstream using the cable load-balance group commands.
init(d)	The DHCP request was received, as DHCPDISCOVER. This also indicates that the first IP broadcast packet has been received from the CM.
init(dr)	The DHCP request has been sent to the cable modem.
init(i)	The cable modem has received the DHCPOFFER reply (DHCPACK) from the DHCP server that has assigned an IP address to the modem, but the modem has not yet replied with a DHCPREQUEST message requesting that particular IP address, nor has it sent an IP packet with that IP address. Note If a cable modem appears to be stuck in this state, the cable modem has likely received the DHCPOFFER reply from the DHCP server, but this reply might have contained one or more invalid options for that particular CM.
init(io)	The Cisco CMTS has seen the DHCP offer as sent to the cable modem from the DHCP server that has assigned an IP address to the modem.

MAC State Value ¹⁷	Description
init(o)	The cable modem has begun to download the option file (DOCSIS configuration file) using the Trivial File Transfer Protocol (TFTP), as specified in the DHCP response. If the cable modem remains in this state, it indicates that the download has failed.
init(t)	Time-of-day (TOD) exchange has started.
resetting	The cable modem is being reset and will shortly restart the registration process.
Registration and Provisioning Status Conditions for Devices Using IPv6 Addressing	
init6(s)	The Cisco CMTS router has seen the DHCPv6 SOLICIT message from the CM.
init6(a)	The Cisco CMTS router has seen the ADVERTISE message from the DHCPv6 server to the CM.
init6(r)	The Cisco CMTS router has seen the REQUEST response from the cable modem to the DHCPv6 server.
init6(i)	The Cisco CMTS router has seen the REPLY message from the DHCPv6 server to the CM.
init6(o)	The Cisco CMTS router has seen the REQUEST message from the cable modem to the TFTP server.
init6(t)	The Cisco CMTS router has seen the REQUEST message from the cable modem to the TOD server.
Non-error Status Conditions	
cc(r1)	The cable modem had registered and was online, but has received a Downstream Channel Change (DCC) or Upstream Channel Change (UCC) request message from the CMTS. The cable modem has begun moving to the new channel, and the CMTS has received the CM's initial ranging on the new downstream or upstream channel. At the MAC layer, the cable modem is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.
cc(r2)	This state should normally follow cc(r1) and indicates that the cable modem has finished its initial ranging on the new channel, and is currently performing continuous ranging on the new channel. At the MAC layer, the cable modem is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.
offline	The cable modem is considered offline (disconnected or powered down).
online	The cable modem has registered and is enabled to pass data on the network.

MAC State Value ¹⁷	Description
online(d)	<p>The cable modem registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. The cable modem does not forward traffic to or from the CPE devices, but the CMTS can continue to communicate with the cable modem using DOCSIS messages and IP traffic (such as SNMP commands).</p> <p>Note If BPI was enabled in the DOCSIS configuration file sent to the cable modem, assume that the cable modem is using BPI encryption, unless other messages show that the BPI negotiation and key assignments have failed.</p>
online(pkd)	<p>The cable modem registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and KEK is assigned.</p> <p>Note This state is equivalent to the online(d) and online(pk) states.</p>
online(ptd)	<p>The cable modem registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and TEK is assigned. BPI encryption is now being performed.</p> <p>Note This state is equivalent to the online(d) and online(pt) states.</p>
online(pk)	<p>The cable modem registered, BPI is enabled and KEK is assigned.</p>
online(pt)	<p>The cable modem registered, BPI is enabled and TEK is assigned. BPI encryption is now being performed.</p> <p>Note If network access was disabled in the DOCSIS configuration file sent to the cable modem, the network disabled status takes precedence, and the MAC status field shows online(d) instead of online(pt) even when BPI encryption is enabled and operational.</p>

MAC State Value ¹⁷	Description
<p>Note If an exclamation point (!) appears in front of one of the online states, it indicates that the cable dynamic-secret command has been used with either the mark or reject option, and that the cable modem has failed the dynamic secret authentication check.</p>	
expire(pk)	<p>The cable modem registered, BPI is enabled, KEK was assigned, but the current KEK expired before the cable modem could successfully renew a new KEK value.</p>
expire(pkd)	<p>The cable modem registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, KEK was assigned, but the current KEK expired before the cable modem could successfully renew a new KEK value.</p> <p>Note This state is equivalent to the online(d) and expire(pk) states.</p>
expire(pt)	<p>The cable modem registered, BPI is enabled, TEK was assigned, but the current TEK expired before the cable modem could successfully renew a new KEK value.</p>
expire(ptd)	<p>The cable modem registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, TEK was assigned, but the current TEK expired before the cable modem could successfully renew a new KEK value.</p> <p>Note This state is equivalent to the online(d) and expire(pt) states.</p>
Error Status Conditions	

MAC State Value ¹⁷	Description
reject(m)	<p>The cable modem attempted to register but registration was refused due to a bad Message Integrity Check (MIC) value. This also could indicate that the shared secret in the DOCSIS configuration file does not match the value configured on the CMTS with the cable shared-secret command.</p> <p>In Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases, this could also indicate that the cable tftp-enforce command has been used to require that a cable modem attempt a TFTP download of the DOCSIS configuration file before registering, but the cable modem did not do so.</p>
reject(c)	<p>The cable modem attempted to register, but registration was refused due to a number of possible errors:</p> <ul style="list-style-type: none"> • The cable modem attempted to register with a minimum guaranteed upstream bandwidth that would exceed the limits imposed by the cable upstream admission-control command. • The cable modem has been disabled because of a security violation. • A bad class of service (COS) value in the DOCSIS configuration file. • The cable modem attempted to create a new COS configuration but the CMTS is configured to not permit such changes. • The cable modem failed the timestamp check for its DOCSIS configuration file. (This could indicate a possible theft-of-service attempt, or a problem with the synchronization of the clocks on the cable modem and CMTS.)
reject(pk)	KEK key assignment is rejected, BPI encryption has not been established.
reject(pkd)	<p>The cable modem registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because KEK key assignment was rejected.</p> <p>Note This state is equivalent to the online(d) and reject(pk) states.</p>
reject(pt)	TEK key assignment is rejected, BPI encryption has not been established.
reject(ptd)	<p>The cable modem registered, but network access for CPE devices using this cable modem has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because TEK key assignment was rejected.</p> <p>Note This state is equivalent to the online(d) and reject(pt) states.</p>

MAC State Value ¹⁷	Description
<p>Note In Cisco IOS Release 12.1(20)EC, Cisco IOS Release 12.2(15)BC1, and earlier releases, when network access is disabled in the DOCSIS configuration file sent to the cable modem, the network disabled status takes precedence, and the MAC status field shows online(d) even if BPI encryption fails. Use the show cable modem mac-address command to confirm whether BPI is enabled or disabled for a particular cable modem.</p>	
reject(ts)	The cable modem attempted to register, but registration failed because the TFTP server timestamp in the cable modem registration request did not match the timestamp maintained by the CMTS. This might indicate that the cable modem attempted to register by replaying an old DOCSIS configuration file used during a prior registration attempt.
reject(ip)	The cable modem attempted to register, but registration failed because the IP address in the cable modem request did not match the IP address that the TFTP server recorded when it sent the DOCSIS configuration file to the CM. IP spoofing could be occurring.

MAC State Value ¹⁷	Description
reject(na)	The cable modem attempted to register, but registration failed because the cable modem did not send a Registration-Acknowledgement (REG-ACK) message in reply to the Registration-Response (REG-RSP) message sent by the CMTS. A Registration-NonAcknowledgement (REG-NACK) is assumed.

¹⁷ The cable modem MAC state field can also be retrieved using SNMP by getting the value of the cdxCmtsCmStatusValue object in the CISCO-DOCS-EXT-MIB.

Note For the complete list of the cable modem status, see [Table 100: Descriptions for the MAC State Field](#), on page 1888.

Cisco cBR-8 Converged Broadband Router

This example shows the output for the **show cable modem unregistered** command:

Related Commands	Command	Description
	cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
	show cable modem	Displays information for the registered and unregistered CMs.
	show cable modem access-group	Displays the access groups for the CMs on a particular cable interface.
	show cable modem classifiers	Displays information about the classifiers for a particular CM.
	show cable modem connectivity	Displays connectivity statistics for one or more CMs.
	show cable modem cpe	Displays the CPE devices accessing the cable interface through a particular CM.
	show cable modem offline	Displays a list of the CMs that are marked as offline with the Cisco CMTS.
	show cable modem registered	Displays a list of the CMs that are marked as registered with the Cisco CMTS.
	show cable modem vendor	Displays the vendor name or Organizational Unique Identifier (OUI) for the CMs on each cable interface.
	show interface cable modem	Displays information about the CMs connected to a particular cable interface.
	show interface cable sid	Displays cable interface information.

show cable modem vendor

To display the vendor name or Organizational Unique Identifier (OUI) for the CMs on each cable interface, use the **show cable modem vendor** command in privileged EXEC mode.

```
show cable modem [cable {slot / subslot / port | slot / subslot / cable-interface-index } [upstream
port [logical-channel-index]]] vendor [summary]
```

Cisco cBR Series Converged Broadband Router

```
show cable modem vendor [summary]
```

```
show cable modem [cable slot / subslot / cable-interface-index [upstream port]] vendor
```

Syntax Description

<i>slot</i>	Slot where the line card resides. The valid range is from 5 to 8. Cisco cBR-8 router—The valid range is from 0 to 3 and 6 to 9.
<i>subslot</i>	Secondary slot number of the cable interface line card. The valid subslots are 0 or 1. Cisco cBR-8 router—The valid subslot is 0.
<i>port</i>	Downstream port number. The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8 router—The valid range is from 0 to 15.
upstream port	(Optional) Displays information for all CMs using this specific upstream. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports on the cable interface line card.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1. This option is not supported on the Cisco cBR-8 router.
summary	(Optional) Displays the total numbers for each vendor and OUI, along with the total numbers of those vendor's CMs that are currently registered with the CMTS, unregistered, or offline.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(8)BC2	This command was introduced for the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 routers.

Release	Modification
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The <i>logical-channel-index</i> argument was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR-8 Converged Broadband Router. The <i>logical-channel-index</i> variable was removed.

Usage Guidelines

This command displays the vendor name for each CM. If the vendor name has not been defined by the **show cable modem vendor** command, the command displays the OUI value for the modem's vendor.

Note The Institute of Electrical and Electronics Engineers (IEEE) is the official issuer of OUI values.

Note Also see the information about this command's behavior in a Hot Standby Connection-to-Connection Protocol (HCCP) configuration.

Examples

The following example shows typical output for the **show cable modem vendor** command:

```
Router# show cable modem vendor

Vendor      MAC Address      I/F      MAC      Prim  RxPwr  Timing  Num  BPI
              State            State    Sid      (db)  Offset  CPE  Enb
Cisco       0001.9659.519f  C1/0/U0  init(rc) 16    0.75   2738   0    N
Cisco       0002.b96f.fdbb  C1/0/U0  online    20    1.00   2738   1    N
Cisco       0002.b96f.fdf9  C1/0/U0  online    21    0.50   2737   1    N
Cisco       0002.b96f.fff7  C1/0/U0  online    12    0.50   2737   1    N
Cisco       0002.fdfa.1163  C1/0/U0  online    1     0.00   2734   1    N

Tip The **show cable modem vendor** command displays the CM timing offset in DOCSIS ticks, while other commands, such as **cable map-advance**, display the offset in microseconds. Use the following method to convert microseconds to DOCSIS ticks: ticks = microseconds*64/6.25 .

Table below describes the major fields shown in the **show cable modem vendor** displays:

Table 146: Descriptions for the show cable modem vendor Fields

Field	Description
Vendor	The vendor name for the indicated CM, as specified by the cable modem vendor command. If no name for this vendor has been specified, displays the modem's OUI value.
MAC Address	The MAC address for the CM.
I/F	The cable interface line card providing the upstream for this CM.
MAC State	The current state of the MAC layer.
Prim SID	The primary SID assigned to this CM.
RxPwr	The received power level (in dB) for the CM. <p>Note An asterisk (*) in the RxPwr column indicates that a power adjustment has been made for that CM. An exclamation point (!) indicates that the CM has reached its maximum power transmit level and cannot increase its power level further.</p> <p>Note RxPwr field is not supported on Cisco cBR-8 router.</p>

Field	Description
Timing Offset	<p>The timing offset for the CM, in ticks, as recognized on the CMTS. (A tick, as used here, is 6.25/64 microseconds.) This is the delay between when a particular cable modem is scheduled to make a transmission and when the CMTS actually receives it.</p> <p>Note An exclamation point (!) in the Timing Offset column indicates that the CM has exceeded the maximum delay and timing offset specified by the cable map-advance command.</p> <p>Note The timing offset shown here is typically smaller than the TX Time Offset value shown by the show cable modem remote-query command, because the latter value is the offset as recognized on the CM (which will include any internal delay between when the CM software begins the transmission and when the bits actually appear on the local cable interface).</p> <p>Note Timing Offset field is not supported on Cisco cBR-8 router.</p>
Num CPE	Indicates the number of CPE devices for which the CM is providing services.
BPI Enbl	Indicates whether Baseline Privacy Interface (BPI) or BPI Plus (BPI+) encryption is enabled for the CM.

Note An asterisk (*) in the RxPwr column indicates that a power adjustment has been made for that CM. An exclamation point (!) in the Receive Power column indicates that the CM has reached its maximum power transmit level and cannot increase its power level further. An exclamation point (!) in the Timing Offset column indicates that the CM has exceeded the maximum delay and timing offset specified by the **cable map-advance** command. A pound sign (#) in the MAC State column indicates that the cable tftp-enforce mark-only command has been used to require that a CM attempt a TFTP download of the DOCSIS configuration file before registering, but the CM did not do so (Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases).

The following example shows typical output for the **show cable modem vendor summary** command, displaying the total numbers for each vendor and OUI, along with the total numbers of those vendor's CMs that are currently registered with the CMTS, unregistered, or offline.

```
Router# show cable modem vendor summary
```

Vendor	OUI	Cable Modem			
		Total	Registered	Unregistered	Offline
00.02.B2	00.02.B2	4288	3997	291	259

Router#

Related Commands

Command	Description
cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem connectivity	Displays connectivity statistics for one or more CMs.
show cable modem cpe	Displays the CPE devices accessing the cable interface through a particular CM.
show cable modem remote-query	Displays information collected by the remote-query feature.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.
show interface cable sid	Displays cable interface information.

show cable modem verbose

To display detailed information of cable modems, use the **show cable modem verbose** command in privileged EXEC mode.

show cable modem [{ **ip-address** | **mac-address** | **cable** { *slot* / *subslot* / *cable-interface-index* }] **verbose**

Syntax Description

<i>ip-address</i>	(Optional) IPv4 or IPv6 address of a specific cable modem. If you specify the IP address for a CPE behind a cable modem, the output displays information for that cable modem.
<i>mac-address</i>	(Optional) MAC address of a specific cable modem. If you specify the MAC address for a CPE behind a cable modem, the output displays information for that cable modem.
cable	(Optional) Displays the modems on a specific cable interface.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is 3–6. • Cisco uBR10012 router—The valid range is 5–8. • Cisco cBR router—The valid range is 0–3 and 6–9.
<i>subslot</i>	Secondary slot number of the cable interface line card. Cisco uBR10012 only—The valid subslots are 0 or 1. Cisco cBR router—The valid value is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is 0–4 (depending on the cable interface).
<i>cable-interface-index</i>	The downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is 0–4. The valid range for the Cisco uBR-MC3GX60V line card is 0–14. • Cisco cBR router—The valid range is 0–15.
verbose	Displays detailed information of the cable modems.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Cupertino 17.15.1w	The output of the command is updated to display the RPD Alias (RPD Name) information.
Cisco IOS XE Dublin 17.12.1x	The output of the command is updated to display D40 cable modem Capabilities.
Cisco IOS XE Cupertino 17.9.1x	This command is modified to support Low Latency DOCSIS Capable information.
Cisco IOS XE Bengaluru 17.6.1z	The output of the command is updated to display UGS Service Flow Limit .
Cisco IOS XE Amsterdam 17.3.1w	The output of the command is updated with partial-mode information.

Example

This example shows the output of the **show cable modem ccf3.c8ff.ed7e verbose . (Cisco IOS XE Cupertino 17.15.1w or later)**.

Note

In the release Cisco IOS XE Dublin 17.12.1y, on CBR8, the command **show cable modem verbose** has been updated for all SCQAM and OFDMA upstream channels to include upstream RF port base power if configured (applicable to RPHY only) in addition to channel power adjust. Additionally we display the "Configured Received Power" and "Received Power" with reference to both:

1. channel width(dBmV@chw) and
2. 1.6MHz PSD (dBmV@1.6MHz)

The newly added/modified fields in the verbose output are listed below:

1. Upstream Channel Width (MHz)
 2. Received Power delta (dBmV)
 3. Configured Received Power (dBmV@chw)
 4. Received Power (dBmV@chw)
 5. Configured Received Power (dBmV@1.6MHz)
 6. Received Power (dBmV@1.6MHz)
-

show cable modem voice

To show the detected voice-enabled modems, use the **show cable modem voice** command.

show cable modem voice [{**pending** | **failed**}]

Syntax Description

pending	(Optional) Displays cable modems that are being moved to the target channel via Downstream Frequency Override (DFO).
failed	(Optional) Displays cable modems that have already reached the maximum Downstream Frequency Override retry limit without success.

Command Default

None

Command Modes

Privileged EXEC

Command History

Release	Modification
12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to display the detected voice-enabled modems.

Note The **show cable modem voice** command is not supported on the Cisco uBR-MC28U line card on the Cisco uBR7200 series routers.

Examples

```
Router# show cable modem voice
MAC Address      IP Address      Host           MAC           Prim  Num  Primary  DS
Interface State          Sid   CPE  Downstream RfId
0013.10bb.22f9  80.17.1.2      C6/0/0/U0  online (pt)   2    0    Mo3/0/0:1  1
0013.10bb.23d1  80.17.1.5      C6/0/1/U1  online (pt)   5    0    C6/0/1     255
```

Related Commands

Command	Description
show cable service-voice downstream-type	Displays the downstream-types that are capable of providing voice services.

show cable modem wideband
