To display information for registered and unregistered wideband CMs, use the **show cable modem wideband** command in privileged EXEC mode.

Cisco uBR Series Router

show cable modem wideband [**registered-traditional-docsis**| **channel**]

show cable modem { *ip-address mac-address* } **wideband** [**channel**]

show cable modem [{ **cable** *slot/subslot/cable-interface-index* [**upstream port**]
[*logical-channel-index*]}] **wideband** [**channel**]

Cisco cBR Series Router

show cable modem wideband [**registered-traditional-docsis**| **channel**]

show cable modem wideband { *forwarding-summary* }

show cable modem { *ip-address mac-address* } **wideband** [**channel**]

show cable modem [{ **cable** *slot/subslot/cable-interface-index* [**upstream port**]}] **wideband** [**channel**]

<i>ip-address</i>	(Optional) Identifies the IP address of a specific wideband CM to be displayed. If you specify the IP address for a CPE device behind a CM, information for that CM is displayed.
<i>mac-address</i>	(Optional) Identifies the MAC address of a specific wideband CM to be displayed. If you specify the MAC address for a CPE device behind a wideband CM, information for that wideband CM is displayed.
<i>slot</i>	Slot where the line card resides. The valid range is from 5 to 8 for uBR series router, 0 to 3 and 6 to 9 for cBR series router.
<i>subslot</i>	Secondary slot number of the cable interface line card. The valid subslots are 0 or 1 for uBR series router, 0 for cBR series router.
<i>cable-interface-index</i>	DOCSIS line card MAC domain index. <ul style="list-style-type: none"> • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR-8 router—The valid range is from 0 to 15.
upstream port	(Optional) Displays information for all CMs using this specific upstream. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports on the cable interface line card.
<i>logical-channel-index</i>	(Optional) Logical channel index. The valid values are 0 or 1.

<i>forwarding-summary</i>	(Optional) Displays the following details: <ul style="list-style-type: none"> • FrwdIF—The wideband interface that each modem is using • BG DS Config—Number of downstreams in the wideband interface • Bonded State—Number of downstreams the modem is currently bonded on • CM DS Capab—Number of downstreams the modem is capable of bonding on
registered-traditional-docsis	(Optional) Displays information for wideband CMs that are currently registered as traditional DOCSIS modems.
channel	(Optional) Displays the number of downstream (DS) and upstream (US) channels used by a cable modem.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 universal broadband router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCB	This command output no longer shows the downstream (DS) channel ID or the bonding group (BG) ID. A new column was added to display the Receive Channel Configuration (RCC) ID of the RCC assigned to the cable modem.
12.2(33)SCE	This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .
12.2(33)SCF	This command was modified. The channel keyword and <i>logical-channel-index</i> argument was added.
12.2(33)SCG	This command output was modified to display direct downstream and upstream channel information on downstream channel bonding (DSCB) and upstream channel bonding (USCB) partial services.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <i>logical-channel-index</i> variable was removed.
IOS-XE 3.18.1SP	This command was modified. The <i>forwarding-summary</i> argument was added.

Usage Guidelines

This command displays information for a one or more wideband CMs. Optionally, the CMs for which to display information can be identified IP address, MAC address, or cable interface.

If a wideband-capable CM is not able to register as a wideband CM (for example, if no wideband channel is available), the CM attempts to register as a traditional DOCSIS modem. The **registered-traditional-docsis** keyword limits the set of wideband CMs for which to display information to wideband-capable CMs that are currently registered as DOCSIS 1.X or DOCSIS 2.0 modems.

The following is a sample output of the **show cable modem wideband forwarding-summary** command for all cable modems running Cisco IOS-XE Release 3.18.1SP:

```
Router# show cable modem wideband forwarding-summary
MAC Address      IP Address      Primary      FrwdIF      BG DS   Bonded   CM DS
                  Config State   Capab

```

Examples

The following is a sample output for the default form of the **show cable modem wideband** command on a Cisco uBR10012 router running a Cisco IOS Release prior to Cisco IOS Release 12.2(33)SCB:

```
Router# show cable modem wideband
MAC Address      IP Address      I/F      MAC      Prim  BG  DSID  MD-DS-SG
                  State          Sid      ID
0014.bfbe.3cc0  1.11.0.1      C5/0/1/U0 w-online(pt)  3    24    24    N/A
0016.92f0.90d6  1.11.0.4      C5/0/1/U0 w-online(pt)  5    24    272    1
0014.bfbe.3cb8  1.11.0.2      C6/0/1/U0 w-online(pt)  3    36    36    N/A
0016.92f0.90d8  1.11.0.3      C6/0/1/U0 w-online(pt)  5    36    274    1
```

Example of the show cable modem wideband Command in Cisco IOS Release 12.2(33)SCB

The following is a sample output for the default form of the **show cable modem wideband** command on a Cisco uBR10012 router running Cisco IOS Release 12.2(33)SCB:

```
Router# show cable modem wideband
MAC Address      IP Address      I/F      MAC      Prim  RCC  MD-DS-SG
                  State          Sid      ID
0014.bfbe.4694  30.2.0.3      C8/0/0/U0 w-online(pt)  3    1    1
0018.6852.84aa  30.2.0.5      C8/0/0/U0 w-online(pt)  4    2    1
```

Note The RCC ID refers to the output of the **show cable mac-domain rcc** command.

Examples of the show cable modem wideband channel Command in Cisco IOS Release 12.2(33)SCF

The following is a sample output of the **show cable modem widebandchannel** command for all cable modems running Cisco IOS Release 12.2(33)SCF:

```
Router# show cable modem wideband channel
MAC Address      IP Address      I/F             MAC              DSxUS Primary
                  State           w-online        2x1             Wi6/1/0:1
0018.6852.7b76  80.62.0.5      C6/1/0/U0      w-online        2x1             Wi6/1/0:1
0019.474a.c182  80.62.0.2      C6/1/0/U0      w-online        2x1             Wi6/1/0:1
```

The following is a sample output of the **show cable modem widebandchannel** command for a specific cable modem identified by its IP address:

```
Router# show cable modem 80.62.0.5 wideband channel
MAC Address      IP Address      I/F             MAC              DSxUS Primary
                  State           w-online        2x1             Wi6/1/0:1
0018.6852.7b76  80.62.0.5      C6/1/0/U0      w-online        2x1             Wi6/1/0:1
```

The following is a sample output of the **show cable modem widebandchannel** command for a specific cable modem identified by its MAC address:

```
Router# show cable modem 0018.6852.7b76 wideband channel
MAC Address      IP Address      I/F             MAC              DSxUS Primary
                  State           w-online        2x1             Wi6/1/0:1
0018.6852.7b76  80.62.0.5      C6/1/0/U0      w-online        2x1             Wi6/1/0:1
```

The following is a sample output of the **show cable modem widebandchannel** command for a specific cable interface:

```
Router# show cable modem Cable 6/1/0 wideband channel
MAC Address      IP Address      I/F             MAC              DSxUS Primary
                  State           w-online        2x1             Wi6/1/0:1
0018.6852.7b76  80.62.0.5      C6/1/0/U0      w-online        2x1             Wi6/1/0:1
0019.474a.c182  80.62.0.2      C6/1/0/U0      w-online        2x1             Wi6/1/0:1
```

Table below describes the significant fields shown in the display:

Table 147: show cable modem wideband Field Descriptions

Field	Description
MAC Address	MAC address for the CM.
IP Address	IP address that the DHCP server has assigned to the CM.
I/F	Cable interface providing the upstream for this CM.
MAC State	Current state of the MAC layer.
Prim SID	Primary SID assigned to this CM.

Field	Description
Bonding group ID	Identifier of the primary wideband channel.
DSID	Downstream Service Identifier.
DSxUS	Number of DS and US channels used by the CM.
Primary WB	Primary wideband channel for the CM.
MD-DS-SG	MAC Domain Downstream Service Group, the downstream channels of a single MAC domain that reach the cable modem.

Following is a sample output of the **show cable modem wideband** command in Cisco IOS Release 12.2(33)SCG:

```
Router# show cable modem cable 7/0/0 wideband channel
MAC Address      IP Address      I/F              MAC              DSxUS Primary
                  State           State           State           State           WB
001a.c30c.7f04  40.4.58.4       C7/0/0/U3       w-online (pt)    3x1             Wi7/0/0:0

4458.2945.2a78  40.4.58.21      C7/0/0/p        w-online (pt)    3x3             Wi7/0/0:0
4458.2945.4604  40.4.58.19      C7/0/0/p        w-online (pt)    3x3             Wi7/0/0:0
```

Note Some modems on CMTS have an exclamation point showing next to their MD-DS-SG, and denotes an FN configuration change on the CMTS. The configuration change might have triggered the MD-DS-SG changes. Every time there is a change in frequency, the SG-ID will be increased by 1. For modems which would use the old SG-ID, they will stay online, but will be marked by an exclamation mark (!).

Table below shows the possible values for the MAC State field for a wideband CM modem that registers as a traditional DOCSIS modem:

Table 148: Descriptions for the MAC State Field (for Traditional DOCSIS Modems)

MAC State Value ¹⁸	Description
Registration and Provisioning Status Conditions	
init(r1)	The CM sent initial ranging.
init(r2)	The CM is ranging. The CMTS received initial ranging from the CM and has sent RF power, timing offset, and frequency adjustments to the CM.
init(rc)	Ranging has completed. Note If a CM appears to be stuck in this state, it could be that the CM is able to communicate successfully on the cable network, but that the upstream is at capacity and does not have any additional bandwidth to allow the CM to finish registration and come online. Either manually move one or more CMs to other upstreams, or enable load balancing on the upstream using the cable load-balance commands.
init(d)	The DHCP request was received, as DHCPDISCOVER. This also indicates that the first IP broadcast packet has been received from the CM.
init(dr)	The DHCP request has been sent to the cable modem.
init(i)	The cable modem has received the DHCPOFFER reply (DHCPACK) from the DHCP server that has assigned an IP address to the modem, but the modem has not yet replied with a DHCPREQUEST message requesting that particular IP address, nor has it sent an IP packet with that IP address. Note If a CM appears to be stuck in this state, the CM has likely received the DHCPOFFER reply from the DHCP server, but this reply might have contained one or more invalid options for that particular CM.
init(io)	The Cisco CMTS has seen the DHCP offer as sent to the cable modem from the DHCP server that has assigned an IP address to the modem.
init(o)	The CM has begun to download the option file (DOCSIS configuration file) using the Trivial File Transfer Protocol (TFTP), as specified in the DHCP response. If the CM remains in this state, it indicates that the download has failed.
init(t)	Time-of-day (TOD) exchange has started.
resetting	The CM is being reset and will shortly restart the registration process.
Non-error Status Conditions	
cc(r1)	The CM had registered and was online, but has received a Downstream Channel Change (DCC) or Upstream Channel Change (UCC) request message from the CMTS. The CM has begun moving to the new channel, and the CMTS has received the CM's initial ranging on the new downstream or upstream channel. At the MAC layer, the CM is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.

MAC State Value ¹⁸	Description
cc(r2)	This state should normally follow cc(r1) and indicates that the CM has finished its initial ranging on the new channel, and is currently performing continuous ranging on the new channel. At the MAC layer, the CM is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.
offline	The CM is considered offline (disconnected or powered down).
online	The CM has registered and is enabled to pass data on the network.
online(d)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. The CM does not forward traffic to or from the CPE devices, but the CMTS can continue to communicate with the CM using DOCSIS messages and IP traffic (such as SNMP commands). Note If BPI was enabled in the DOCSIS configuration file sent to the CM, assume that the CM is using BPI encryption, unless other messages show that the BPI negotiation and key assignments have failed.
online(pkd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and KEK is assigned. Note This state is equivalent to the online(d) and online(pk) states.
online(ptd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note This state is equivalent to the online(d) and online(pt) states.
online(pk)	The CM registered, BPI is enabled and KEK is assigned.
online(pt)	The CM registered, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note If network access was disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows online(d) instead of online(pt) even when BPI encryption is enabled and operational.
Note	If an exclamation point (!) appears in front of one of the online states, it indicates that the cable dynamic-secret command has been used with either the mark or reject option, and that the cable modem has failed the dynamic secret authentication check
expire(pk)	The CM registered, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value.
expire(pkd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value. Note This state is equivalent to the online(d) and expire(pk) states.

MAC State Value ¹⁸	Description
expire(pt)	The CM registered, BPI is enabled, TEK was assigned, but the current TEK expired before the CM could successfully renew a new KEK value.
expire(ptd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, TEK was assigned, but the current TEK expired before the CM could successfully renew a new KEK value. Note This state is equivalent to the online(d) and expire(pt) states.
Error Status Conditions	
reject(m)	The CM attempted to register but registration was refused due to a bad Message Integrity Check (MIC) value. This also could indicate that the shared secret in the DOCSIS configuration file does not match the value configured on the CMTS with the cable shared-secret command. In Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases, this could also indicate that the cable tftp-enforce command has been used to require that a CM attempt a TFTP download of the DOCSIS configuration file before registering, but the CM did not do so.
reject(c)	The CM attempted to register, but registration was refused due to a a number of possible errors: <ul style="list-style-type: none"> • The CM attempted to register with a minimum guaranteed upstream bandwidth that would exceed the limits imposed by the cable upstream admission-control command. • The CM has been disabled because of a security violation. • A bad class of service (COS) value in the DOCSIS configuration file. • The CM attempted to create a new COS configuration but the CMTS is configured to not permit such changes. • The CM failed the timestamp check for its DOCSIS configuration file. (This could indicate a possible theft-of-service attempt, or a problem with the synchronization of the clocks on the CM and CMTS.)
reject(pk)	KEK key assignment is rejected, BPI encryption has not been established.
reject(pkd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because KEK key assignment was rejected. Note This state is equivalent to the online(d) and reject(pk) states.
reject(pt)	TEK key assignment is rejected, BPI encryption has not been established.

MAC State Value ¹⁸	Description
reject(ptd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because TEK key assignment was rejected. Note This state is equivalent to the online(d) and reject(pt) states.
reject(ts)	The CM attempted to register, but registration failed because the TFTP server timestamp in the CM registration request did not match the timestamp maintained by the CMTS. This might indicate that the CM attempted to register by replaying an old DOCSIS configuration file used during a prior registration attempt.
reject(ip)	The CM attempted to register, but registration failed because the IP address in the CM request did not match the IP address that the TFTP server recorded when it sent the DOCSIS configuration file to the CM. IP spoofing could be occurring.
reject(na)	The CM attempted to register, but registration failed because the CM did not send a Registration-Acknowledgement (REG-ACK) message in reply to the Registration-Response (REG-RSP) message sent by the CMTS. A Registration-NonAcknowledgement (REG-NACK) is assumed.

¹⁸ The CM MAC state field can also be retrieved using SNMP by getting the value of the cdxCmtsCmStatusValue object in the CISCO-DOCS-EXT-MIB.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Table below shows the possible values for the MAC state field for a wideband-capable CM that registers as a wideband modem:

Table 149: Additional MAC States for a Wideband Cable Modem

MAC State Value	Description
Non-error Status Conditions	
w-online	The WCM has registered and is enabled to pass data on the network.
w-online(d)	The WCM registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. The CM does not forward traffic to or from the CPE devices, but the WCMTS can continue to communicate with the WCM using DOCSIS messages and IP traffic (such as SNMP commands). Note If BPI was enabled in the DOCSIS configuration file sent to the WCM, assume that the CM is using BPI encryption, unless other messages show that the BPI negotiation and key assignments have failed.
w-online(pkd)	The WCM registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and KEK is assigned. Note This state is equivalent to the w-online(d) and w-online(pk) states.

MAC State Value	Description
w-online(pt)	The WCM registered, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note If network access was disabled in the DOCSIS configuration file sent to the WCM, the network disabled status takes precedence, and the MAC status field shows w-online(d) instead of w-online(pt) even when BPI encryption is enabled and operational.
w-online(ptd)	The WCM registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note This state is equivalent to the w-online(d) and w-online(pt) states.
w-online(pk)	The WCM registered, BPI is enabled and KEK is assigned.
w-expire(pk)	The WCM registered, BPI is enabled, KEK was assigned, but the current KEK expired before the WCM could successfully renew a new KEK value.
w-expire(pkd)	The WCM registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value. Note This state is equivalent to the w-online(d) and w-expire(pk) states.
w-expire(pt)	The WCM registered, BPI is enabled, TEK was assigned, but the current TEK expired before the WCM could successfully renew a new KEK value.
w-expire(ptd)	The WCM registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, TEK was assigned, but the current TEK expired before the WCM could successfully renew a new KEK value. Note This state is equivalent to the w-online(d) and w-expire(pt) states.
Error Status Conditions	
w-reject(pk)	KEK key assignment is rejected, BPI encryption has not been established.
w-reject(pkd)	The WCM registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because KEK key assignment was rejected. Note This state is equivalent to the w-online(d) and w-reject(pk) states.
w-reject(pt)	TEK key assignment is rejected, BPI encryption has not been established.
w-reject(ptd)	The WCM registered, but network access for CPE devices using this WCM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because TEK key assignment was rejected. Note This state is equivalent to the w-online(d) and w-reject(pt) states.

Note For the complete list of the cable modem status, see [Table 100: Descriptions for the MAC State Field](#), on page 1888.

Related Commands	Command	Description
	show cable modem vendor	Associates the name of a vendor with its Organizational Unique Identifier (OUI).
	show cable modem	Displays information for the registered and unregistered CMs.
	show cable modem summary	Displays voice call information for a particular CM, identified either by its IP address or MAC address.
	show cable modem classifiers	Displays information about the classifiers for a particular CM.
	show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.
	show cable modem connectivity	Displays connectivity statistics for one or more CMs.
	show cable modem errors	Displays error statistics for one or more CMs.
	show cable modem flap	Displays flap list statistics for one or more cable modems.
	show cable modem maintenance	Displays station maintenance (SM) error statistics for one or more cable modems.
	show cable modem remote-query	Displays information collected by the remote-query feature.
	show cable modulation-profile	Displays modulation profile group information.
	show interface cable modem	Displays information about the CMs connected to a particular cable interface.
	show interface cable sid	Displays cable interface information.

show cable modem wideband phy

To display the physical information of registered and unregistered wideband CMs on the Cisco CMTS router, use the **show cable modem wideband phy** command in privileged EXEC mode.

show cable modem wideband phy

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following is a sample output for the default form of the **show cable modem wideband phy** command:

```
Router# show cable modem wideband phy

Table below describes the significant fields shown in the display:

Table 150: show cable modem wideband phy Field Descriptions

Field	Description
MAC Address	MAC address of the CM.
IP Address	IP address that the DHCP server has assigned to the CM.
I/F	Cable interface providing the upstream to the CM.
MAC State	Current state of the MAC layer.
Chan Desc	Descriptive name of the channel.
Frq State (MHZ)	Frequency value.
SNR (db)	Upstream signal-to-noise ratio (SNR) for a particular CM.
Pwr (dBmV)	Power value.

Related Commands

Command	Description
show cable modem	Displays information for the registered and unregistered CMs.
show cable modem summary	Displays voice call information for a particular CM, identified either by its IP address or MAC address.
show cable modem wideband	Displays information of registered and unregistered wideband CMs.
show interface cable modem	Displays information about the CMs connected to a particular cable interface.

show cable modem wideband primary-channel

To display primary-channel information for a wideband channel, use the **show cable modem wideband primary-channel** command in privileged EXEC mode.

show cable modem {ip-address | mac-address} wideband primary-channel

Syntax Description		
	<i>ip-address</i>	Identifies the IP address of a specific cable modem to be displayed. If you specify the IP address for a CPE device behind a cable modem, information for that cable modem is displayed.
	<i>mac-address</i>	Identifies the MAC address of a specific cable modem to be displayed. You can also specify the MAC address for a CPE device behind a cable modem, and information for that cable modem will be displayed.

Command Modes

Privileged EXEC

Command History

Release	Modification
12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command displays primary-channel information for a wideband channel that is associated with a specific MAC address or IP address of a cable modem or CPE device being the cable modem.

Related Commands

Command	Description
show cable modem	Displays information for the registered and unregistered cable modems.
show cable modem primary-channel summary total	Displays information for the wideband and narrowband cable modems and location of the primary downstream channel.

show cable modem wideband rcs-status

To display details of events for each RF channel in the cable modem's receive channel configuration (RCC), use the **show cable modem wideband rcs-status** command in privileged EXEC mode.

Cisco uBR Series Router

show cable modem {**mac-address** | **ip-address** | **cable slot/subslot/port**} **wideband rcs-status**

Cisco cBR Series Router

show cable modem {**mac-address** | **ip-address** | **cable slot/subslot/mac-domain**} **wideband rcs-status** [**verbose**]

Syntax Description

mac-address	(Optional) Specifies the MAC address of a wideband CM to be displayed.
ip-address	(Optional) Specifies the IP address of a wideband CM to be displayed.
cable slot/subslot/port	(Optional) Identifies a cable interface on the Cisco uBR10012 router. The following are the valid values: <ul style="list-style-type: none"> <i>slot</i> —Specifies the chassis slot number of the cable interface line card. Valid values are 5 to 8. <i>subslot</i> —Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1. <i>port</i> —Specifies the port number. Valid values are 0 to 4 (depending on the cable interface).
cable slot/subslot/mac-domain	(Optional) Identifies a cable interface on the Cisco cBR-8 router. The following are the valid values: <ul style="list-style-type: none"> <i>slot</i> —Specifies the chassis slot number of the cable interface line card. Valid values are 0 to 9. <i>subslot</i> —Specifies the secondary slot number of the cable interface line card. Valid subslots is 0. <i>mac-domain</i> —Specifies the mac-domain. The valid values are 0 to 15.

Table 151: Field Description for show cable modem wideband rcs-status command:

Field	Description
CM	Cable Modem
DS-CTRL	Downstream Integrated Controller
STATUS	RF channel DS resiliency status
RF CH ID	RF channel Docsis Channel ID
TYPE	RF channel OAM type
PRIM-CHAN	If it is a primary channel

Table 152: Field Description for show cable modem wideband rcs-status verbose command on the Cisco cBR Series Converged Broadband Routers:

Field	Description
CM	Cable Modem
RF	RF Channel
Status	RF channel DS resiliency status
FEC/QAM Failure	Loss of FEC lock or QAM count
Dup FEC/QAM Failure	Duplicate Loss of FEC lock or QAM count
FEC/QAM Recovery	FEC lock or QAM recovery count
Dup FEC/QAM Recovery	Duplicate FEC lock or QAM recovery count
MDD Failure	Secondary channel MDD timeout count
Dup MDD Failure	Duplicate Secondary channel MDD timeout count
MDD Recovery	Secondary channel MDD recovery count
Dup MDD Recovery	Duplicate Secondary channel MDD recovery count
Flaps	RF channel flap count
Flap Duration	RF channel flap duration
NCP PROF Failure	Loss of FEC lock on NCP count
Dup NCP PROF Failure	Duplicate loss of FEC lock on NCP count
NCP PROF Recovery	FEC recovery on NCP profile count

Field	Description
Dup NCP PROF Recovery	Duplicate FEC recovery on NCP profile count
PLC Lock Failure	Loss of FEC lock on PLC channel count
Dup PLC Lock Failure	Duplicate loss of FEC lock on PLC count
PLC Lock Recovery	FEC recovery on PLC channel count
Dup PLC Lock Recovery	Duplicate FEC recovery on PLC channel count
OFDM Profile Id	OFDM profile ID
Status	OFDM profile status
Profile Failure	Loss of FEC lock on OFDM profile count
DUP Profile Failure	Duplicate Loss of FEC lock on OFDM profile count
Profile Recovery	FEC recovery on OFDM profile count
DUP Profile Recovery	Duplicate FEC recovery on OFDM profile count

Related Commands

Command	Description
show cable modem summary wb-rf	Displays the number of RFs that are down on a cable interface.

show cable modulation-profile

To display modulation profile group information for a Cisco CMTS, use the **show cable modulation-profile** command in privileged EXEC mode.

Cisco uBR Series Router

```
show cable modulation-profile [profile [verbose]] [iuc-code]
show cable modulation-profile cable {slot /port | slot /subslot/port } [upstream port ]
```

Cisco cBR Series Router

```
show cable modulation-profile [profile [verbose]] [iuc-code]
show cable modulation-profile Upstream-Cable slot /card/port us-channel us-channel-id
show cable modulation-profile ofdma
```

Syntax	Description
<i>profile</i>	(Optional) Profile number. Valid values start with 1.
verbose	(Optional) Displays detailed information for an individual profile.
<i>iuc-code</i>	(Optional) Internal usage code (IUC). Valid options are: a-long —Advanced Phy Long Grant Burst (IUC 10) a-short —Advanced Phy Short Grant Burst (IUC 9) a-ugs —Advanced Phy Unsolicited Grant Burst (IUC 11) initial —Initial Ranging Burst (IUC 3) long —Long Grant Burst (IUC 6) reqdata —Request/Data Burst (IUC 2) request —Request Burst (IUC 1) short —Short Grant Burst (IUC 5) station —Station Ranging Burst (IUC 4)
cable <i>slot /port</i>	For uBR series router, identifies a cable interface and downstream port on the Cisco uBR7100 series and Cisco uBR7200 series routers. On the Cisco uBR7100 series router, the only valid value is 1/0 . On the Cisco uBR7200 series router, <i>slot</i> can range from 3 to 6, and <i>port</i> can be 0 or 1, depending on the cable interface.
cable <i>slot /subslot /port</i>	For uBR series router, identifies a cable interface on the Cisco uBR10012 router. The following are the valid values: <ul style="list-style-type: none"> • <i>slot</i> = 5 to 8 • <i>subslot</i> = 0 or 1 • <i>port</i> = 0 to 4 (depending on the cable interface)
upstream <i>port</i>	(Optional) For uBR series router, displays information for a particular upstream on the selected cable interface. The <i>port</i> value starts with 0 and continues up, depending on the type of cable interface card.

show cable modulation-profile

cable <i>slot /card/port</i>	For cBR series router, identifies a cable interface on the Cisco cBR-8 router. The following are the valid values: <ul style="list-style-type: none"> • <i>slot</i> = 0 to 9 • <i>card</i> = 0 • <i>port</i> = 0 to 15 (depending on the cable interface)
us-channel <i>us-channel-id</i>	(Optional) For cBR series router, displays information for a particular upstream on the selected cable interface. The <i>us-channel-id</i> value is from 0 to 12, depending on the type of cable interface card.
ofdma	Displays the OFDMA modulation profile details.

¹⁹ The Cisco CMTS recognizes the reqdata burst type but does not use it.

Command Modes

Privileged EXEC

Command History

Release	Modification
11.3 XA	This command was first introduced.
12.(0)5T1, 12.0(6)SC, 12.1(2)EC	This command was supported, replacing the show cable burst-profile command.
12.1(3a)EC	This reqdata type was added as a placeholder for scripts that might reference it, but the DOCSIS MAC scheduler on the Cisco CMTS does not use this type of burst.
12.2(15)CX	Support was added for the Cisco uBR-MC28U/X cable interface line card, including support for DOCSIS 2.0 A-TDMA and mixed modulation profiles. This includes adding additional information to the command's display, as well as adding the a-long , a-short , a-ugs , and verbose options.
12.2(15)CX1	Added the ability to display the modulation profiles being used by a particular cable interface and upstream.
12.2(15)BC2	This command displays all default modulation profiles (1, 21, 41, 101, 121, 201, 221, and 241), even when the cable interface card that is associated with those profiles is not installed. Previous releases displayed only the default modulation profiles that were in use.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The value range for the <i>slot /card /port</i> variables are changed.
Cisco IOS XE Everest 16.6.1	This command was modified. The ofdma keyword was added to display the OFDMA modulation profile details.

Usage Guidelines

The **show cable modulation-profile** command displays modulation profile group information. A modulation profile is a collection of burst profiles that are sent out in a Upstream Channel Descriptor (UCD) message to configure a modem's transmit parameters for an upstream message burst type.

Table below shows the IUC codes for each burst type:

Table 153: Internal Usage Code Types

IUC	Type	IUC	Type
IUC 1	Request Burst (req)	IUC 7	Not used
IUC 2	Request/Data Burst (reqdata) ²⁰	IUC 8	Not used
IUC 3	Initial Ranging Burst (initial)	IUC 9	Advanced Phy Short Grant Burst (a-short)
IUC 4	Station Ranging Burst (station)	IUC 10	Advanced Phy Long Grant Burst (a-long)
IUC 5	Short Grant Burst (short)	IUC 11	Advanced Phy Unsolicited Grant Burst (a-ugs)
IUC 6	Long Grant Burst (long)	IUC 12	Not used

²⁰ The Cisco CMTS recognizes the reqdata burst type but does not use it.

Modulation Profile Ranges

The ranges for modulation profiles depends on the cable interface being used and the type of modulation profile being created. Table below lists the valid ranges according to cable interface and modulation type:

Table 154: Allowable Ranges for Modulation Profiles

Cable Interface	DOCSIS 1.X (TDMA)	Mixed DOCSIS 1.X/2.0	DOCSIS 2.0 (A-TDMA)
Cisco uBR7100 series	1 to 10 ²¹ , default=1	N/A	N/A
Cisco uBR-MC16C	1 to 10, default=1	N/A	N/A
Cisco uBR-MC16S	1 to 10, default=1	N/A	N/A
Cisco uBR-MC28C	1 to 10, default=1	N/A	N/A
Cisco uBR10-MC5X20S, Cisco uBR10-MC5X20U, Cisco uBR10-MC5X20H	21 to 30, default=21	121 to 130, default=121	221 to 230, default=221
Cisco uBR-MC16U/X, Cisco uBR-MC28U/X	41 to 50, default=41	141 to 150, default=141	241 to 250, default=241

²¹ Only 8 modulation profiles are supported in Cisco IOS software releases before 12.2(15)BC1, so in these releases the valid range is 1 to 8.

Note Default modulation profiles are created for each type of card and operation mode. You cannot delete the default modulation profiles (1, 21, 41, 101, 121, 201, 221, and 241). In Cisco IOS Release 12.2(15)BC2 and later, all default modulation profiles are displayed, even when that particular cable interface is not installed. In previous versions, only the default modulation profiles that were in use were displayed.

Examples

The following example shows a sample output of the show cable modulation-profile ofdma command in Cisco IOS XE Everest 16.6.1 release:

show cable modulation-profile

```
Router# show cable modulation-profile ofdma

Mod  Subc   IUC type   Act  Preamble  Bit      Pilot
      Spacing  (IR)      subc Symbols  Loading  Pattern
421  25KHz   3         64      4
      4 (FR)   192      1
      13 (data)
      16-QAM  8

423  25KHz   3 (IR)    64      4
      4 (FR)   128      1
      6 (data)
      10 (data)
      11 (data)
      12 (data)
      13 (data)
      1024-QAM 8
      512-QAM  8
      256-QAM  8
      128-QAM  9
      64-QAM   9

461  50KHz   3 (IR)    32      4
      4 (FR)   192      1
      13 (data)
      16-QAM  1

466  50KHz   3 (IR)    64      4
      4 (FR)   128      1
      13 (data)
      1024-QAM 2
```

The following example shows a sample output of the show cable modulation-profile ofdma command in Cisco IOS XE Everest 16.6.1 release to show a list of upstream state us channels for a specific OFDMA profile:

```
Router# show cable modulation-profile ofdma 421

Mod  Subc   IUC type   Act  Preamble  Bit      Pilot
      Spacing  (IR)      subc Symbols  Loading  Pattern
421  25KHz   3         64      4
      4 (FR)   192      1
      13 (data)
      1024-QAM 8
```

```
**** OFDMA Profile Assigned Channels ****
Prof Channel
421 1/0/1:/12
```

The following is sample output from the show cable modulation-profile command in Cisco IOS Release 12.2(11)BC3 and earlier releases:

```
CMTS01# show cable modulation-profile

Mo IUC      Type  Preamb Diff FEC      FEC      Scrambl Max  Guard Last Scrambl Preamb
length enco T      CW      seed    B    time CW      offset
      bytes size size size size short
1  request qpsk  64    no  0x0  0x10  0x152  1    8    no    yes    56
1  initial qpsk  128   no  0x5  0x22  0x152  0    48   no    yes    0

```

Table below describes the significant fields displayed by the show cable modulation-profile command.

Table 155: show cable modulation-profile field descriptions

Field	Description
Mo	Modulation profile group number. A modulation profile group is the set of burst profiles that defines upstream transmit characteristics for the various types of upstream transmission classes.
IUC	Interval usage code. Each upstream transmit burst belongs to a class that is given a number called the interval usage code (IUC). Bandwidth maps messages (MAP) by IUC codes used to allocate upstream time slots. The following types are currently defined: <ul style="list-style-type: none"> • Request—Bandwidth request slot • Request Data—Bandwidth request and short data burst slot • Initial Maintenance—Initial link registration contention slot • Station Maintenance—Link keepalive slot • Short Data Grant—Short data burst slot • Long Data Grant—Long data burst slot
Type	Modulation type.
Preamb length	Preamble length.
Diff enco	Differential encoding enabled (yes) or not enabled (no).
FEC T bytes	Number of bytes that can be corrected for each forward error correction (FEC) code word.
FEC CW size	Size, in bytes, of the FEC code word.
Scrambl seed	Scrambler seed value in hex format.
Max B size	Maximum burst size.
Guard time size	Time between successive bursts measured in symbols.

Field	Description
Last CW short	Handling of FEC for shortened last code word.
Scrambl	Scrambler enabled (yes) or not enabled (no).
Preamb offset	(DOCSIS 1.0 and DOCSIS 1.1 modulation profiles) The bits to be used for the preamble value.
Pre offst	(DOCSIS 2.0 modulation profiles) The bits to be used for the preamble value.
Pre Type	(DOCSIS 2.0 modulation profiles) The A-TDMA preamble type (qpsk0 or qpsk1).
RS	(DOCSIS 2.0 modulation profiles) The A-TDMA RS encoding type.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable upstream modulation-profile	Configures a spectrum group to use a specified frequency.
show cable hop	Displays CM configuration settings.
show interface cable sid	Displays cable interface information.

show cable multicast authorization

To display the list of defined multicast authorization profiles and all CMs associated with corresponding profiles, use the **show cable multicast authorization** command in privileged EXEC mode.

show cable multicast authorization profile-group {*profile-group-number* | **all**} **profile-list** {*profile-number* | **all**}

Syntax Description

profile-group	Displays the profile group.
<i>profile-group-number</i>	Displays the profile number.
all	Displays all profile groups.
profile-list	Displays the profile list.
<i>profile-number</i>	Displays the profile number.
all	Displays all profiles.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
12.2(33)SCC	The command output was modified to display profile description for the specified profile.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to display all the profile groups, profile descriptions, and CMs associated with the profiles.

Examples

The following command shows all the profile groups and rules associated with it:

```
Router# show cable multicast authorization profile-group all
Profile-Group Index: 1
  CMs using this group: 2
  ProfileId   CMs      Profile
  -----
    0         2      prof1
    1         2      prof2
    2         2      prof3
Session-Rule List:
  Group / Source                                Prio  Action
  -----
  grp: FF15::1/64                              1     permit
  src: 0::0/0
  grp: FF15::1/64                              1     permit
```

```

src: 1234::1/64
grp: 224.1.1.1/16          1    permit
src: 0.0.0.0/0
grp: FF16::1/64          1    permit
src: 0::0/0
grp: 224.1.1.1/16        1    permit
src: 10.1.1.1/16
-----

```

The following command shows a particular profile group and rules associated with it:

```

Router# show cable multicast authorization profile-group 1
Profile-Group Index: 1
  CMs using this group: 2
  ProfileId   CMs      Profile
  -----
    0         2      prof1
    1         2      prof2
    2         2      prof3
Session-Rule List:
  Group / Source          Prio  Action
  -----
  grp: FF15::1/64        1     permit
  src: 0::0/0
  grp: FF15::1/64        1     permit
  src: 1234::1/64
  grp: 224.1.1.1/16      1     permit
  src: 0.0.0.0/0
  grp: FF16::1/64        1     permit
  src: 0::0/0
  grp: 224.1.1.1/16      1     permit
  src: 10.1.1.1/16
-----

```

The following command shows all the profiles and their profile descriptions, and the session rules for each profile.

```

Router# show cable multicast authorization profile-list all
CMTS Authorization Profile List
-----
Profile-Index: 0    Name: prof1
  Number of CMs: 2
  Id      Group / Source          Prio  Action
  -----
  1      grp: FF15::1/64
         src: 0::0/0              1     permit
  2      grp: FF15::1/64
         src: 1234::1/64         1     permit
  3      grp: 224.1.1.1/16
         src: 0.0.0.0/0         1     permit
  4      grp: FF16::1/64
         src: 0::0/0              1     permit
  5      grp: 224.1.1.1/16
         src: 10.1.1.1/16       1     permit
-----
Profile-Index: 1    Name: prof2

  -----
-----
Profile-Index: 2    Name: prof3
  Number of CMs: 2
  Id      Group / Source          Prio  Action
  -----
-----

```

 The following command shows a particular profile and its description.

```
Router# show cable multicast authorization profile-list 3
CMTS Authorization Profile List
-----
Profile-Index: 3    Name: gold
  Number of CMs: 0
  Profile Description: gold profile for higher bandwidth
  Id          Group / Source                                Prio  Action
-----
```

Table below describes the significant fields shown in the display.

Table 156: show cable multicast authorization Field Descriptions

Field	Description
Profile-Group Index	Displays the profile group index.
Name	Displays the name of the profile group.
Profile Description	Displays the description given to the profile.
ProfileId	Displays the QoS profile being used.
CMs	Displays the CMs belonging to the profile.
Profile	Displays the profile being used for multicast.
Session-Rule List	Displays the list of session rules being used for the multicast.
Source (src)	Displays the source IP address.
Group (grp)	Displays the group IP address.
Priority	Displays the rule priority value.
Action	Displays the action taken for multicast.

Related Commands

Command	Description
cable multicast auth enable default-action	Configures cable multicast authorization profile and sets the maximum sessions limit.
cable multicast auth profile-name	Configures cable multicast authorization profile.
profile description	Configures profile descriptions for each profile in the selected cable multicast authorization profile.
show cable multicast db	Displays the contents of multicast explicit tracking database.
show cable multicast dsid	Displays the entire DSID database content.

Command	Description
show cable multicast qos	Displays the configuration information for MQoS, (Group-Config, Group-QoS-Config, Group-Encryption-Config).

show cable multicast db

To display the contents of the multicast explicit tracking database, use the **show cable multicast db** command in privileged EXEC mode.

```
{show cable multicast db [{bundle bundle-interface [{ipv4-address|ipv6-address | summary}]} | cm-mac
[{host-mac-add | hosts | proxy}] | summary | client pcmm}] | [detail]}
```

Syntax Description

<i>bundle bundle-interface</i>	(Optional) Displays the bundle interface. For example, Bundle 10.
<i>ipv4-address</i>	(Optional) IPv4 address.
<i>ipv6-address</i>	(Optional) IPv6 address of the group that should be matched using the format X:X:X:X:X.
<i>cm-mac</i>	(Optional) MAC address of the cable modem.
<i>host-mac-add</i>	(Optional) Host MAC address.
hosts	(Optional) Displays host details.
proxy	(Optional) Displays proxy details.
summary	(Optional) Displays the bundle interface summary or the multicast explicit tracking database summary.
client	(Optional) Displays entries by the client type.
pcmm	(Optional) Displays all PacketCable multimedia (PCMM) client entries.
detail	(Optional) Displays additional information related to the multicast explicit tracking database.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
12.2(33)SCE	This command was modified. The following two keywords were added to this command: <ul style="list-style-type: none"> • client • pcmm
12.2(33)SCF	This command was modified. A new keyword, detail , was added to provide additional information related to the multicast explicit tracking database.

Release	Modification
IOS-XE 3.15.0S	This command was integrated into Cisco IOS-XE Release 3.15.0S. Support for the Cisco cBR Series Converged Broadband Routers was added.

Usage Guidelines

Starting with Cisco IOS Release 12.2(33)SCF:

- There is an Explicit Tracking Database (ETDB) entry for each static multicast configuration.
- The total number of replications supported on each chassis is restricted to a maximum of 5000 replications.
- The total number of replications corresponding to static multicast is restricted to a maximum of 1500 replications.
- The **show cable multicast db detail** command is not applicable for ETDB entries created by the static TLV.

Examples

The following is a sample output from the **show cable multicast db** command:

```
Router# show cable multicast db
Interface : Bundle1
Session (S,G) : (*,230.1.1.1)
Fwd Intfc Sub Intfc Host Intfc CM Mac Hosts
w1/0/0:0      Bundle1      w1/0/0:0      aaaa.bbbb.cccc      2
w1/0/0:0      Bundle1      w1/0/0:0      aaaa.bbbb.cccc      2
Session (S,G) : (255.255.255.255,255.255.255.255)
Fwd Intfc Sub Intfc Host Intfc CM Mac Hosts
w1/0/0:0      Bundle1      w1/0/0:0      aabb.bbcc.ccdd      3
Interface : Bundle2
Session (S,G) : (*,230.1.1.1)
Fwd Intfc Sub Intfc Host Intfc CM Mac Hosts
w1/0/0:0      Bundle2      w1/0/0:0      aaaa.bbbb.cccc      2
w1/0/0:0      Bundle2      w1/0/0:0      aaaa.bbbb.cccc      2
Session (S,G) : (255.255.255.255,255.255.255.255)
Fwd Intfc Sub Intfc Host Intfc CM Mac Hosts
w1/0/0:0      Bundle2      w1/0/0:0      aabb.bbcc.ccdd      3
```

The following is a sample output from the **show cable multicast db summary** command:

```
Router# show cable multicast db summary
Interface Session Count CM Count
Bundle1      10      5
Bundle2      23      11
```

The following is a sample output from the **show cable multicast db bundle bundle-interface** command:

```
Router# show cable multicast db bundle 1
Interface : Bundle1
Session (S,G) : (*,230.1.2.3)
Fwd Intfc Sub Intfc Host Intfc CM Mac Hosts

Table below describes the significant fields shown in the show cable multicast db command display.

Table 157: show cable multicast db Field Descriptions

Field	Description
Bundle Interface	Bundle interface number.

Field	Description
CM Mac	MAC address of the CM.
Host Mac	Host MAC address.
Fwd Intfc	Forwarding interface name.
Sub Intfc	Sub-interface name.
Host Intfc	Host interface name.
IGMP/MLD Ver	IPv4 or IPv6 multicast group signaling protocols. IPv4: IGMPv1/v2/v3 IPv6: MLDv1/v2
TimeStamp Delta	Timestamp of the session.
Hosts	Hosts behind the CM.
CPE IP	IP address of the CPE.
Gate-ID	Unique number identifying the local PCMM multicast gate.
SFID	Service flow ID (SFID) for the downstream associated with this PCMM multicast gate.

Note For cBR Series Broadband Converged Routers, multicast ipv6 support will be supported in later releases.

Related Commands

Command	Description
show cable multicast authorization	Displays the list of defined multicast authorization profiles and all cable modems associated with the corresponding profiles.
show cable multicast dsid	Displays the entire multicast downstream service identifier (DSID) database content.
show cable multicast qos	Displays the configuration information of the MQoS (Group-Config, Group-QoS-Config, Group-Encryption-Config).
show packetcable gate multimedia	Displays the information about the total number of PCMM multicast gates.

show cable multicast debug

To display information about debug counters, use the **show cable multicast** debug command in privileged EXEC mode.

show cable multicast debug [**etdb** [{*multicast-group-address**mac-address*}]]

Syntax Description	etdb	(Optional) Displays information about multicast explicit tracking database debug counters.
	<i>multicast-group-address</i>	(Optional) IP address of the multicast group.
	<i>mac-address</i>	(Optional) MAC address of the cable modem.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCE	This command was introduced.

Usage Guidelines The **show cable multicast debug** command provides information only about the explicit tracking database counter in Cisco IOS Release 12.2(33)SCE and later. This means that the command output does not include other debug counters such as multicast authorization and multicast quality of service (QoS).

If you want to verify multicast group specific or MAC specific debug counters, you must turn on debugging of multicast counters using the debug cable multicast counter start command before using the **show cable multicast debug** command.

Note The command output will be the same if you run the **show cable multicast debug** command with or without the keyword **etdb** in Cisco IOS Release 12.2(33)SCE, because this command does not support any other debug counters in Cisco IOS Release 12.2(33)SCE.

Examples

The following is a sample output of the **show cable multicast debug** command that displays information about multicast explicit tracking database debug counters on the Cisco uBR10012 router:

```
Router# show cable multicast debug
ETDB
counter                value
et_ses_update          3
et_ses_delete          0
et_cm_delete           0
et_post_host_add       1
et_post_cm_add         1
et_post_ses_intf_update 3
et_post_ses_intf_delete 0
```

```
et_post_cm_delete          0
et_post_host_delete       0
```

The following is a sample output of the **show cable multicast debug** command that displays information about multicast explicit tracking database debug counters based on a particular multicast group:

```
Router# show cable multicast debug etdb 230.1.1.1
ETDB GROUP:230.1.1.1
counter                    value
et_ses_update             3
et_ses_delete             0
et_post_host_add          1
et_post_cm_add            1
et_post_ses_intf_update   3
et_post_ses_intf_delete   0
et_post_cm_delete         0
et_post_host_delete       0
```

The following is a sample output of the **show cable multicast debug** command that displays information about multicast explicit tracking database debug counters based on a particular cable modem:

```
Router# show cable multicast debug etdb 001a.c3ff.d41a
ETDB CM:001a.c3ff.d41a
counter                    value
et_ses_update             2
et_ses_delete             0
et_cm_delete              0
et_post_host_add          0
et_post_cm_add            0
et_post_ses_intf_update   2
et_post_cm_delete         0
et_post_host_delete       0
```

Table below describes the major fields shown in the **show depi** command display:

Table 158: show cable multicast debug Field Descriptions

Field	Description
ETDB	Multicast explicit tracking database
counter	Debug counters for the multicast operation.
value	Debug counter values.
ETDB GROUP	Identifies a particular multicast group for explicit tracking database debug counters.
ETDB CM	Identifies a particular cable modem for explicit tracking database debug counters.

Related Commands

Command	Description
debug cable multicast counter clear	Resets debugging of multicast counters.
debug cable multicast counter start	The Cisco CMTS router starts collecting multicast debug counters based on a particular multicast group or a cable modem.

Command	Description
debug cable multicast counter stop	The Cisco CMTS router stops collecting multicast debug counters.

show cable multicast dsid

To display the entire Downstream Service Identifier (DSID) database content, use the **show cable multicast dsid** command in privileged EXEC mode.

Cisco uBR7246VXR and Cisco uBR7225VXR Routers

```
show cable multicast dsid [{dsidip-address | [ source-ip ] | integrated-cable slot /port :integrated-channel
{dynamic | static} | wideband-cableslot /port :wideband-channel {dynamic } ipv6-address}]
```

Cisco uBR10012 Router

```
show cable multicast dsid [{dsidip-address | [ source-ip ] | integrated-cable slot /sub-slot /port
: integrated-channel {dynamic | static} | wideband-cableslot /bay /port :wideband-channel {dynamic
| static} ipv6-address}]
```

Cisco cBR Series Router

```
show cable multicast dsid [{dsidip-address | [ source-ip ] | integrated-cable slot /sub-slot /port
: integrated-channel {dynamic | static} | wideband-cableslot /bay /port :wideband-channel dynamic
ipv6-address}]
```

Syntax Description

dsid	Specifies the Downstream Service Identifier.
ip-address	Specifies the IP address of the group.
integrated-cable slot /sub-slot /port :integrated-channel	Identifies the cable interface on the router for which information should be displayed, where: <ul style="list-style-type: none"> • <i>slot</i>—0 to 8 for uBR series router, 0 to 9 for cBR series router • <i>sub-slot</i>—0 or 1 for uBR series router, 0 for cBR series router • <i>port</i>—0 to 4 for uBR series router, 0 to 7 for cBR series router • <i>integrated-channel</i> —0 to 3 for uBR series router, 0 to 157 for cBR series router
wideband-cable slot /sub-slot /port :wideband-channel	Identifies the wideband interface on the router for which information should be displayed, where: <ul style="list-style-type: none"> • <i>slot</i>—0 to 8 for uBR series router, 0 to 9 for cBR series router • <i>sub-slot</i>—0 or 1 for uBR series router, 0 for cBR series router • <i>port</i>—0 to 4 for uBR series router, 0 to 7 for cBR series router • <i>wideband-channel</i>—0 to 5 for uBR series router, 0 to 63 for cBR series router
ipv6-address	Specifies the IPv6 address of the group that should be matched using the format X:X:X:X::X.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
12.2(33)SCC	This command was modified to display all the SIP/SPA indexes assigned for a multicast session.
12.2(33)SCD	This command was modified. Support for Cisco uBR7246VXR and Cisco uBR7225VXR routers were added. Two new keywords, dynamic and static, were added to this command.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The dynamic keyword in the wideband-cable was removed.

Usage Guidelines

Use this command to display the DSID database content and SIP/SPA indexes assigned for a multicast session.

Examples

The following example shows sample output for the **show cable multicast dsid** command:

```
Router# show cable multicast dsid

Multicast Group   : 230.1.2.3
  Source          : *

```

Table below describes the significant fields shown in the display.

Table 159: show cable multicast dsid Field Descriptions

Field	Description
Multicast Group	Displays the multicast group.
Source	Displays the source IP address.
IDB	Interface description block number.
Interface	Displays the interface name.
Dsid	The Downstream Service Identifier.
StatIndex	The Blaze indexes assigned for a multicast session.
SAID	Security Association Identifier (SAID).

Related Commands

Command	Description
show cable multicast authorization	Displays the list of defined multicast authorization profiles and all CMs associated with corresponding profiles.
show cable multicast db	Displays the contents of multicast explicit tracking database.
show cable multicast qos	Displays the configuration information for MQoS, (Group-Config, Group-QoS-Config, Group-Encryption-Config).

show cable multicast qos

To display the configuration information for multicast quality of service (MQoS), use the **show cable multicast qos** command in privileged EXEC mode.

```
show cable multicast qos {group-config [group-config-index] | group-encryption
[group-encryption-index] | group-qos [group-qos-index]}
```

Syntax Description

group-config	Displays multicast group configuration information.
group-config-index	(Optional) Index for the multicast group. The valid range is from 1 to 2048.
group-encryption	Displays multicast group encryption information.
group-encryption-index	(Optional) Index for the multicast group encryption.
group-qos	Displays multicast group QoS information.
group-qos-index	(Optional) Index for the multicast group QoS.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
12.2(33)SCC	The command output was modified to display the application ID for default multicast group QoS configuration.
12.2(33)SCE	The command output was modified to list the PCMM application for multimedia multicast configuration.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

Example of the **show cable multicast qos** Command Output for Multicast Group Configuration

The following example shows a sample output of the command that displays multicast group configuration information: :

```
Router# show cable multicast qos group-config
Default Multicast Group-Qos Application ID 65535
Multiast Group Config 1 : Priority 1
Group QOS - 1
Group Encryption - 1
Application ID 65534
Session Range - Group Prefix 230.0.0.0 Mask 255.0.0.0 Source Prefix 0.0.0.0 Mask 0.0.0.0
```

Example of the **show cable multicast qos** Command Output for Multicast Group Encryption

The following example shows a sample output of the **show cable multicast qos** command that displays multicast group encryption information:

```
Router# show cable multicast qos group-encryption
Multicast Group Encryption 1 : Algorithm 56bit-des
Multicast Group Encryption 2 : Algorithm 128bit-aes
```

Example of the show cable multicast qos Command Output for Multicast Group QoS

The following example shows a sample output of the **show cable multicast qos** command that displays multicast group QoS information in Cisco IOS Release 12.2(33)SCC:

```
Router# show cable multicast qos group-qos
Group QoS Index Service Class Control Igmp Limit Override
DEFAULT MQOS_DEFAULT Aggregate NO-LIMIT 1 MQOS Aggregate NO-LIMIT
```

The following example shows a sample output of the **show cable multicast qos** command that displays multicast group QoS information including the application (the App field) for multimedia multicast configuration in Cisco IOS Release 12.2(33)SCE:

```
Router# show cable multicast qos group-qos
Group QoS Index Service Class Control Igmp Limit Override App
DEFAULT mcast_default Aggregate NO-LIMIT
1 SDV_SD Single --- No CLI
512 SDV_HD Single --- No PCMM
```

Table below describes the significant fields shown in the display.

Table 160: show cable multicast qos Field Descriptions

Field	Description
Group	Identifies the multicast group.
QoS	Identifies the QoS profile that is being enforced.
Index	Index number of the QoS group.
Service Class	Identifies the service class being used for the multicast.
Control	Identifies the type of control.
Igmp Limit	Displays the Internet Group Management Protocol (IGMP) session limit for aggregate service flows.
Override	Displays the additional IGMP session admitted and forwarded as best effort traffic.
App	Displays the application used for multimedia multicast.

Related Commands

Command	Description
show cable multicast authorization (for uBR series router)	Displays the list of defined multicast authorization profiles and all CMs associated with corresponding profiles.
show cable multicast db	Displays the contents of multicast explicit tracking database.
show cable multicast dsid	Displays the entire Downstream Service Identifier (DSID) database content.

show cable multicast ses-cache

To display the current multicast replication sessions cache information, use the **show cable multicast ses-cache** command in interface configuration and global configuration mode.

```
show cable multicast ses-cache interface integrated-cable slot/subslot/port:rf-channel [{summary | verbose}]
show cable multicast ses-cache interface modular-cable slot/{subslotbay}/port:interface-number [{summary | verbose}]
show cable multicast ses-cache interface wideband-cable slot/{subslotbay}/port:wideband-channel [{summary | verbose}]
show cable multicast ses-cache global [summary]
```

Syntax Description	
interface integrated-cable <i>slot/subslot/port:rf-channel</i>	Displays the multicast replication sessions cache information for a integrated-cable interface. <ul style="list-style-type: none"> • <i>slot</i>—Slot where a line card resides. • <i>subslot</i>—(Cisco uBR10012 only) Secondary slot number of a line card. • <i>port</i>—Downstream port number. • <i>rf:channel</i>—RF channel number.
interface integrated-cable <i>slot/{subslot / bay}/port:interface-number</i>	Displays the multicast replication sessions cache information for a wideband-cable interface. <ul style="list-style-type: none"> • <i>slot</i>—Slot where a SPA interface processor (SIP) or a line card resides. • <i>subslot</i>—Secondary slot for a shared port adapter (SPA) or a line card. • <i>bay</i>—Bay in a SIP where a SPA is located. • <i>port</i>—Downstream port number. • <i>interface-number</i>—Modular cable interface number
interface wideband-cable <i>slot/{subslot / bay}/port:wideband-channel</i>	Displays the multicast replication sessions cache information for a wideband-cable interface. <ul style="list-style-type: none"> • <i>slot</i>—Slot where a SPA interface processor (SIP) or a line card resides. • <i>subslot</i>—Secondary slot for a shared port adapter (SPA) or a line card. • <i>bay</i>—Bay in a SIP where a SPA is located. • <i>port</i>—Downstream port number. • <i>wideband-channel</i>—Wideband channel number.
global	Displays the multicast replication sessions cache information at a global level.
summary	Provides summarized information of the multicast replication sessions cache.

verbose	Provides detailed information of the multicast replication session cache.
----------------	---

Command Modes

Global configuration (config)

Interface configuration (config-if)

Command History

Release	Modification
12.2(33)SCH	This command was introduced.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **show cable multicast ses-cache interface** and the **show cable multicast ses-cache global** command displays the session cache information when multicast replication session cache is configured on the Cisco uBR10012 router. The **show cable multicast ses-cache global** command displays the cache information for all interfaces at the chassis level. The **show cable multicast ses-cache interface** displays the session cache information for a particular interface.

Table below displays the valid values for an integrated-cable interface.

Table 161: Integrated Cable Interface Density Information

CMTS Router	Line Card	Slot	Subslot	Port	RF Channel Number
Cisco uBR10012	Cisco uBR-MC3GX60V	5 to 8	0 or 1	0 to 4	0 to 3
	Cisco UBR-MC20X20V				
	Cisco uBR10-MC5X20				
Cisco uBR7225VXR	All	1 or 2	—	0 or 1	—
Cisco uBR7246VXR	All	3 to 6	—	0 or 1	—

Table below displays the valid values for a modular cable interface.

Table 162: Modular Cable Interface Density Information

Line Card	Slot	Subslot	Bay	Port	Interface Number
Cisco uBR-MC3GX60V	5 to 8	0 or 1	—	0 to 2	0 to 23
Cisco UBR-MC20X20V			—	0 to 5	
Cisco Wideband SPA	—	0 or 1 ²²	0 to 3	0	
Cisco Wideband SIP / Cisco SIP-600	1 or 3	—	—	—	

²² Applicable to SPAs when the SIP is in Slot1 or Slot 3. The subslot is not specified from Cisco IOS Release 12.2(33)SCB onwards.

Table below displays the valid values for a wideband-cable interface.

Table 163: Wideband Interface Density Information

CMTS Router	Line Card	Slot	Subslot	Bay	Port	Wideband Channel
Cisco uBR10012	Cisco uBR-MC3GX60V	5 to 8	0 or 1	—	0 to 4	0 to 31
	Cisco UBR-MC20X20V			—		0 to 5
	Cisco uBR10-MC5X20			—		—
	Cisco Wideband SPA	—	0 or 1 ²³	0 to 3	0	—
	Cisco Wideband SIP / Cisco SIP-600	1 or 3	—	—	—	—
Cisco uBR7225VXR	All	1 to 2	—	—	0 or 1	0 to 5
Cisco uBR7246VXR	All	3 to 6	—	—		

²³ Applicable to SPAs when the SIP is in Slot1 or Slot 3. The subslot is not specified from Cisco IOS Release 12.2(33)SCB onwards.

Examples

The following example displays the multicast replication session cache information at the global level:

```
Router#
show cable multicast ses-cache global
```

```
Fwd Intfc      Sub Intfc      Session (S,G)
Wi7/1/0:0      Bundle1        (30.30.30.30,227.0.0.20)
                Bundle1        (30.30.30.30,227.0.0.22)
Wi7/1/0:1      Bundle1        (30.30.30.30,226.0.0.20)
                Bundle1        (30.30.30.30,226.0.0.22)
                Bundle1        (30.30.30.30,226.0.0.23)
                Bundle1        (30.30.30.30,226.0.0.21)
Mo6/0/1:0      Bundle1        (*, 230.0.8.138)
In8/1/0:1      Bundle1        (*, 226.0.0.18)
```

The following example displays the multicast replication session cache at the wideband-cable interface:

```
Router# show cable multicast ses-cache interface wi7/1/0:1
Fwd Intfc      Sub Intfc      Session (S,G)
Wi7/1/0:1      Bundle1        (30.30.30.30,226.0.0.20)
                Bundle1        (30.30.30.30,226.0.0.22)
                Bundle1        (30.30.30.30,226.0.0.23)
                Bundle1        (30.30.30.30,226.0.0.21)
```

Table below describes the significant fields shown in the display.

Table 164: show cable multicast ses-cache Field Descriptions

Field	Description
Fwd Intc	Layer 2 forwarding interface such as interface cable, integrated-cable and wideband-cable interface.
Sub Intfc	Sub interface.
Session (S,G)	Secondary multicast group.

The following example shows a summarized view of the multicast replication session cache information at the chassis level:

```
Router# show cable multicast ses-cache global summary
Global Cache Config: 20
```

```
-----
Fwd          Cache      Cache      Cache      Cache
Intfc        Config     Used       Missed     Hitted
Wi7/1/0:1    10         4          4          12
Mo6/0/1:0    12         3          3          15
In8/1/0:1    100        1          1          0
-----
```

Total

The following example is a summary of the multicast replication session cache at the wideband interface:

```
Router# show cable multicast ses-cache interface wi7/1/0:1 summary
Global Cache Config: 20
```

```
-----
Fwd          Cache      Cache      Cache      Cache
Intfc        Config     Used       Missed     Hitted
Wi7/1/0:1    10         4          4          12
-----
```

Table below describes the significant fields shown in the display.

Table 165: show cable multicast ses-cache summary Field Descriptions

Field	Description
Fwd Intfc	Layer 2 forwarding interface.
Cache Config	Multicast session cache value.
Cache Used	No. of sessions used from cache.
Cache Missed	No. of IGMP join sessions that were missed.
Cache Hitted	No. of times the IGMP join session was matched with the reused cache sessions.

The following example displays verbose information of the multicast replication session cache at the wideband interface:

```
Router# show cable multicast ses-cache wi8/0/0:0 verbose
Multicast Group : 232.10.0.8
Source          : 100.0.0.2
```

```

Act GCRs : 1
Interface : Bu255                State: A      GI: Bu255      RC: 0
GCR      : GC SAID SFID Key GQC GEn
           10 8858 24 0 1 0
Multicast Group : 232.10.0.16
Source        : 100.0.0.2
Act GCRs     : 1
Interface    : Bu255                State: A      GI: Bu255      RC: 0
GCR         : GC SAID SFID Key GQC GEn
              10 8859 25 0 1 0
Total session cache num: 2

```

Table below describes the significant fields shown in the display.

Table 166: show cable multicast ses-cache verbose Field Descriptions

Field	Description
Multicast Group	IP address of the multicast group
Source	IP address of the source.
Act GCRs	Active group classifier rules on the multicast QoS.
Interface	Forwarding interface.
GCR	Group classifier rules.

Related Commands

Command	Description
cable multicast ses-cache	Enables multicast replication session on the forwarding interface on the Cisco uBR10012 router.
clear cable multicast ses-cache	Clears the multicast replication session cache on the interfaces on the Cisco uBR10012 router.

show cable multicast statistics

To display the multicast statistics details, use the **show cable multicast statistics** command in privileged EXEC mode.

show cable multicast statistics {*index* | **failure** | **pool** [*pool-id*] [**verbose**]}

Syntax Description

index Statistics index value of the configured multicast. The valid range is from 61320 to 64815.

failure Displays the multicast statistics failure information.

pool Displays the multicast statistics pool information.

pool-id Multicast statistics pool ID. The valid range is from 0 to 15.

verbose Displays the detailed multicast statistics pool information.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCF	This command was introduced.
12.2(33)SCI	This command was modified. The output of the command with the pool keyword was modified to display the downstream service identifier (DSID) allocation information.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The Pool_Start and Pool_End columns in the output were removed.

Usage Guidelines

The **show cable multicast statistics failure** command displays information about admission control failure, PXF (uBR series router) or DP (cBR series router) queue failure, IGMP report drop, and DBC failure counters.

Examples

The following is a sample output from the **show cable multicast statistics failure** command in uBR series router:

```
Router# show cable multicast statistics failure
```

```
counter                value
Admission Control Failure  0
PXF Queue Failure       0
IGMP Report Drop        0
DBC Failure              0
```

```
Driver IGMP Dropped:
  Fragmented             0
  Record Size Incorrect  0
  IP Sanity Error        0
  IGMP Sanity Error      0
  IGMP CRC Error         0
```

The following is a sample output from the **show cable multicast statistics failure** command in cBR series router:

```
Router# show cable multicast statistics failure

counter                value
Admission Control Failure  0
DP Queue Failure         0
IGMP Report Drop         0
DBC Failure              0

Driver IGMP Dropped:
  Fragmented              0
  Record Size Incorrect   0
  IP Sanity Error         0
  IGMP Sanity Error       0
  IGMP CRC Error          0
```

The following is a sample output from the **show cable multicast statistics pool** command in uBR series router:

```
Router# show cable multicast statistics pool

Pool  Total  Allocated  Pool_Start  Pool_End
9     3496   24         24          0
```

The following is a sample output from the **show cable multicast statistics pool** command in cBR series router:

```
Router# show cable multicast statistics pool

Pool  Total  Allocated
9     3496   24
```

The following is a sample output from the **show cable multicast statistics pool** command for the pool ID 9 in uBR series router:

```
Router# show cable multicast statistics pool 9

Pool  Total  Allocated  Pool_Start  Pool_End
9     3496   24         24          0

Stat Index List:
    61320 61321 61322 61323 61324 61325 61326 61327 61328 61329 61330 61331
    61332 61333 61334 61335 61336 61337 61338 61339 61340 61341 61342 61343
```

The following is a sample output from the **show cable multicast statistics pool** command for the pool ID 9 in cBR series router:

```
Router# show cable multicast statistics pool 9

Pool  Total  Allocated
6     18256  1136

Stat Index List:
243888 243890 243892 243894 243895 243896 243898 243899 243900 243902 243904 243906
243907 243908 243910 243911 243912 243914 243916 243918 243919 243920 243922 243923
```

The table below describes the significant fields shown in the display:

Table 167: show cable multicast statistics pool Field Descriptions

Field	Description
Pool	Multicast statistics pool ID.
Total	Total number of statistics index.
Allocated	Number of allocated statistics index.
Pool_Start	For uBR series router, pointer to the position of the first available statistics index.
Pool_End	For uBR series router, pointer to the position of the last available statistics index.
Stat Index List	List of the allocated statistics index in the pool.

The following is a sample output from the **show cable multicast statistics** command with an index value of 61328:

```
Router# show cable multicast statistics 61328

Stat Index Pool id: 9

Multicast Group   : 232.1.1.1
  Source          : N/A
  Interface: Mo5/1/0:8   StatIndex : 61328
  SAID           : 8203           SFID : 59           NB/WB index : 15/0
```

The following is a sample output from the **show cable multicast statistics pool verbose** command:

```
Router# show cable multicast statistics pool verbose

Stat Index Pool id: 9

Multicast Group   : 232.1.1.1
  Source          : N/A
  Interface: Mo5/1/0:0   StatIndex : 61320

```

The table below describes the significant fields shown in the display:

Table 169: show cable multicast statistics pool Field Descriptions

Field	Description
Pool	Multicast statistics pool ID.
Total	Total number of statistics index.

Field	Description
Allocated	Number of the allocated statistics index.
Min DSID	Minimum value of the DSID.
Max DSID	Maximum value of the DSID.

Related Commands

Command	Description
show cable multicast db	Displays the contents of the multicast explicit tracking database.
clear cable multicast statistics counter	Clears all multicast statistics counters.

show cable noise

To display cable noise statistics on a Cisco CMTS, use the **show cable noise** command in EXEC mode.

show cable {*slot /port* | *slot /subslot /port*} **noise**

Syntax Description		
<i>slot /port</i>	Identifies the cable interface and downstream port on the Cisco uBR7100 series and Cisco uBR7200 series routers.	On the Cisco uBR7100 series router, the only valid value is 1/0 . On the Cisco uBR7200 series router, <i>slot</i> can range from 3 to 6, and <i>port</i> can be 0 or 1, depending on the cable interface.
<i>slot /subslot /port</i>	Identifies the cable interface on the Cisco uBR10012 router. The following are the valid values:	<ul style="list-style-type: none"> • <i>slot</i> = 5 to 8 • <i>subslot</i> = 0 or 1 • <i>port</i> = 0 to 4 (depending on the cable interface)

Command Modes

EXEC

Command History

Release	Modification
12.0(4)XI	This command was introduced.
12.1(3a)EC1	This command was removed from the 12.1 EC release.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command is not supported on Cisco IOS Release 12.1(3a)EC1 or later releases.

Examples

The following example shows how to display CM noise statistics:

```
Router# show cable 6/0 noise
```

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
show cable modem	Displays CM configuration settings.

show cable ofdm-chan-profiles

To verify the OFDM channel profile configuration, use the **show cable ofdm-chan-profile** command in privileged EXEC mode.

show cable ofdm-chan-profile{*id* | **channels** | **configuration**}

Syntax Description

id	Display an individual OFDM channel profile's configuration and assigned channels.
channels	Display the assigned channels for all configured OFDM channel profiles.
configuration	Display the configuration for all OFDM channel profiles.

Command Modes

Privileged EXEC

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.18.1SP	This command was modified on the Cisco cBR Series Converged Broadband Routers. guardband override was added in the command output.

Examples

The following example displays an individual OFDM channel profile's configuration and assigned channels:

```
Router# show cable ofdm-chan-profile 21
**** OFDM Channel Profile Configuration ****

Prof  Cycl  Roll  Guardband  FFT  Intr  Pilot  Modulation (D-Default, P-Profile)

Related Commands

Command	Description
cable downstream ofdm-chan-profile	Define the OFDM channel profile on the OFDM channel.

show cable ofdm-modulation-profiles

To verify the OFDM modulation profile configuration, use the **show cable ofdm-modulation-profile** command in privileged EXEC mode.

show cable ofdm-modulation-profile {*id* | **channel-profiles** | **configuration**}

Syntax Description

<i>id</i>	Display an individual OFDM modulation profile's configuration and channel profiles that include this modulation profile.
channel-profiles	Display the OFDM channel profiles that include this modulation profile.
configuration	Display the configuration for all OFDM modulation profiles.

Command Modes

Privileged EXEC

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example displays an individual OFDM modulation profile's configuration and channel profiles that include this specific modulation profile:

```
Router# show cable ofdm-modulation-profile 8

**** OFDM Modulation Profile Configuration ****

Related Commands

Command	Description
cable downstream ofdm-modulation-profile	Define the OFDM modulation profile on the OFDM channel.

show cable privacy

To display Baseline Privacy Interface Plus (BPI+) certificate information and the security or privacy information for the Cisco CMTS router, use the **show cable privacy** command in privileged EXEC mode.

Cisco uBR Series Router

```
show cable privacy {eae-exclude | hotlist cm | manufacturer-cert-list | root-cert-list}
```

Cisco cBR Series Router

```
show cable privacy {eae-exclude | hotlist {cm | host} | manufacturer-cert-list | root-cert-list}
```

Syntax Description

eae-exclude	Displays the early authentication and encryption (EAE) details.
hotlist cm	Displays a list of cable modems detected as clones.
host	Block a CPE.
manufacturer-cert-list	Displays the BPI manufacturer certificate verification list.
root-cert-list	Displays the BPI root certificate verification list.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
11.3 NA	This command was introduced in a different form and its functions moved to the show interface cable privacy command.
12.2(4)BC1	This command was introduced in its current form.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCC	This command was modified. The eae-exclude keyword was added.
12.2(33)SCE	This command was modified. The hotlist keyword was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The host keyword was added.

Usage Guidelines

The **show cable privacy** command is available only in IOS images that support BPI and BPI+ encryption.

Examples

The following is a sample output of the show cable privacy command with the **eae-exclude** keyword that lists the cable modems excluded from the early authentication and encryption process:

```
Router#
  show cable privacy eae-exclude

EAE Exclusion List:
```

```
MAC: 1111.1111.1111 Mask: ffff.ffff.ffff
MAC: 2222.2222.2222 Mask: ffff.ffff.ffff
```

The following is a sample output of the show cable privacy command with the **hotlist** keyword that lists the permanent and temporary hotlist entries:

```
Router#
show cable privacy hotlist
cm
MAC Address          Last Ranged          Type          Interface
0025.2eaf.6f16      Dec 13 21:03:56      Permanent     C8/1/0
0025.2eaf.6f26      Dec 13 21:03:56      Temporary     C5/1/0
```

Table below describes the significant fields shown in the **show cable privacy command** display:

Table 170: show cable privacy Command Field Description

Field	Description
MAC Address	MAC address of the cable modem that is on the hotlist.
Last Ranged On	Displays the time stamp when the cable modem last attempted registration on that interface. This value helps gauge the frequency with which the MAC address is attempting to be cloned, and manage the hotlist accordingly.
Type	<ul style="list-style-type: none"> • Permanent—The cable modem entry can be configured as a permanent clone from the CLI by executing the cable privacy hotlist cable modem command. A cable modem marked as a permanent clone can only be removed from the hotlist by executing the no form of the cable privacy hotlist cable modem command. • Temporary—The Cisco CMTS detects a duplicate cable modem MAC address. This duplicate MAC address is flagged as a clone and is prevented from coming online for 180 seconds.

Related Commands

Command	Description
cable privacy add-certificate (for uBR series router)	Configures certificates for BPI+ encryption.
cable privacy	Enables and configures BPI+ encryption on a cable interface.
show cable modem	Displays cable modem configuration settings.
show interface cable privacy	Displays baseline privacy information.

show cable profile

To display configuration of profile in service group based configuration, use the **show cableprofile** command in the Privileged EXEC mode.

show cable profile [**downstream** | **mac-domain** | **service-group** | **wideband**] *profile-name*

Syntax Description	
downstream	Shows OPS downstream profile.
mac-domain	Shows OPS mac-domain profile.
service-group	Shows OPS service-group profile.
wideband	Shows OPS wideband profile.
<i>profile name</i>	Name of the desired profile.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS-XE 3.17.0S	This command was introduced.

Usage Guidelines This command is used to display the configuration of profile in service group.

```

```

show cable qam-profile

To display information about the QAM profile, use the **show cable qam-profile** command in privileged EXEC mode.

show cable qam-profile *qam-profile-id*

Syntax Description

<i>qam-profile-id</i>	Specifies a qam-profile ID. Valid values range from 0 to 31.
-----------------------	--

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use the **show cable qam-profile** command to display information about a qam-profile. If you specify the *qam-profile-id*, the command displays the QAM profile with the specified ID.

Examples

The following is a sample output of the **show cable qam-profile** command:

```
Router# show cable qam-profile
QAM Profile ID 0: default-annex-b-64-qam
  annex: B
  modulation: 64
  interleaver-depth: I32-J4
  symbol rate: 5057 kilo-symbol/second
  spectrum-inversion: off

QAM Profile ID 1: default-annex-b-256-qam
  annex: B
  modulation: 256
  interleaver-depth: I32-J4
  symbol rate: 5361 kilo-symbol/second
  spectrum-inversion: off

QAM Profile ID 2: default-annex-a-64-qam
  annex: A
  modulation: 64
  interleaver-depth: I12-J17
  symbol rate: 6952 kilo-symbol/second
  spectrum-inversion: off

QAM Profile ID 3: default-annex-a-256-qam
  annex: A
```

The following is a sample output of the **show cable qam-profile** *qam-profile-id* command:

```
Router# show cable qam-profile 1
QAM Profile ID 1: default-annex-b-256-qam
  annex: B
  modulation: 256
```

```

interleaver-depth: I32-J4
symbol rate: 5361 kilo-symbol/second
spectrum-inversion: off

```

This table describes the fields shown in the **show cable qam-profile** command display.

Table 171: show cable qam-profile Field Descriptions

Field	Description
annex	Displays the annex (MPEG framing format) configured in the QAM profile.
modulation	Displays the QAM modulation format configured in the QAM profile.
interleaver-depth	Displays the interleaver-depth configured in the QAM profile.
symbol rate	Displays the symbol rate configured in the QAM profile.
spectrum-inversion	Displays the spectrum-inversion status configured in the QAM profile.

Related Commands

Command	Description
cable downstream qam-profile	Set the QAM profile for the cable interface line card.

show cable qos enforce-rule

To display the quality of service (QoS) enforce-rules that are currently defined, use the **show cable qos enforce-rule** command in privileged EXEC mode.

show cable qos enforce-rule [*name*] [*verbose*]

Syntax Description

<i>name</i>	(Optional) Specifies the name of a particular enforce-rule to be displayed.
<i>verbose</i>	(Optional) Displays detailed information about the QoS enforce-rule options that are currently defined.

Command Default

All enforce-rules are displayed.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(15)BC1	This command was introduced.
12.3(9a)BC	This command was integrated into Cisco IOS Release 12.3(9a)BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.3(23)BC2	The following new output fields were added for the verbose form of the command: Penalty End-time, Weekend First Peak Time, Weekend First Duration, Weekend First Average-rate, Weekend Second Peak Time, Weekend Second Duration, Weekend Second Average rate, Weekend Offpeak Duration, Weekend Offpeak Average-rate, and Weekend Auto-enforce.
12.2(33)SCB	The new output fields for the verbose form of the command were integrated into Cisco IOS Release 12.2(33)SCB.
12.3(23)SCD2	The following new output fields were added for the verbose form of the command: Monitoring after RelTime, Penalty-Period for week-days, Penalty-Period for week-ends. The following output fields were modified for the verbose form of the command: Penalty End-time, First Peak Time, Second Peak Time, Weekend First Peak Time, Weekend Second Peak Time. The output field Penalty End-time was renamed as Default Penalty Duration.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows typical output for the default version of the **show cable qos enforce-rule** command:

```
Router# show cable qos enforce-rule
```

```

Name                Dur  Dir byte-cnt Auto rate  penalty Reg  Enf  Ena  Persist
                   (min)   (kbytes) enf (min) (min)  QoS QoS

```

The following example shows sample output from the **show cable qos enforce-rule** command for a particular enforce-rule named “residential”:

```

Router# show cable qos enforce-rule residential
Name                Dur  Dir byte-cnt Auto rate  penalty Reg  Enf  Ena  Persist
                   (min)   (kbytes) enf (min) (min)  QoS QoS
residential         10  us   5       act  1   10080  5   10  Yes  Yes

```

Table below describes the significant fields displayed by the **show cable qos enforce-rule** command.

Table 172: show cable qos enforce-rule Field Descriptions

Field	Description
Name	Name of the enforce-rule.
Dur (min)	The monitoring duration period, in minutes.
Dir	Direction in which the byte-count is applied: <ul style="list-style-type: none"> • DS—Downstream direction • US—Upstream direction
byte-cnt (kbytes)	Maximum number of bytes, in kilobytes, that subscribers using this enforce-rule can transmit during the monitoring-duration window before being considered to be overconsuming.
Auto enf	Displays whether the enforce-rule QoS profile is automatically activated when a subscriber exceeds their allowed bandwidth.
rate (min)	Size of the sample-rate interval, in minutes.
penalty (min)	Size of the penalty period, in minutes.
Reg QoS	Profile ID for the registered QoS profile or the name of the service class.

Field	Description
Enf QoS	Profile ID for the enforced QoS profile or the name of the service class.
Ena	Displays whether this enforce-rule is currently enabled and active.
Persist	Displays whether this enforce-rule keeps the enforced QoS profile in force across cable modem reboots: <ul style="list-style-type: none"> • Yes—Enforced QoS profiles remain in effect across cable modem reboots. • No—Enforced QoS profiles do not remain in effect when a cable modem reboots. See the no-persistence option for the qos-profile enforced command.

The following example shows the sample output from the **show cable qos enforce-rule verbose** form of the command with the new output fields beginning in Cisco IOS Release 12.3(23)BC2:

```
Name : test
Version : docsis10
Monitoring Type : peak-offpeak
Registered : 255
Enforced : 4
Monitoring Duration : 120 (in minutes)
Sample-rate : 10 (in minutes)
Average-rate : 1 kbits/sec
Direction : upstream
Penalty Time : 10080 (in minutes)
Penalty End-time : 23 (time of day in hrs)
Rule Enabled : Yes
Persistence : Yes
Week-end : Yes
First Peak Time : 6
Duration : 180 (in minutes)
First Average-rate : 2 kbits/sec
Second Peak Time : 18
Duration : 240 (in minutes)
Second Average-rate : 3 kbits/sec
Offpeak Duration : 120 (in minutes)
Offpeak Average-rate : 1 kbits/sec
Auto-enforce : active
Weekend First Peak Time : 8
Weekend First Duration : 120 (in minutes)
Weekend First Average-rate : 2 kbits/sec
Weekend Second Peak Time : 18
Weekend Second Duration : 180 (in minutes)
Weekend Second Average-rate : 5 kbits/sec
Weekend Offpeak Duration : 240 (in minutes)
Weekend Offpeak Average-rate : 4 kbits/sec
Weekend Auto-enforce : active
```

The following example shows the sample output from the **show cable qos enforce-rule verbose** form of the command with the new output fields in Cisco IOS Release 12.3(33)SCD2:

```
Router# show cable qos enforce-rule test verbose
Name : test
Version : docsis11
Monitoring Type : peak-offpeak
Registered : REG-DS
Enforced : ENF-DS
Monitoring Duration : 70 (in minutes)
Sample-rate : 10 (in minutes)
```

```

Average-rate           : 3 kbits/sec
Direction              : downstream
Auto Enforce           : Yes
Current Penalty Duration : 10 (in minutes)
Default Penalty Duration : 10 (in minutes)
Penalty End-time       : 23:0 (time of day)
Rule Enabled           : Yes
Persistence            : Yes
Weekend                : No
Penalty Off            : No
Monitor Weekend        : Yes
Monitoring after RelTime : Off
First Peak Time        : 10:0

```

Related Commands

Command	Description
cable qos enforce-rule	Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode.
duration	Specifies the time period and sample rate to be used for monitoring subscribers.
enabled (enforce-rule)	Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.
penalty-period	Specifies the time period that an enforced QoS profile should be in effect for subscribers that violate their registered QoS profiles.
qos-profile enforced	Specifies a QoS profile that should be enforced when users violate their registered QoS profiles. This command is applicable for only DOCSIS 1.0 cable modems.
qos-profile registered	Specifies the registered QoS profile that should be used for this enforce-rule. This command is applicable for only DOCSIS 1.0 cable modems.
service-class (enforce-rule)	Specifies a service class (enforced or registered) that should be used for the cable modem monitoring in an enforce-rule. This command is applicable for DOCSIS 1.1 or later cable modems.

Command	Description
show cable subscriber-usage	Displays subscribers who are violating their registered QoS profiles.

show cable qos permission

To display the status of permissions for changing quality-of-service (QoS) tables on a Cisco CMTS, use the **show cable qos permission** command in privileged EXEC mode.

show cable qos permission

Syntax Description

This command has no keywords or arguments.

Command Modes

Privileged EXEC

Command History

Release	Modification
12.1 T	This command was introduced.
12.1(4)CX	This command was deprecated for DOCSIS 1.1 use, because DOCSIS 1.1 replaces the QoS profile model with a service flow model. The show interface cable qos paramset command is used for DOCSIS 1.1 operation.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example displays the output of the **show cable qos permission** command:

```
CMTS01# show cable qos permission
Create by mgmt   Update by mgmt   Create by modems
no               no               yes
```

Table below describes the fields displayed by the **show cable qos permission** command.

Table 173: show cable qos permission Command Field Descriptions

Field	Description
Create by mgmt	Indicates permission setting for creation of QoS table entries by the Simple Network Management Protocol (SNMP).
Update by mgmt	Indicates permission setting for creation of QoS table entries by modem registration requests.
Create by modems	Indicates permission setting for dynamic updating of QoS table entries by the SNMP.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable qos permission	Specifies permission for updating the cable router QoS table.
cable qos profile	Configures a QoS profiles.
cable service-flow inactivity-timeout	Sets the amount of time a dynamic service-flow can be present in the system without any activity.
show controllers cable	Displays cable router QoS profiles.
show interface cable qos paramset	Displays the DOCSIS 1.1 QoS parameter sets.

show cable qos profile

To display quality-of-service (QoS) profiles for a Cisco CMTS, use the **show cable qos profile** command in privileged EXEC mode.

show cable qos profile *profile-index* [**verbose**]

Syntax Description	
<i>profile-index</i>	Displays cable QoS table. Valid range is 1 to 255.
verbose	Displays detailed information about the QoS profiles.

Command Modes

Privileged EXEC

Command History

Release	Modification
11.3NA	This command was introduced.
12.0(3)T	The command was included in the mainline release.
12.0(7)XR	The verbose option was added.
12.1(1)T	The IP precedence rate enabling bits were added to the display.
12.1(4)CX	This command was deprecated for DOCSIS 1.1 use, because DOCSIS 1.1 replaces the QoS profile model with a service flow model. The show interface cable qos paramset command is used for DOCSIS 1.1 operation.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to display the existing QoS profiles on the CMTS:

```
Router# show cable qos profile

ID  Prio Max      Guarantee Max      Max      TOS  TOS   Create  B   IP prec.
    upstream upstream downstream tx    mask value by    priv rate
    bandwidth bandwidth bandwidth burst
1   0    0          0          0          0    0x0  0x0  cmts(r) no   no
2   0    64000     0          1000000    0    0x0  0x0  cmts(r) no   no
3   7    31200     31200     0          0    0x0  0x0  cmts   yes  no
4   7    87200     87200     0          0    0x0  0x0  cmts   yes  no
5   2    256000    0          128000     1503 0x0  0x0  cm     no   no
```

Profiles 1 and 2 are always created by the CMTS at initial startup. The CMTS dynamically creates profiles 3 and 4, as shown above, to support Voice over IP (VoIP) codecs G.711 and G.729 when a CM configures phone lines and uses dynamic service requests to request VoIP service. The remaining profiles, such as profile 5 above, are typically created by a CM when it comes online.

Profile 3 creates a grant-size of 31.22 KiloBytes per second for G.729 service, and profile 4 creates a grant-size of 87.2 KiloBytes per second for G.711 service. Both profiles use a default grant-interval of 20 milliseconds. For more information on these profiles, see the TAC technical note at the following URL: http://www.cisco.com/warp/public/109/uBR7200_QoSMAc.html

The following example displays detailed output for profile 1:

```
Router# show cable qos profile 1 verbose

Profile Index          1
Name                   Default
Upstream Traffic Priority 0
Upstream Maximum Rate (bps) 0
Upstream Guaranteed Rate (bps) 0
Unsolicited Grant Size (bytes) 0
Unsolicited Grant Interval (usecs) 0
Upstream Maximum Transmit Burst (bytes) 0
IP Type of Service Overwrite Mask 0x0
IP Type of Service Overwrite Value 0x0
Downstream Maximum Rate (bps) 0
Created By             cmts(r)
Baseline Privacy Enabled no
```

Table below describes the fields displayed by the **show cable qos profile** command.

Table 174: show cable qos profile Command Field Descriptions

Field	Description
ID	Profile number.
Prio	Priority level.
Max upstream bandwidth	Maximum upstream bandwidth.
Guarantee upstream bandwidth	Guaranteed minimum upstream bandwidth.
Max downstream bandwidth	Maximum downstream bandwidth.
Max tx burst	Maximum transmit burst size in bytes.
Tos mask	Hex value of the mask bits.
Tos value	Hex value of the mask byte.
Create by	Identity of who created the profile: <ul style="list-style-type: none"> • cmts = Created by the CMTS with read-write properties. The profile can be modified but not deleted. • cmts(r) = Created by the CMTS with read-only properties. The profile cannot be modified or deleted. • cm = Created by the CM DOCSIS configuration file. • mgmt = Created by an operator using CLI commands.
B priv enab	Describes whether Baseline Privacy Interface (BPI) encryption is enabled (yes) or disabled (no) for this QoS profile.
IP prec. rate enab	Describes whether IP precedence rate limiting enabling is enabled (yes) or disabled (no) for this QoS profile. When a profile is created by a CM, this value is set by the Type Length Value (TLV) 11 fields in the DOCSIS configuration file, unless overwritten using the cable qos profile command.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable qos permission	Specifies permission for updating the cable router QoS table.
cable qos profile	Configures a QoS profiles.
cable service-flow inactivity-timeout	Sets the amount of time a dynamic service-flow can be present in the system without any activity.
show cable modem qos	Displays quality of service (QoS) and service flow information for a particular CM.
show cable noise	Displays the status of permissions for changing QoS tables.
show interface cable qos paramset	Displays the DOCSIS 1.1 QoS parameter sets.

show cable rate-adapt

To display the global and local upstream utilization optimization configuration parameters, use the **show cable rate-adapt** command in privileged EXEC mode.

show cable rate-adapt

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(23)BC2	This command was introduced.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command displays the current global rate-adapt settings that govern all cable modem and the local rate-adapt settings that relate to a specific cable modem upstream.

Examples

The following example shows a typical display of the **show cable rate-adapt** command:

```
Router# show cable rate-adapt
Global:Enabled Local-Only:Enabled global:maps 500 priority 6, rate 12 bcs 10 fcms On
```

Note The output “maps 500” relates to duration. It indicates that the service flow is optimized for 500 MAPs.

Table below describes the fields shown in the **show cable rate-adapt** display.

Table 175: show cable rate-adapt Field Descriptions

Field	Description
Global	Indicates if upstream utilization optimization is enabled globally on all cable modems.
Local	Indicates if upstream utilization optimization is enabled locally on a specific upstream flow.
priority	Indicates the specified priority setting.
rate	Indicates the specified minimum max-rate.
bcs	Indicates the number of broadcast contention minislots (BCS).
fcms	Indicates if forced broadcast contention minislot (fcms) is turned on or off.

Field	Description
duration	Indicates the duration of a rate-adapt flow.

Related Commands

Command	Description
cable upstream rate-adapt (global)	Enables upstream utilization optimization globally on all cable modem upstream flows.
cable upstream rate-adapt (interface)	Enables upstream utilization optimization locally.

show cable rate-limit-ccf

To display information about rate limiting criteria for upstream bonded service flows on the Cisco uBR10-MC5X20H cable interface line card, use the **show cable rate-limit-ccf** command in privileged EXEC mode.

show cable rate-limit-ccf [*{start-index count | clear}*]

Syntax Description	
<i>start-index</i>	(Optional) Starting index for the log entries. The valid range is from 0 to 2000. The default value is 0.
<i>count</i>	(Optional) Total number of log entries to be displayed. The valid range is from 0 to 2000.
clear	(Optional) Clears information about rate limiting.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following is a sample output of the **show cable rate-limit-ccf** command that displays information about rate limiting criteria for upstream bonded service flows on a Cisco uBR10-MC5X20H cable interface line card:

```
Router# show cable rate-limit-ccf
rate_limiting config: aggr_throughput: 215000000 aggr_burst: 240000
cpu_threshold: 50 cpu_burst: 10
5X20H rate limit: cpu-throttle 0 ccf-bw-drop 0 others 0
5X20H rate limit ccf info count: 0
```

Table below describes the fields shown in the **show cable rate-limit-ccf command display**.

Table 176: show cable rate-limit-ccf Field Descriptions

Field	Description
aggr_throughput	Aggregate throughput value.
aggr_burst	Aggregate burst rate value.
cpu_threshold	CPU threshold for Continuous Concatenation and Fragmentation (CCF) in percentage.
cpu_burst	CPU burst for CCF in percentage

Field	Description
cpu-throttle	Total number of bandwidth requests that stopped due to CPU throttle.
ccf-bw-drop	Total number of bandwidth requests that stopped due to CCF resource constraint.
5X20H rate limit ccf info count	Total number of log entries.

Related Commands

Command	Description
cable upstream rate-limit-ccf	Configures rate limiting criteria for upstream bonded service flows on a Cisco uBR10-MC5X20H cable interface line card.

show cable rcp-id

To view available Receive Channel Profile (RCP) on the cmts which includes well-known RCP defined in CableLab DOCSIS MULPI specification, use **show cable rcp-id** command in privileged EXEC mode.

show cable rcp-id

Syntax Description	<i>rcp id</i> Specifies a unique RCP ID in hexadecimal.
---------------------------	---

Command Default	None.
------------------------	-------

Command Modes	Privileged EXEC (#)
----------------------	---------------------

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR8 Series Converged Broadband Routers.

Usage Guidelines The **show cable rcp-id** is used along with RCP-ID to view the RCP definition.

The following example shows a typical display for the **show cable rcp-id** command:

```
Router#show cable rcp-id 00 10 18 80 61
RCP ID : 00 10 18 80 61
Name :
Center Frequency Spacing : 0
Max number of Channels : 0
Primary Capable Channel : 1
Number of Modules : 1
Module[1]:
Number of Adjacent Channels: 1
Minimum Center Frequency-Hz: 111000001
Maximum Center Frequency-Hz: 111000000
```

Related Commands

Command	Description
cable rcp-id	Specifies the receive channel profile ID.
show cable rcps	Displays all the available Receive Channel Profiles (RCP) on the CMTS.

show cable rcps

To view all the available Receive Channel Profiles (RCP) on the CMTS, use the **show cable rcps** command in privileged EXEC mode.

show cable rcps

Syntax Description This command has no arguments.

Command Default None.

Command Modes Privileged EXEC (#)

Release	Modification
IOS-XE 3.15.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **show cable rcps** allows users to view all the available RCP's in CMTS.

Examples

The following example shows a typical display for the **show cable rcps** command for all cable interfaces:

```
Router# show cable rcps
RCP-ID : 00 10 00 10 04
  Name : CLAB-8M-004
  Center Frequency Spacing : 8
  Number of Channels : 4
  Primary Capable Channels : 1
  Number of Modules : 1
  Module [1]:
    Number-of-adjacent-channels : 8
    Minimum-center-frequency : 112000000
    Maximum-center-frequency : 858000000
    Connected Module : 64
```

Related Commands	Command	Description
	cable rcp-id	Specifies the receive channel profile ID.
	show cable rcp-id	Displays all available Receive Channel Profile (RCP) on the cmts which includes well-known RCP defined in CableLab DOCSIS MULPI specification.

show cable redundancy

To display the DDC redundancy partners and their relative states, and additional information about DDC states on the Cisco CMTS, use the **show cable redundancy** command in privileged EXEC mode.

show cable redundancy {**hashfilter** | **class** | **calls**}

Syntax Description	Parameter	Description
	hashfilter	Displays the hash filter(s) being used in the scheme.
	class	Displays the displays the number of cable modems in each DDC class of the same scheme.
	calls	Displays the number of active and E911 calls currently being supported on the relative DDC nodes.

Command Default This command has no default behaviors or values.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Release 12.3(9a)BC	This command was introduced on the Cisco uBR7246 universal broadband router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example of the **show cable redundancy hashfilter** command illustrates the same DDC Redundancy scheme (two Cisco uBR7246VXR routers). This command displays the configured hash filter parameters. You can either list all hash filters (as shown) or list one hash filter, if specified with the optional *hash_id* value at the end of the command.

```
Router# show cable redundancy hashfilter
HashFilter 1
HashType      MacMask
default       ffff.ffff.ffff
MacAddr      OUI      Node
0000.39cc.b270      1
0000.39cc.ba70      2
0000.39cc.c070      2
HashFilter 2
HashType      MacMask
default       0000.00ff.ffff
MacAddr OUI Node
00.00.39 1
00.08.0D 1
00.0C.E5 1
```

The following example of the **show cable redundancy class** command displays the number of cable modems in each DDC class of the same scheme (two Cisco uBR7246VXR routers).

```
Router# show cable redundancy class
Number of modems in each DDC class:
Interface Class0 Class1 Class2 Class3 Class4
```

```

Cable3/0 32 0 0 0 0
Cable3/1 32 0 0 0 0
Cable4/0 32 0 0 0 0
Cable4/1 0 0 0 0 0
Cable5/0 31 0 0 0 0
Cable5/1 32 0 0 0 0
Cable6/0 0 0 0 0 0
Cable6/1 0 0 0 0 0

```

The following example of the **show cable redundancy calls** command displays the number of active 911 (E911) calls, voice calls, and the number of cable modems with service flows for each subinterface. If the subinterface is configured on a bundle, the number of calls is the total for all the members in the bundle.

```

Router# show cable redundancy calls
SubInterface 911Calls  VoiceCalls  ModemCount  ServiceFlow
Cable3/0.1   0           0           159         159
Cable3/0.2   0           0           0           0

```

Related Commands

Command	Description
cable redundancy hashfilter	Sets the MAC address and DDC node mappings of the DDC redundancy scheme.
cable redundancy myid	Sets the total number of Cisco DDC nodes (routers) in the DDC Redundancy scheme and sets the ID of the current DDC node.
cable redundancy node	Configures the DDC node with active or standby state.
cable redundancy node frequency	Sets the downstream frequencies for each node participating in the scheme other than the current DDC node (router).
cable redundancy target	Sets the target DDC node (router) to use in a DDC switchover event.
cable redundancy threshold	Sets the active voice call threshold on the current DDC node (router).

show cable resil-rf-status

To display the logical up and down state of a channel number, or the logical state of all RF channels, use the **show cable resil-rf-status** command in privileged EXEC mode.

```
show cable resil-rf-status [{integrated-cable slot / card / port wb-rf-channel-number | down | uncfg | up}]
```

Syntax Description		
integrated-cable	(Optional) Specifies the integrated cable interface.	
<i>slot</i>	(Optional) The slot where a SIP resides. Valid values are from 0 to 3 and 6 to 9.	
<i>card</i>	(Optional) The bay in a SIP where a SPA is located. Valid values is 0.	
<i>port</i>	(Optional) Specifies the interface number on the SPA. Valid values are from 0 to 15.	
<i>wb-rf-channel-number</i>	(Optional) Specifies the channel number for the RF channel. Valid values are from 0 to 162.	
down	(Optional) Display the RF in "DOWN" status.	
uncfg	(Optional) Display the RF in "UNCFG" status.	
up	(Optional) Display the RF in "UP" status.	

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the show cable rf-status command.

Examples

The following is a sample output of the **show cable resil-rf-status** command used to display the logical state of all RF channels on a integrated cable interface:

```
Router# show cable rf-status
      Logical Suspend Suspend Flap Flap
RF      Status Status  Fails  Counts Time
-----
3/0/0 0  UP      N/A     0      0
      1  UP      N/A     0      0
      2  UP      N/A     0      0
      3  UP      N/A     0      0
      4  UP      N/A     0      0
      5  UP      N/A     0      0
      6  UP      N/A     0      0
      7  UP      N/A     0      0
      8  UP      N/A     0      0
      9  UP      N/A     0      0
```

```

10 UP      N/A      0      0
11 UP      N/A      0      0
12 UP      N/A      0      0
13 UP      N/A      0      0
14 UP      N/A      0      0
15 UP      N/A      0      0
16 UP      N/A      0      0
17 UP      N/A      0      0
18 UP      N/A      0      0
19 UP      N/A      0      0
20 UP      N/A      0      0

```

Table below describes the significant fields shown in the display.

Table 177: show cable resil-rf-status Field Descriptions

Field	Description
RF	Indicates the RF channel ID.
Suspend Status	Indicates if the channel is currently suspended
Suspend Fails	Indicates the number of times that the CMTS attempted to suspend a channel without success.
Logical Status	Indicates the logical up and down state of all RF channels.
Flap Counts	Indicates the number of times the RF channel has dropped and recovered.
Flap Time	Indicates the duration in seconds for each flap count.

The following is a sample output of the **show cable resil-rf-status** command used to display the logical up and down state of a particular channel number on a integrated cable interface:

```

Router# show cable resil-rf-status integrated-cable 3/0/3:111
      Logical  Suspend  Suspend  Flap  Flap
RF     Status  Status   Fails   Counts  Time
-----
3/0/3 111 UP      N/A      0        0

```

Related Commands

Command	Description
show interface resil-rf-status	Displays the logical up and down state for each of the configured RF channels for a wideband interface.

show cable resiliency

To display all information about the resiliency bonding groups and their assigned status on the Cisco CMTS router, use the **show cable resiliency** command in privileged EXEC mode.

show cable resiliency

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows a sample output of the **show cable resiliency** command:

```
Router# show cable resiliency
      BG   Resil BG
Resil BG I/F ID   State      Count Time              RF
-----
Wi1/2/0:10  10  Free
Wi1/2/0:20  20  Free
Wi7/0/0:1   1   Assigned    3   Nov 3  09:55:49  0
                                                    1
                                                    2
Wi7/0/0:2   2   Assigned    3   Nov 3  09:57:09  0
                                                    1
                                                    3
```

Table below describes the significant fields shown in the display.

Table 178: show cable resiliency Field Descriptions

Field	Description
Resil BG I/F	Bonding group interface assigned to resiliency mode.
BG ID	Bonding group ID.
Resil BG State	Status of the resiliency bonding group—free or assigned.
Count	Number of times this bonding group has been assigned.
Time	Day and time the bonding group was last assigned.
RF Ctrl	Primary RF channel.
RF Num	RF index number of the assigned RF channel.

Related Commands

Command	Description
cable resiliency ds-bonding	Enables the Downstream Resiliency Bonding Group feature on the Cisco CMTS router.
cable ds-resiliency	Reserves a resiliency bonding group for a line card on the Cisco CMTS router.
show cable modem resiliency	Displays resiliency status of the cable modem in resiliency mode on the Cisco CMTS router.

show cable resiliency counts

You can use the **show cable resiliency counts** command in privileged EXEC mode to display the number of RBGs created per downstream port.

show cable resiliency counts

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Dublin 17.12.1x	This command is introduced for the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use the **show cable resiliency counts** command to monitor RBG creation counts per DS port and quickly identify where most RBGs are created. You can use this information to further identify which DS channels and cable modems have the most impairments.

Examples

The following example shows a sample output of the **show cable resiliency counts** command:

```
Router# show cable resiliency counts
Load for five secs: 3%/0%; one minute: 4%; five minutes: 4%
Time source is NTP, 10:30:03.791 EDT Mon Nov 30 2023

RBG Creation Count Per Port:
DS-CTRL      Total
              RBG Count
-----
1/0/0        1
1/0/1        2
```

Related Commands

Command	Description
cable resiliency exclude	Use this command to exclude cable modems from Downstream Resiliency operations.

show cable resiliency exclude

You can use the **show cable resiliency exclude** command in privileged EXEC mode to display a list of cable modems excluded from Downstream Resiliency operations.

show cable resiliency exclude

Command Default None

Command Modes Privileged EXEC (#)

show cable resiliency throttled-cm

You can use the **show cable resiliency throttled-cm** command in privileged EXEC mode to display RGB throttle information.

show cable resiliency throttled-cm { list | stats }

Syntax Description

list	Displays all the CMs that are moved to NB due to RBG throttle.
stats	Displays the RBG Throttle statistics information.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Bengaluru 17.6.1z	This command is introduced for the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows a sample output of the **show cable resiliency throttled-cm stats** command:

```
Router# show cable resiliency throttled-cm stats
RBG Throttle:           Enabled
RBG Throttle Auto Mode: Enabled

RBG Throttle Auto Mode State:  STEADY
RBG Throttle Auto Mode Settling State Duration:  2 (minutes)
RBG Throttle Auto Mode NB to RBG Rate:  2 (per 30 seconds)

Metric:           Configured Threshold:   Current Value:
RBG Creation Rate      010                      0
CPU Usage              095%                      3
CM Online Rate        025                      0
```

Examples

The following example shows a sample output of the **show cable resiliency throttled-cm list** command:

```
Router# show cable resiliency throttled-cm list
Number of Throttled CMs: 3

MAC Address Timestamp
-----
c8fb.26a3.cd54 Jul 28 23:25:58
c8fb.26a3.961a Jul 28 23:26:06
c8fb.26a3.aa82 Jul 28 23:26:11
```

Related Commands

Command	Description
cable resiliency rbg-throttle	Use this command to reduce SUP CPU usage during CM Mass Registration Events.

show cable rf-adapt

To display the downgrade and upgrade candidate modems, use the **show cable rf-adapt** command in user EXEC or privileged EXEC mode.

```
show cable rf-adapt [{cable {slot / cable-interface-index | slot / subslot / cable-interface-index }
[{upgrade-candidates | downgrade-candidates | upstream upstream-channel-id [{upgrade-candidates
| downgrade-candidates}]}]} | upgrade-candidates | downgrade-candidates}]
```

Syntax Description

cable	Displays information about the cable modems in a specific cable interface.
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.
upgrade-candidates	Displays information about the upgrade candidate cable modems.
downgrade-candidates	Displays information about the downgrade candidate cable modems.
upstream <i>upstream-channel-id</i>	(Optional) Displays candidates on a particular upstream channel. The valid range for <i>upstream-channel-id</i> is from 0 to 3.

```

The following is a sample output of the **show cable rf-adapt cable upstream downgrade-candidates** command:

```
Router# show cable rf-adapt cable 7/0/0 upstream 0 downgrade-candidates
MAC Address      IP Address      Source          Destination
Upstream         Upstream
0019.474a.d4cc   10.10.1.9      C7/0/0/U3.0    C7/0/0/U3.1
```

The following is a sample output of the **show cable rf-adapt cable upstream upgrade-candidates** command:

```
Router# show cable rf-adapt cable 7/0/0 upstream 0 upgrade-candidates
MAC Address      IP Address      Source          Destination
Upstream         Upstream
0019.474a.d554   10.10.1.73     C7/0/0/U0.1    C7/0/0/U0.0
```

The following is a sample output of the **show cable rf-adapt cable downgrade-candidates** command:

```
Router# show cable rf-adapt cable 7/0/0 downgrade-candidates
MAC Address IP Address Source Destination
Upstream Upstream
0019.474a.d4cc 10.10.1.9 C7/0/0/U3.0 C7/0/0/U3.1
```

The following is a sample output of the **show cable rf-adapt cable upgrade-candidates** command:

```
Router# show cable rf-adapt cable 7/0/0 upgrade-candidates
MAC Address      IP Address      Source          Destination
Upstream         Upstream
0019.474a.d554   10.10.1.73     C7/0/0/U0.1    C7/0/0/U0.0
```

Table below describes the significant fields shown in the display.

Related Commands

Command	Description
cable rf-adapt timer	Configures timers for RF adaptation.
cable upstream rf-adapt	Enables RF adaptation on the physical upstream channel.

Command	Description
cable upstream rf-adapt (logical channel)	Specifies the primary upstream logical channel and the secondary upstream logical channel.
cable upstream threshold rf-adapt	Configures the upstream RF adaptation threshold value, which prevents excessive relocation of modems from the primary upstream channel to the secondary upstream channel.
show cable modem	Displays information about the registered and unregistered cable modems.

show cable rf-status

To display the logical up and down state of a channel number, or the logical state of all RF channels, use the **show cable rf-status** command in privileged EXEC mode.

show cable rf-status [**modular-cable** *slot* /**bay** /*port:nb-channel-number*]

Syntax Description	Parameter	Description
	modular-cable	(Optional) Specifies the modular cable interface.
	<i>slot</i>	(Optional) The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs.
	bay	(Optional) The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).
	<i>port</i>	(Optional) Specifies the interface number on the SPA.
	<i>nb-channel-number</i>	(Optional) Specifies the channel number for the RF channel.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.0S	This command was replaced by the show cable resil-rf-status command on the Cisco cBR Series Converged Broadband Routers.

Examples

The following is a sample output of the **show cable rf-status** command used to display the logical state of all RF channels on a modular cable interface:

```
Router# show cable rf-status
      Logical  Flap   Flap
RF      Status Counts  Time
-----
1/0/0  0   UP      0
      1   UP      0
      2   UP      0
      3   UP      0
      5   UP      0
      6   UP      0
      7   UP      0
      8   UP      0
      9   UP      0
     10   UP      0
     11   UP      0
     12   UP      0
     13   UP      0
     14   UP      0
```

show cable rf-status

```

15 UP      0
16 UP      0
17 UP      0
18 UP      0
19 UP      0
20 UP      0
21 UP      0
22 UP      0
23 UP      0

```

Table below describes the significant fields shown in the display.

Table 179: show cable rf-status Field Descriptions

Field	Description
RF	Indicates the RF channel ID.
Logical Status	Indicates the logical up and down state of all RF channels.
Flap Counts	Indicates the number of times the RF channel has dropped and recovered.
Flap Time	Indicates the duration in seconds for each flap count.

The following is a sample output of the **show cable rf-status** command used to display the logical up and down state of a particular channel number on a modular cable interface:

```

Router# show cable rf-status modular-cable 1/0/0:1
Load for five secs: 6%/0%; one minute: 3%; five minutes: 2%
Time source is NTP, .14:47:27.751 EDT Thu Aug 7 2008

      Logical  Flap    Flap
RF      Status  Counts  Time
-----  -
1/0/0 1  UP      0

```

Related Commands

Command	Description
show interface rf-status	Displays the logical up and down state for each of the configured RF channels for a wideband interface.

show cable rpd

To display the active Cisco Remote PHY Devices (RPD), use the **show cable rpd** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

```
show cable rpd { slot slot | [{ ip-address mac-address | id id | name name }] | tengigabitethernet
| { slot / subslot / port } } [verbose]
```

Syntax Description		
<i>ip-address</i>	(Optional) IP address of the RPD.	
<i>mac-address</i>	(Optional) MAC address of the RPD.	
id <i>id</i>	(Optional) A unique string to identify the RPD. Specifies the MAC address of the RPD.	
name <i>name</i>	(Optional) Name of the RPD.	
tengigabitethernet <i>slot</i>	Ten Gigabit Ethernet line card slot number of the RPD.	
tengigabitethernet <i>subslot</i>	Ten Gigabit Ethernet line card secondary slot number of the RPD.	
tengigabitethernet <i>port</i>	Ten Gigabit Ethernet line card port number of the RPD.	
verbose <i>port</i>	Displays detailed information of the RPD.	

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
	Cisco IOS XE Fuji 16.7.1	This command was updated to support IPv6 on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use this command to verify the active RPDs with the principal and auxiliary roles.

The following example shows the sample output for the **show cable rpd** command:

```
Router#show cable rpd
MAC Address      IP Address      I/F      State      Role HA  Auth Name
0000.5e00.5301  192.0.2.21     Te1/1/0  online     Pri Act N/A shelf-node8

show cable rpd alloc-chan-resources

To display the allocation status for both upstream and downstream channel resources of the Cisco Remote PHY Device (RPD), use the **show cable rpd alloc-chan-resources** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd [*ip-address mac-address* | *id id* | *name name*] **alloc-chan-resources**

Syntax Description	
<i>ip-address</i>	(Optional) IP address of the RPD.
<i>mac-adderss</i>	(Optional) MAC address of the RPD.
<i>id id</i>	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.
<i>name name</i>	(Optional) Name of the RPD.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use this command to verify the allocation status for channel resources of the RPD.

The following example shows the sample output for the **show cable rpd alloc-chan-resources** command for a specific RPD:

```
Router#show cable rpd name node alloc-chan-resources
RPD ID : 0004.9f00.0907
Downstream RF Port Index : 0
Allocated DS OFDM Channels : 0
Allocated DS SCQAM Channels : 0
Allocated DS OOB55D1 Channels : 0
Allocated DS NDF Channels : 0
Downstream RF Port Index : 1
Allocated DS OFDM Channels : 0
Allocated DS SCQAM Channels : 0
Allocated DS OOB55D1 Channels : 0
Allocated DS NDF Channels : 0
Upstream RF Port Index : 0
Allocated US OFDMA Channels : 0
Allocated US SCQAM Channels : 0
Allocated US OOB55D1 Channels : 0
Allocated US NDR Channels : 0
Upstream RF Port Index : 1
Allocated US OFDMA Channels : 0
Allocated US SCQAM Channels : 0
Allocated US OOB55D1 Channels : 0
Allocated US NDR Channels : 0
```

show cable rpd auxiliary

To display the Cisco Remote PHY Device (RPD) with the auxiliary role, use the **show cable rpd auxiliary** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd auxiliary

show cable rpd [*ip-address mac-address* | *id id* | *name name*] **auxiliary**

Syntax Description		
<i>ip-address</i>	(Optional) IP address of the RPD with the auxiliary role.	
<i>mac-address</i>	(Optional) MAC address of the RPD with the auxiliary role.	
<i>id id</i>	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.	
<i>name name</i>	(Optional) Name of the RPD with the auxiliary role.	
tengigabitethernet slot	Ten Gigabit Ethernet line card slot number of the RPD.	
tengigabitethernet subslot	Ten Gigabit Ethernet line card secondary slot number of the RPD.	
tengigabitethernet port	Ten Gigabit Ethernet line card port number of the RPD.	

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use this command to verify the RPDs that are in the auxiliary role.

The following example shows the sample output for the **show cable rpd auxiliary** command:

```
Router#show cable rpd auxiliary

MAC Address      IP Address      I/F           State          Role HA  Name
0000.5e00.5301  192.0.2.11     Te7/1/1      online         Aux  Act  node
0000.5e00.5301  192.0.2.11     Te7/1/2      online         Aux  Act  node
0000.5e00.5301  192.0.2.11     Te7/1/7      online         Aux  Act  node
```

The following example shows the sample output for the **show cable rpd ip-address auxiliary** command:

show cable rpd auxiliary

```
Router#show cable rpd 192.0.2.11 auxiliary
```

MAC Address	IP Address	I/F	State	Role HA	Name
0000.5e00.5301	192.0.2.11	Te7/1/1	online	Aux	Act node
0000.5e00.5301	192.0.2.11	Te7/1/2	online	Aux	Act node
0000.5e00.5301	192.0.2.11	Te7/1/7	online	Aux	Act node

! = PTP clock out of phaselock occurred, ^ = Default password in use

The following example shows the sample output for the **show cable rpd MAC address auxiliary** command:

```
Router#show cable rpd 0000.5e00.5301 auxiliary
```

MAC Address	IP Address	I/F	State	Role HA	Name
0000.5e00.5301	192.0.2.11	Te7/1/1	online	Aux	Act node
0000.5e00.5301	192.0.2.11	Te7/1/2	online	Aux	Act node
0000.5e00.5301	192.0.2.11	Te7/1/7	online	Aux	Act node

! = PTP clock out of phaselock occurred, ^ = Default password in use

The following example shows the sample output for the **show cable rpd id id auxiliary** command:

```
Router#show cable rpd id 0000.5e00.5301 auxiliary
```

MAC Address	IP Address	I/F	State	Role HA	Name
0000.5e00.5301	192.0.2.11	Te7/1/1	online	Aux	Act node
0000.5e00.5301	192.0.2.11	Te7/1/2	online	Aux	Act node
0000.5e00.5301	192.0.2.11	Te7/1/7	online	Aux	Act node

! = PTP clock out of phaselock occurred, ^ = Default password in use

The following example shows the sample output for the **show cable rpd name name auxiliary** command:

```
Router#show cable rpd name node auxiliary
```

MAC Address	IP Address	I/F	State	Role HA	Name
0000.5e00.5301	192.0.2.11	Te7/1/1	online	Aux	Act node
0000.5e00.5301	192.0.2.11	Te7/1/2	online	Aux	Act node
0000.5e00.5301	192.0.2.11	Te7/1/7	online	Aux	Act node

! = PTP clock out of phaselock occurred, ^ = Default password in use

show cable rpd capability

To display the capability information of Cisco Remote-PHY device (RPD), use the **show cable rpd capability** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd [*ip-address mac-address* | *id id* | *name name*] **capability**

Syntax Description	<i>ip-address</i> (Optional) IP address of the RPD.				
	<i>mac-adderss</i> (Optional) MAC address of the RPD.				
	<i>id id</i> (Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.				
	<i>name name</i> (Optional) Name of the RPD.				
Command Default	None				
Command Modes	Privileged EXEC (#)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.5.1</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.5.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.5.1	This command was introduced.				

Usage Guidelines Use this command to monitor buffer depth of RPD towards various types of upstream and downstream channels.

The following example shows the sample output for the **show cable rpd capability** command for a specific RPD:

```
Router#show cable rpd name node capability

RPD ID                               : 0004.9f00.0907
Bi-direction RF Ports                 : 2
Downstream RF Ports                   : 1
Upstream RF Ports                     : 1
10 Gigabit Ethernet Ports             : 2
1 Gigabit Ethernet Ports              : 1

Highest CW Tone Frequency              : 999000000
Maximum Power of CW Tone Generators   : 340
QAM as Pilot setting                  : 1
Buffer depth monitor alert support     : 0
Buffer depth configuration support     : 0
Rpd ucd processing time                : 0
Rpd ucd change null grant time        : 0
Multi section timing mer reporting support: 0
```

show cable rpd config

To display the Cisco Remote PHY Device (RPD) downstream configuration information for CCAP-Core side (local) and RPD side (remote), use the **show cable rpd config** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

```
show cable rpd [{ip-address mac-address | id id | name name}] | tengigabitethernet | {slot / subslot / port}
} config downstream { local remote }
```

Syntax Description		
<i>ip-address</i>	(Optional) IP address of the RPD.	
<i>mac-adderss</i>	(Optional) MAC address of the RPD.	
id <i>id</i>	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.	
name <i>name</i>	(Optional) Name of the RPD.	
tengigabitethernet <i>slot</i>	Ten Gigabit Ethernet line card slot number of the RPD.	
tengigabitethernet <i>subslot</i>	Ten Gigabit Ethernet line card secondary slot number of the RPD.	
tengigabitethernet <i>port</i>	Ten Gigabit Ethernet line card port number of the RPD.	

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use this command to verify the RPD downstream configuration information for CCAP-Core side (local) and RPD side (remote).

The following example shows the sample output for the **show cable rpd config** command:

```
Router#show cable rpd 0004.9f33.0731 Te9/1/6 config downstream local
```

```
Load for five secs: 8%/3%; one minute: 9%; five minutes: 9%

  annex B
```

show cable rpd config

```
modulation 256  
interleaver-depth I_32_J_4  
spectrum-inversion off  
symbol-rate 5361
```

show cable rpd core-ident

You can use the **show cable rpd core-ident** command in privileged EXEC mode to display RPD CCAP Core Identification information.

Cisco cBR Series Converged Broadband Router

show cable rpd { **slot** *slot* | [{ *mac-address ip-address* }] | **id** *id* | **name** *name* | **tengigabitethernet** { *slot* | *subslot* | *port* } } **core-ident**

Syntax Description	slot <i>slot</i>	(Optional) The slot number of the Digital Position Independent Card (DPIC) that connects to the RPD.
	<i>ip-address</i>	(Optional) IP address of the RPD.
	<i>mac-adderss</i>	(Optional) MAC address of the RPD.
	id <i>id</i>	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.
	name <i>name</i>	(Optional) Name of the RPD.
	tengigabitEthernet <i>slot</i>	(Optional) The slot number of the DPIC in the Ten Gigabit Ethernet interface that connects to the RPD.
	tengigabitEthernet <i>subslot</i>	(Optional) The secondary slot number of the DPIC in the Ten Gigabit Ethernet interface that connects to the RPD. The secondary slot number is always 1.
	tengigabitEthernet <i>port</i>	(Optional) The port number of the DPIC in the Ten Gigabit Ethernet interface that connects to the RPD.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Bengaluru 17.6.1z	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use the **show cable rpd core-ident** command to display to display RPD CCAP Core identification information.

The following example shows the sample output for the **show cable badb.ad13.2be0 core-ident** command:

```
Router#show cable rpd badb.ad13.2be0 core-ident
RPD ID                               : badb.ad13.2be0
Core Index                            : 0
Core ID                               : 005f.8692.dd31
Core IP Address Type                  : Ipv4
```

show cable rpd core-ident

```

Related Commands

Command	Description
show cable rpd	Displays general information and status of RPD when the RPD is in the initialization state (L2TP).

show cable rpd depi

To display Downstream External PHY Interface (DEPI) session and tunnel information of the Cisco Remote-PHY device (RPD), use the **show cable rpd depi** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd {slot *slot* | [{ *mac-address* | *ip-address* | **id** *id* | **name** *name*}] | **tengigabitEthernet** | {*slot* / *subslot* / *port* }} **depi**

Syntax Description	slot <i>slot</i>	(Optional) The slot number of the Digital Position Independent Card (DPIC) that connects to the RPD.
	<i>ip-address</i>	(Optional) IP address of the RPD.
	<i>mac-address</i>	(Optional) MAC address of the RPD.
	id <i>id</i>	(Optional) A unique string to identify the RPD. Specifies the MAC address of the RPD.
	name <i>name</i>	(Optional) Name of the RPD.
	tengigabitEthernet <i>slot</i>	(Optional) The slot number of the DPIC in the Ten Gigabit Ethernet interface that connects to the RPD.
	tengigabitEthernet <i>subslot</i>	(Optional) The secondary slot number of the DPIC in the Ten Gigabit Ethernet interface that connects to the RPD. The secondary slot number is always 1.
	tengigabitEthernet <i>port</i>	(Optional) The port number of the DPIC in the Ten Gigabit Ethernet interface that connects to the RPD.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use the **show cable rpd depi** command to display the complete DEPI session and L2TP status information associated to the RPD.

Use the **show cable rpd slot *slot* depi** command to display the DEPI session and L2TP status information associated to a specific slot of the RPD.

Use the **show cable rpd ip-address *ip-address* depi** command to display the DEPI session and L2TP status information associated to the RPD with a specific IP address.

Use the **show cable rpd mac-address *mac-address* depi** command to display the DEPI session and L2TP status information associated to the RPD with a specific MAC address.

Use the **show cable rpd id identifier depi** command to display the DEPI session and L2TP status information associated to the RPD with a specific identifier.

Use the **show cable rpd name name depi** command to display the DEPI session and L2TP status information associated to the RPD with a specific name.

Use the **show cable rpd tengigabitEthernet slot/subslot/port depi** command to display the DEPI session and L2TP status information associated to the RPD on a specific Ten Gigabit Ethernet interface of the RPD.

The following example shows the sample output for the **show cable rpd depi** command for a specific RPD:

```
Router#show cable rpd depi

Related Commands

Command	Description
show cable rpd	Displays general information and status of RPD when the RPD is in the initialization state (L2TP).
show cable rpd depi session	Displays DEPI session information of RPD.

show cable rpd depi session

To display Downstream External PHY Interface (DEPI) session information of the Cisco Remote-PHY device (RPD), use the **show cable rpd depi session** command in privileged EXEC mode.

```
show cable rpd {slot slot | [{ mac-address ip-address | id id | name name}] | tengigabitEthernet {slot /subslot/port }} depi [{session | [{session-id | configured | endpoints | name session-name | tsid tsid}]]
```

Syntax	Description
slot <i>slot</i>	(Optional) The slot number of the Digital Position Independent Card (DPIC) that connects to the RPD.
<i>mac-address</i>	(Optional) MAC address of the RPD.
<i>ip-address</i>	(Optional) IP address of the RPD.
id <i>identifier</i>	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.
name <i>name</i>	(Optional) Name of the RPD.
tengigabitEthernet <i>slot</i>	(Optional) The slot number of the DPIC in the Ten Gigabit Ethernet interface that connects to the RPD.
tengigabitEthernet <i>subslot</i>	(Optional) The secondary slot number of the DPIC in the Ten Gigabit Ethernet interface that connects to the RPD. The secondary slot number is always 1.
tengigabitEthernet <i>port</i>	(Optional) The port number of the DPIC in the Ten Gigabit Ethernet interface that connects to the RPD.
session <i>session-id</i>	(Optional) The DEPI session ID of the RPD. The value ranges from 1 to 4,294,967,295.
session configured	(Optional) Displays all the DEPI sessions configured and their state. The states are IDLE and ACTIVE..
session endpoints	(Optional) The DEPI session endpoints including tunnel ID.
session name <i>session-name</i>	(Optional) The DEPI session name of the RPD.
session tsid <i>tsid</i>	(Optional) The information for DEPI sessions identified by Transport Stream Identifier (TSID).

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines

Use the **show cable rpd depi session** command to display the complete DEPI session information associated to the RPD.

Use the **show cable rpd depi session *session-id*** command to display a DEPI session information with a specific session identifier.

Use the **show cable rpd depi session configured** command to display all the DEPI sessions configured and their states.

Use the **show cable rpd depi session endpoints** command to display the DEPI session endpoints including tunnel ID.

Use the **show cable rpd depi session name *session-name*** command to display a DEPI session information with a specific session name.

Use the **show cable rpd depi session tsid *tsid*** command to display the information for DEPI sessions identified by a specific TSID.

Use the **show cable rpd slot *slot* depi session** command to display the DEPI session information associated to a specific slot of the RPD.

Use the **show cable rpd tengigabitEthernet *slot/subslot/port* depi session** command to display the DEPI session information associated to the RPD on a specific Ten Gigabit Ethernet interface of the RPD.

Use the **show cable rpd *mac-address* depi session *session-id*** command to display a specific DEPI session information associated to the RPD with a specific MAC address.

Use the **show cable rpd *ip-address* depi session configured** command to display a specific DEPI session configured associated to the RPD with a specific IP address.

Use the **show cable rpd id *identifier* depi session endpoints** command to display the DEPI session endpoint information associated to the RPD with a specific identifier.

Use the **show cable rpd name *name* depi session name *name*** command to display the DEPI session information associated to the RPD with a specific name.

Use the **show cable rpd *mac-address* depi session tsid *tsid*** command to display the information for DEPI sessions identified by a specific TSID.

Use the **show cable rpd *mac-address* tengigabitEthernet *slot/subslot/port* depi session** command to display the DEPI session information associated to the RPD with a specific MAC address on a specific Ten Gigabit Ethernet interface of the RPD.

The following example shows the sample output for the **show cable rpd depi session** command for particular RPD:

```
Router#show cable rpd te7/1/0 depi session
```

```
Load for five secs: 6%/1%; one minute: 6%; five minutes: 6%

Related Commands

Command	Description
show cable rpd	Displays general information and status of RPD when the RPD is in the initialization state (L2TP).
show cable rpd depi tunnel	Displays DEPI tunnel information of RPD.

show cable rpd depi tunnel

To display Downstream External PHY Interface (DEPI) tunnel information of the Cisco Remote-PHY device (RPD), use the **show cable rpd depi tunnel** command in privileged EXEC mode.

```
show cable rpd {slot slot | [{ mac-address ip-address | id id | name name}] | tengigabitEthernet | {slot /subslot/port }} depitunnel tunnel-id ver
```

Syntax Description	slot slot	(Optional) The slot number of the Digital Position Independent Card (DPIC) that connects to the RPD.
	mac-address	(Optional) MAC address of the RPD.
	ip-address	(Optional) IP address of the RPD.
	id identifier	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.
	name name	(Optional) Name of the RPD.
	tengigabitEthernet slot	(Optional) The slot number of the DPIC in the Ten Gigabit Ethernet interface that connects to the RPD.
	tengigabitEthernet subslot	(Optional) The secondary slot number of the DPIC in the Ten Gigabit Ethernet interface that connects to the RPD. The secondary slot number is always 1.
	tengigabitEthernet port	(Optional) The port number of the DPIC in the Ten Gigabit Ethernet interface that connects to the RPD.
	tunnel tunnel-id ver	(Optional) Local tunnel identifier. The value ranges from 1 to 4,294,967,295.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use this command to view the detailed information of DEPI tunnel with Layer 2 Tunnel Protocol (L2TP) status of the RPD.

Use the **show cable rpd depi tunnel** command to display the DEPI tunnel with Layer 2 Tunnel Protocol (L2TP) status of the RPD.

Use the **show cable rpd slot slot depi tunnel** command to display the DEPI tunnel information associated to a specific slot of the RPD.

Use the **show cable rpd tengigabitEthernet slot/subslot/port depi tunnel** command to display the DEPI tunnel information associated to the RPD on a specific Ten Gigabit Ethernet interface of the RPD.

Use the **show cable rpd mac-address depi tunnel** command to display a specific DEPI tunnel information associated to the RPD with a specific MAC address.

Use the **show cable rpd ip-address depi tunnel** command to display a specific DEPI tunnel associated to the RPD with a specific IP address.

Use the **show cable rpd identifier depi tunnel** command to display the DEPI tunnel information associated to the RPD with a specific identifier.

Use the **show cable rpd name name depi tunnel name name** command to display the DEPI tunnel information associated to the RPD with a specific name.

Use the **show cable rpd mac-address tengigabitEthernet slot/subslot/port depi tunnel** command to display the DEPI tunnel information associated to the RPD with a specific MAC address on a specific Ten Gigabit Ethernet interface of the RPD.

The following example shows the sample output for the **show cable rpd depi tunnel** command for particular RPD:

```
Router#show cable rpd 0004.9f03.0214 te7/1/0 depi tunnel
```

Related Commands

Command	Description
show cable rpd	Displays general information and status of RPD when the RPD is in the initialization state (L2TP).
show cable rpd depi session	Displays DEPI session information of RPD.

show cable rpd event

To display event logging information and messages of the Cisco Remote PHY Devices (RPD), use the **show cable rpd event** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd [*{ip-address mac-address | id id | name name}*]event

Syntax Description	<i>ip-address</i> (Optional) IP address of the RPD.				
	<i>mac-adderss</i> (Optional) MAC address of the RPD.				
	id id (Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.				
	name name (Optional) Name of the RPD.				
Command Default	None				
Command Modes	Privileged EXEC (#)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.5.1</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS XE Everest 16.5.1	This command was introduced.
Release	Modification				
Cisco IOS XE Everest 16.5.1	This command was introduced.				
Usage Guidelines	Use this command to verify error event information of the RPD.				

The following example shows the sample output for the **show cable rpd event** command for RPDs:

```
Router#show cable rpd event
RPD          EventId  Level Count      LastTime      Message
0004.9f00.0401 66070205 Error 37      Nov21 22:43:41 Loss of Clock Sync

```

show cable rpd gcp-session

To display the GCP session information for the Cisco Remote-PHY device (RPD), use the **show cable rpd tengigabitethernetgcp-session** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd {slot *slot* | [{*ip-address mac-address* | **id** *id* | **name** *name*]} | **tengigabitethernet** | {*slot /subslot/port* }}**gcp-session**

Syntax Description		
	<i>ip-address</i>	(Optional) IP address of the RPD.
	<i>mac-adderss</i>	(Optional) MAC address of the RPD.
	id <i>id</i>	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.
	name <i>name</i>	(Optional) Name of the RPD.
	tengigabitethernet <i>slot</i>	Ten Gigabit Ethernet line card slot number of the RPD.
	tengigabitethernet <i>subslot</i>	Ten Gigabit Ethernet line card secondary slot number of the RPD.
	tengigabitethernet <i>port</i>	Ten Gigabit Ethernet line card port number of the RPD.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use this command to verify the GCP session details with the packet and message statistical information of the RPD.

The following example shows the sample output for the **show cable rpd tengigabitethernetgcp-session** command for a specific RPD:

```
Router#show cable rpd name node te1/1/0 gcp-session
```

```
GCP Session ID : 10
Core Address   : 120.100.1.1:8190
RPD Address    : 120.100.1.20:60656
Next Hop MAC   : 0004.9F00.0901
Session State  : Active
```

```
Packet Statistics:

show cable rpd group

To display Cisco Remote-PHY devices (RPD) of all groups, use the **show cable rpd group** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

```
show cable rpd group group id
clear cable rpd group group id {reset | delete}
show cable rpd group { eeprom-fanio | eeprom-psio | eeprom-psu }
```

Syntax Description	<i>group id</i>	Specify the ID of the group to display RPDs of that group.
	reset	Reset RPDs of a specific group.
	delete	Delete RPDs of a specific group.
	eeprom-fanio	Shows shelf group fanio eeprom info.
	eeprom-psio	Shows shelf group psio eeprom info.
	eeprom-psu	Shows shelf group psu eeprom info.
Command Default	None	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
	Cisco IOS XE Fuji 16.8.1	Options to show eeprom info for shelf group fanio, psio, and psu were added.

The following example shows the sample output for the **show cable rpd group** command to display specific RPDs:

```
Router# show cable rpd group 0004.9f30.a078

MAC Address      IP Address      I/F      State      Group Id      Slot  M Name

show cable rpd host-resources

To display the brief CPU process and memory information of the Cisco Remote PHY Devices (RPD), use the **show cable rpd host-resources** command in privileged EXEC mode.

show cable rpd [*{ip-address mac-address | id identifier | name name}*]**host-resources**

Syntax Description	
<i>ip-address</i>	(Optional) IP address of the RPD.
<i>mac-adderss</i>	(Optional) MAC address of the RPD.
id identifier	(Optional) Unique string to identify the RPD. Specifies the MAC address of the RPD.
<i>name</i>	(Optional) Name of the RPD.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use this command to verify the CPU process and memory information of the RPD.

The following sample output shows the **show cable rpd host-resources** command for a specific RPD:

```
Router#show cable rpd name node host-resources
RPD ID           : 0004.9f00.0901
MemorySize      : 898112KB
CPU Load        : 73%

Storages:
  Index  Type           Size (KB)  Used (KB)  AllocUnits  AllocFailures
  ----  -
  1      Ram             898112    682116    1024        0
  2      FixedDisk       128804    87288     1024        0
  3      VirtualMemory   131072    20728     1024        0

Processes:

show cable rpd lcce-chan-reach

To display the connectivity constraints and channel supported information of the Cisco Remote PHY Device (RPD), use the **show cable rpd lcce-chan-reach** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd [*ip-address mac-address* | **id** *id* | **name** *name*] **lcce-chan-reach**

Syntax Description	
<i>ip-address</i>	(Optional) IP address of the RPD.
<i>mac-address</i>	(Optional) MAC address of the RPD.
id <i>id</i>	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.
name <i>name</i>	(Optional) Name of the RPD.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use this command to verify the Ethernet port and RF port details with the channel type of RPD.

The following example shows the sample output for the **show cable rpd lcce-chan-reach** command for a specific RPD:

```
Router#show cable rpd 0004.9f00.0907 lcce-chan-reach
RPD ID           EthPort   ChnlType   RFPort   FirstChnl   LastChnl
0004.9f00.0907  1         DsScQam    1         1            1
```

show cable rpd identification

To display the identification parameters of the Cisco Remote-PHY device (RPD), use the **show cable rpd identification** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd [*ip-address mac-address* | **id** *id* | **name** *name*] **identification**

Syntax Description	
<i>ip-address</i>	(Optional) IP address of the RPD.
<i>mac-address</i>	(Optional) MAC address of the RPD.
id <i>id</i>	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.
name <i>name</i>	(Optional) Name of the RPD.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use this command to verify the vendor details with model number and software version of a specific RPD.

The following example shows the sample output for the **show cable rpd identification** command for a specific RPD:

```
Router#show cable rpd name node identification

RPD ID                : 0004.9F00.0907
Vendor Name           : Cisco
Vendor Id             : AB
Model Number          : 123456
Device Mac Address    : 0004.9F00.0907

show cable rpd lcha-cores

To display the Cisco Remote PHY Device (RPD) Line Card High Availability (LCHA) active and standby cores, use the **show cable rpd lcha-cores** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd [{*ip-address mac-address* | **id** *id* | **name** *name*}]**lcha-cores** [{*active standbysummary*}]

Syntax Description

<i>ip-address</i>	(Optional) IP address of the RPD.
<i>mac-address</i>	(Optional) MAC address of the RPD.
id <i>id</i>	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.
name <i>name</i>	(Optional) Name of the RPD.
active	(Optional) Displays RPD LCHA active cores.
standby	(Optional) Displays RPD LCHA standby cores.
summary	(Optional) Displays RPD LCHA cores summary.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS-XE 16.5.1	This command was introduced.

Usage Guidelines

Use this command to verify the RPD LCHA cores.

The following example shows the sample output for the **show cable rpd lcha-cores** command:

```
Router#show cable rpd lcha-cores

show cable rpd location

To display the location information of the Cisco Remote PHY Device (RPD), use the **show cable rpd location** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd [*ip-address mac-address* | *id id* | *name name*] **location**

Syntax Description	
<i>ip-address</i>	(Optional) Location information displayed for the RPD with the specified IP address.
<i>MAC address</i>	(Optional) Location information displayed for the RPD with the specified MAC address.
<i>id id</i>	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.
<i>name name</i>	(Optional) Name of the RPD.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use this command to verify the location information of the remote physical device.

The following example shows the sample output for the **show cable rpd location** command for a specific RPD:

```
Router#show cable rpd 0004.9f00.0907 location
RPD ID : 0004.9f00.0907
Location Description : NM
Latitude : NN
Longitude : NO
```

show cable rpd md-association

To display MAC Domain (MD) association details of the Cisco Remote PHY Devices (RPD), use the **show cable rpd md-association** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd {*slot slot* | **tengigabitethernet** | {*slot /subslot/port* }} **md-association**

Syntax Description	<i>slot</i>	(Optional) The slot number of the Digital Position Independent Card (DPIC) that connects to the RPD.
	tengigabitethernet <i>slot</i>	Ten Gigabit Ethernet line card slot number of the RPD.
	tengigabitethernet <i>subslot</i>	Ten Gigabit Ethernet line card secondary slot number of the RPD.
	tengigabitethernet <i>port</i>	Ten Gigabit Ethernet line card port number of the RPD.
Command Default	None	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Cupertino 17.15.1w	The output of the command is updated to display the RPD Alias (RPD Name) and the associated fiber node IDs information.

! = PTP clock out of phaselock occurred, ^ = Default password in use

show cable rpd pilot-tone

To display the pilot tone configuration of a specific Cisco Remote PHY Device (RPD), use the **show cable rpd pilot-tone** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd *{{ mac-address ip-address | id identifier | name name }}* **pilot-tone**

Syntax Description	
<i>mac-address</i>	(Optional) MAC address of the RPD.
<i>ip-address</i>	(Optional) IP address of the RPD.
id identifier	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.
name name	(Optional) Name of the RPD.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use this command to verify the pilot tones and alignment carriers information, and the leakage detection signal of a specific RPD.

Use the **show cable rpd capability** command to show the pilot tone capability of the RPD.

The following example shows the sample output for the **show cable rpd pilot-tone** command:

```
Router#show cable rpd 0004.9f00.0719 pilot-tone
Load for five secs: 8%/1%; one minute: 9%; five minutes: 9%
No time source, *06:03:44.969 CST Wed Mar 29 2017

Downstream 0 pilot tone profile 1:
SC-QAM as tone list:
  rf-chan-id   freq           pwr_adj  mute
  35           267000000     0.0      N
  37           270000000     10.0     N
Dedicated tone list:
  dedicated-tone  freq           freq_frac  pwr_adj  mute
  0               400000000     0          12.0     N

Maximum Power of CW Tone Generators : 340
QAM as Pilot setting              : 1
```

Related Commands

Command	Description
show cable rpd capability	Displays the pilot tone capability of a specific RPD.

show cable rpd principal

To display the Cisco Remote PHY Device (RPD) with the principal role, use the **show cable rpd principal** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd principal

show cable rpd [*ip-address mac-address* | **id** *id* | **name** *name*] **principal**

Syntax Description		
<i>ip-address</i>	(Optional) IP address of the RPD with the principal role.	
<i>mac-address</i>	(Optional) MAC address of the RPD with the principal role.	
id <i>id</i>	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.	
name <i>name</i>	(Optional) Name of the RPD with the principal role.	
tengigabitethernet <i>slot</i>	Ten Gigabit Ethernet line card slot number of the RPD.	
tengigabitethernet <i>subslot</i>	Ten Gigabit Ethernet line card secondary slot number of the RPD.	
tengigabitethernet <i>port</i>	Ten Gigabit Ethernet line card port number of the RPD.	

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use this command to verify the RPDs that are in the principal role.

The following example shows the sample output for the **show cable rpd principal** command:

```
Router#show cable rpd principal

MAC Address      IP Address      I/F      State      Role HA  Name
0000.5e00.53c0  192.0.2.16     Te7/1/0  online     Pri  Act  node

! = PTP clock out of phaselock occurred, ^ = Default password in use
```

The following example shows the sample output for the **show cable rpd ip-address principal** command:

```
Router#show cable rpd 93.7.10.11 principal
```

MAC Address	IP Address	I/F	State	Role HA	Name
0000.5e00.53c0	192.0.2.16	Te7/1/0	online	Pri Act	node

! = PTP clock out of phaselock occurred, ^ = Default password in use

The following example shows the sample output for the **show cable rpd *MAC address* principal** command:

```
Router#show cable rpd 0004.9f00.0413 principal
```

MAC Address	IP Address	I/F	State	Role HA	Name
0000.5e00.53c0	192.0.2.16	Te7/1/0	online	Pri Act	node

! = PTP clock out of phaselock occurred, ^ = Default password in use

The following example shows the sample output for the **show cable rpd id *id* principal** command:

```
Router#show cable rpd id 0004.9f00.0413 principal
```

MAC Address	IP Address	I/F	State	Role HA	Name
0000.5e00.53c0	192.0.2.16	Te7/1/0	online	Pri Act	node

The following example shows the sample output for the **show cable rpd name *name* principal** command:

```
Router#show cable rpd name node principal
```

MAC Address	IP Address	I/F	State	Role HA	Name
0000.5e00.53c0	192.0.2.16	Te7/1/0	online	Pri Act	node

! = PTP clock out of phaselock occurred, ^ = Default password in use

show cable rpd sbfd-session

To display the seamless BFD (SBFD) session information of the Cisco Remote PHY Device (RPD), use the **show cable rpd sbfd-session** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd sbfd-session[*{session-id | summary}*]

Syntax Description	<i>session-id</i> (Optional) SBFD session identifier of the RPD.				
	summary (Optional) Complete SBFD session information of the RPD.				
Command Default	None				
Command Modes	Privileged EXEC (#)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS-XE 16.5.1</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS-XE 16.5.1	This command was introduced.
Release	Modification				
Cisco IOS-XE 16.5.1	This command was introduced.				
Usage Guidelines	<p>Use this command to verify the SBFD session information of the RPD.</p> <p>The following example shows the sample output for the show cable rpd sbfd-session command:</p> <pre>Router#show cable rpd sbfd-session</pre>				

show cable rpd spectrum-capture-capabilities

You can use the **show cable rpd spectrum-capture-capabilities** command in privileged EXEC mode, to display the spectrum capture capability of the Remote PHY Device (RPD).

Cisco cBR Series Converged Broadband Router

show cable rpd spectrum-capture-capabilities

show cable rpd [*ip-address mac-address | id id | name name*] **spectrum-capture-capabilities**

Syntax Description		
<i>ip-address</i>	(Optional) IP address of the RPD with the principal role.	
<i>mac-address</i>	(Optional) MAC address of the RPD with the principal role.	
id <i>id</i>	(Optional) An unique string to identify the RPD. Specifies the MAC address of the RPD.	
name <i>name</i>	(Optional) Name of the RPD with the principal role.	
spectrum-capture-capabilities <i>slot</i>	Display the spectrum capture capability of the Remote PHY Device (RPD).	
Command Default	None	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Bengaluru 17.6.1z	This command is introduced for the Cisco cBR Series Converged Broadband Routers

Usage Guidelines Use this command to display the spectrum capture capability of the Remote PHY Device (RPD).

The following example shows the sample output for the **show cable rpd 0018.4802.71a8 spectrum-capture-capabilities** command:

```
Router# show cable rpd 0018.4802.71a8 spectrum-capture-capabilities

```

show cable rpd slot

To display the active Cisco Remote PHY Devices (RPD) configured under a specific slot, use the **show cable rpd slot** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd slot *slot*

Syntax Description	<i>slot</i> Slot number of the RPD line card to which the RPDs are connected
---------------------------	--

Command Default	None
------------------------	------

Command Modes	Privileged EXEC (#)
----------------------	---------------------

Command History	Release	Modification
	Cisco IOS-XE 16.5.1	This command was introduced.

Usage Guidelines	Use this command to verify the active RPDs configured for a specific slot.
-------------------------	--

The following example shows the sample output for the **show cable rpd slot** *slot* command:

```
Router#show cable rpd slot 7
```

```
MAC Address      IP Address      I/F      State      Role HA Name
0000.5e00.53c0  192.0.2.16     Te7/1/0  online     Pri  Act node
0000.5e00.53c0  192.0.2.16     Te7/1/1  online     Aux  Act node

0000.5e00.53c0  192.0.2.16     Te7/1/7  online     Aux  Act node
```

! = PTP clock out of phaselock occurred, ^ = Default password in use

show cable rpd summary

To display the Cisco Remote PHY Device (RPD) information on all or specified Ten Gigabit Ethernet interfaces, use the **show cable rpd summary** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable rpd {*slot slot* | **tengigabitethernet** | {*slot /subslot/port* }}**summary**

Syntax Description		
<i>slot</i>	(Optional) The slot number of the Digital Position Independent Card (DPIC) that connects to the RPD.	
tengigabitethernet <i>slot</i>	Ten Gigabit Ethernet line card slot number of the RPD.	
tengigabitethernet <i>subslot</i>	Ten Gigabit Ethernet line card secondary slot number of the RPD.	
tengigabitethernet <i>port</i>	Ten Gigabit Ethernet line card port number of the RPD.	

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use this command to verify the complete detailed information of RPDs.

The following example shows the sample output for the **show cable rpd summary** command:

```
Router#show cable rpd summary

I/F      Total  offline  init(auth)  init(gcp)  init(clock)  init(l2tp)  online

show cable rsvp flow-db

To display contents of the Resource ReSerVation Protocol (RSVP) to DOCSIS service-flow mapping database, use the show cable rsvp flow-db command in user EXEC mode.

show cable rsvp flow-db [*mac-addr*]

Syntax Description	mac-addr (Optional) The MAC address of the specific cable modem in hexadecimal format.
---------------------------	--

Command Default	None
------------------------	------

Command Modes	User EXEC mode
----------------------	----------------

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **show cable rsvp flow-db** command displays contents of the RSVP to DOCSIS service-flow mapping database.

Examples The following example shows the sample output for the **show cable rsvp flow-db** command.

```
Router# show cable rsvp flow-db
CM Count      : 1
Flow Count    : 1
Mac Address   Src IP           Src  Dest IP           Dest Pr Sfid  Dir Handle
              Port              Port ot           (Hex)
0019.474a.c5f6 200.0.0.1       1000 40.1.1.62        1000 6 11   DS  7000406
```

Table below describes the significant fields shown in the display.

Table 180: cable rsvp flow-db Field Descriptions

Field	Description
Mac Address	The MAC address of the specific cable modem.
Src IP	RSVP path source IP address.
Src Port	RSVP path source port number.
Dest IP	Destination IP address.
Dest port	Destination port number.
Proto	IP protocol type. Here 17 is the UDP's IP protocol number.
SFid	Service flow ID.

show cable rsvp flow-db

Field	Description
Dir	Direction of the DOCSIS service flow. Here DS indicates downstream flow.

Related Commands

Command	Description
cable rsvp default-sc	Specifies the default service class for the RSVP.

show cable service-class

To display the parameters for cable service class, use the **show cable service class** command in privileged EXEC mode.

show cable service-class [*sclass-index*] [**verbose**]

Syntax Description	
<i>sclass-index</i>	Identifies the index for a service class that has already been defined (1 to 255).
verbose	Displays all of the defined attributes for the service class.

Command Modes

Privileged EXEC

Command History

Release	Modification
12.1(4)CX	This command was introduced.
12.2(4)BC1	Support was added to the Release 12.2 BC train.
12.2(33)SCC	This command was integrated into Cisco IOS Release 12.2(33)SCC. The command output was modified to display the traffic peak rate value for a specific service flow.
12.2(33)SCG	The command output was modified to display the scheduling type as “N/A” for all downstream service flows.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

You can display a summary of either one service class or all service classes. You can also display a complete listing of each service class and of all the defined service classes.

Note Starting with Cisco IOS Release 12.2(33)SCG, the output of the **show cable service class** command displays the scheduling type of all downstream service flows (DS-SF) as “N/A” to indicate that the DS-SFs do not have any scheduling type.

Examples

The following sample output shows the standard and verbose formats of the **show cable service class** command:

```
Router# show cable service-class

Index Name           Dir  Sched  Prio MaxSusRate  MaxBurst  MinRsvRate
1     UP_UGS             US/DS UGS    0      0           1522       0

```

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable service class	Defines and modifies a service class.
show interface cable qos paramset	Displays the parameters in one or more service templates.

show cable service-voice downstream-type

To display the downstream-types that are capable of providing voice services, use the **show cable service-voice downstream-type** command.

show cable service-voice downstream-type

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes Privileged EXEC

Command History	Release	Modification
	12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use this command to display the downstream-types that are capable for providing voice services on each uBR10-MC 5x20 line card.

Examples

The example below shows that both HA-capable-DS and MDC-DS are enabled for downstream types on the uBR10-MC5X20 line card in slot 5, subslot 1 and the line card in slot 6, subslot 0.

```
Router# show cable service-voice downstream-type
Slot 5/1 :   HA-capable-DS           MDC-DS
Slot 6/0 :   HA-capable-DS           MDC-DS
```

show cable service-flow summary

To display system level service flow and downstream classifier summary information per line card basis, use the **show cable service-flow summary** command in privileged EXEC mode..

show cable service-flow summary

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes Privileged EXEC mode

Release	Modification
12.2(33)SCJ	This command was introduced.
IOS-XE 3.18.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **show cable service-flow summary** command displays system level service flow and downstream classifier summary information per line card basis. For uBR10K series routers, system level downstream classifier resource used percentage and downstream service flow system limit are displayed. However, for cBR Series Converged Broadband Routers, the downstream classifier used percentage and system limit are not displayed. This command displays only the unicast service flow summary information and limit and excludes multicast service flows.

For uBR10k series routers:

- Downstream service flow:
 - For a given MC2020, MC3G60, 3GSPA or 6GSPA Line Card, per Line Card limit is about 64k. However, the upper limit per line card is highly dependent on configuration. For example, the downstream service flow limit would differ if two MC3G60 Line Cards share the same 3GSPA. So it is not possible to set a fixed value for Line Card downstream service flow upper limit.
 - For each chassis limit the fixed value is 294865. This is similar to a “RP flow” table resource.

Note Each downstream service flow and downstream classifier consumes one “RP flow” table resource. So actual limit depends on the downstream service flow and classifier configuration.

- Upstream service flow
 - Limited by 8K SID space per mac-domain.

Note If SID Cluster is configured, one upstream service flow might have multiple SIDs and the total upstream service flow limit per mac-domain will be lesser than 8K.

- 64K per line card.
- There is no chassis limit on the CMTS. In order to specify this, the command output displays "Not Applicable".
- Downstream classifier
 - Each chassis is limited by "RP flow" table resource.
 - The fixed limit is displayed in percentage.
- Upstream classifier
 - The upstream classifier has no limit on CMTS and it is not displayed on the output.

For cBR Series Converged Broadband Routers, the following limitations are applicable:

- Downstream service flow
 - The downstream service flow count is limited by Yoda capability even though hardware limitation per CLC is 128K. Each Yoda has a limitation about 100K+ service flows and the Yoda to CLC mapping decides the CLC limitation. For example, if Yoda 1 is mapped to CLC1 and CLC2, the two CLCs has a shared limitation of 100K service flows. However, if Yoda 1 is mapped only to CLC1, CLC1 alone could reach 100K service flows.
 - 426K per chassis for Quad Yoda. 72K per chassis for one Yoda.
 - The downstream service flow upper limit is not displayed since it is not possible to derive a fixed value.
- Upstream service flow
 - Similar to uBR10K Series Routers, the upstream service flow is limited by 8K SID space per mac-domain.

Note If SID Cluster is configured, one upstream service flow might have multiple SIDs and the total upstream service flow limit per mac-domain will be lesser than 8K.

- No chassis limit on CMTS.
- Downstream classifier
 - No limit on CMTS.
 - There is no "RP flow" table resource for cBR Series Converged Broadband Routers and no used percentage is displayed on the output.
- Upstream classifier

- The upstream classifier has no limit on CMTS and it is not displayed on the output.

Examples

The following example shows the sample output for the **show cable service-flow summary** command on the uBR10K series routers.

```
Router# show cable service-flow summary
          Upstream Service Flow

Command	Description
show cable service-flow summary	Displays system level service flow and downstream classifier summary information per line card basis.

show cable signal-quality

To display information about the signal quality of an upstream port on a cable interface, use the **show cable signal-quality** command in privileged EXEC mode.

Cisco uBR Series Router

show cable signal-quality {**cable** {*slot /port* | *slot /subslot /port*} **upstream number** | **cmts** | **mer**}

Cisco cBR Series Router

show cable signal-quality {**cable** *slot /card /port* **upstream number** | **cmts** | **mer**}

Syntax Description

cable	Specifies the cable interface.
<i>slot /subslot /port</i>	For uBR series router, displays information about all CMs on the specified cable interface line card on a Cisco CMTS router: <ul style="list-style-type: none"> • <i>slot</i>—Chassis slot number of the cable interface line card. Valid slots are from 5 to 8. • <i>subslot</i>—Secondary slot number of the cable interface line card. Valid subslots are 0 or 1. • <i>port</i>—Port number. Valid ports are from 0 to 4, depending on the cable interface line card.
<i>slot /subslot /port</i>	For cBR series router, displays information about all CMs on the specified cable interface line card on a Cisco CMTS router: <ul style="list-style-type: none"> • <i>slot</i>—Chassis slot number of the cable interface line card. Valid slots are 0 to 3 and 6 to 9. • <i>card</i>—Secondary slot number of the cable interface line card. Valid subslots is 0. • <i>port</i>—Cable interface index. Valid ports are from 0 to 15, depending on the cable interface line card.
upstream number	Specifies the upstream channel ID. Valid values are from 0 to 15.
cmts	Displays the carrier-to-noise ratio (CNR) data and expected signal power received per cable interface.
mer	Displays the modulation error rate (MER) data per cable interface.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.

Release	Modification
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The value range for the <i>slot /card /port</i> variables are changed.
Cisco 1x2 RPD Software 4.1	The output of this command was updated when virtual combining of upstream channels was introduced in this release on Cisco Remote PHY Devices.

Usage Guidelines

The **show cable signal-quality** command with the **mer** keyword displays the modulation error rate data per cable interface. Note that at least one cable modem (CM) must be online on the cable interface for this command to provide the modulation error rate data. This is identical to the modulation error rate data displayed by the **show controllers** command.

The CNR data is displayed only for the upstream channels that are assigned to a spectrum group. Upstream channels with fixed frequencies do not return any CNR data.

Examples

The following example shows the CNR data received on the upstream ports on the cable interface line card at slot/subslot/port 7/0/3 on a Cisco uBR10012 router:

```
Router# show cable signal-quality cable 7/0/3 cmts
I/F          CNiR          Expected Received
              (dB)          Signal Power (dBmV)
Cable7/0/3/U0 55.0          1.0
Cable7/0/3/U1 44.0          0.0
Cable7/0/3/U2 43.0         -1.0
Cable7/0/3/U3 43.0          2.0
```

The following example shows the MER data received on the cable upstream port 3 on the cable interface line card at slot/subslot/port 5/0/0 on a Cisco uBR10012 router:

```
Router# show cable signal-quality cable 5/0/0 upstream 3 mer
I/F          Received MER   Received MER
              (dB)          Samples
Cable5/0/0/U3 36.0          10
```

The following example shows the signal quality information for all cable interfaces on a Cisco uBR10012 router:

```
Router#show cable signal-quality mer

The following table describes the major fields displayed by the **show cable signal-quality** command.

Table 183: show cable signal-quality Command Field Descriptions

Field	Description
I/F	Cable interface.
CNiR (db)	CNR value.
Expected Received Signal Power (dBmV)	Expected signal power received per upstream port.
Received MER (db)	Received MER signal-to-noise ratio (SNR) value.
Received MER (samples)	Samples used for calculating the SNR per upstream port.

The following example shows the signal quality information of the specified channels supporting virtual combining:

```

show cable signal-quality cmts
I/F          DevID   CNiR      Expected Received
                      (dB)      Signal Power (dBmV)

```

Related Commands	Command	Description
	show cable spectrum-analysis	Displays information about the spectrum measurements of an upstream port on a cable interface on a Cisco uBR10012 router.
	show controllers	Displays information about the interface controllers for a cable interface on the Cisco CMTS router.
	show cable modem cnr	Displays information about CNR or SNR data for a particular cable modem.
	show cable modem	Displays information about the registered and unregistered CMs on a Cisco CMTS router.

show cable snmp cache-status

To display the SNMP cache status, use the **show cable snmp cache-status** command in privileged EXEC mode.

show cable snmp cache-status

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Important You must configure the **service internal** command in global configuration mode to display the SNMP cache status.

Example

The following is a sample output of the **show cable snmp cache-status** command:

```
Router# show cable snmp cache-status
Cache engine is ON, age: 5 seconds
```

Table 184: show cable snmp cache-status Field Descriptions

Field	Description
age	The time interval for which the SNMP cache information is stored on the Supervisor.

Related Commands

Command	Description
cable snmp cache active	Configures the SNMP cache status.

show cable spectrum-analysis

To display information about the spectrum measurements of an upstream port on a cable interface line card, use the **show cable spectrum-analysis** command in privileged EXEC mode.

Cisco uBR Series Router

```
show cable spectrum-analysis slot /subslot /port upstream port
```

Cisco cBR Series Router

```
show cable spectrum-analysis Cable slot /subslot /port upstream port
```

Syntax Description	
<i>slot /subslot /port</i>	Displays information about all CMs on the specified cable interface line card on a Cisco CMTS router: <ul style="list-style-type: none"> • <i>slot</i>—Chassis slot number of the cable interface line card. Valid slots are from 5 to 8 for uBR series router, from 0 to 9 for cBR series router. • <i>subslot</i>—Secondary slot number of the cable interface line card. Valid subslots are 0 or 1 for uBR series router, 0 for cBR series router. • <i>port</i>—Downstream port number. Valid ports are from 0 to 4 for uBR series router, from 0 to 7 for cBR series router, depending on the cable interface line card.
upstream port	Specifies the upstream port number.

Command Modes

Privileged EXEC(#)

Command History

Release	Modification
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The value range for the <i>slot /subslot /port</i> variables are changed. This command replaces the show controllers cable upstream spectrum command.
Cisco 1x2 RPD Software 4.1	The output of this command was updated when virtual combining of upstream channels was introduced in this release on Cisco Remote PHY devices.

Examples

The following example shows the spectrum measurements on upstream port 1 on a Cisco uBR10012 router:

```
Router# show cable spectrum-analysis c5/0/0 upstream 1
Spectrum Analysis Measurements for Cable5/0/0: Upstream 1
Channel Center Frequency: 17000000 Hz
Frequency Span: 6400000 Hz
Number of Bins: 321
Bin Spacing: 20000 Hz
```

```

Resolution Bandwidth: 34200 Hz
Amplitude Data:
  Bin  1: -60.00 dBmV
  Bin  2: -58.00 dBmV
  Bin  3: -58.00 dBmV
  Bin  4: -58.00 dBmV
  Bin  5: -55.00 dBmV
  Bin  6: -55.00 dBmV
  Bin  7: -58.00 dBmV
  Bin  8: -55.00 dBmV
  Bin  9: -49.00 dBmV
  Bin 10: -49.00 dBmV
  Bin 11: -49.00 dBmV
  Bin 12: -49.00 dBmV
  Bin 13: -49.00 dBmV
  Bin 14: -55.00 dBmV
  Bin 15: -58.00 dBmV
  Bin 16: -45.00 dBmV
  Bin 17: -38.00 dBmV
  Bin 18: -35.00 dBmV
  Bin 19: -33.00 dBmV
  Bin 20: -33.00 dBmV
  Bin 21: -34.00 dBmV
  Bin 22: -37.00 dBmV

Related Commands

Command	Description
show cable signal-quality	Displays information about the signal quality of an upstream port on a cable interface line card.
show controllers cable	Displays information about the interface controllers for a cable interface line card on a Cisco CMTS router.
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) or signal-to-noise ratio (SNR) for a particular cable modem.

show cable spectrum-group

To display information about spectrum groups on a Cisco CMTS, use the **show cable spectrum-group** command in user EXEC or privileged EXEC mode.

show cable spectrum-group [*groupnum*] [**detail**]

Syntax Description

<i>groupnum</i>	(Optional) Displays information about the specified group number (1–32). If no group number is specified, information for all spectrum groups is displayed.
detail	(Optional) Displays whether the groups are allocated, free, or in-use.

Command Modes

User EXEC, Privileged EXEC

Command History

Release	Modification
11.3 NA	This command was introduced.
12.0(5)SC, 12.0(5)T	The detail keyword was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following is sample output from the **show cable spectrum-group** command for all upstream spectrum groups:

```
CMTS01# show cable spectrum-group
Group No.      Frequency Band      (Mhz)      Upstream Port      Weekly Scheduled Availability      From Time:      To Time:      Power Level      Shared Spectrum

```

Table below describes the fields shown in the **show cable spectrum-group** displays.

Table 186: show cable spectrum-group Command Field Descriptions

Field	Description
Group No.	<p>Identifies the spectrum group. When using the detail keyword, the following also appear:</p> <ul style="list-style-type: none"> • A = Signifies that the band is allocated. • F = Signifies that the band is free. • I = Signifies that the band is in-use. • C = Identifies the channel width. • O = Identifies the offered list bands (based on the current channel widths).

Field	Description
Frequency Band (MHz)	Identifies the upper and lower ranges of the frequency for this spectrum group.
Upstream Port	Identifies the upstream port number.
Weekly Scheduled Availability	Identifies the day and time of day when this group is available. If no values appear in the From and To Time fields, this group is available at all times.
Power Level (dBmV)	Identifies the assigned decibels per millivolt (dBmV) input level.
Shared Spectrum	Indicates if upstreams are physically combined (share the same combiner group). Y or yes values indicate that upstreams that are members of the spectrum group are combined and cannot be assigned overlapping frequency bands. N or no values indicate that upstreams that are members of the spectrum group are not combined and can be assigned overlapping frequency bands.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
show cable hop	Displays CM configuration settings.
show cable modulation-profile	Displays modulation profile group information.

show cable subscriber-usage

To display subscribers who are violating their registered quality of service (QoS) profiles, use the show cable subscriber-usage command in privileged EXEC mode.

```
show cable subscriber-usage [over-consume][{cable slot / port | cable slot / subslot / port }][upstream port ][sort-byte-count][sort-avg-rate]
```

Syntax Description	
over-consume	(Optional) Displays only those subscribers who have exceeded their maximum allowed bandwidth.
cable slot / port	(Optional) Displays information for all CMs on the specified cable interface and downstream port on a Cisco 7100 series or Cisco 7200 series router, where: <ul style="list-style-type: none"> <i>slot</i>—Specifies the chassis slot number of the cable interface line card. <i>port</i>—Specifies the downstream port number. Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering.
cable slot/subslot/port	(Optional) Displays information for all CMs on the specified cable interface on a Cisco uBR10012 router, where: <ul style="list-style-type: none"> <i>slot</i> —Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8. <i>subslot</i> —Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1. <i>port</i> —Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.
upstream port	(Optional) Displays information for a particular upstream on the selected cable interface. The <i>port</i> value starts with 0 and continues up, depending on the type of cable interface card.
sort-byte-count	(Optional) Sorts the list by the subscriber byte count, with the highest byte counts listed first. The default is to sort the list by Service Flow ID (SFID). (This option is replaced by the sort-avg-rate keyword in later releases.)
sort-avg-rate	(Optional) Sorts the list by the subscriber's average rate. The default is to sort the list by Service Flow ID (SFID).

Command Default All subscribers are shown, with the display sorted by SFID.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(15)BC1	This command was introduced.

show cable subscriber-usage

Release	Modification
12.3(9a)BC	This command was integrated into Cisco IOS Release 12.3(9a)BC. The sort-byte-count keyword option is replaced by the sort-avg-rate keyword option.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added. The output field Total-Kbyte Count was modified to Mon-Dur Cons (kbits/sec).
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The show cable subscriber-usage command displays the current usage statistics for all subscribers on the Cisco CMTS router, all subscribers on a particular cable interface, or for only those subscribers that are marked as over-consuming bandwidth.

Effective with Cisco IOS Release 12.3(9a)BC, the **sort-byte-count** keyword option is replaced by the **sort-avg-rate** keyword option.

Examples

The following example shows typical output for the default version of the show cable subscriber-usage command:

```
Router# show cable subscriber-usage
Sfid Mac Address Enforce-rule Mon-dur Cons Last-detect Last-penalty Pen
      Name          (kbits/sec)      time          time          Flag

5    0007.0e03.2c25 test1      13440960

```

Table below describes the fields shown by the show cable subscriber-usage command.

Table 187: show cable subscriber-usage Field Descriptions

Field	Description
SFID	Number of the Service Flow ID.
Mac Address	Hardware address (MAC address) of the subscriber's cable modem.
Enforce-rule Name	Name of the enforce-rule being applied to this subscriber.
Total-Kbyte	Total number of kilobytes consumed by the subscriber's cable modem during the last monitoring-duration window. Note The total byte count is reset to 0 whenever an enforce-rule's configuration is changed. Note Effective with Cisco IOS Release 12.2(33)SCA, the field Total-Kbyte has been modified to Mon-Dur Cons (kbits/sec).
Last-detect time	Last time period, if any, at which it was determined that the cable modem was using more bandwidth than allowed by their QoS profile. This value also shows the time at which the enforced QoS profile was automatically applied, if this option has been enabled.

Field	Description
Last-penalty time	If an enforced QoS profile is currently in effect, this field shows the time period at which the subscriber's current penalty time expires, at which point their original registered QoS profile is restored.
Pen Flag	Identifies whether a penalty enforce-rule has been applied to this cable modem.

Related Commands

Command	Description
activate-rule at-byte-count	Specifies the number of bytes that a subscriber can transmit during the monitoring period on a Cisco CMTS router.
cable qos enforce-rule	Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode.
duration	Specifies the time period and sample rate to be used for monitoring subscribers.
enabled (enforce-rule)	Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS Router.
penalty-period	Specifies the time period that an enforced QoS profile should be in effect for subscribers who violate their registered QoS profiles.
qos-profile enforced	Specifies a QoS profile that should be enforced when users violate their registered QoS profiles.
qos-profile registered	Specifies the registered QoS profile that should be used for this enforce-rule.
show cable qos enforce-rule	Displays the QoS enforce-rules that are currently defined.

show cable tech-support

To display general information about the router when reporting a problem, use the **show cable tech-support** command in privileged EXEC mode.

show cable tech-support {*slot /port* | *slot /subslot /port* }

Syntax Description	
<i>slot /port</i>	<p>(Optional) Cisco IOS Release 12.3(9a)BC allows you to display information about one specific cable interface.</p> <p>Identifies the cable interface and downstream port on the Cisco uBR7100 series and Cisco uBR7200 series routers.</p> <p>On the Cisco uBR7100 series router, the only valid value is 1/0. On the Cisco uBR7200 series router, <i>slot</i> can range from 3 to 6, and <i>port</i> can be 0 or 1, depending on the cable interface.</p>
<i>slot /subslot /port</i>	<p>(Optional) Cisco IOS Release 12.3(9a)BC allows you to display information about one specific cable interface.</p> <p>Identifies the cable interface on the router. The following are the valid values:</p> <ul style="list-style-type: none"> • <i>slot</i> = 5 to 8 for uBR series router, 0 to 9 for cBR series router. • <i>subslot</i> = 0 or 1 for uBR series router, 0 for cBR series router. • <i>port</i> = 0 to 4 for uBR series router, 0 to 7 for cBR series router (depending on the cable interface).

Command Default None.

Command Modes Privileged EXEC

Command History	Release	Modification
	11.2	This command was introduced.
	12.1(1a)T1	This command was modified to include information about the cable clock card.
	12.2(15)BC2	This command added several show pxf commands to the display on the Cisco uBR10012 router.
	12.3(9a)BC	The output of the command was significantly shortened by moving a number of show commands (the ones that display information about individual cable modems) to the show tech-support command. This release also adds support for an option to display information about only one specific cable interface.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The value range for the <i>slot /subslot /port</i> variables were changed.

Usage Guidelines

The **show cable tech-support** command displays a large amount of configuration, run-time status, and other information about the cable interfaces on the Cisco CMTS. The output of this command can be provided to technical support representatives when reporting a problem.

Note The **show tech-support** includes most of the information shown in the **show cable tech-support** command. Unless the problem is clearly cable-specific, TAC personnel will typically request the **show tech-support** output to troubleshoot any problems.

The **show cable tech-support** command displays the output of a number of different show commands. The exact output depends on the platform, configuration, and type of protocols being used. The output includes the output from the following commands:

- **show cable modem**
- **show cable flap-list**
- **show cable qos profile**
- **show cable modulation-profile**
- **show cable spectrum-group**
- **show cable hop**
- **show interface cable sid (for each cable interface)**
- **show interface cable sid connectivity (for each cable interface)**
- **show interface cable downstream**
- **show interface cable upstream**
- **show interface cable mac-scheduler**
- **show interface cable modem**

Other commands could be included in the **show cable tech-support** output, depending on the CMTS platform, the Cisco IOS software being used, and the cards that are installed in the chassis.

On the Cisco uBR10012 router, the following commands also appear in Cisco IOS Release 12.2(15)BC2 and later releases:

- **show pxf cpu statistics**
- **show pxf cpu subblocks**
- **show pxf cpu buffer**
- **show pxf dma**
- **show pxf cpu cef memory**
- **show pxf cpu queue**
- **show pxf cpu statistics drop**
- **show cable modem partial-mode**

Tip Depending on the platform and configuration, the output from the **show cable tech-support** command can easily exceed the buffers found in most communications programs. To capture this output so it can be sent to Cisco TAC, use a Telnet program that allows you to capture the output directly to disk.

Examples

The following abbreviated example illustrates the cable modem and interface information for the Cisco uBR10012 router on which Cisco IOS Release 12.3(9a)BC is installed.

```

Router# show cable tech-support
----- Slot 8/1 -----
----- show cable modem Cable8/1/0 -----

```

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands	Command	Description
	show controllers cable	Displays information about a specific line card's interface controllers.
	show interface cable downstream	Displays information about the cable interface.
	show running-config	Displays the current run-time configuration.
	show startup-config	Displays the configuration that was used to initially configure the CMTS at system startup.
	show tech-support	Displays the output from show commands that display the router's configuration and run-time status.

Command	Description
show version	Displays the configuration of the system hardware, the software version, the names and sources of configuration files, and the boot images.

show cable throttle-modem

To display cable modem (CM) throttle information, use the **show cable throttle-modem** command in user EXEC or privileged EXEC mode.

show cable throttle-modem

Syntax Description This command has no arguments or keywords.

Command Default None

Command Modes User EXEC (>),

Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCF3	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following is a sample output of the **show cable throttle-modem** command when the Cable Modem Registration Throttling feature is disabled:

```
Router# show cable throttle-modem
CPU for five seconds: 4%/0%; one minute: 1%; five minutes: 1%
CM Throttle Status : Config Disabled; Oper Disabled;
CM Throttle Config : Init Rate 32 CM/Sec; Holdoff 45 Sec;
Flush Rate 300 CM/Sec
CM Register Rate : 0 CM/Sec
```

The following is a sample output of the **show cable throttle-modem** command when the Cable Modem Registration Throttling feature is enabled:

```
Router# show cable throttle-modem
CPU for five seconds: 5%/0%; one minute: 1%; five minutes: 1%
CM Throttle Status : Config Enabled; Oper Enabled;
CM Throttle Config : Init Rate 32 CM/Sec; Holdoff 45 Sec;
Flush Rate 300 CM/Sec
CM Register Rate : 0 CM/Sec
CM Throttling Rate : 4 CM/Sec
Num of CM in Queue : 0
```

Table below describes the significant fields shown in the display.

Table 188: show cable throttle-modem Field Descriptions

Field	Description
CPU for five seconds	CPU usage information.

Field	Description
CM Throttle Status	CM throttle operating status. The valid values are: <ul style="list-style-type: none"> • Config Enabled—Feature is enabled. • Oper Enabled—Feature is functional.
CM Throttle Config	CM throttle configuration parameters.
CM Register Rate	Information about the current cable modem registration success rate.
CM Throttling Rate	Dynamic cable modem throttle rate from the waiting queue, adjusted according to CPU usage, capped by the init-rate value.
Num of CM in Queue	Number of CMs in the queue.

Related Commands

Command	Description
cable throttle-modem	Enables the Cable Modem Registration Throttling feature.

show cable upstream controller-profile

To display the cable upstream controller profile, use the **show cable upstream controllerprofile** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show cable upstream controller profile *id*{**us-channel** *chan-id1* *chan-id2*}

Syntax Description	profile <i>id</i>	Profile identifier.
	us-channel <i>chan-id1</i> <i>chan-id2</i>	Channel identifier.
Command Default	None	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use this command to verify the cable upstream controller profile.

The following example shows the sample output for the **show cable upstream controllerprofile** command:

```
Router#show cable upstream controller-profile 0

Load for five secs: 2%/0%; one minute: 3%; five minutes: 3%
Time source is NTP, 15:14:27.916 CST Fri Feb 24 2017

Upstream controller-profile 0
Description:
Upstream controller-profile 0 is being used by controller Upstream-Cable:
8/0/1, 8/0/0
  Controller Upstream-Cable
  ...
  Upstream-channel 0
    chan-class-id           : 0x0
    channel-width           : 1600000 1600000
    docsis-mode              : atdma
```

show cable upstream service-flow summary

To display the upstream service flow summary information on the Cisco CMTS router, use the **show cable upstream service-flow summary** command in privileged EXEC mode.

show cable upstream service-flow summary

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following is a sample output of the **show cable upstream service-flow summary** command:

```
Router# show cable upstream service-flow summary
Interface          Static Upstream Service Flow Dynamic Upstream Service Flow Desc
                   Total PRI BE   UGS  UGS-AD RTPS N-RTPS BE   UGS  UGS-AD RTPS  N-RTPS

```

Table below describes the significant fields shown in the display.

Table 189: show cable upstream service-flow summary Field Descriptions

Field	Description
Interface	Cable interface.
Total	Total number of upstream service flows.
PRI	Number of primary upstream service flows.
BE	Number of best effort service schedule types.
UGS	Number of unsolicited grant service schedule types.

Field	Description
UGS-AD	Number of unsolicited grant service with activity detection schedule types.
RTPS	Number of real-time polling service schedule types.
N-RTPS	Number of non-real-time polling service schedule types.
Description	Descriptive name for the bonding group.

Related Commands

Command	Description
show interface cable	Displays configuration and status information for the cable interface on the Cisco CMTS router.
show interface cable downstream	Displays information about the downstream cable interface on the Cisco CMTS router.

show cable upstream ofdma mer-fec

To display the per-IUC summary information for every OFDMA channel that is active in the system, you can use the **show cable upstream ofdma mer-fec** command in privileged EXEC mode.

show cable upstream ofdma mer-fec

To clear FEC and MER counts on every OFDMA channel in the system, you can use the **clear cable upstream ofdma mer-fec all**

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC (#)

Command History

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.12.1z	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following is a sample output of the **show cable upstream ofdma mer-fec** command:

```
Router# show cable upstream ofdma mer-fec

```

show cable urm

To view the mapping of cable MAC domain upstream channel to connector on a Cisco uBR-MC3GX60V cable interface line card in the Cisco uBR series router, or view the mapping of MAC domain upstream channel/upstream-cable controller us channel/the US PHY receiver in the Cisco cBR series router, use the **show cable urm** command in the privileged EXEC mode.

show cable urm [slot/subslot]

Syntax Description	slot/subslot
	Identifies the cable interface on the router. <ul style="list-style-type: none"> slot—Slot where the line card resides. The valid range is from 5 to 8 for uBR series router, 0 to 9 for cBR series router. subslot—Subslot where the line card resides. Available slots are 0 or 1 for uBR series router, 0 for cBR series router.

Command Default Display information for all the slot/subslot values that has been configured.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCE	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following is a sample output indicating the connector group table information of the cable line card in slot 6/1 of the uBR series router:

```
Router# show cable urm 6/1
===
connector group table
===
card  cnrs  md:us=>cnr
6/1  0-3     3:2=> 1 *empty*  *empty*  *empty*  *empty*  *empty*
      *empty* *empty*  *empty*  *empty*  *empty*  *empty*
      4-7     *empty* *empty*  *empty*  *empty*  *empty*  *empty*
      *empty* *empty*  *empty*  *empty*  *empty*  *empty*
      8-11   *empty* *empty*  *empty*  *empty*  *empty*  *empty*
      *empty* *empty*  *empty*  *empty*  *empty*  *empty*
      12-15  *empty* *empty*  *empty*  *empty*  *empty*  *empty*
      *empty* *empty*  *empty*  *empty*  *empty*  *empty*
      16-19  *empty* *empty*  *empty*  *empty*  *empty*  *empty*
      *empty* *empty*  *empty*  *empty*  *empty*  *empty*
```

Table below describes the significant fields shown in the display.

Field	Description
card	The slot/subslot information of the card.

Field	Description
cnrns	The connector index range of connectors in a connector group. The values for the Cisco uBR-MC3GX60V, Cisco UBR-MC20X20V, and the Cisco uBR10-MC5X20U line cards are 0-19.
md:us=>cnr	The MAC domain upstream channel to connector mapping information of a physical upstream channel. The entry position corresponding to a physical upstream channel index in a connector group. For uBR-MC3GX60V line card, there are 12 physical upstream channels in each connector group. For the UBR-MC20X20V and uBR10-MC5X20U line cards, there are 2 channels in each group. In the example, C6/1/3:U2 is mapped to connector 1 in the running config by the user using connector command. Internally, CMTS software maps C6/1/3:U2 to physical upstream channel 0 (1st entry) in the 0-3 connector group.

Examples

The following is a sample output indicating the URM mapping table information of the cable line card in slot 9/0 of the cBR series router:

```
Router# show cable urm 9/0
===
Card 9/0
===

===

```

Table below describes the significant fields shown in the display.

Field	Description
UPSTREAM-CHAN	The upstream channel under upstream-cable controller.
MD-US	The upstream channel under mac domain interface.
CARD-CNNR	The card level connector number.
CARD-RCVR	The card level receiver number.
CHIP	The US PHY chip number.
CHIP-CNNR	The chip level connector number.
CHIP-RCVR	The chip level receiver number.
SLOT/SUBSLOT	The slot and subslot number for this card.

Field	Description
DEV	The US PHY device number.
DEV-RCVR	The US PHY device receiver.
MD-US	The upstream channel under MAC domain.
MD-IDX	The internal MAC domain index.
CARD-CNNR	The card level connector number.
CARD-RCVR	The card level receiver number.
DEV-CNNR	The device level connector number.

Related Commands

Command	Description
show running-config interface cable	Shows the MD:US connector mapping configured by users.

show cable us-sg

To display the upstream service groups configured on all cable interfaces of a Cisco CMTS router, use the **show cable us-sg** command in privileged EXEC mode.

show cable us-sg

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following is a sample output of the **show cable us-sg** command.

```
Router# show cable us-sg

Cable MD 5/0/0
  US-SG-ID   : 1           US-Chan : U0,1,2,3,4,5
  Primary-DS: 1/0/0:0    US-SG-ID: 1
  MDD US-List : U0,1,2,3,4,5
  MDD Ambiguity : U0,1,2,3,4,5
Cable MD 6/0/0
  US-SG-ID   : 1           US-Chan : U0,1,2,3
  Primary-DS: 1/0/0:4    US-SG-ID: 1
  MDD US-List : U0,1,2,3
  MDD Ambiguity : U0,1,2,3
Cable MD 7/0/0
  US-SG-ID   : 1           US-Chan : U0,1,2,3
  Primary-DS: 7/0/0:0    US-SG-ID: 1
  MDD US-List : U0,1,2,3
  MDD Ambiguity : U0,1,2,3
  Primary-DS: 7/0/0:1    US-SG-ID: 1
  MDD US-List : U0,1,2,3
  MDD Ambiguity : U0,1,2,3
```

Table below shows the significant fields shown in the display:

Table 190: show interface cable service-flow Field Descriptions

Field	Description
US-SG-ID	Upstream service group ID.
US-Chan	Upstream channels on the cable interface line card.
Primary-DS	Primary downstream interface.
MDD US-List	MAC management message: MDD TLV type 7 content, upstream active channel list.

Field	Description
MDD Ambiguity	MAC management message: MDD TLV type 8 content, upstream ambiguity resolution channel list.

Related Commands

Command	Description
show cable mac-domain upstream-service-group	Displays runtime statistics of the upstream service group on a cable interface line card.

show cable video announce-event-profile

To display the configuration of the GQI announce event profile and a list of LEDs that use the profile, use the **show cable video announce-event-profile** command in privileged EXEC mode.

show cable video announce-event-profile [**name** *name* | **id** *id*]

Syntax Description

name <i>name</i>	Displays the information for the GQI announce-event-profile of this name if it exists.
id <i>id</i>	Displays the information for the GQI announce-event-profile of this ID if it exists.

Command Default

None.

Command Modes

Privileged EXEC (#).

Command History

Release	Modification
Cisco IOS XE Everest 16.6.1	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following sample output shows the GQI announce event profile and the list of LEDs:

```
Router# show cable video announce-event-profile id 3
ID:3                               Name: profile-2
  ACK timeout: 240 seconds
  Number of Event Filters: 10
    2104 4400 4401 5200 5401 5404 5405 5406 5502 5602

  Number of Logical-edge-device: 2
    ID   Name
  -----
    2    led2
    3    led3
```

Related Commands

Command	Description
announce-event-profile	Configures the GQI announce event profile.
event-profile	Applies the GQI announce event profile to a specific LED.

show cable video encryption

To display the cable video encryption, use the **show cable video encryption** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router
show cable video encryption

Syntax Description

=

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS-XE 16.5.1	This command was introduced.

Usage Guidelines

Use this command to verify the active RPDs with the principal and auxilliary roles.

The following example shows the sample output for the **show cable videoencryption** command:

```
Router#show cable video encryption
```

show cable video encryption dvb

To display the digital video broadcasting encryption information, use the **show cable video encryption dvb** command in privileged EXEC mode.

```
show cable video encryption dvb {ca-interface brief | ecmg { all | id id | { brief | connection | desc-rule | overrule } | name name | { brief | connection | desc-rule | overrule } | mode | { broadcast | tier-based | vod } } eis { all | id id | name name } summary }
show cable video encryption dvb tier-based { config | ecms }
```

Syntax Description

ca-interface brief	Displays the CA interface details.
ecmg all	Displays the information of all the ECMG connections.
id <i>id</i>	Specifies the ECMG ID.
name <i>name</i>	Specifies the ECMG name.
brief	Displays the brief summary of ECMG.
connection	Displays the details of all the connections of this ECMG.
desc-rule	Displays the details of all the descriptor rules of this ECMG.
overrule	Displays the details of all the overrule settings of this ECMG.
mode {broadcast tier-based vod}	Displays the details of ECM application mode.
eis all	Displays the information of all the EIS connections.
id <i>id</i>	Specifies the EIS connection ID.
name <i>name</i>	Specifies the EIS connection name.
summary	Displays the information of scrambler general settings.
tier-based config	Displays the detail information of tier-based scrambling configuration.
tier-based ecms	Displays Entitlement Control Messages information and debug information for tier-based scrambling.

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Release	Modification
Cisco IOS XE Amsterdam 17.3.1x	This command was modified by changing the show cable video encryption dvb tier-based form of the command to have two options: config and ecms

Usage Guidelines

This command displays the digital video broadcasting encryption information.

Examples

The following sample outputs show the ECMG connection information:

```
Router# show cable video encryption dvb ecmg id 1 connection
```

ECMG ID	ECMG Name	ECMG Slot	ECMG Type	ECMG Connections	CA Sys ID	CA Subsys ID	CA Application	PID Source	Lower limit	Upper limit	Streams/ECMG	Open Streams/ECMG	ID
1	polaris_ecmg01		standard		0x4748	0x0		sid	0	0	1	1	
Enabled RP 1 Tier-Based													

ECMG Connections for ECMG ID = 1

Conn -ID	Conn Priority	IP Address	Port Number	Channel ID	Conn Status	Open Streams
1	1	1.200.1.81	8888	1	Open	1

```
Router# show cable video encryption dvb ecmg id 7 connection
```

ECMG ID	ECMG Name	ECMG Slot	ECMG Type	ECMG Connections	CA Sys ID	CA Subsys ID	CA Application	PID Source	Lower limit	Upper limit	Streams/ECMG	Open Streams/ECMG	ID
7	ecmg-7		standard		0x950	0x1234		sid	0	0	1680	1680	
Enabled 7 1 VOD													

ECMG Connections for ECMG ID = 1

Conn -ID	Conn Priority	IP Address	Port Number	Channel ID	Conn Status	Open Streams
1	1	1.200.1.81	8888	1	Open	1

The following sample output shows the CA interface details:

```
Router# show cable video encryption dvb ca-interface brief
CA Interface configuration
```

Linecard	IP Address	VRF
7	1.24.10.8	N/A

ECMG Route configuration

IP Address	NetMast	Interface
------------	---------	-----------

show cable video encryption dvb

```
-----
1.200.1.0      255.255.255.0  TenGigabitEthernet4/1/2

```

Related Commands

Command	Description
dvb	Enters the DVB scrambling configuration mode.

show cable video encryption linecard

To display the encryption configuration information of the line card, use the **show cable video encryption linecard** command in privileged EXEC mode.

show cable video encryption linecard {*slot/bay* | **all**}

Syntax Description	
<i>slot/bay</i>	Displays the encryption configuration information of the line card with this slot and bay number. <ul style="list-style-type: none"> <i>slot</i>—The line card slot number. The valid range is from 0 to 9. <i>bay</i>—The line card bay number. The valid value is 0.
all	Displays encryption support for all line cards.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.
	Cisco IOS XE Everest 16.5.1	Support for powerKEY and PME encryption on the Cisco Remote-PHY device (RPD).

Usage Guidelines This command displays the encryption configuration information of the line card.

Note The Cisco Remote-PHY device (RPD) supports powerKEY and PME encryption.

Examples

The following sample output shows the encryption configuration information:

```
Router# show cable video encryption linecard 7/0
Line card: 7/0
CA System Scrambler
=====
PME dvs-042
```

Related Commands	Command	Description
	linecard	Defines the encryption type for a line card.
	encrypt	Encrypts the virtual carrier group.
	rf-channel	Specifies the virtual RF channels in a virtual carrier group.
	virtual-edge-input-ip	Specifies and configures a cable multicast QoS group.

Command	Description
show cable video encryption pme	Displays the privacy mode encryption information.
show cable video session logical-edge-device	Displays the session information for the logical edge device.

show cable video encryption pme

To display the Privacy Mode Encryption (PME) information, use the **show cable video encryption pme** command in privileged EXEC mode.

show cable video encryption pme {linecard *slot* / *bay* session {*stream-id* | **all** | **summary**} | **status** | **version**}

Syntax Description	
linecard <i>slot</i> / <i>bay</i>	Displays the privacy mode encryption line card information with this slot and bay number. <ul style="list-style-type: none"> • <i>slot</i>—The line card slot number. The valid range is from 0 to 9. • <i>bay</i>—The line card bay number. The valid value is 0.
session	Displays the session information. <ul style="list-style-type: none"> • <i>stream-id</i> —Displays the privacy mode encryption session information with this stream ID. The valid range is from 1 to 65535. • all —Displays the statistics for all the privacy mode encryption sessions. • summary —Displays the summary for all the privacy mode encryption sessions.
status	Displays the privacy mode encryption status.
version	Displays the version of the privacy mode encryption module.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.
	Cisco IOS XE Everest 16.5.1	The Cisco Remote-PHY device (RPD) supports powerKEY and PME encryption.

Usage Guidelines This command displays the PME information.

Note

Examples

The following sample output shows the privacy mode encryption line card information:

```
Router# show cable video encryption pme linecard 7/0 session 32
Stream 32, session 7681 is active
Stream number = 32 Session number = 7681
ECM requests = 8 ECM replies = 2
```

show cable video encryption pme

```
ECM ID = 32 CryptoPeriod num = 2
CP duration = 0 Nominal duration = 40000
CA transfer mode = 1 Stream status = No
Error Blob details
```

```
Router# show cable video encryption pme linecard 7/0 session summary
Currently active streams:
Active = 4
ECM req/resp mismatch = 4
ECM req, all streams = 32
ECM resp, all streams = 8
Since last reset:
Sessions created = 4
Sessions deleted = 0
ECMs received =2
ECMs discarded = 0
```

The following sample output shows the privacy mode encryption status information:

```
Router# show cable video encryption pme status
PME Connection Status:
VODS-ID : 111
CEM IP : 1.200.1.163
CEM Port : 5000
Local Mgmt IP : 1.24.2.6
Local Port : 50394
CEM Connection State : Connected
Count of ECMs recd : 2
```

Related Commands

Command	Description
linecard	Defines the encryption type for a line card.
encrypt	Encrypts the virtual carrier group.
pme cem	Configures the parameters for the Cisco Edge QAM Manager server.
pme mgmt-ip	Configures the privacy mode encryption management IP to establish CEM connection.
pme vods-id	Configures the VODSID of Cisco Edge QAM Manager server.
show cable video encryption linecard	Displays the encryption configuration information of the line card.

show cable video gqi connections

To display the GQI protocol connection information of the logical edge device with the Session Resource Manager, use the **show cable video gqi connections** command in privileged EXEC mode.

show cable video gqi connections

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command displays the GQI connection information of the logical edge device with the Session Resource Manager.

Examples

The following sample output shows the GQI connection information of the logical edge device with the Session Resource Manager:

```
Router# show cable video gqi connections
LED Management Server Connection Version Event Reset Encryption
ID IP IP Status Pending Indication Discovery
-----
1 1.23.2.10 1.200.3.75 Not Connected 0 0 Not Sent Not Sent
```

Related Commands

Command	Description
logical-edge-device	Defines a logical edge device.
protocol	Specifies the protocol used in the logical edge device.
mgmt-ip	Defines the local management IP address for a logical edge device.
mac-address	Defines the MAC address for a logical edge device.
vcg	Specifies the virtual carrier group assigned to the logical edge device.
virtual-edge-input-ip	Defines a virtual edge input.
show cable video logical-edge-device	Displays the logical edge device information.
show diag all eeprom detail include MAC	Displays the chassis MAC address information.

show cable video jitter

To display the session jitter information, use the **show cable video jitter** command in privileged EXEC mode.

show cable video jitter

Command Default

None.

Command Modes

Privileged EXEC (#)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following sample outputs show the session jitter information:

```
Router# show cable video jitter
Session jitter:
  VOD: 200
  SDV: 200
  broadcast: 200
  gaming: 5
  table-based: 100
```

Related Commands

Command	Description
jitter	Sets session jitter.

show cable video integrated-cable

To display the integrated cable information, use the **show cable video integrated-cable** command in privileged EXEC mode.

show cable video integrated-cable *slot/bay/port* [**rf-channel** *rf-channel*]

Syntax Description	
<i>slot/bay/port</i>	<ul style="list-style-type: none"> • <i>slot</i>—Specifies the slot number. The valid range is from 0 to 9. • <i>bay</i>—Specifies the bay number. The valid value is 0. • <i>port</i>—Specifies the port number. The valid range is from 0 to 7.
rf-channel <i>channel number</i>	Displays the RF channel information with this channel number. The valid range is from 0 to 157.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command displays the integrated cable information.

Examples

The following sample output shows the virtual carrier group information:

```
Router# show cable video integrated-cable 8/0/0
Integrated TSID ONID Output Physical Admin Operational Virtual-Carrier-Group
Service-Distribution-Group Logical-Edge-Device Encryption Total
Cable Port QAM ID State State Name Name
Name Capable Sessions
-----
8/0/0:20 1 0 1 unavailable OFF DOWN pme_tbv pme_tbv
pme_tbv pme 2
8/0/0:21 2 0 2 unavailable OFF DOWN pme_tbv pme_tbv
pme_tbv pme 2
8/0/0:22 3 0 3 unavailable OFF DOWN pme_tbv pme_tbv
pme_tbv pme 2
8/0/0:23 4 0 4 unavailable OFF DOWN pme_tbv pme_tbv
pme_tbv pme 0
8/0/0:24 5 0 5 unavailable OFF DOWN pme_tbv pme_tbv
pme_tbv pme 0
```

Related Commands	Command	Description
	vcg	Specifies the virtual carrier group assigned to the logical edge device
	logical-edge-device	Define a logical edge device.

Command	Description
protocol	Specifies the protocol used in the logical edge device.
virtual-edge-input-ip	Configures a virtual edge input.
show cable video logical-edge-device	Displays the logical edge device information.

show cable video logical-edge-device

To display the logical edge device information, use the **show cable video logical-edge-device** command in privileged EXEC mode.

```
show cable video logical-edge-device {all | id id [{reserve-pid-range}] | name name
[{reserve-pid-range}]}
```

Syntax Description	all	Displays all logical edge devices.
	id <i>id</i>	Displays the information of the logical edge device with this ID.
	name <i>name</i>	Displays the information of the logical edge device with this name.
	reserve-pid-range	Displays the reserved PID range.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command displays the logical edge device information.

Examples

The following sample output shows the logical edge device information:

```
Router# show cable video logical-edge-device id 1
Logical Edge Device: led
Id: 1
Protocol: GQI
Service State: Active
Discovery State: Disable
Management IP: 1.33.2.10

```

Related Commands

Command	Description
virtual-edge-input-ip	Specifies and configures a cable multicast QoS group.
encrypt	Encrypts the virtual carrier group.
service-type	Specifies the service type of the virtual carrier group.
rf-channel	Specifies the virtual RF channels in a virtual carrier group.
virtual-carrier-group	Defines a virtual carrier group.

show cable video low-latency linecard

To display the linecard low latency information, use the **show cable video low-latency linecard** command in privileged EXEC mode.

show cable video low-latency linecard {*slot/bay* | **all**}

Syntax Description

<i>slot/bay</i>	Displays the low latency information for a specific linecard.
all	Displays the low latency information for all the linecards.

Command Default

None.

Command Modes

Privileged EXEC (#)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following sample outputs show the linecard low latency information:

```
Router# show cable video low-latency linecard 1/0
Line Card: 1
  Virtual-Carrier-Group: vcg1
  Service-Distribution-Group: sdg1
  Logical-Edge-Device: led1
  Number of RF-Channels: 8
  RF-Channel Range      TSID Range      Output Port Number Range
  -----
  0-7                   100-107         100-107
```

Related Commands

Command	Description
low-latency	Sets low latency VCG.

show cable video output-port

To display the output port information, use the **show cable video output-port** command in privileged EXEC mode.

show cable video output-port *port*

Syntax Description	<i>port</i> Displays the output port information with this port number.
---------------------------	---

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command displays the output port information.

Examples

The following sample output shows the output port information:

Router# **show cable video output-port 10**

```

Integrated TSID  ONID  Output Physical  Admin  Operational  Virtual-Carrier-Group
Cable           Port   QAM ID   State   State         Name

vod                          led-vei              powerkey    2

```

Related Commands	Command	Description
	virtual-edge-input-ip	Specifies and configures a cable multicast QoS group.
	encrypt	Encrypts the virtual carrier group.
	service-type	Specifies the service type of the virtual carrier group.
	rf-channel	Specifies the virtual RF channels in a virtual carrier group.
	virtual-carrier-group	Defines a virtual carrier group.

show cable video scg

To display the scrambling control group information, use the **show cable video scg** command in privileged EXEC mode.

show cable video scg {**all** | **id** *id* | **logical-edge-device** {**id** *id* | **name** *name*} | **summary** | **tsid** *number* **onid** *number*}

Syntax Description		
all		Displays all the scrambling control groups.
id <i>id</i>		Displays the information of the scrambling control group with this ID. The valid range is from 0 to 1008730111.
logical-edge-device		Displays the information of the scrambling control groups on the logical edge device. <ul style="list-style-type: none"> • id <i>id</i> —Displays the information of the scrambling control groups on the logical edge device with this ID. The valid range is from 0 to 32. • name <i>name</i> —Displays the information of the scrambling control groups on the logical edge device with this name.
summary		Displays the number of scrambling control groups and encrypted carriers.
tsid <i>number</i> onid <i>number</i>		Displays the list of scrambling control groups on a transport stream identifier. <p><i>tsid</i>—The valid range is from 0 to 65535.</p> <p><i>onid</i>—The valid range is from 0 to 65535.</p>

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command displays the scrambling control group information.

Examples The following sample output shows the scrambling control group information:

```
Router# show cable video scg logical-edge-device id 1
LED 1 has 8137 SCGs on 128 carriers
SCG ID      Session ID  LED  TSID  ONID
-----
68157683   1048819    1    1     100
68157684   1048820    1    1     100

Router# show cable video scg id 68157684
SCGid: 68157684
```

show cable video scg

```
Status: SUCCESS
TSID: 1
ONID: 100
Nominal CP: 550
```

```
Router# show cable video scg logical-edge-device id 68157684 | inc session 1048820
```

```
SCG ID      Session ID  LED  TSID  ONID
-----
68157684   1048820    1    1    100
```

Related Commands

Command	Description
virtual-edge-input-ip	Specifies and configures a cable multicast QoS group.
service-distribution-group	Defines a service distribution group.
onid	Override the default ONID.
rf-port integrated-cable	Specifies the RF ports in a service distribution group.
show cable video logical-edge-device	Displays the logical edge device information.

show cable video service-distribution-group

To verify the service distribution group (SDG) configuration, use the **show cable video service-distribution-group** command in the privileged EXEC (#) mode.

show cable video service-distribution-group [**all** | **id** *id*]

Syntax Description

all Displays the information for all SDGs.

id *id* Displays the information for the SDG with this ID.

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command is used to verify the SDG configuration.

The following sample output shows the SDG information:

```
router#show cable video service-distribution-group all
Number of Service Distribution Groups: 1
ID Name Virtual-Carrier-Group Logical-Edge-Device RF-Port ONID PSI Interval
      Name                               Name
-----
1 vod vod LEDnew 7/0/0 0 100
1 vod vod LEDnew 7/0/1 0 100
1 vod vod LEDnew 7/0/2 0 100
1 vod vod LEDnew 7/0/3 0 100
1 vod vod LEDnew 7/0/4 0 100
1 vod vod LEDnew 7/0/5 0 100
1 vod vod LEDnew 7/0/6 0 100
1 vod vod LEDnew 7/0/7 0 100
```

Related Commands

Command	Description
service-distribution-group	Defines a service distribution group.
rf-port integrated-cable	Defines the physical slot/bay/port to be used in a video service.
psi-interval	Override the default PSI value.
onid	Override the default ONID.

show cable video session all

To display the video session information for the entire chassis, use the **show cable video session all** command in privileged EXEC mode.

show cable video session all

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 16.8.1	The input program number and the remux information was added to the command output.
Cisco IOS XE Gibraltar 16.10.1c	Added two columns—Encrypt Type and Encrypt Status in the command output. The Encrypt Type column displays the sessions that are encrypted at source as Pre-encrypted and Encrypt Status displays Encrypted.
Cisco IOS XE Amsterdam 17.3.1x	Added the option dvb-ecm to the command.
Cisco IOS XE Bengaluru 17.6.x	Added the Virtual Carrier Group ID column in the command output. The VCG ID helps in better debugging.

The following is an example of how to view the session information:

```
Router#show cable video session all
LED Session      Output Streaming  Sess Session Source      UDP  VCG  Input
Output Input      Output Streaming  Sess Session Source      Low PMV  Session

Router#
```

show cable video session logical-edge-device

To display the session information for a specific logical edge device, use the **show cable video session logical-edge-device** command in privileged EXEC mode.

```
show cable video session logical-edge-device { id number | name led-name } [ { session-id id |
session-name name } | { dvb-ecm } ] [ { downstream-cable | integrated-cable | downstream-video
} slot | linecard slot/bay | summary | debug ]
```

Syntax Description

<i>number</i>	Specifies the logical edge device identifier.
session-id <i>id</i>	Specifies the session identifier for the logical edge device.
session-name <i>name</i>	Specifies the session identifier for the logical edge device.
summary	Specifies remux processing type.
debug	Displays debug information.
dvb-ecm	Displays the current Entitlement Control Messages packet identifiers for the specified session.

Command Default None

Command Modes Privileged EXEC (#)

The following table describes the significant fields in the command output:

Table 191: show cable video session logical-edge-device Field Descriptions

Field	Description
Session ID	Session identifier.
Output Port	Output port for the session.
Streaming Type	Streaming type of the session.
Session Type	Session type information.
Session Ucast Dest	Unicast session destination IP address.
Source IP/Mcast IP (S,G)	Source IP address and multicast session IP address.
UDP Port	UDP port information for the session.
Input program	Input program information of the session.
Output Program	Output program information of the session.
Input State	Session input state.
Output State	Session output state.
Input Bitrate	Session input bitrate.
Output Bitrate	Session output bitrate.
Encrypt Type	Session encryption type.
Encrypt Status	Session encryption status.
Session Name	Session name.

Related Commands

Command	Description
encrypt	Encrypts the virtual carrier group.
rf-channel	Specifies the virtual RF channel in a virtual carrier group.

show cable video snmp-alarms

To display the active alarms in the system, use the **show cable video snmp-alarms** command in privileged EXEC mode.

show cable video snmp-alarms

show cable video vei-bundle

To display the virtual edge input bundle information, use the **show cable video vei-bundle** command in privileged EXEC mode.

show cable video vei-bundle {*id* | **all**}

Syntax Description	<i>id</i>	Displays the information of the virtual edge input bundle with this ID.
	all	Displays all virtual edge input bundles.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command displays the virtual edge input bundle information.

Examples The following sample output shows the virtual edge input bundle information:

```
Router# show cable video vei-bundle all
Total VEI Bundles: 1
Bundle      LED      Input Port  VEI      Slot/Bay  Gateway
ID          ID          ID          IP
-----
40000      1          33          33.33.33.33  7/0      177.0.10.3
40000      1          44          44.44.44.44  7/0      177.0.10.3
40000      1          66          66.66.66.66  7/0      177.0.10.3
40000      1          77          77.77.77.77  7/0      177.0.10.3
40000      1          222         222.222.222.222 7/0      177.0.10.3
```

Related Commands	Command	Description
	virtual-edge-input-ip	Configures a virtual edge input.
	logical-edge-device	Define a logical edge device.
	protocol	Specifies the protocol used in the logical edge device.
	vei-bundle	Bundles the virtual edge inputs for a particular LED.
	show cable video logical-edge-device	Displays the logical edge device information.

show cable video virtual-carrier-group

To display the virtual carrier group information, use the **show cable video virtual-carrier-group** command in privileged EXEC mode.

show cable video virtual-carrier-group {**all** | **id** *id* | **name** *name*}

Syntax Description

all	Displays all virtual carrier groups.
id <i>id</i>	Displays the information of the virtual carrier group with this ID.
name <i>name</i>	Displays the information of the virtual carrier group with this name.

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 16.4.1	This command was modified on the Cisco cBR Series Converged Broadband Routers. Low latency status was added in the output.

Usage Guidelines

This command displays the virtual carrier group information.

Examples

The following sample output shows the virtual carrier group information:

```
Router# show cable video virtual-carrier-group all
Number of Virtual Carrier Groups: 1
ID      Name      Input      Service-Distribution-Group  Logical-Edge-Device  Total
-----  -----  -----  -----  -----  -----
1       vcg-0     -          vcg          vcgcast          5
```

Examples

The following sample output shows the information of a specific virtual carrier group with low latency status:

```
Router# show cable video virtual-carrier-group id 1
Name: vcg1
ID: 1
Service Distribution Group Name: sdg1
Service Distribution Group ID: 1
Logical Edge Device Name: led1
Logical Edge Device ID: 1
ServiceType: narrowcast
Encrypted: N
Low Latency: Y
Number of VEIs: 0
```

```

Virtual Edge Input:
Input Port   VEI           Bundle
ID           IP             ID
-----
Number of RF-Channels: 8
RF-Channel Range  TSID Range  Output Port Number Range
-----
0-7              100-107    100-107

```

Related Commands

Command	Description
virtual-edge-input-ip	Specifies and configures a cable multicast QoS group.
encrypt	Encrypts the virtual carrier group.
service-type	Specifies the service type of the virtual carrier group.
rf-channel	Specifies the virtual RF channels in a virtual carrier group.
virtual-carrier-group	Defines a virtual carrier group.
low-latency	Sets low latency VCG.

show checkpoint

To display information about the Checkpoint Facility (CF) subsystem on a Cisco CMTS, use the **show checkpoint** command in privileged EXEC mode.

```
show checkpoint {clients [client-id] | entities | statistics}
```

Cisco cBR Series Converged Broadband Router

```
show checkpoint [{domain default }]{clients [client-id] | entities [entity-id] | statistics [buffer-usage]}
```

Syntax Description

domain default	Specifies the RF domain. The default keyword specifies the default RF domain. This option is supported only on the Cisco cBR router.
clients	Displays a list of current checkpoint clients.
<i>client-id</i>	(Optional) Particular client statistics.
entities	Displays a list of current checkpoint entities.
statistics	Displays the current status for checkpoint operations.
buffer-usage	Displays the checkpoint client statistics using a large number of buffers.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(11)BC3	This command was introduced to support High Availability (HA) redundancy operations.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The domain default and buffer-usage keywords were added. This option is supported only on the Cisco cBR router.

Usage Guidelines

The Checkpoint Facility (CF) subsystem manages the passing of messages from the Active to Standby interfaces. It also handles sequencing and throttling, as needed during redundancy operations. Checkpoint clients, such as line cards and other subsystems, register with the CF subsystem so that they can update the Protect card or standby processor with state changes as necessary.

The **show checkpoint** command displays information about the clients (other processes on the CMTS that are sending checkpoint messages), entities, and run-time status for checkpoint operations.

The **show checkpoint clients** *client-id* command displays information about the client with a particular client ID.

Examples

The following shows typical output for the **show checkpoint clients** command:

```

Router# show checkpoint clients
                        Check Point List of Clients
CHKPT on ACTIVE server.
Client Name      Client ID      Msg Send      Msg len      Bundling
                  (number of)      (Total)
-----

Related Commands

These related commands are not supported on Cisco cBR Series Converged Broadband Router.

Command	Description
hccp authentication	Changes the minimum time between frequency hops.
hccp check version	Exits bypass version mode, and returns to normal HCCP operation.
hccp ds-switch	Specifies the downstream upconverter module for a Working CMTS or Protect CMTS (deprecated command).
hccp protect	Allows you to configure a Cisco CMTS to be a Protect CMTS for a specified Working CMTS in a 1+1 redundancy environment.
hccp working	Allows you to designate a Cisco CMTS to be a Working CMTS in a 1+1 redundancy environment.
show hccp	Displays information for all cable interfaces on which one or more HCCP groups and authentication modes have been configured.
show hccp interface	Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured.

show cmts ipc-cable client base

To display the interprocess communication (IPC) session status, the service information for all the slots and subslots on the line cards, and statistics for each session on the Cisco uBR10012 router, use the **show cmts ipc-cable client base** command in user EXEC or privileged EXEC mode.

```
show cmts ipc-cable client base {client | service | stats}
```

Syntax Description	client	Displays the IPC session status information.
	service	Displays all the IPC services for the slots and subslots on the Cisco uBR10012 router.
	stats	Displays the IPC layer statistics information for every session.

Command Default None

Command Modes

User EXEC (>) or

Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	12.2(33)SCF	The service keyword was added to this command.
	IOS-XE 3.15.0S	This command was removed.

Usage Guidelines

The **show cmts ipc-cable client base client** command displays the IPC session information for a group of messages that are exchanged between a route processor (RP) and a line card or between two line cards. This information includes the client ID, client name, IPC transport information, slot and subslot information, session state to identify whether the session is ready for message exchange, number of messages that are pending, and number of messages dropped.

The **show cmts ipc-cable client base service** command displays the IPC service information for all the slots and subslots on the Cisco uBR10012 router. This information includes IPC port information, such as type of service and port ID, retry and timeout information of the IPC messages, and watermark information in the request queue.

The **show cmts ipc-cable client base stats** command displays the IPC layer error statistics for every session and is used for internal debugging purposes. The error statistics information includes the client ID, client name, transport type, slot and subslot information, client buffer, IPC layer state, error counter information for the sent and received messages, and IPC In Service Software Upgrade (ISSU) register information.

Examples

The following is a sample output of the **show cmts ipc-cable client base client** command:

```

The table below describes the significant fields shown in the display:

Table 192: show cmts ipc-cable client base client Field Descriptions

Field	Description
Client Id	ISSU client ID.
Name	Client session name.
Slot/subslot	Slot and subslot.
Seat	IPC seat number for the session.

Field	Description
ISSU Sid	ISSU application client session service identifier.
Connection	Connection type.
State	Connection state that is established.
Ready	Readiness of the session.
Transport	Transport stream that is used.
Msg-Pending	Total number of messages waiting for acknowledgement.
MsD-Dropped	Total number of messages dropped.
ISSU MTU	IPC Maximum Transmission Unit (MTU) of the ISSU session.

```

The table below describes the significant fields shown in the display:

Table 193: show cmts ipc-cable client base service Field Descriptions

Field	Description
CMTS IPC service 1/0: default	Slot and subslot. Describes the type of service—default, inband, expedite, or non-critical.
ipc_port_info	IPC port information.
ipc_port_id	IPC port ID.
retry_max	Maximum retries in Cisco IOS software IPC layer.
retry_period	Time period of the retry interval in the IOS IPC layer.
rpc_timeout	RPC timeout value.
context	Context value.
pid	Program identifier value.
name	Type of IPC service.
in_transit	Indicates total number of messages waiting for acknowledgement
inband	Inband service type.

Field	Description
reqQ size	Size of the request queue.
reqQ watermark	Threshold value of the queue.
resume_send	IPC message sent is resumed.
block_done	IPC message is blocked.

The following is a sample output of the **show cmts ipc-cable client base stats** command:

```
Router# show cmts ipc-cable client base stats
Client Id: 0          Name: CLNT DOCSIS
Slot/subslot: 5 /0   Transport Type = RP-CLC
IPC getbuffer fail   : 0
IPC layer is down    : 0
Sender msg has error : 0
Rcvd msg fail parser : 0
Sender drop - Misc.  : 0
SID mgmt Q drop-No CM : 0
SID mgmt Q drop-Misc : 0
SID mgmt Q full      : 0
SID mgmt Q drop-IF down: 0
IPC timeout          : 0
IPC - no watch boolean : 0
Rcvd client no callback : 0
CR10K IPC Header transform error : 0
CR10K IPC ISSU send nego failed : 0
CR10K IPC ISSU not compatible : 0
CR10K IPC ISSU start nego failed : 0
CR10K IPC ISSU register failed : 0
```

The table below describes the significant fields shown in the display:

Table 194: show cmts ipc-cable client base stats Field Descriptions

Field	Description
Client Id	ISSU client ID.
Name	Client session name.
Slot/subslot	Slot and subslot.
Transport Type	Transport type.

Related Commands

Command	Description
show cable ipc-stats	Displays the statistics of all IPC messages on the Cisco CMTS router.

show controller gigabitethernet

To display information about the Gigabit Ethernet interface used by the Downstream External PHY Interface (DEPI), use the **show controller gigabitethernet** command in privileged EXEC mode.

show controller gigabitethernet *slot/subslot/{bayport}*

Syntax Description

<i>slot</i>	The slot where a SIP or cable line card resides. <ul style="list-style-type: none"> • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR7225VXR router—The valid range is from 1 to 2. • Cisco uBR10012 router—The valid range for: <ul style="list-style-type: none"> • Cable line card is from 5 to 8 • SIP is 1 and 3
<i>subslot</i>	The subslot where a SIP or cable line card resides. <ul style="list-style-type: none"> • Cisco uBR10012 router—The valid value for: <ul style="list-style-type: none"> • Cable line card in slot 5 to 8 is 0 or 1 • SPAs in a SIP in slot 1 or 3, prior to Cisco IOS Release 12.2(33)SCB is 0 or 1. For Cisco IOS Release 12.2(33)SCB and later, subslot is not specified.
<i>bay</i>	The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).
<i>port</i>	Specifies the port number. <ul style="list-style-type: none"> • Cisco uBR7246VXR router and Cisco uBR7225VXR router—The valid range is from 0 to 1. • Cisco uBR10012 router—The valid value for: <ul style="list-style-type: none"> • Slot 1 and 3 is 0 • Slot 5 to 8 is from 0 to 4

Command Default

None

Command Modes

Privilege EXEC (#)

Command History

Release	Modification
12.2(33)SCE	This command was introduced.
IOS-XE 3.15.0S	This command was replaced by the show controllers TenGigabitEthernet command.

Examples

This is a sample output for the **show controller gigabitethernet** command:

```
Router# show controller gigabitethernet 6/1/0
```

```

DEPI INTERFACE : GigabitEthernet6/1/0
slot           : 6
subunit        : 256

Port0 Status   : 1
Port1 Status   : 1
DS             : 11B7A40C

```

The table below describes the significant fields shown in the display:

Table 195: show controller gigabitethernet Field Descriptions

Field	Description
visible_bw	Configured bandwidth for bypass traffic
IB CHANNEL	Ironbus channel ID for bypass traffic
Port0 Status	Status of GigE port 0
Port1 Status	Status of GigE port 1

Related Commands

Command	Description
show controller ethernet	Displays the hardware status of the backplane ethernet (BPE) device.

show controller integrated-cable

To view information about the Cisco UBR-MC20X20V or Cisco uBR-MC88V line card, Cisco cBR Series Converged Broadband Router statistics or profile downgrade ordering on a given OFDM channel, use the **show controller integrated-cable** command in privileged EXEC mode.

This command also displays the details of the OFDM Channel power profile applied to the Cisco cBR Series Router.

```
show controller integrated-cable {slot/portslot/subslot/port} [{all | association | bpi-entry bpi-index | brief | config | counters {rf-channel [rf-channel] | wb-channel [wb-channel]} | errors | fpga_version | iofpga | mapping {rf-channel [rf-channel] | wb-channel [wb-channel]} | registers | rf-channel [rf-channel] | status | wideband-channel [wb-channel]}]
```

Cisco cBR Series Converged Broadband Routers

```
show controllers integrated-cable slot/subslot/port {acfe { cluster index } | all | association | bandwidth { rf-channel [rf-channel] | wb-channel [wb-channel] } | counter {ofdm-channel | rf-channel [rf-channel] | wb-channel [wb-channel] } | mapping { rf-channel [rf-channel] | wb-channel [wb-channel] } | rf-channel grouplist [verbose | prof-order] | rf-port | wideband-channel }
```

Syntax Description

<i>slot/port / slot/subslot/port</i>	<p>Identifies the cable interface on the Cisco uBR7225VXR, Cisco uBR7246VXR, or Cisco uBR10012 router.</p> <ul style="list-style-type: none"> • <i>slot</i> —Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router: The valid range is from 1 to 2. • Cisco uBR7246VXR router: The valid range is from 3 to 6. • Cisco uBR10012 router: The valid range is from 5 to 8. • Cisco cBR Series Converged Broadband Routers: The valid range is from 0 to 3 and from 6 to 9. • <i>subslot</i> —Subslot where the line card resides. Available slots are 0 or 1. This option is available on the Cisco uBR10012 router. For Cisco cBR Series Converged Broadband Routers, the available slot is 0. • <i>port</i> —Downstream port number on the line card. <ul style="list-style-type: none"> • Cisco uBR10012 router: The valid range is from 0 to 4. • Cisco uBR7246VXR and Cisco uBR7225VXR routers: The valid port value is 0 or 1. • Cisco cBR Series Converged Broadband Routers: The valid range is from 0 to 7.
all	(Optional) Displays the complete information about the line card statistics.

(For Cisco cBR Series Converged Broadband Routers only) acfe	(Optional) Displays controller acfe information.
association	(Optional) Displays the controller association information.
bpi-entry	(Optional) Displays the controller Baseline Privacy Interface (BPI) information. • <i>bpi-index</i> —BPI index number. The valid range is from 0 to 24575.
brief	(Optional) Displays brief information about the line card statistics.
(For Cisco cBR Series Converged Broadband Routers only) bandwidth	(Optional) Displays information about RF and Wideband channels.
config	(Optional) Displays statistics about the JIB hardware and downstream PHY configuration.
counters	(Optional) Displays information about the RF and wideband (WB) channel counters.
(For Cisco cBR Series Converged Broadband Routers only) counter	(Optional) Displays information about channel counters.
ofdm-channel	Displays the OFDM channel information.
rf-channel	Displays the RF channel information.
<i>rf-channel</i>	(Optional) RF channel number. The valid range is from 0 to 3.
wb-channel	Displays the wideband channel information.
<i>wb-channel</i>	(Optional) Wideband channel number. The valid range is from 0 to 5.
errors	(Optional) Displays information about the error counters, such as DOCSIS processor error counters, BPI error counters, and queue manager error counters.
fpga_version	(Optional) Displays the FPGA version information.
iofpga	(Optional) Displays the IOFPGA information.
mapping	(Optional) Displays mapping statistics of the RF and WB channels.
registers	(Optional) Displays the list of JIB hardware downstream register values.
(For Cisco cBR Series Converged Broadband Routers only) rf-channel	(Optional) Displays information about RF channels.
(For Cisco cBR Series Converged Broadband Routers only) prof-order	(Optional) Displays information about the profile downgrade ordering on a given OFDM channel.

(For Cisco cBR Series Converged Broadband Routers only) rf-port	(Optional) Displays information about RF port.
status	(Optional) Displays the JIB hardware and downstream PHY status.
wideband-channel	(Optional) Displays the controller wideband cable information.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
12.2(33)SCD	The command was modified. Added support for the Cisco uBR-MC88V line card on Cisco uBR7246VXR and Cisco uBR7225VXR universal broadband routers.
12.2(33)SCE	This command was modified. The following optional keywords were added: <ul style="list-style-type: none"> • fgpa_version • iofpga • rf-channel • wideband-channel
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.18.0SP	This command was modified. The prof-order and ofdm-channel keywords were added.
IOS-XE 3.18.1SP	This command was modified. The command output was updated to include the guardband override status indication.
Cisco IOS XE 16.8.1	The output of the command with the verbose keyword was modified to display the ZBL related information.

Usage Guidelines

This command allows the user to view the following line card statistics:

- Controller association
- JIB hardware downstream configuration
- Channel counters
- Errors
- Mapping of WB and RF channels
- JIB hardware downstream registers
- JIB hardware downstream status

Examples

The following example shows a typical display of the **show controller integrated-cable** command and the **acfe cluster** keyword:

```
Router# show controller integrated-Cable 3/0/0 acfe cluster 0
Integrated-Cable 3/0/0 status:
Topology changed: No

=====Cluster 0=====
Number of RF: 2
RF      FlexBW      WB      ExcessBW  Quanta
0       35625          -      35438     35438
        0           0       187       187
1       35250          0      35250     35250

Number of BG: 2
Intf    Demand      CIR      Max      CstrMin  Alloc  NBonus  Ratio
WB0     1000         0        70875   35250    35437  35438   14855190400
IC0     1000         0        35625   0        35438  187     14855609600
```

The following example shows a typical display of the **show controller integrated-cable** command and the **all** keyword:

```
Router# show controllers integrated-Cable 6/0/0 all
Integrated Cable Controller 6/0/0:
-----
Channel 1 Annex = B Modulation = 256 QAM
Channel 2 Annex = B Modulation = 256 QAM
Channel 3 Annex = B Modulation = 256 QAM

```
Router# show controllers integrated-Cable 6/0/0 brief
Integrated Cable Controller 6/0/0:
-----
Channel 1 Annex = B Modulation = 256 QAM
Channel 2 Annex = B Modulation = 256 QAM
Channel 3 Annex = B Modulation = 256 QAM
Channel 4 Annex = B Modulation = 256 QAM
Jib3-DS Device Information:
-----
Jib3-DS Version = 2.2.1.8
SW Rev ID = 0x00020002 HW Rev ID = 0x00010008
Device Type: Coldplay
Driver State: 3
Channel Resources:
-----
Total Non-bonded Channels.....= 20
Per-Controller Non-bonded Channels = 4
Total Bonded Channels.....= 32
Per-Controller Bonded Channels.....= 6
Slot-Wide Resources:
-----
Number of PHS Rules.....= 12K (0x3000)
Number of BPI Table Entries...= 24K (0x6000)
Number of Service Flows.....= 64K (0x10000)
DS PHY Device Information:
-----
Remora Version = 3.10
UPX SW Version = 0x10D
Upconverter Type:Unknown
UPX Part Number =
Device Status:
-----
UPX Alarm Status = 0x3FF
UPX Alarm Mask = 0x19000
```

The following example shows a typical display of the **show controller integrated-cable** command and the **bpi-entry** keyword:

```
Router# show controller integrated-cable 7/1/4 bpi-entry 3
BPI index:3 segment:0 key_no:3 said:2 key_seq:7 AES
Even 5A4B-68E8-5948-FD84-F5E2-1D28-311C-37D8
Iv 4E33-379E-6FCF-9A8E-01CB-AC95-5B4D-AE76
Odd A871-76EA-1D3E-02F8-5EDA-8A8E-1F15-52E6
Iv 6F62-765C-C9E7-DB8A-6FA5-91E8-BE41-3075
```

Effective from Cisco IOS Release 12.2(33)SCD, the BPI key information stored on the Cisco UBR-MC20X20V line card is displayed using the show controller integrated-cable command with the bpi-entry keyword.

The following is a sample output of the **show controller integrated-cable** command with the **bpi-entry** keyword:

```
Router# show controller integrated-cable 6/0/0 bpi-entry 1
BPI Index: 1 Segment: 0
Even Key: Valid, Odd Key: Valid
Key Sequence Number: 1 Security Association: 0x2
Key Type: DES
Even Key: 1CE8-45A1-1903-E5 IV: 1513-236D-1FF7-046E
Odd Key: 10EC-6DB2-5441-EC IV: 07C7-1089-0E34-026B
```

The following example provides information about all controllers using the **show controller integrated-cable** command and the **wideband** keyword:

```
Router# show controller integrated-cable 7/1/4 wideband
WB          BG   WB Host      Primary
channel     ID   Slot/Subslot  BG
Wideband-Cable7/1/4:0 1185 7/1           Yes
Wideband-Cable7/1/4:1 1186 7/1           Yes
Wideband-Cable7/1/4:2 1187 7/1           Yes
Wideband-Cable7/1/4:3 1188 7/1           Yes
Wideband-Cable7/1/4:4 1189 7/1           Yes
Wideband-Cable7/1/4:5 1190 7/1           Yes
```

The following example provides information about all controllers using the **show controller integrated-cable** command and the **config** keyword:

```
Router# show controllers integrated-Cable 6/0/0 config
Integrated Cable Controller 6/0/0:
-----
Channel 1 Annex = B Modulation = 256 QAM
Channel 2 Annex = B Modulation = 256 QAM
Channel 3 Annex = B Modulation = 256 QAM
Channel 4 Annex = B Modulation = 256 QAM
Jib3-DS Device Information:
-----

Router# show controllers integrated-Cable 6/0/0 mapping wb-channel
Load for five secs: 18%/1%; one minute: 11%; five minutes: 13%
Time source is NTP, *15:07:17.566 EDT Sun Mar 21 2010
Ctrlr  WB      RF      BW %      Remaining
      channel channel  Ratio
6/0/0  0        6/0/0:0 63      1
      6/0/0:1 63      1
      6/0/0:2 63      1
      6/0/0:3 63      1

```

The following example provides information about all controllers using the **show controller integrated-cable** command and the **registers** keyword:

```

Router# show controllers integrated-Cable 6/0/0 registers
JIB3_DS BPI registers (base address 0xF8880000)
bpi_int_isr_0          [0x00000000] = 0x00000000
bpi_int_ier_0         [0x00000004] = 0x0000000F

```

show controller integrated-cable

```

```

The following example provides information about all controllers using the **show controller integrated-cable** command and the **status** keyword:

```
Router# show controllers integrated-Cable 6/0/0 status
Load for five secs: 9%/0%; one minute: 11%; five minutes: 13%
Time source is NTP, *15:07:31.309 EDT Sun Mar 21 2010
Jib3-DS Status:
-----
  Rx SPI.....: OK
  Tx SPI.....: OK
  DCM Status.....: OK
  ERP Status.....: OK
  DOCSIS RLD RAM Status: OK
  QM RLD RAM Status....: OK
DS PHY Device Information:
-----
  Remora Version = 3.10
  UPX SW Version = 0x10D
  Upconverter Type:Unknown
  UPX Part Number =
Device Status:
-----
  UPX Alarm Status = 0x3FF
  UPX Alarm Mask   = 0x19000
```

The following example shows a typical display of the **show controller integrated-cable** command on Cisco cBR Series Converged Broadband Routers:

```
Router# show controllers integrated-Cable 7/0/0 ?
 acfe          Show contrller acfe
 all           Show all M-CMTS information
 association   Show interface association info
 bandwidth    Show bandwidth of WB/RF channels
 counter      Show channel counters
 mapping      Show mapping of WB/RF channels
 rf-channel   Show rf channels
 rf-port      Show rf port
 wideband-channel Show wideband channels
```

The following example shows a sample output for the **show controllers integrated-cable rf-channel** command on Cisco cBR Series Converged Broadband Routers:

```
Router# show controller Integrated-Cable 3/0/4 rf-channel 158 verbose
Chan State Admin Mod-Type Start Width PLC Profile-ID dcid
          Frequency

Active subcarrier count: 1804, ZBL count: 1
```

The table below describes the fields displayed in the show controller integrated-cable command output with various keywords (as described in preceding examples):

Table 196: show controller integrated-cable Field Descriptions

Field	Description
WB channel	Wideband channel number.
BG ID	Bonding group ID.
Bundle num	Bundle number.
NB channel	Narrowband channel number.
NB chan ID	Narrowband channel ID.
Reserved CIR	Reserved committed information rate (CIR) value.
Total CIR	Total committed information rate (CIR) value.
Controller Chan	Controller channel number.
RF Packets	RF packets.
MPEG bps	MPEG value in bps.
MPEG mbps	MPEG value in Mbps.
MPEG Packets	MPEG packets.

Field	Description
Sync Packets	Synchronization packets.
MAP/UCD	MAP/ UCD value
Tx Packets	Tx packets
Tx Octets	Tx octets
Offset	Memory offset
Register	Line card registers
Value	Register values.
BPI Index	Baseline Privacy Interface (BPI) index number.
Segment	Hardware segment being used by DOCSIS MAC.
Even Key	Current value of the Even Key in the BPI entry.
Odd Key	Current value of the Odd Key in the BPI entry.
Key Sequence Number	Key sequence number.
Security Association	Security association identifier.
Key Type	The type of key stored based on the encryption algorithm (Data Encryption Standard [DES] or Advanced Encryption Standard [AES]).
Demand	EIR demand used, which is the weight used to balance the bandwidth between bonding groups.
ZBL count	The number of zero bit loading subcarrier.

Related Commands

Command	Description
cable rf-bandwidth-percent	Enables static or dynamic bandwidth sharing for a modular cable (MC) interface.
cable upstream connector	Maps an upstream port to a physical port on the Cisco UBR-MC20X20V cable interface line card for use with a particular downstream.
show controller cable	Displays information about the interface controllers for a cable interface on the Cisco CMTS router.
show hw-module bay	Displays information about the wideband channels or RF channels on a Wideband SPA.
show interface cable	Displays the current configuration and status of a cable interface.

Command	Description
show cable modem phy ofdm-profile	Displays information about the profiles associated with the cable modems (CMs).
show cable modem prof-mgmt	Displays detailed profile management data associated with each cable modem.

show controllers integrated-cable counter ofdm-channel snmp-rolling-avg

To display the rolling average value computed for each of the OFDM channels, use the **show controllers integrated-cable slot/subslot/port counter ofdm-channel snmp-rolling-avg** command in privileged EXEC mode.

show controllers integrated-cable slot/subslot/port counter ofdm-channel snmp-rolling-avg

Syntax Description

controllers	Interface controller status.
counter	(Optional) Displays information about channel counters.
integrated-Cable	Integrated Cable controller.
ofdm-channel	OFDM channel counters.
<i>slot/subslot/port</i>	Identifies the cable interface. <ul style="list-style-type: none"> • <i>slot</i> — Slot where the line card resides. The valid range is 0–3 and 6–9. • <i>subslot</i> — Subslot where the line card resides. The available slot is 0. • <i>port</i> — Downstream port number on the line card. The valid range is 0–7.
snmp-rolling-avg	Calculates of SNMP Rolling average.

Related Commands

Command	Description
show controller ethernet	Displays the hardware status of the backplane ethernet (BPE) device.

show controllers cable

To display information about the interface controllers on a cable interface on the Cisco CMTS router, use the **show controllers cable** command in user EXEC or privileged EXEC mode.

```
show controllers cable {slot/portslot/subslot/port} [{downstream | upstream [port][ipc] [mem-stat] [memory] [proc-cpu][tech-support]}]
```

Cisco IOS Release 12.2(33)SCE and Later

```
show controllers cable {slot/cable-interface-indexslot/subslot/cable-interface-index} [{downstream | upstream [upstream-index][ipc] [mem-stat] [memory] [proc-cpu][tech-support]}]
```

Cisco cBR Series Converged Broadband Router

```
show controllers cable slot/subslot/cable-interface-index [{downstream | upstream [port]}]
```

Syntax Description

<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR7225VXR router—The valid range is from 1 to 2. • Cisco uBR7100 series router—The valid value is 1. • Cisco cBR routers—The valid values are 0 to 3 and 6 to 9.
<i>subslot</i>	(Cisco uBR10012 only) Secondary subslot of the cable interface line card. The valid slots are 0 or 1. For Cisco cBR routers—The valid values is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR routers—The valid values are 0 to 15.
downstream	(Optional) Displays the downstream interface status.
upstream	(Optional) Displays the upstream interface status.
<i>port</i>	(Optional) Specifies the desired upstream port. Valid values start with 0 for the first upstream port on the cable interface line card. For Cisco cBR routers—The valid values are 0 to 7.

<i>upstream-index</i>	(Optional) Specifies the desired index for the upstream port. Valid values for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards range from 0 to 3.
ipc	(Optional) Displays the Inter-Process Communication (IPC) information between different line cards. This option is not supported on the Cisco cBR router.
mem-stat	(Optional) Displays the output from the show memory statistics command that contains a summary of memory statistics for a Broadband Processing Engine (BPE) cable interface line card. This option is not supported on the Cisco cBR router.
memory	(Optional) Displays the output from the show memory command that contains a summary of memory statistics, including the memory as it is allocated per process, for a BPE cable interface line card. This option is not supported on the Cisco cBR router.
proc-cpu	(Optional) Displays the output from the show processes cpu command that contains the processor status for a BPE cable interface line card. This option is not supported on the Cisco cBR router.
tech-support	(Optional, privileged EXEC mode only) Displays the output from the show tech-support command for a BPE cable interface line card. This option is not supported on the Cisco cBR router.

Command Modes

User EXEC (all options except **tech-support**), Privileged EXEC (#)

Command History

Release	Modification
11.3 NA	This command was introduced.
12.0(2)XC	This command was modified to show a number of additional fields.
12.1(5)EC1	Support was added for the Cisco uBR7100 series router, including information about the Cisco uBR7100 series integrated upconverter.
12.2(1)XF1	Support was added for the Cisco uBR10012 router.
12.0(16)SC2, 12.1(10)EC1, 12.2(4)BC1b	The algorithm for calculating the SNR value was enhanced for a more accurate value.
12.2(15)CX	Support was added for the Cisco uBR-MC28U/X cable interface line card, including the display of the number of packets dropped because they were for a Service Flow ID (SFID) of 0.
12.2(15)BC2b	The mem-stat , memory , and proc-cpu keywords were added to obtain processor information from the onboard processor on Broadband Processing Engine (BPE) cable interface line cards, such as the Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, and Cisco uBR10-MC5X20S/U cards.

Release	Modification
12.3(9a)BC	Added the optional tech-support keyword to optimize the collection of line card information without consuming the console session for a long period of time.
12.3(17a)BC	Added support for Dynamic Channel Change (DCC) for Load Balancing on the Cisco CMTS.
12.3(17a)BC2	Added support for the Cisco uBR10-MC5X20H interface line cards.
12.3(23)BC	The downstream keyword displays status and characteristics of modular cable interfaces associated with the Cisco uBR10-MC5X20 line card MAC domain host interface.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCC	The command output was modified to show logical channels information when multiple logical channels are configured.
12.2(33)SCE	The command syntax was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. The upstream <i>port</i> parameter was changed to <i>upstream-index</i> .
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The ipc , mem-stat , memory , proc-cpu , tech-support keywords were removed.

Usage Guidelines

The **mem-stat**, **memory**, and **proc-cpu** keywords are used to obtain the relevant information from the onboard processor on BPE cable interface line cards, such as the Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, and Cisco uBR10-MC5X20S/U/H cards. This allows you to obtain information that is specific to a line card, as opposed to having to run these commands on the entire router.

The *logical-index* is shown only when multiple logical channels are configured using the **cable upstream max-logical-chans** command.

Note The **mem-stat**, **memory**, and **proc-cpu** options are not available for cable interface line cards that do not contain an onboard processor (for example, the Cisco uBR-MC16C card).

Dynamic Channel Change (DCC) Support for Load Balancing

The following commands and fields illustrate the show controllers command used with DCC:

```
Router# show controllers cable x/y upstream | i DCC
DCC: 0 REQs  n2 RSPs  0 ACKs
Router# show controllers cx/y downstream| i DCC
DCC: n1  REQs  0 RSPs  n3 ACKs
n4 Successful DCCs  n5 DCC Failures
DCC end of transaction counts:
DCC unknown cause(e1) offline(e2) if down(e3) no cm(e4)
DCC no resource(e5) no retries(e6) reject(e7) unknown state (e8)
```

```
DCC rebuild err (e9) T15 timeout(e10) reinit MAC (e11) dcc succeeds(e12)
```

The fields in this example are as follows:

- n1—The number of DCC REQ messages traversing an interface, nonzero on downstream.
- n2—The number of DCC RSP messages traversing an interface, nonzero on upstream.
- n3—The number of DCC ACK messages traversing an interface, nonzero on downstream.
- n4—The number of successful DCC transactions, nonzero on downstream direction.
- n5—The number of failed DCC transactions, nonzero only on downstream direction

The above counters are DOCSIS-specific DCC counters, which can also be collected via SNMP MIB.

The following summary illustrates classified DCC transaction end counts originated from the interface with the above **show controllers** command example:

- e1—The number of DCC transactions ended with unknown causes.
- e2—The number of DCC transactions ended due to modems going offline.
- e3—The number of DCC transactions ended due to interface down.
- e4—The number of DCC transactions ended due to a nonexistent cable modem.
- e5—The number of DCC transactions ended due to insufficient resources on target.
- e6—The number of DCC transactions ended due to exhausted DCC-REQ retries.
- e7—The number of DCC transactions ended due to rejected DCC-REQ.
- e8—The number of DCC transactions ended due to unknown DCC state.
- e9—The number of DCC transactions ended due to failure to assign a cable modem on the target.
- e10—The number of DCC transactions ended due to T15 time out.
- e11—The number of DCC transactions ended due to CM MAC reinitialization.
- e12—The number of DCC transactions ended successfully.

This command is subject to the restrictions and prerequisites described in the *Configuring Load Balancing and Dynamic Channel Change (DCC) on the Cisco CMTS feature guide* on Cisco.com.

Examples

The following abbreviated example illustrates the initial information for the **tech-support** keyword for the Cisco uBR10012 router on which Cisco IOS Release 12.3(9a)BC is installed:

```
Router# show controllers cable 8/1/0 tech-support
----- show version -----

```

The following is a sample output of the **show controllers cable downstream** command for downstream connection at slot 3 on a Cisco CMTS router:

```
Router# show controllers cable 3/0 downstream
Cable 3/0 Downstream is up
Frequency not set, Channel Width 6 MHz, 64-QAM, Symbol Rate 5.056941 Msps
FEC ITU-T J.83 Annex A, R/S Interleave I=12, J=17
```

The table below describes the fields shown in the **show controllers cable downstream** command display.

Table 197: show controllers cable downstream Field Descriptions

Field	Description
Cable	Slot and port number indicating the location of the Cisco cable interface line card.
Downstream is up	RF downstream interface is enabled.
Frequency	Transmission frequency of the RF downstream. (This information may not match the current transmission frequency, which is external on Cisco CMTS platforms that use an external upconverter.)
Channel Width	Width of the RF downstream channel.
QAM	Modulation scheme.
Symbol Rate	Transmission rate (in number of symbols per second).
FEC ITU-T	Motion Picture Experts Group (MPEG) framing standard.
Annex	Annex for the RF downstream channel.
R/S Interleave I/J	Reed Solomon framing based on ITU S.83-B.

For cable interfaces that include an integrated upconverter, the **show controllers cable** command includes the frequency and power settings for the integrated upconverter. The following example shows a typical output for the **show controllers cable** command that includes the information for the integrated upconverter:

```
Router# show controllers cable 1/0

Interface Cable1/0
Hardware is IMC11
BCM3210 revision=0x56B2
Cable1/0 Upconverter is Enabled Output is Enabled
Model: 74-2094-01 Serial Number: 0WAV04480010 CLEI Code:      CLEI#
HW Rev:    PC2D0107 SW Rev: 007, NVRAM Rev: 006 ECI number 123456
Downstream Frequency 525.0000 MHz
IF Power 0.3 dBmV RF Power 51.0 dBmV
...
```

The following example is a sample output of the **show controllers cable** command with the cable interface index 0, on the Cisco UBR-MC3XG60V line card. The downstream channel ID and RFID are also displayed in the output:

```

Router# show controller cable 5/0/0
Interface Cable5/0/0
Hardware is M3G60

The table below describes the fields shown in the **show controllers cable downstream** command display.

Table 198: show controllers cable downstream Field Descriptions

Field	Description
Downstream Frequency	Center frequency (in MHz) for which the integrated upconverter is configured.
IF Power	Power level (in dBmV) of the signal that the integrated upconverter is receiving from the cable interface line card in the Cisco uBR7100 series router.
RF Power	Power level (in dBmV) of the RF output signal that the integrated upconverter is transmitting on the DS0 RF port.
Dynamic Services Stats	Dynamic downstream service statistics for a specific cable interface.
CM STATUS Stats	Cable modem status statistics for a specific cable interface.
DS_chan_id	Downstream channel ID for a specific cable interface.
RFID	RF ID associated to a specific cable interface.
MDDs	MAC Domain Descriptor (MDD).
Primary	Primary MDD.

Field	Description
Non-Primary	Non-primary MDD.

The following is sample output from the **show controllers cable upstream** command for a Cisco CMTS router with a cable interface line card located in slot 4, port 0:

```
Router# show controllers cable 4/0 upstream 2

Cable4/0 Upstream 2 is administratively down
  Frequency 5.008 MHz, Channel Width 0.200 MHz, QPSK Symbol Rate 0.160 Msps

For Broadband Processing Engine (BPE) cards and other cable interfaces that include onboard upconverters, the **show controllers cable** command also displays the upconverter status and configuration information. The following excerpt from the show controllers cable command output shows the information that is displayed for the Cisco uBR10-MC5X20S cable interface line card:

```

Router# show controllers cable 5/1/4

Interface Cable5/1/4

```

```

Hardware is MC520S
JIB version 66
Cable5/1/4 Upconverter is Enabled Output is Enabled
Model: 74-2094-04 Serial Number: 0WAV0649000L CLEI Code: FFFFFFFF
HW Rev: PC2D0108 SW Rev: 010, NVRAM Rev: 006 ECI number FFFFFF
Downstream Frequency 255.0000 MHz
RF Power 49.8 dBmV
...

```

The following example is a sample output of the **show controllers cable upstream** command for the Cisco uBR-MC3GX60V line card sharing downstreams with the Cisco Wideband SPA, in Cisco IOS Release 12.2(33)SCG:

```

Router# show controllers cable 8/0/0 upstream
Cable8/0/0 Upstream 0 is up
Frequency 15.000 MHz, Channel Width 0.800 MHz, Symbol Rate 0.640 Msps
Modulations (16-QAM) - Short 16-QAM, Long 16-QAM
Mapped to shared connector 0 and receiver 0
Spectrum Group is overridden
US phy MER(SNR)_estimate for good packets - 36.1280 dB
Nominal Input Power Level -4 dBmV, Tx Timing Offset 5734
Ranging Backoff Start 3, Ranging Backoff End 6
US timing offset adjustment type 0, value 0
Ranging Insertion Interval automatic (60 ms)
US throttling off
Tx Backoff Start 3, Tx Backoff End 5
Modulation Profile Group 21
Concatenation is enabled
Fragmentation is enabled

The table below describes the fields shown in the **show controllers cable upstream** command display.

Table 199: show controllers cable upstream Field Descriptions

Field	Description
Cable	Slot and port number indicating the location of the Cisco cable interface line card.
Upstream is up/administratively down	Administrative state of the upstream (whether it is shutdown or not).

Field	Description
Channel Width	Width of the RF upstream channel.
QPSK Symbol Rate	Modulation technique for upstream transmission.
Spectrum Group 4	Spectrum group associated with this slot and port.
Frequency	<p>Transmission frequency of the RF upstream channel.</p> <p>Note Cisco cable interface line cards always program the upstream center frequency in 16 KHz increments. This is the frequency displayed in the router configuration and the show controllers cable upstream command. For example, if you use the cable upstream frequency command to specify a center frequency of 27 MHz, the actual center frequency will be 27.008 MHz, which is the next highest 16 KHz boundary.</p>
Modulations	Spectrum group associated with this slot and port.
SNR measurement	<p>Estimate for the overall signal-to-noise ratio (SNR) for cable interfaces that do not include onboard hardware-based spectrum management. For most cable interface line cards, this value reflects the modulation error rate (MER) value for the upstream (as calculated according to the IEEE 802.14 PHY layer specifications). The MER is sometimes incorrectly referred to as the carrier-to-noise ratio (CNR), and the SNR value is generally lower than the CNR value.</p> <p>Note In Cisco IOS Release 12.1(10)EC1 and Cisco IOS Release 12.2(4)BC1b, the algorithm for calculating the SNR estimate was refined for a more accurate value. Depending on the plant characteristics, the new SNR estimate could be up to 6 dB lower than the values shown in earlier software releases. This value is only an estimate—for the most accurate value, use a spectrum analyzer.</p>
<card-name> CNR measurement	<p>Estimate for the overall carrier-to-noise ratio (CNR) for the upstream on cable interfaces that include onboard hardware-based spectrum management. When the CNR measurement exceeds 40 dB, this line states “better than 40 dB.” As a general rule, the CNR is greater than the SNR value.</p> <p>Note This value is only an estimate—for the most accurate value, use a spectrum analyzer or use the show controllers cable upstream spectrum command. For individual cable modems, you can also use the show cable modem cnr command.</p>
Nominal Input Power level	Desired power level coming into the receiver.
Tx Timing Offset	Largest ranging offset reported by CMs on the upstream.

Field	Description
Ranging Backoff Start/End	Ranging slots (expressed as an exponent of 2) to back off before resending the ranging bursts after an upstream collision. These values are configured using the cable upstream range-backoff start end command.
Ranging Backoff Automatic	Start and end ranging backoff exponents, which are set automatically, using the cable upstream range-backoff automatic command. Note These counters are not accurately updated on the Cisco uBR10-MC5X20S cable interface line card, which should manually configure the ranging backoff instead.
US timing offset	Upstream timing offset adjustment type and value.
Ranging Insertion Interval	Ranging insertion interval.
US throttling	Status of the upstream throttling.
Tx Backoff Start	Starting exponential backoff value for data collisions.
Tx Backoff End	Ending exponential backoff value for data collisions.
Modulation Profile Group	Set of burst profiles defining an upstream range.
part_id=	Part number of the PHY chip. FFFF means the PHY chip is turned off.
rev_id=	PHY chip revision number.
rev2_id=	PHY chip subrevision number.
nb_agc_thr=	Threshold used to control gain.
nb_agc_nom=	Accelerate convergence of input power level.
Range Load Reg Size=	Size in symbols for range request bursts.
Request Load Reg Size=	Size in symbols for request bursts.
Minislot Size in number of Timebase Ticks is	Size in tick units of upstream minislot. A tick is 6.25 microseconds.
Minislot Size in Symbols	Size in symbols of the upstream minislot.
Bandwidth Requests	Number of successful bandwidth requests received in the contention minislots.
Piggyback Requests	Number of successful bandwidth requests piggybacked with regular data transmissions.
Invalid BW Requests	Number of invalid bandwidth (BW) requests. An example of an invalid bandwidth request is a modem using a nonexistent service identifier (SID) to request bandwidth.
Minislots Requested	Total number of minislots requested.

Field	Description
Minislots Granted	Total number of minislots granted.
Minislot Size in Bytes	Size of the minislot in bytes.
Map Advance (Dynamic)	Dynamic map advance time.
Map Count	Total number of map counts.
Remote Map Counts	Total number of remote map counts.
UCD Count	Number of Upstream Channel Descriptors (UCDs) sent for this upstream.
Remote UCD Counts	Number of remote UCDs sent for this upstream.
PHY	Physical layer information for the following: <ul style="list-style-type: none"> • us errors—Number of upstream errors. • us recoveries—Number of upstream recoveries.
MAC PHY TSS	Statistics on the integrity of sync status of timestamp snapshot values between MAC and PHY.
MAC PHY Status	MAC physical status for the following: <ul style="list-style-type: none"> • bcm3140 status • lookout status
MAP/UCD Replication Instructions	MAP/UCD replication instructions.
DES Ctrl Reg # =	Interval data encryption standard (DES) controller register dump.
Null Modem RateLimit Dropped Pkts	(Cisco uBR-MC16U/X, Cisco uBR-MC28U/X only) Number of packets that were dropped because they had a Service Flow ID (SFID) of 0, which occurs when the packets are dropped due to rate-limiting on their original service flow.
Additional Information for Broadband Processing Engine (BPE) Cable Interface Line Cards	
JIB Version	Revision of the JIB circuitry, which is the custom processor onboard the BPE cards that handles the MAC-layer processing.
Upconverter is Enabled Output is Enabled	Status of the upconverter and the signal output. If this field shows that the output is disabled, use the no cable downstream rf-shutdown command to re-enable it.
Downstream Frequency	Configured frequency, in MHz, for the integrated upconverter (if present).
RF Power	Current RF power, in dBmV, as measured on the cable interface line card upconverter. The upconverter circuitry is accurate to a few tenths of a dBmV, but might vary +/- 1 dBmV depending on the transient noise that occurs when the power is measured.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in the line configuration mode.

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show controllers cable upstream** command:

```
Router#show controllers cable 1/0/0 upstream
Controller 1/0/0 upstream 0 AdminState:UP OpState: UP

Related Commands

Command	Description
cable downstream frequency	Configures the downstream center frequency on the integrated upconverter.
cable downstream rf-power	Configures the desired RF output power on the integrated upconverter.
cable spectrum-group (global configuration)	Creates spectrum groups, which contain one or more upstream frequencies.
cable upstream frequency	Specifies that the upstream should be set to either a specific center frequency or be set dynamically.
show controllers cable upstream spectrum	(Cisco uBR-MC16 line card only) Displays the noise levels for a particular CM or displays the background noise for an entire upstream .
show interface cable sid	Displays interface controller information for a specific cable access router card slot.

show controllers cable jib

To display the ASIC processor (JIB) register information on a cable interface on the Cisco CMTS router, use the **show controllers cable jib** command in user EXEC or privileged EXEC mode.

show controllers cable *{slot/cable-interface-indexslot/subslot/cable-interface-index}* **jib us-partial-reset**

Syntax Description	
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.
jib	Displays JIB register information.
us-partial-reset	Displays JIB3 upstream partial reset data.

Command Modes

User EXEC (>) or

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

The **show controllers cable jib** command displays the packet capture buffers retrieved during the partial reset. It displays all of the capture buffers associated with the last partial reset event and also other information useful for determining the Partial Reset state.

Examples

The following is a sample output of the **show controllers cable jib** command:

```
Router# show controllers cable 5/0/0 jib us-partial-reset
```

```

The table below describes the fields shown in the **show controllers cable jib** command display.

Table 200: show controllers cable jib Field Descriptions

Field	Description
TOTAL Partial Resets	Total number of partial resets.
PHY Side Partial Resets	Number of partial resets that occurred on the PHY side of the network.

Field	Description
CCF Partial Resets	Number of partial resets that occurred on the Continuous Concatenation and Fragmentation (CCF) processor.
FrameP Partial Resets	Number of partial resets that occurred on the Frame Processor (FrameP).
FragP Partial Resets	Number of partial resets that occurred on the Fragmentation Processor (FragP).
PktP Partial Resets	Number of partial resets that occurred on the Packet Processor (PktP).
C2C Partial Resets	Number of partial resets that occurred on the Chip to Chip (also called FL2FA—Flora to Fauna) (C2C) processor.
PHY Side	Partial reset status on the PHY side.
Fauna	Partial reset status on the Fauna.
PHY Side Partial Resets	Number of partial resets that occurred on the PHY side processor.
PHY Side Partial Status	Partial reset status on the PHY side.
CCF Partial Resets	Number of partial resets that occurred on the CCF processor.
CCF Partial Status	Partial reset status on the CCF processor.
FrameP Partial Resets	Number of partial resets that occurred on the Frame processor.
FrameP Partial Status	Partial reset status on the Frame processor.
FragP Partial Resets	Number of partial resets that occurred on the Fragmentation processor.
FragP Partial Status	Partial reset status on the Fragmentation processor.
PktP Partial Resets	Number of partial resets that occurred on the Packet processor.
PktP Partial Status	Partial reset status on the Packet processor.
C2C Partial Resets	Number of partial resets that occurred on the C2C processor.
C2C Partial Status	Partial reset status on the C2C processor.
PHY Side Buf Ptr	PHY partial reset packet capture buffer pointer.
PHY Side Buf Cnt	PHY partial reset packet capture buffer count.
FA1 Buf Ptr	Partial reset packet capture buffer 1 pointer on the Fauna processor.
FA1 Buf Cnt	Number of packet capture buffer 1 counts associated with the partial reset on the Fauna processor.
FA2 Buf Ptr	Partial reset packet capture buffer 2 pointer on the Fauna processor.
FA2 Buf Cnt	Number of packet capture buffer 2 counts associated with the partial reset on the Fauna processor.

Field	Description
FA3 Buf Ptr	Partial reset packet capture buffer 3 pointer on the Fauna processor.
FA3 Buf Cnt	Number of packet capture buffer 3 counts associated with the partial reset on the Fauna processor.
FA4 Buf Ptr	Partial reset packet capture buffer 4 pointer on the Fauna processor.
FA4 Buf Cnt	Number of packet capture buffer 4 counts associated with the partial reset on the Fauna processor.

Related Commands

Command	Description
show controllers cable	Displays information about the interface controllers on a cable interface on the Cisco CMTS router.

show controllers cable upstream spectrum

To display the noise levels for a particular CM or to display the background noise for an entire upstream on the Cisco uBR-MC16 line card, use the **show controllers cable upstream spectrum** command in user EXEC or privileged EXEC mode.

```
show controllers cable {slot/portslot/subslot/port} upstream n spectrum [{ip-addressmac-address}]
start-freq end-freq res-freq
```

Syntax Description

<i>slot/port</i>	Identifies the cable interface and downstream port on the Cisco uBR7100 series and Cisco uBR7200 series routers. On the Cisco uBR7100 series router, the only valid value is 1/0 . On the Cisco uBR7200 series router, <i>slot</i> can range from 3 to 6, and <i>port</i> can be 0 or 1, depending on the cable interface.
<i>slot/subslot/port</i>	Identifies the cable interface on the Cisco uBR10012 router. The following are the valid values: <ul style="list-style-type: none"> • <i>slot</i> = 5 to 8 • <i>subslot</i> = 0 or 1 • <i>port</i> = 0 to 4 (depending on the cable interface)
<i>n</i>	Port number for the desired upstream (0 to 5).
<i>ip-address</i>	(Optional) IP address, in dotted decimal notation, for a CM on the specified upstream.
<i>mac-address</i>	(Optional) MAC address, in dotted hexadecimal notation, for a CM on the specified upstream.
<i>start-freq</i>	Starting frequency for the frequency range that is being reported (5 to 42 MHz; can also be specified as 5000 to 42000 KHz or 5000000 to 42000000 Hz).
<i>end-freq</i>	Ending frequency for the frequency range that is being reported (5 to 42 MHz). Note The ending frequency must be greater than the starting frequency and must be specified using the same units as the starting frequency (MHz, KHz, Hz).
<i>res-freq</i>	Resolution frequency to determine the number of data points for the report (12 to 37000 KHz). Note The resolution frequency must be specified in the same units as the starting and ending frequency (MHz, KHz, Hz). To use a resolution value less than 1 MHz, you must specify the other parameters in either Hz or KHz.

Command Modes

User EXEC, Privileged EXEC

Command History

Release	Modification
12.1(7)CX1	This command was introduced for Cisco CMTS routers using the Cisco uBR-MC16S cable interface line card.

Release	Modification
12.2(8)BC2	Support was added for the Cisco uBR10012 router and the Cisco uBR-LCP2-MC16S cable interface line card.
12.3(21)BC	This command is obsolete.
IOS-XE 3.15.0S	This command was replaced by the show cable spectrum-analysis command.

Usage Guidelines

Cisco IOS Release 12.3(9a)BC adds the **tech-support** keyword to the **show controllers cable** command. This change allows users with large numbers of online cable modems to collect the necessary line card information without consuming the console session for a long period of time.

Additional and related improvements are also available for the **show cable tech-support** command.

For all supported releases, the **show controllers cable upstream spectrum** command displays the power in dBmV for a given frequency range for the specified upstream. The frequency range can cover any portion of the DOCSIS upstream frequency range (5 to 42 MHz), and the frequency range can be divided into a resolution as small as 12 KHz.

If a CM is specified by its IP address or MAC address, the power information for that particular CM is given. If no IP or MAC address is given, the command displays the background noise for the entire upstream. All displays use historical averaging of data collected at the time the command is used; historical information is not saved.

Note Cisco cable interface line cards always program the upstream's center frequency in 16-KHz increments, and this is the frequency displayed by the **show controller cable upstream** command. For example, if you use the **cable upstream frequency** command to specify a center frequency of 27 MHz (**cable upstream x frequency 27000000**), the actual center frequency will be 27.008 MHz, which is the next-highest 16-KHz boundary.

Tip By default, the **show controller cable upstream** command displays its output to the router's console port. To display the command's output when logged in during a Telnet session over an Ethernet port, use the **terminal monitor** command before giving the **show controller cable upstream** command.

Examples

The following example shows the **show controllers cable upstream** command displaying the power information for a particular CM on upstream 5 of cable interface slot 3/0. The power information is displayed over the entire upstream (5–42 MHz), with a resolution of 5 MHz:

```
Router# show cable modem

MAC Address      IP Address      I/F      MAC      Prim  RxPwr  Timing  Num  BPI
                IP Address      I/F      State    Sid   (db)   Offset  CPEs  Enbld
...
00d0.ba77.7595  10.20.114.34   C3/0/U5  online   1     0.25  2740   1    yes
00d0.ba77.7621  10.20.114.17   C3/0/U5  online   2     0.25  2740   2    yes
00d0.ba77.7533  10.20.114.55   C3/0/U5  online   3     0.25  2740   1    yes
...
```

```

Router# show controllers cable 3/0 upstream 5 spectrum 10.20.114.34 5 42 5

02:16:49: Spectrum DATA(@0x4B060004) for u5: 4995-41991KHz(resolution 4992KHz, sid 1):
02:16:49: Freq(KHz) dBmV Chart
02:16:49: 4995 : -5 *****
02:16:49: 9987 : -7 *****
02:16:49: 14979: -24 *****

02:16:49:
Router#

```

Note The output for each frequency range includes a time-stamp, the ending frequency for each range (in KHz), the historical average power level for that range (in dBmV), and a series of asterisks that provides a graphical representation of the noise floor level for the signal (a stronger signal is indicated by more asterisks).

The following example shows a partial display of the background noise data for upstream 4 of cable interface slot 6/0. The command covers the entire upstream spectrum (5–42 MHz) at the minimum resolution of 12 KHz.

```

Router# show controller cable 6/0 upstream 4 spectrum 5000 42000 12

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable modulation-profile	Creates a cable modulation profile.
cable upstream hop-priority	Determines the order of the corrective actions to be taken when ingress noise exceeds the allowable value for an upstream.
cable upstream modulation-profile	Configures an upstream for one modulation profile (static profile) or two modulation profiles (Dynamic Upstream Modulation).
show cable hop	Displays the current hop period and threshold for an upstream, along with other statistics.
show cable modem cnr	Displays information about the upstream carrier-to-noise ratio (CNR) for a particular cable modem.
show cable modulation-profile	Displays the cable modulation profiles that have been created.

Command	Description
show controllers cable	Displays detailed statistics for the cable interface.

show controllers clock-reference

To display hardware information, register values, and current counters for the TCC+ card or the Cisco cable clock card, use the **show controllers clock-reference** command in privileged EXEC mode.

show controllers clock-reference

Syntax Description

This command has no keywords or arguments.

Command Modes

Privileged EXEC

Command History

Release	Modification
12.1(1a)T1	This command was introduced.
12.1(2)EC1	This command was supported on the EC train.
12.2(2)XF	This command was supported for the TCC+ card on Cisco uBR10012 routers.
12.2(4)BC1	Support was added to the Release 12.2 BC train.

Usage Guidelines

To reset the counters that are displayed with the **show controllers clock-reference** command, use the **cable clock clear-counters** command.

Note This command is not applicable on the SC train.

This command supports the Cisco CMTS clock feature set, which provides a synchronized clock for improved Voice-over-IP (VoIP) operations. The clock feature set requires one of the following configurations:

- A Cisco uBR10012 router with one or two TCC+ cards that are connected to an external national clock source.
- A Cisco uBR7246 VXR router using a Cisco uBR-MC16S, Cisco uBR-MC16E, Cisco uBR-MC28C, or Cisco uBR-MC28C-BNC cable interface line card. The router must also be equipped with a Cisco cable clock card and be running Cisco IOS 12.1(1a)T1, 12.1(2)EC1, or a later release. The Cisco cable clock card should be connected to an external national clock source.

Only these cable interface cards support the external clock card reference from a clock card to distribute that signal to CMs or set-top boxes (STBs) attached to the specific network segments. You can use other cable interface cards, such as the Cisco uBR-MC16C, with the clock card, but these other cable interfaces will not synchronize their downstream SYNC messages with the external clock source.

Each CM or STB must also support VoIP applications and the clock feature set. For example, the Cisco uBR924, running Cisco IOS Release 12.0(7)T or later, supports clock card feature automatically.

Examples

The following is sample output from the **show controllers clock-reference** command for a Cisco uBR7246 VXR router with a national clock card:

```
Router# show controllers clock-reference
```

```
National clock card with T1 controller
Control register      :0x4
Status register      :0x54
LIU Config Register 0:0x0
LIU Config Register 1:0x0
1 events reported in 266636 seconds
Primary active :1, LOS :0
Secondary active :0, LOS :1
Holdovers :0, HW faults :0
Router#
```

The following is sample output from the **show controllers clock-reference** command for a Cisco uBR10012 router with two TCC+ cards.

Note Each TCC+ card—Active and Backup—has its own separate set of registers.

```
Router# show controllers clock-reference
```

```

```

Note The **show controllers clock-reference** command might display compare errors on the Cisco uBR10012 router because there could be a slight delay at system startup before the TCC+ cards synchronize with each other. These initial compare errors can be ignored and cleared with the **cable clock clear-counters** command.

Most of the information shown by the **show controllers clock-reference** command is in the form of a hexadecimal bitfield that is not meaningful for normal operations, but the following fields can be useful in troubleshooting problems with the TCC+ and cable interface line cards:

- UCPC Bus Control Status Reg—Displays the status of both TCC+ cards and whether the LCD Display Panel is present.
- Line Card Presence Status Reg—Provides a software view of whether a cable interface line card is physically present in the Cisco uBR10012 chassis.
- LC Presence Input Reg—Provides a hardware view of whether a cable interface line card is physically present in the Cisco uBR10012 chassis.
- LC Power off Status Reg—Indicates whether a cable interface line card slot has been powered off using the **cable power** command.

The table below shows how to interpret these fields:

Table 201: show controllers clock-reference Field Descriptions

Field	Description
UCPC Bus Control Status Reg	<p>Displays the status of both TCC+ cards and of the LCD Display Panel. Each TCC+ card displays this field from its own point of view, where “this card” refers to itself and “the other card” refers to the other TCC+ card slot.</p> <ul style="list-style-type: none"> • Bits 2–0 display the status of the other TCC+ card: <ul style="list-style-type: none"> • 0x00=No card. • 0x03=The other card is the backup card. • 0x05=The other card is the active card. • Bit 3 is set to 1 upon a state change for the other TCC+ card. • Bits 6–4 display the status of this TCC+ card: <ul style="list-style-type: none"> • 0x00=No card. • 0x03=This card is the backup card. • 0x05=This card is the active card. • 0x06=This card has assumed the active card role, because the other card had been active but is now unresponsive. • Bit 7 is set to 1 upon a state change for this TCC+ card. • Bits 13–8 are unused. • Bit 14 is set to 1 if the LCD Display Panel is present. • Bit 15 is set to 1 if the presence of the LCD Display Panel has changed since the counters were last cleared.
<p>The most common bit patterns for the UCPC Bus Control Status Reg field are:</p> <ul style="list-style-type: none"> • 0x4003—This TCC+ card is not present, the other card is the active card, and an LCD Display is present. • 0x4030—This TCC+ card is the active card, the other card is not present, and an LCD Display is present. • 0x4035—This TCC+ card is the backup card, the other card is the active card, and an LCD Display is present. • 0x4053—This TCC+ card is the active card, the other card is the backup card, and an LCD Display is present. • 0x4065—This TCC+ card has assumed the active card role, because the other card had been active but is now unresponsive. The LCD Display is present. 	

Field	Description
Line Card Presence Status Reg	<p>The first eight bits indicate whether the line card is physically present, and the high eight bits indicate whether the card's physical state has changed since the counters were last cleared using the cable clock clear-counters command.</p> <p>0x0001=slot 5/0 contains a cable interface card 0x0002=slot 5/1 contains a cable interface card 0x0004=slot 6/0 contains a cable interface card 0x0008=slot 6/1 contains a cable interface card 0x0010=slot 7/0 contains a cable interface card 0x0020=slot 7/1 contains a cable interface card 0x0040=slot 8/0 contains a cable interface card 0x0080=slot 8/1 contains a cable interface card 0x0100=slot 5/0 has changed physical state 0x0200=slot 5/1 has changed physical state 0x0400=slot 6/0 has changed physical state 0x0800=slot 6/1 has changed physical state 0x1000=slot 7/0 has changed physical state 0x2000=slot 7/1 has changed physical state 0x4000=slot 8/0 has changed physical state 0x8000=slot 8/1 has changed physical state</p>
LC Presence Input Reg	<p>The lower eight bits of this register indicate whether a cable interface line card is physically present in the chassis slot. The bit meanings are the same as the lower eight bits the Line Card Presence Status Reg.</p> <p>The upper eight bits of this register are unused.</p>
Note	The Line Card Presence Status Reg displays the line card state as determined by the Cisco IOS software, while the LC Presence Input Reg displays the state as determined by the chassis hardware.

Field	Description
LC Power off Status Reg	0x01=slot 5/0 is powered off 0x02=slot 5/1 is powered off 0x04=slot 6/0 is powered off 0x08=slot 6/1 is powered off 0x10=slot 7/0 is powered off 0x20=slot 7/1 is powered off 0x40=slot 8/0 is powered off 0x80=slot 8/1 is powered off

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable clock clear-counters	Clears the counters displayed with the show controllers clock-reference command.
cable power	On the Cisco uBR10012 routers, turns a cable interface line card on or off, which updates the LC Power off Status registers displayed with the show controllers clock-reference command.
show cable clock	Displays the status of the Cisco cable clock card and the TCC+ card.

show controllers downstream-cable

To display information about an OFDM channel or RF channel on the Cisco cBR Series Converged Broadband Routers, use the **show controllers downstream-cable** command in user EXEC or privileged EXEC mode.

```
show controllers downstream-cable { slot/port slot/subslot/port } [{ prof-order | verbose }]
[{ counter ofdm-channel | counter rf-channel | { snmp-rolling-avg } }]
```

Syntax Description

<i>slot</i>	Slot where the line card resides. For Cisco cBR Series Converged Broadband Routers routers, the valid values are 0–3 and 6–9.
<i>subslot</i>	For Cisco cBR Series Converged Broadband Routers routers, the valid value is 0.
<i>port</i>	Downstream port number. For Cisco cBR Series Converged Broadband Routers, the permitted range is 0–15.
prof-order	Displays information about the profile downgrade ordering on a specific OFDM channel.
verbose	Displays the details of an OFDM channel profile.
counter ofdm-channel	Displays the details of an OFDM channel.
rf-channel	Displays the RF channel information.
snmp-rolling-avg	Displays the rolling average value that is computed for each of the DS SCQAM channels.

Command Modes

User EXEC (all options except **tech-support**), Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
Cisco IOS XE Gibraltar 16.10.1f	QAM utilization percentage is now displayed in the show controllers downstream-Cable counter rf-channel command output.
Cisco IOS XE Dublin 17.12.1y	The snmp-rolling-avg option is introduced.

This example shows the output of the **show controllers downstream-cable 3/0/0 counter ofdm-channel snmp-rolling-avg** command (Cisco IOS XE Dublin 17.12.1y):

```
Router#show controller downstream-cable 3/0/0 counter ofdm-channel snmp-rolling-avg
Contr- Chan# Profile/ Packets Bytes MaxRate Rate SnmpRollingAvg
oller PLC (Mbps) (Mbps) (%)
3/0/0 158 Total 359757 280164645 - 23.148686 99
3/0/0 158 0 64644 3734106 252 0.003928
3/0/0 158 1 177103 268665251 315 23.136879
```

```

3/0/0 158 PLC-MMM 117999 7748601 0.007879
3/0/0 158 PLC-EM 0 0 0.000000
3/0/0 158 PLC-TR 0 0 0.000000

```

This example shows the output of the **show controllers downstream-cable 3/0/0 counter rf-channel snmp-rolling-avg** command (Cisco IOS XE Dublin 17.12.1y and later):

```

Router#show controllers downstream-Cable 3/0/0 counter rf-channel snmp-rolling-avg

Related Commands

Command	Description
show downstream ofdm configuration	Displays OCD and DPD messages from RPD.
show downstream ofdm counter profile	Displays per-profile counter on RPD.
show downstream channel counter	Displays the drop counter in the DPS module.

show controllers downstream-cable rf-channel prof-order

To display which OFDM Profile Downgrade method is configured, use the **show controllers integrated-cable slot/subslot/port rf-channel rf-channel prof-order** command in privileged EXEC mode.

show controllers downstream-cable slot/subslot/port rf-channel rf-channel prof-order

Syntax Description	controllers	Interface controller status.
	downstream-cable	Downstream Cable controller.
	rf-channel rf-channel	RF channel counters.
	slot/subslot/port	Identifies the cable interface. <ul style="list-style-type: none"> • <i>slot</i> — Slot where the line card resides. The valid range is 0–3 and 6–9. • <i>subslot</i> — Subslot where the line card resides. The available slot is 0. • <i>port</i> — Downstream port number on the line card. The valid range is 0–15.
	prof-order	Displays OFDM Profile Downgrade method. The two methods are: <ul style="list-style-type: none"> • bit-loading - Legacy method of profile downgrade. • capacity - This option is configure if you wish to downgrade the profile based on the capacity. This option does not skip any good profiles.

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Dublin 17.12.1z	The Ordering method is displayed in the command output.
Cisco IOS XE Everest 16.6.1	This command is introduced on the Cisco cBR-8 Series Converged Broadband Routers.

Examples

The following example shows a sample output for the **show controllers downstream-cable slot/subslot/port rf-channel rf-channel prof-order** command on Cisco cBR-8 Series Converged Broadband Routers, when the Capacity method is configured:

```
Router# show controllers downstream-cable 8/0/0 rf-channel 160 prof-order
OFDM channel data profile order: [8/0/0:160]
Ordering method : Capacity
RxMER Subcarrier Difference Tolerance: 2%
-----
Data Profile:           Downgrade Profile:
Profile 1      ->      Profile 2
Profile 2      ->      Profile 3
```

show controllers downstream-cable rf-channel prof-order

```
Profile 3    ->   Profile 4
Profile 4    ->   Profile 0
```

Examples

The following example shows a sample output for the **show controllers downstream-cable slot/subslot/port rf-channel rf-channel prof-order** command on Cisco cBR-8 Series Converged Broadband Routers, when the Bit-loading method is configured:

```
Router# show controllers downstream-cable 8/0/0 rf-channel 160 prof-order
OFDM channel data profile order: [8/0/0:160]
Ordering method : Bit-loading
RxMER Subcarrier Difference Tolerance: 2%
-----
Data Profile:      Downgrade Profile:
Profile 1    ->   Profile 3
Profile 2    ->   Profile 4
Profile 3    ->   Profile 0
Profile 4    ->   Profile 0
```

Related Commands

Command	Description
show controller cable	Displays information about the interface controllers for a cable interface on the Cisco CMTS router.

show controllers jacket

To display Wideband SIP register values, use the **show controllers jacket** command in privileged EXEC mode.

show controllers jacket *slot/subslot* [{**all** | **cpld** | **processor** | **vanadium** | **spi_fpga**}]

Syntax Description

<i>slot</i>	The slot where the Wideband SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for the Wideband SIP.
<i>subslot</i>	The subslot where the Wideband SIP resides. On the Cisco uBR10012 router, subslot 0 is always specified.
all	(Optional) Displays values for all registers.
cpld	(Optional) Displays values for the CPLD registers.
processor	(Optional) Displays values for the processor registers.
vanadium	(Optional) Displays values for the Vanadium registers.
spi_fpga	(Optional) Displays values for the SPI FPGA registers.

Command Default

If you do not specify **all** or the keyword for a specific register, **show controllers jacket** displays values for all registers.

Command Modes

Privileged EXEC (#)

12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

Use the **show controllers jacket** command to display Wideband SIP register values. Values for the following Wideband SIP components can be displayed:

- **CPLD**—A Complex Programmable Logic Device (CPLD) that contains logic to control resets, the I/O bus, and SPA OIR.
- **Processor**—The Wideband SIP on-board processor that is responsible for configuring the chips on the SIP, communication to the PRE module, and communication with the SPA.
- **Vanadium**—A Cisco-designed ASIC that provides a link between the Wideband SIP and the PRE module.
- **SPI FPGA**—A bus converter that supports up to eight channels on a POS-PHY Level 3 (PL3) interface and up to eight channels shared between the two System Packet Interface Level 4 Phase 2 (SPI 4.2) interfaces. The SPI FPGA also interfaces the on-board processor complex to the Wideband SIP bus.

Examples

The following examples display **show controllers jacket** command output for the **cpld** and **processor** keywords:

```
Router# show controllers jacket 1/0 cpld
CPLD registers

[A4000000] Version:4
[A4000004] Clock frequency:32
[A4000008] Reset status and control:1
[A400000C] Software reset reason:0
[A4000010] Datapath reset: 19
[A4000014] SPA 0 OIR register: FF
[A4000018] SPA 1 OIR register: FF
[A400001C] SPA OIR interrupt status: (would clear on read)
[A4000020] SPA OIR interrupt mask: FF

Router# show controllers jacket 1/0 processor
Processor Registers
Port A:
  Pin Assignment      C00000
  Data Direction     FF437C3A
  Open-Drain         1800F
  Data                A88005
  Special Options    0000
Port B:
  Pin Assignment      0008
  Data Direction     FFFFBEF
  Open-Drain         0000
  Data                BF0FEFC
  Special Options    0008
Port C:
  Pin Assignment      3580C
  Data Direction     FF7CA7F3
  Open-Drain         0000
  Data                84D004
  Special Options    0000
Port D:
  Pin Assignment      30005
  Data Direction     FFCFFFE
  Open-Drain         30000
  Data                30000
  Special Options    30000
```

Related Commands

Command	Description
show controllers modular-cable	Displays Wideband SPA information.

show controllers modular-cable

To display information about the Cisco uBR-MC3GX60V cable line card and Wideband SPA, use the **show controllers modular-cable** command in privileged EXEC mode.

```
show controllers modular-cable slot/subslot/bay {brief | fpga_registers | {all | sfp [port port_num] | ge_phy [port port_num]}}
```

Cisco IOS Releases 12.3(23)BC5, 12.2(33)SCB and later releases

```
show controllers modular-cable slot/bay/port
slot/subslot/controller {all | association | bpi-entry bpi-index | brief | config | crashinfo | dsid-log search
min max | dsid-ref-log dsid n | errors | fpga_version | fpga_registers | ge_phy [port port_num] | io-fpga
| mapping [{rf-channelwb-channel}] | registers | rf-channel channel_number | sfp [port port_num] |
spa-log-all | stat-index-log search min max | status | wideband-channel channel_number}
```

Note The options mentioned in the syntax above are indicative and may vary with the cable interface line card used in the Cisco uBR10012 universal broadband router.

Syntax Description

<i>slot/subslot/bay or slot/bay/port</i>	Wideband SPA slot, subslot, bay, and port. <ul style="list-style-type: none"> <i>slot</i>—Slot where the Wideband SIP resides. The valid values are 1 and 3. <i>subslot</i>—Subslot where the Wideband SIP resides. The valid value is 0. <i>bay</i>—Wideband SIP bay where the SPA resides. The valid range is from 0 to 3.
<i>slot/subslot/controller</i>	Modular-cable line card slot, subslot, and controller. <ul style="list-style-type: none"> <i>slot</i>—Modular-cable line card slot. The valid value range is from 5 to 8. <i>subslot</i>—Modular-cable line card subslot. The valid value is 0 or 1. <i>controller</i>—Modular-cable line card controller. The valid range is from 0 to 2.
<i>port</i>	Specifies the interface number on the SPA.
all	(Optional) Displays all information about the modular-cable controller.
association	Displays associations between the MAC domains and wideband interfaces.
bpi-entry <i>bpi-index</i>	Displays information about Baseline Privacy Interface (BPI). <ul style="list-style-type: none"> <i>bpi-index</i>—BPI index. The valid range is from 0 to 24575.
brief	(Optional) Displays a brief summary of the controller information.
config	Displays information about the configuration of the downstream field-programmable gate array (FPGA).
counters	Displays information about channel counters.
crashinfo	Displays crash information for the Wideband SPA.

dsid-log search <i>min max</i>	<p>Searches for downstream IDs (DSID) in the Wideband SPA logs.</p> <ul style="list-style-type: none"> • <i>min</i>—Minimum search value. The valid range is from 1 to 65535. • <i>max</i>—Maximum search value. The valid range is from 1 to 65535. <p>Note This keyword is used to collect data only when requested by Cisco TAC.</p>
dsid-ref-log <i>dsid n</i>	<p>Retrieves last statistical index and ref count for DSID.</p> <ul style="list-style-type: none"> • <i>n</i>—DSID search value. The valid range is from 1 to 65535. <p>Note This keyword is used to collect data only when requested by Cisco TAC.</p>
errors	Displays errors.
fpga_registers	(Optional) Displays information on the Wideband SPA Field-Programmable Gate Array (FPGA) (Blaze) registers.
fpga_version	Displays the FPGA version of the cable interface line cards.
ge_phy	(Optional) Displays physical layer (PHY) information on the Gigabit Ethernet ports.
iofpga	Displays information about I/O FPGA.
mapping	<p>Displays information about the mapping of the configured RF channel and wideband channels.</p> <ul style="list-style-type: none"> • <i>rf-channel</i>—RF channel counters. The valid range is from 0 to 31. If not specified all channels are displayed. • <i>wb-channel</i>—Wideband channel counters. The valid range is from 0 to 31. If not specified all channels are displayed.
registers	Displays registers for the downstream FPGAs.
rf-channel <i>channel-number</i>	<p>Displays information for the RF channel indicated by <i>channel-number</i>.</p> <ul style="list-style-type: none"> • <i>channel-number</i>—RF channel number. The valid values are from 0 to 23.
sfp	(Optional) Displays information about the small form-factor pluggable (SFP) modules.
stat-index-log search <i>min max</i>	<p>Searches for downstream statistical indexes in SPA logs.</p> <ul style="list-style-type: none"> • <i>min</i>—Minimum search value. The valid range is from 1 to 65535. • <i>max</i>—Maximum search value. The valid range is from 1 to 65535. <p>Note This keyword is used to collect data only when requested by Cisco TAC.</p>
spa-log-all	<p>Displays SPA debug logs.</p> <p>Note This keyword is used to collect data only when requested by Cisco TAC.</p>

port <i>port_num</i>	(Optional) When used with sfp or ge_phy keywords, the information displayed is for the specified Gigabit Ethernet port. If the port <i>port_num</i> argument is not used, the information displayed is for both Gigabit Ethernet ports.
status	Displays status of the downstream FPGAs.
wideband-channel <i>channel-number</i>	Displays information about the wideband channel indicated by <i>channel-number</i> . <ul style="list-style-type: none"> <i>channel-number</i>—Wideband channel number. The valid values are from 0 to 31.

Command Default

If you specify no keyword or argument, all categories of information for both Gigabit Ethernet ports are displayed.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.3(23)BC5	The command output was modified.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. This command was modified to change the addressing format for a modular cable interface from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> .
12.3(23)BC6	The command output was modified to capture the SPA environment monitoring information.
12.2(33)SCC	The command output was modified to capture the toggle information.
12.2(33)SCE	This command was modified to include multiple keywords for the Cisco uBR-MC3GX60V cable line card.
12.2(33)SCG	This command was modified to include dsid-log , dsid-ref-log , stat-index-log , and spa-log-all keywords.
12.2(33)SCH	Support was added for the Bonding Across 3G60 Controllers Support feature added. The valid ranges for <i>rf-channel</i> and <i>wb-channel</i> counters for the mapping option are specified.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

If you specify **all** instead of **sfp** or **ge_phy**, information for the SFP module and PHY is displayed.

**Note**

This command will not provide crash dump information for the Cisco 10000 series SIP-600. Use the show diag 1/0 crashdump command to obtain this information for the Cisco 10000 Series SIP-600.

Example of the show controllers modular-cable Command that displays BPI key information stored on the Cisco uBR-MC3GX60V line card.

The following is a sample output of the show controller integrated-cable command with the bpi-entry keyword:

```
Router# show controllers modular-Cable card 8/1 bpi-entry 1
BPI Index: 1 Segment: 0
  Even Key: Invalid, Odd Key: Invalid
  Key Sequence Number: 0 Security Association: 0x0
  Key Type: DES
  Even Key: 0000-0000-0000-00 IV: 0000-0000-0000-0000
  Odd Key: 0000-0000-0000-00 IV: 0000-0000-0000-0000
```

Table 202: show controller modular-cable Field Descriptions

Field	Description
BPI Index	BPI index number.
Segment	Hardware segment used by the DOCSIS MAC address.
Even Key	Current value of the Even Key in the BPI entry.
Odd Key	Current value of the Odd Key in the BPI entry.
Key Sequence Number	Key sequence number.
Security Association	Security association identifier.
Key Type	Type of key stored based on the encryption algorithm (Data Encryption Standard [DES] or Advanced Encryption Standard [AES]).

The following is a sample output of the **show controllers modular-cable** command with **fpga_registers**, **sfp**, and **ge_phy** keywords. In some cases, only part of the output is shown.

```

Note The temperature sensor readings in the command output shown above is specific to the Cisco IOS Release 12.3(23)BC and will not appear in the Cisco IOS Release 12.2(33)SCB and later releases.

Beginning in Cisco IOS Release 12.3(23)BC6, the command output was modified to capture the SPA environment monitoring information. The environment monitoring information includes:

Temperature sensor information:

- Sensor number
- Current sensor reading
- Low threshold
- Warning threshold
- Critical threshold
- Shutdown threshold

Voltage sensor information:

- Nominal value of the rail
- Current voltage reading
- Low shutdown threshold
- Low warning threshold
- High warning threshold
- High shutdown threshold

The following is a sample output of the show controllers modular-cable command that displays the SPA environment monitoring information.

```

Router# show controllers modular-cable 1/0/0 | b SPA Env
SPA Environment Monitoring Information:

```

```

Temperature sensors for SPA-24XDS-SFP[1/0]:
Sensor   Reading  Low      Warning  Critical  Shutdown
0        26C     0C       58C      68C       85C
1        27C     0C       58C      68C       85C
Voltage sensors for SPA-24XDS-SFP[1/0]:
Nominal  Reading  LowShut  LowWarn  HighWarn  HighShut
3.300V   3.276V  3.069V  3.135V  3.465V   3.531V
2.500V   2.485V  2.325V  2.375V  2.625V   2.675V
1.200V   1.186V  1.116V  1.140V  1.260V   1.284V
1.800V   1.801V  1.674V  1.710V  1.890V   1.926V

```

Note The SPAs are shut down automatically when the sensor readings go beyond the threshold shutdown value.

In Cisco IOS Release 12.2(33)SCC, when the primary link on the SPA toggles more than five times within 30 seconds, and the backup link is UP, the backup link is selected for traffic. The link switches back to the primary link during the next primary link transition after 30 seconds or when the backup link fails. The show controllers modular-cable command output was modified to capture the toggle information.

The following is a sample output of the show controllers modular-cable command that displays the toggle information.

```

Router# show controllers modular-cable 1/1/0
SPA 1 is present
status LED: [green]
Host 12V is enabled and is okay.
Power has been enabled to the SPA.
SPA reports power enabled and okay.
SPA reports it is okay and is NOT held in reset.

Wideband-Cable8/1/0:29 1406 Yes
Wideband-Cable8/1/0:30 1407 Yes
Wideband-Cable8/1/0:31 1408 Yes
Router# show controllers Modular-Cable 8/1/0 wideband-channel 0
WB                BG      Primary
channel           ID      BG
Wideband-Cable8/1/0:0 1377 Yes

```

The following is a sample output of the show controllers modular-cable mapping command:

```

router# show controllers modular-cable mapping
Ctrlr   RF      MC      MC Rem.   WB      WB Rem.
        channel BW %      Ratio    channel  BW %      Ratio
5/1/0   2        0        0         0         0         0

```

Effective with Cisco IOS Release 12.2(33)SCH, the Bonding Across 3G60 Controllers Support feature is introduced. The following example shows the output of the **show controllers modular-cable mapping** command to display bonding of RF channels across 3G60 controllers:

```
Router#show controllers modular-cable 7/0/0 mapping rf-channel 21
```

```
Ctrlr RF MC MC Rem. WB WB WB Rem.
```

```
channel BW % Ratio channel BW % Ratio
```

```
7/0/0 21 0 0 7/0/0:0 10 1
```

```
7/0/1:30 10 1
```

```
Router#show controllers modular-cable 7/0/1 mapping wb-channel 30
```

```
Ctrlr WB RF BW % Remaining
```

```
channel channel Ratio
```

```
7/0/1 30 7/0/0:20 10 1
```

The output of the *rf-channel* keyword above shows that the RF channel number 21 belongs to wideband interface bonding group 0 on controller 0 and bonding group 30 on controller 1, with 10 percent bandwidth allocated to it on each controller.

The following is a sample output of the **show controllers modular-cable registers** command:

```

router# show controllers modular-Cable 5/1/0 registers
JIB3_DS BPI registers (base address 0xF8880000)
bpi_int_isr_0 [0x00000000] = 0x00000000

```

Related Commands

Command	Description
show controllers jacket	Displays Wideband SIP register values.

show controllers upstream-cable

To display information about the OFDMA channel configuration on the Cisco cBR Series Converged Broadband Routers, use the **show controllers upstream-cable us-channel** command in user EXEC or privileged EXEC mode.

show controllers upstream-cable {*slot/port slot/subslot/port*} **us-channel** *n* {**cdm-ump**}

Syntax Description

<i>slot</i>	Slot where the line card resides. The valid values are 0 to 3 and 6 to 9.
<i>subslot</i>	Subslot where the line card resides. The available slot is 0.
<i>port</i>	Cable upstream port number. The valid range depends on the number of upstream channels configured in a MAC domain. For example, if the total number of upstream channels configured is 4, then the valid range for the upstream port number is from 0 to 3.
<i>n</i>	Physical upstream channel number. The valid range is from 0 to 15.
cdm-ump	Displays additional information about lower level modules.

Command Modes

User EXEC, Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was implemented on the Cisco cBR Series Converged Broadband Routers.
Cisco 1x2 RPD Software 4.1	The output of this command was updated when virtual combining of upstream channels was introduced in this release on Cisco Remote PHY Devices.
Cisco IOS XE Gibraltar 16.12.1z	The output of this command was updated to include four columns for OFDMA channels.

Examples

The following is a sample output of the **show controllers upstream-cable us-channel** command:

```
Router# show controllers upstream-Cable 1/0/4 us-channel 12
USPHY OFDMA support: FULL

show cpd

To display the CPD functionality state, use the **show cpd** command in privileged EXEC mode.

show cpd

Command Default Information for the CPD state is displayed.

Command Modes Privileged EXEC

Release	Modification
12.3(21a)BC3	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Examples This example shows the output of the **show cpd** command:

```
Router# show cpd
CPD enabled
CR ID :12345
```

Command	Description
cpd	Enables CPD.

show cr10k-rp cable

Note This command is meant for engineering debugging, and not for general customer use.

To display packet processing information for a particular service ID (SID) on a cable interface, use the **show cr10k-rp cable** command in user EXEC or privileged EXEC mode.

show cr10k-rp cable *slot/subslot/port sid* {**classifier** | **mac-rw-index** | **queue** | **service-flow** {**ds** | **us**}}

Syntax Description

cable <i>slot/subslot/port</i>	Identifies the cable interface on the Cisco uBR10012 router for which information should be displayed, where: <ul style="list-style-type: none"> • <i>slot</i>—0 to 8 • <i>subslot</i>—0 or 1 • <i>port</i>—0 to 4 (depending on the cable interface)
<i>sid</i>	(Optional) Identifies the service ID (SID) for which information should be displayed.
classifier	Displays classifier information for the SID.
mac-rw-index	Displays the MAC rewrite index for the SID.
queue	Displays information about the output packet queues for the modem identified by the SID.
service-flow ds	Displays the information of the downstream service-flows for the modem identified by the SID.
service-flow us	Displays the information of the upstream service-flows for the modem identified by the SID.

Command Default

None

Command Modes

User EXEC (>)

Privileged EXEC (#)

Command History

Release	Modification
12.2(15)BC1	This command was introduced for the Cisco uBR10012 router.
12.3BC	This command was integrated into Cisco IOS release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS release 12.2(33)SCA.
IOS-XE 3.15.OS	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **show cr10k-rp cable** command displays information that the PRE routing processor (RP) module has about a particular SID. This information includes configuration information about the SID, as well as internal status information that is useful only to Cisco engineers in troubleshooting problems.

Examples

The following example shows typical output for the **show cr10k-rp cable** command for a SID that identifies a cable modem:

```
Router# show cr10k-rp c6/1/0 2 classifier

Mac Rw Index: 5 CCB Index: 7
CM Classifiers:
id=4, sfid=14 CFR Index 16396 RP sfindex 16396,
  prio=10, sip=0.0.0.0, sip mask=0.0.0.0
  dip=0.0.0.0, dip mask=0.0.0.0, prot=17, tos=A0,E0

-----

```

The following example shows typical output for the **mac-rw-index** option:

```

Router# show cr10k-rp c8/0/0 1 mac-rw-index

CPE Information for Interface Cable8/0/0 SID 1:
  Link Table Slot: 17 Mac-rw-index: 17
Router# show cr10k-rp c8/0/0 2 mac-rw-index

CPE Information for Interface Cable8/0/0 SID 2:
  Link Table Slot: 18 Mac-rw-index: 18
Router#

```

Tip To display more information about the max-rw-index, use the **show pxf cpu cef** command to display information for a specific IP address. The output of this command shows the max-rw-index value in the “rw_index” field.

The following example shows typical output for the **show cr10k-rp queue** command:

```

Router# show cr10k-rp c6/1/0 1 queue

RP SFID 16384 LC SFID 4
Queue Index: 293      QID 293 VCCI 6162      ClassID 5      Refcount 1

show cr10k-rp controller modular-cable *slot/subslot/unit* {**acfe** [**cluster** *cluster-index*] | **lblt** | **pblt**}

Syntax Description

modular-cable <i>slot/bay/port</i>	Identifies the cable interface on the Cisco uBR10012 router for which information should be displayed, where: <ul style="list-style-type: none"> • <i>slot</i>—0 to 8 • <i>bay</i>—0 or 1 • <i>subslot</i>—0 to 3 • <i>port</i>—0 • <i>unit</i>—0
acfe	Identifies the Logical Bandwidth Limiting Traffic (LBLT) associated with the RF Physical Logical Bandwidth Limiting Traffic (PBLT). <ul style="list-style-type: none"> • <i>cluster-index</i>—Cluster index. The valid values range from 0 to 31.
lblt	Identifies the LBLT associated with the RF PBLT.
pblt	Identifies the PBLTs associated with the RF Channels.

Privileged EXEC (#)

Command History

Release	Modification
12.2(15)BC1	This command was introduced for the Cisco uBR10012 router.
12.3BC	This command was integrated into Cisco IOS release 12.3BC. The modular-cable keyword was introduced.
12.2(33)SCA	This command was integrated into Cisco IOS release 12.2(33)SCA.

Release	Modification
12.2(33)SCB	This command was modified. The addressing format for the modular-cable interface and wideband-cable interface changed from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> .
12.2(33)SCF	This command was modified. The <i>acfe</i> keyword was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

The **show cr10k-rp controller** command displays information that the PRE route processor (RP) module has for a particular SID. This information includes configuration information about the SID, as well as internal status information that is useful only to Cisco engineers during troubleshooting.

Examples

The following examples show sample outputs for the **show cr10k-rp controller** command for a SID that identifies a cable modem:

```
Router# show cr10k-rp controller modular-cable 1/1/0 lblt
```

```
LBLTs on each RF Channel's PBLT
RFChnl WBChnl/LBLTGrp LBLTId Weight/Quantum
0      -/36          37      1/5520

Related Commands

Command	Description
show cr10k-rp queue	Displays information about the packet queues for a cable interface.

show crypto entropy sample

To view the sample collection of an entropy source, use the **show crypto entropy status** command in user EXEC or privileged EXEC mode.

show crypto entropy sample *entropy-source-sample*

Syntax Description	<i>entropy-source-sample</i> The value of the entropy source to sample. The valid range is 0-9.
---------------------------	---

Syntax Description	This command has no keywords or arguments.
---------------------------	--

Command Default	None
------------------------	------

Command Modes	User EXEC (>)
----------------------	---------------

	Privileged EXEC (#)
--	---------------------

Command History	Release	Modification
	Cisco IOS-XE 16.4.1	This command is introduced on the Cisco cBR-8 Converged Broadband Routers.

Usage Guidelines	The command displays the sample collection of an entropy source.
-------------------------	--

Examples	The following example shows typical output:
-----------------	---

```
Router# show crypto entropy sample 2
Load for five secs: 3%/0%; one minute: 4%; five minutes: 4%
Time source is NTP, 21:05:45.964 EDT Mon Jun 19 2023
Entropy source ubr_entropy_rp provided this sample:
B4 3A F8 D0 02 C3 75 5E 88 95 53 39 79 32 F5 5D
7F F2 9C CE 49 53 84 1F D2 84 F8 3E 27 04 17 92
Sample consists of 32 bytes and contains 256 bits of entropy
```

show crypto entropy status

To view the status of entropy sources, use the **show crypto entropy status** command in user EXEC or privileged EXEC mode. This command is only supported on SUP IOSd.

show crypto entropy status

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes
User EXEC (>)

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Dublin 17.12.1	CPU jitter entropy source is introduced.
Cisco IOS XE 16.4.1	This command is introduced on the Cisco cBR-8 Converged Broadband Routers.

Usage Guidelines

The command displays the status of entropy sources.

Examples

The following example shows the typical output for **show crypto entropy status**:

```
Router# show crypto entropy status
Load for five secs: 4%/0%; one minute: 4%; five minutes: 4%
Time source is NTP, 21:06:09.976 EDT Mon Jun 19 2023
# Entropy source      Type Status Requests Entropy Bits
1 CPU jitter          Prim Working 126005    256/48011264
2 ubr_entropy_rp      Phy Working  124      256/31744
3 randfill            NPhy Working 124      128/15872  (*)
4 getrandombytes      NPhy Working 124      160/19840  (*)

Secure mode enabled, SEC-CRY-PRIM enabled
(*) - The entropy collected from NPhy sources was not counted
      as a part of achieving the entropy target

Fresh entropy collected once every 60 minutes
Entropy most recently collected 27 minutes ago
Entropy target = 256 bits; entropy actually collected = 640 bits

-- Primary entropy source version 3.4.1 --

Crypto Version:
  IC2M Rel5a
  CiscoSSL 1.1.11.7.2.289
```

Here, CPU jitter is the primary source and ubr_entropy_rp is the legacy source.

show crypto ikev2|ipsec sa detail

To view your IPsec information, use the **show crypto ikev2 | ipsec sa detail** command in user EXEC or privileged EXEC mode.

show crypto ikev2 | ipsec sa detail

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes User EXEC (>)

Privileged EXEC (#)

Command History	Release	Modification
	17.2.1	This command was introduced for the Cisco cBR-8.

Usage Guidelines The command displays information with regard to IPsec security.

Examples The following example shows typical output:

```
Router# show crypto ipsec sa detail

show debug

To display current debugging information that includes PacketCable COPS messages on the Cisco CMTS, use the **show debug** command in privileged EXEC mode.

show debug

Syntax Description No additional keywords or arguments

Command Modes Privileged EXEC

Command History	Release	Modification
	12.3(13a)BC	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines For additional information about this feature and related commands, refer to the following document on Cisco.com:

- *COPS Engine Operation on the Cisco CMTS*

Examples

The following example illustrates the use of the show debug command in relation to the COPS Engine Operation feature on the Cisco CMTS.

```
Router# show debug
PacketCable Client:
  Pktcbl COPS msgs debugging is on
PacketCable specific:
  Debugging is on for Subscriber 68.1.2.4, Mask 255.255.255.255
SLOT 6/0: Nov 19 04:57:09.219: %UBR10000-5-UNREGSIDTIMEOUT: CMTS deleted unregistered Cable
  Modem 0002.8a8c.8c1a
SLOT 6/0: Nov 19 04:57:12.279: %UBR10000-5-UNREGSIDTIMEOUT: CMTS deleted unregistered Cable
  Modem 0002.8a8c.92ae
*Nov 19 04:57:19.751: PktCbl(cops): Received callback [code 2, handle: 0x63982B08] from
  COPS engine
*Nov 19 04:57:19.751: PktCbl(cops): Received a COPS DEC message, flags is 0x1
*Nov 19 04:57:19.755: PktCbl(cops): Received callback [code 2, handle: 0x63982B08] from
  COPS engine
*Nov 19 04:57:19.755: PktCbl(cops): Received a COPS DEC message, flags is 0x1
*Nov 19 04:57:19.755: PktCbl(cops): Received callback [code 2, handle: 0x63982B08] from
  COPS engine
*Nov 19 04:57:19.755: PktCbl(cops): Received a COPS DEC message, flags is 0x1
*Nov 19 04:57:19.755: PktCbl(cops): Received callback [code 2, handle: 0x63982B08] from
  COPS engine
*Nov 19 04:57:19.755: PktCbl(ndle: 0x63982B08] from COPS engine
```

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show debug** command on the Cisco cBR router:

```

Router#show debug
network RF:
  network-rf idb-sync-history events debugging is on
IOSXE Conditional Debug Configs:

Conditional Debug Global State: Stop

IOSXE Packet Tracing Configs:

Packet Infra debugs:

Ip Address _____ Port
-----|-----

% Invalid input detected at '^' marker.

```

Related Commands

Command	Description
cops ip dscp	Specifies the Common Open Policy Service (COPS) Differentiated Services Code Point (DSCP) markings for COPS messages that are transmitted by the Cisco router
cops listeners access-list	Configures access control lists (ACLs) for inbound connections to all COPS listener applications on the Cisco CMTS.
cops tcp window-size	Overrides the default TCP receive window size that is used by COPS processes.
debug packetcable cops	Enables debugging processes for PacketCable with the COPS engine.
debug packetcable gate control	Enables and displays debugging processes for PacketCable gate control.
debug packetcable subscriber	Enables and displays debugging processes for PacketCable subscribers.
show cops servers	Displays COPS server addresses, port, state, keepalives, and policy client information.
show ip rsvp policy	Displays policy server addresses, ACL IDs, and client/server connection status.

show depi

To display Downstream External PHY Interface (DEPI) tunnel and session information, use the **show depi** command in privileged EXEC mode.

show depi

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Table 203: show depi Field Descriptions

Field	Description
LocTunID	Identifier of the local tunnel.

Field	Description
RemTunID	Identifier of the remote tunnel.
Remote Name	Name of the remote tunnel.
State	State of the tunnel.
Remote Address	IP address of the remote tunnel.
Session Count	Number of sessions.
L2TP Class/VPDN Group	L2TP class name for the tunnel.
LocID	Identifier of the session.
RemID	Identifier of the remote session.
TunID	Identifier of the tunnel.
State	State of the session.
Last Chg	Last state change timestamp.
Uniq ID	Unique identifier of the QAM channel.
Type	Primary or secondary session.

Related Commands

Command	Description
depi-tunnel	Creates a template of DEPI tunnel configuration settings that can be inherited by different pseudowire classes.
rf-channel depi-tunnel	Binds the depi-tunnel to an rf-channel on a shared port adapter (SPA).
controller modular-cable	Enters controller configuration mode to configure the SPA controller.
show depi session	Displays information about DEPI sessions.
show depi tunnel	Displays information about DEPI tunnels.

show depi session

To display information about Downstream External PHY Interface (DEPI) sessions, use the **show depi session** command in privileged EXEC mode.

show depi session [*session-id* | **configured** | **name** *session-name* | **controller modular-cable***slot/subslot/unit-number* | **interface** *interface-name* | **primary** | **secondary** | **tsid** *ts-id* | **endpoints**] [**verbose**]

Syntax Description

<i>session-id</i>	(Optional) Local session ID value. The allowed range is from 1 to 4294967295.
verbose	(Optional) Displays detailed DEPI session information.
configured	(Optional) Displays all the DEPI sessions configured and their state. The states are IDLE and ACTIVE.
name <i>session-name</i>	(Optional) Specifies the name of the DEPI session.
controller modular-cable <i>slot/subslot/unit-number</i>	(Optional) Specifies the controller modular cable interface. <ul style="list-style-type: none"> <i>slot</i>—Controller modular cable interface slot. The valid range is from 0 to 8. <i>subslot</i>—Controller modular cable interface subslot. The valid value is 0 or 1. <i>unit-number</i>—Controller unit number. The valid range is from 0 to 2.
interface <i>interface-name</i>	(Optional) Specifies the interface type.
primary	(Optional) Specifies the primary DEPI session.
secondary	(Optional) Specifies the backup DEPI session.
tsid <i>ts-id</i>	(Optional) Specifies the Transport Stream Identifier (TSID).
endpoints	(Optional) Specifies DEPI session endpoints including tunnel ID and Edge Quadrature Amplitude Modulation (EQAM) RF port.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.

Release	Modification
12.2(33)SCE	This command was modified. The following keywords were added to this command: <ul style="list-style-type: none"> • primary • secondary • tsid • name • controller Modular-Cable • interface • endpoints
12.2(33)SCG	This command was modified to support verbose output with the tsid option.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Examples

The following is a sample output of the **show depi session** command for all the established DEPI data sessions:

```
Router# show depi session
LocID      RemID      TunID      Tsid      State  Last Chg  Uniq ID    Type

Table 204: show depi Field Descriptions

Field	Description
LocID	Identifier of the session.
RemID	Identifier of the remote session.
TunID	Identifier of the tunnel.
Tsid	Transport Stream Identifier.

Field	Description
State	State of the session.
Last Chg	Last state change timestamp.
Uniq ID	Unique identifier of the QAM channel.
Type	Primary or secondary session.
RF Channel	RF channel interface.
EQAM rf-port	The EQAM RF port used for the DEPI session.

Related Commands

Command	Description
depi-tunnel	Creates a template of DEPI tunnel configuration settings that can be inherited by different pseudowire classes.
rf-channel depi-tunnel	Binds the DEPI tunnel to an RF channel on a shared port adapter (SPA).
controller modular-cable	Enters controller configuration mode to configure the SPA controller.
show depi	Displays information about DEPI sessions and tunnels.
show depi tunnel	Displays information about DEPI tunnels.

show depi tunnel

To display information about Downstream External PHY Interface (DEPI) tunnels, use the **show depi tunnel** command in privileged EXEC mode.

show depi tunnel [{*tunnel-id* **verbose** | **endpoints**}]

Syntax Description	
tunnel-id	(Optional) Name of the DEPI tunnel.
verbose	(Optional) Displays detailed DEPI tunnel or session information.
endpoints	(Optional) Specifies DEPI tunnel endpoints including tunnel ID and Edge Quadrature Amplitude Modulation (EQAM) RF port.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	12.2(33)SCE	This command was modified. Support for a new keyword, endpoints , was added to provide DEPI tunnel endpoint information.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Examples

The following example shows a sample output of the **show depi tunnel** command for all the active control connections:

```
Router# show depi tunnel
LocTunID   RemTunID   Remote Name   State   Remote Address   Sessn L2TP Class
                               Count
555844637  4037701912 RFGW-10-1    est     11.30.14.100    4     test10
1486289361 1394811300 RFGW-10-1    est     12.30.14.100    4     test10
1688275168 1361251901 RFGW-10-1    est     24.30.14.100    4     test10
```

The following example shows a sample output of the **show depi tunnel** command for a specific active control connection identified by the DEPI tunnel name:

```
Router# show depi tunnel 1834727012 verbose
Tunnel id 1834727012 is up, remote id is 3849925733, 1 active sessions
  Locally initiated tunnel
  Tunnel state is established, time since change 04:10:38
  Remote tunnel name is RFGW-10
    Internet Address 1.3.4.155, port 0
  Local tunnel name is myankows_ubr10k
    Internet Address 1.3.4.103, port 0
  L2TP class for tunnel is rf6
  Counters, taking last clear into account:
    0 packets sent, 0 received

depi_working_tunnel_8_0_0 Mod8/0/0          est    1.30.3.100      24

```

Table 205: show depi Field Descriptions

Field	Description
LocTunID	Identifier of the local tunnel.
RemTunID	Identifier of the remote tunnel.
Remote Name	Name of the remote tunnel.
State	State of the tunnel.
Remote Address	IP address of the remote tunnel.
Session Count	Number of sessions.
L2TP Class	L2TP class name for the tunnel.
Modular Controller	Controller modular cable interface for primary and secondary DEPI tunnels.

Related Commands

Command	Description
depi-tunnel	Creates a template of DEPI tunnel configuration settings that can be inherited by different pseudowire classes.
rf-channel depi-tunnel	Binds the depi-tunnel to an rf-channel on a shared port adapter (SPA).

Command	Description
controller modular-cable	Enters controller configuration mode to configure the SPA controller.
show depi	Displays information about DEPI sessions and tunnels.
show depi session	Displays information about DEPI sessions.

show derived-config interface cable

To display the detailed configuration and channel list information of dynamic bonding group, use the **show derived-config interface cable** (X/Y/Z) command in privileged EXEC mode.

show derived-config interface cable(X/Y/Z)

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 16.10.1f	This command was introduced on the Cisco cBR Series Converged Broadband Router.

- Note**
- For legacy DSG, you can see the DSG command by using **show derived-config interface** and **show interface Cable1/0/1** command.
 - For OPS DSG, you can see the DSG command by using the **show derived-config interface** command, instead of the **show interface Cable1/0/1** command.

Examples

The following example shows a sample output when the legacy DSG is used:

```
Router# show running interface cable1/0/1
interface Cable1/0/1
 cable downstream dsg chan-list 111
 cable downstream dsg timer 2
 cable downstream dsg vendor-param 2
 cable downstream dsg tg 4500 channel 1
 cable mac-domain-profile MD1
 cable bundle 255
 cable managed fiber-node 1
End
Router# show derived-config interface c1/0/
interface Cable1/0/1
.....
 cable downstream dsg chan-list 111
 cable downstream dsg timer 2
 cable downstream dsg vendor-param 2
 cable downstream dsg tg 4500 channel 1
end
```

The following example shows a sample output when the OPS DSG command is used. This option hides the DSG configuration under MD when you run the show running command.

```
Router# show running interface cable 1/0/1
interface Cable1/0/1
 cable mac-domain-profile MD1
```

show derived-config interface cable

```
  cable bundle 255
  cable managed fiber-node 1
End
```

show derived-config interface wideband-Cable

To display the detailed channel list information of dynamic bonding group, use the **show derived-config interface wideband-Cable** command in privileged EXEC mode.

show derived-config interface wideband-Cable

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 16.7.1	This command was introduced on the Cisco cBR Series Converged Broadband Router.

Examples

The following example shows a sample output of the **show derived-config interface wideband-Cable** command for all the active control connections:

```
Router# show derived-config interface wideband-Cable 3/0/1:1
Building configuration...
Derived configuration: 113 bytes
!
interface Wideband-Cable3/0/1:1
  cable bundle 255
  cable rf-channels channel-list 0-7 bandwidth-percent 1
end
```

For a dynamically created bonding group, the **show derived-config interface wideband-Cable** shows the rf-channel list information as shown above while the **show run interface wideband-cable** does not show the show the rf-channel list details. A sample output for **show run interface wideband-cable** is shown below:

```
BXB-TB8#show run int wideband-Cable 1/0/0:10
Load for five secs: 9%/1%; one minute: 8%; five minutes: 9%
Time source is NTP, 10:46:09.783 EST Fri Dec 15 2017

Building configuration...

Current configuration : 117 bytes
!
interface Wideband-Cable1/0/0:10
  cable bundle 1
end
```

Related Commands

Command	Description
show cable modem wideband channel	Displays the cable modem's primary wideband interface.
show cable modem verbose in DS Tuner	Displays the cable modem's downstream tuner capability.

Command	Description
show cable mac-domain Cable <i>x/y/z</i> rcc	Displays runtime receive channel configuration (RCC) on a cable line card interface.
show cable dynamic-bonding-group summary	Display the details of the dynamically created bonding groups.

show dhcp

To display the current Dynamic Host Configuration Protocol (DHCP) settings on point-to-point interfaces, use the **show dhcp** command in privileged EXEC mode.

Cisco uBR904, uBR905, uBR924, uBR925 cable access routers, Cisco CVA122 Cable Voice Adapter
show dhcp {lease | server}

Cisco cBR Series Converged Broadband Router
show dhcp {lease | server}

Syntax Description

lease	Displays DHCP addresses leased from a server.
server	Displays known DHCP servers.

Command Modes

Privileged EXEC

Command History

Release	Modification
11.3(4)NA	This command was introduced for the Cisco uBR904 cable access router.
12.0(4)XI1	Support was added for the Cisco uBR924 cable access router.
12.1(3)XL	Support was added for the Cisco uBR905 cable access router.
12.1(5)XU1	Support was added for the Cisco CVA122 Cable Voice Adapter.
12.2(2)XA	Support was added for the Cisco uBR925 cable access router.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

You can use this command on any point-to-point type of interface that uses DHCP for temporary IP address allocation.

Examples

This example shows the output from the **show dhcp lease** command:

```
Router# show dhcp lease

Temp IP addr: 188.188.1.40 for peer on Interface: cable-modem0
Temp sub net mask: 0.0.0.0
  DHCP Lease server: 4.0.0.32, state: 3 Bound
  DHCP transaction id: 2431
  Lease: 3600 secs, Renewal: 1800 secs, Rebind: 3150 secs
Temp default-gateway addr: 188.188.1.1
  Next timer fires after: 00:58:01
  Retry count: 0 Client-ID: 0010.7b43.aa01
Router#
```

Table 206: show dhcp lease Field Descriptions

Field	Description
Temp IP addr	IP address leased from the DHCP server for the cable interface.
Temp subnet mask	Temporary subnet mask assigned to the cable interface.
DHCP Lease server	IP address of the DHCP server that assigned an IP address to this client.
state	Current state of this client (the cable interface). Possible states are Bound, Renew, or Rebinding. For descriptions of these states, see RFC 2131.
DHCP transaction id	Unique number established by the router before the first request message is sent to the DHCP server. The same transaction ID is used as long as the lease keeps getting renewed and is valid. If a new “discover” message is sent, a new transaction ID is used.
Lease	Time (in seconds) for which the leased IP address is valid; the duration of the lease.
Renewal	Time interval (in seconds) from address assignment until the client transitions to the renewing state. When the renewal (T1) time expires, the client sends a unicast dhcprequest message to the server to extend its lease. The default value of this timer is 0.5 times the duration of the lease.
Rebind	Time interval (in seconds) from address assignment until the client transitions to the rebinding state and sends a broadcast dhcprequest message to any DHCP server to extend its lease. The default value of this timer (T2) is 0.875 times the duration of the lease.
Temp default-gateway addr	IP address of the router closest to this client on the network.
Next timer fires after	Time in hours, minutes, and seconds until the next timer expires.
Retry count	Number of times the client has sent any message to the DHCP server—most likely a request message to extend its lease. When the lease is renewed, the Retry count is reset to 0.
Client-ID	MAC address (with optional media type code) that uniquely identifies the client on the subnet for binding lookups.

This example shows the output for the **show dhcp server** command:

```
Router# show dhcp server

DHCP server: ANY (255.255.255.255)
Leases: 1
Offers: 1      Requests: 2      Acks: 1      Naks: 0
Declines: 0    Releases: 0    Bad: 0
TFTP Server Name: SOHOSERVER
TIME0: 1.2.0.250, TIME1: 0.0.0.0
Subnet: 255.255.255.0
Router#
```

Table 207: show dhcp server Field Descriptions

Field	Description
DHCP server	MAC address used by the DHCP server.
Leases	Number of current leased IP addresses.
Offers	Number of offers for an IP address sent to a proxy client from the server.
Requests	Number of requests for an IP address to the server.
Acks	Number of acknowledge messages sent by the server to the proxy client.
Naks	Number of not acknowledge messages sent by the server to the proxy client.
Declines	Number of offers from the server that have been declined by the proxy client.
Releases	Number of times IP addresses have been relinquished gracefully by the client.
Bad	Number of bad packets received due to wrong length, wrong field type, or other causes.
TFTP Server Name	Name (if any) configured for the server providing TFTP downloads to the CM.
TIME0	IP address of the primary Time-of-Day (ToD) server.
TIME1	IP address of the secondary ToD server.
Subnet	Subnet containing the DHCP server.

Tip In Cisco IOS Release 12.2(8)T and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable-modem voip best-effort	Allows voice calls to be sent upstream over the cable interface using best effort.
show bridge cable-modem	Displays bridging information for the cable interface.
show interfaces cable-modem	Displays information about the cable interface.

show diag all eeprom detail | include MAC

To display the chassis MAC address information, use the **show diag all eeprom detail | include MAC** command in privileged EXEC mode.

show diag all eeprom detail | include MAC

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command displays the chassis MAC address information.

Examples

The following sample output shows the chassis MAC address information:

```
Router# show diag all eeprom detail | include MAC
Chassis MAC Address      : c414.3c17.1c00
MAC Address block size  : 1024
```

Related Commands

Command	Description
logical-edge-device	Defines a logical edge device.
protocol	Specifies the protocol used in the logical edge device.
mgmt-ip	Defines the local management IP address for a logical edge device.
mac-address	Defines the MAC address for a logical edge device.
vcg	Specifies the virtual carrier group assigned to the logical edge device.
virtual-edge-input-ip	Defines a virtual edge input.
show cable video logical-edge-device	Displays the logical edge device information.
show cable video gqi connections	Displays the GQI connection information of the logical edge device with the Session Resource Manager.

show diagnostic bootup level

To display the currently configured diagnostics level at bootup, use the **show diagnostic bootup** command in user EXEC or privileged EXEC mode.

show diagnostic bootup level

Syntax Description This command has no arguments or keywords.

Command Default None

Command Modes
User EXEC (>)
Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCC	The command was introduced in this release to support Generic Online Diagnostics (GOLD) functionality for Cisco uBR10012 Universal Broadband Router.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines The level of diagnostic tests which run at bootup can be either configured as complete or minimal. To configure the bootup level, use the **diagnostic bootup level** command in global configuration mode. The **show diagnostic bootup level** command is used to display the currently configured bootup diagnostic level.

Examples This example shows the output of the **show diagnostic bootup level** command on the Cisco uBR10012 Router:

```
Router# show diagnostic bootup level
Current bootup diagnostic level: complete
```

Related Commands	Command	Description
	diagnostic bootup level	Configures the level of diagnostic tests which run at booup.

show diagnostic content

To display information about available tests, including test ID, test attributes, test schedule, and supported coverage test levels for each test and for each of the bays and line-cards, use the **show diagnostic content** command in user EXEC or privileged EXEC mode.

show diagnostic content [**all** | **bay** *slot/bay* | **slot** *slot-no* | **subslot** *slot/subslot*]

all	Displays information about available tests for all modules.
bay <i>slot/bay</i>	Indicates the card slot and bay number of the SPA for which the available test content details is displayed. The bay keyword is used to refer a SPA on the router. The valid range for the slot number is from 1 to 8 and 0 to 3 for the bay number.
slot <i>slot-no</i>	Indicates the slot number of the full-height line card for which the available test content details is displayed. The slot keyword is used to refer a full-height line card on the router. The valid range for slot is 1 to 8.
subslot <i>slot/subslot</i>	Indicates the slot and subslot number of half-height line card for which the available test content details has to be displayed. The subslot keyword is used to refer a half-height line card on Cisco uBR10012 Router. The valid range for the slot number is from 1 to 8 and 0 to 1 for the subslot number.

Command Default

None

Command Modes

User EXEC (>)
Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCC	This command was introduced for the Cisco uBR10012 Router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

For each available diagnostic test, a set of attributes is displayed as a series of characters in the Attributes field of the command output. An asterisk (*) in the character location indicates that the attribute is not applicable to the test. The following set of attribute s is displayed:

Attribute	Description
M	Test runs when the bootup diagnostic level is set to either Minimal or Complete.
C	Test runs when the bootup diagnostic level is set to Complete.
B	Test runs when the diagnostic ondemand command is executed. Indicates that the test is a basic ondemand test.
P	Test runs on a port, not the entire device (per-port test).
V	Test runs on the entire device (per-device test).

Attribute	Description
D	Test disrupts the network traffic (disruptive test).
N	Test runs when the system is online without disrupting the network traffic (non disruptive test).
S	If the card under test is a standby card, only the standby card runs the test. The test does not run from the active card. If the card under test is an active card, the active card runs the test on itself.
X	Test is not a health-monitoring test.
F	Monitoring interval of the test cannot be modified by the user (fixed monitoring test).
E	User cannot disable the test (always enabled test).
A	Monitoring is active for this test.
I	Monitoring is inactive for this test.

If a test is configured to run periodically, the interval will be displayed in the Test Interval field of the command output in the format dd hh:mm:ss.ms, indicating days, hours, minutes, seconds, and milliseconds. For example, the test interval of a test that runs every 15 minutes will be displayed as 000 00:15:00.00. The test interval of a test that runs every 14 days will be displayed as 014 00:00:00.00.

Examples

This example shows a sample output of the **show diagnostic content** command that displays the test suite, monitoring interval, and test attributes for bay 1/0 on the Cisco uBR10012 Universal Broadband Router.

```
Router# show diagnostic content bay 1/0
Bay 1/0: 2jacket-1
Diagnostics test suite attributes:
  M/C/* - Minimal bootup level test / Complete bootup level test / NA
  B/* - Basic ondemand test / NA
  P/V/* - Per port test / Per device test / NA
  D/N/* - Disruptive test / Non-disruptive test / NA
  S/* - Only applicable to standby unit / NA
  X/* - Not a health monitoring test / NA
  F/* - Fixed monitoring interval test / NA
  E/* - Always enabled monitoring test / NA
  A/I - Monitoring is active / Monitoring is inactive

Test In terval
ID   Test Name                               Attributes                               day hh:mm:ss.

```

Related Commands

Command	Description
diagnostic bootup level	Sets the bootup diagnostic level.
diagnostic monitor	Configures the health-monitoring diagnostic testing.
diagnostic ondemand	Configures the on-demand diagnostics.
diagnostic schedule test	Sets the scheduling of test-based diagnostic testing for a specific module or schedules a supervisor engine switchover.
show diagnostic description	Describes the diagnostic tests.
show diagnostic bootup	Displays the configured diagnostics level at bootup.
show diagnostic events	Displays the diagnostic event log.
show diagnostic ondemand settings	Displays the settings for the on-demand diagnostics.
show diagnostic result	Displays the diagnostic test results for a module.
show diagnostic schedule	Displays the current scheduled diagnostic tasks.
show diagnostic status	Displays the running diagnostics tests.
diagnostic ondemand	Configures the on-demand diagnostics.

Command	Description
diagnostic event-log size	Modifies the diagnostic event-log size dynamically.
diagnostic start	Runs the specified diagnostic test.
diagnostic stop	Stops the testing process.

show diagnostic ood-status

To display status information, such as the line card slot and name, Field Diagnostic image status, and overall results from previous diagnostic tests, enter the **show diagnostic ood-status** command.

show diagnostic ood-status [{slot *slot-number* | subslot *slot-number/subslot-number*}] [**detail**]

Syntax Description

slot	Specifies that the status information will be viewed for a line card in a full slot.
subslot	Specifies that the status information will be viewed for a line card in a subslot.
<i>slot-number</i>	Specifies the slot number of the line card whose status information will appear in the command output.
<i>subslot-number</i>	Specifies the subslot number of the line card whose status information will appear in the command output.
detail	Displays the status information and the detailed test results of the specified line card in the command output.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

The **show diagnostic ood-status** output discloses if a line card supports Field Diagnostic testing and if the line card has already downloaded a Field Diagnostic image. Therefore, the **show diagnostic ood-status** command is useful as a reference before loading the Field Diagnostic image onto the line card.

It is important to note that the **show diag** and **show diagnostic** commands produce completely different outputs. Therefore, the **show diagnostic** output cannot be gathered using **show diag** because the autocomplete function will generate the **show diag**, not the **show diagnostic**, output. If you want to abbreviate the **show diagnostic** command, the shortest possible abbreviation is **show diagn**.

Examples

In the following example, the **show diagnostic ood-status** command is used to view status information of all the line card in the uBR10012 router.

```
Router# show diagnostic ood-status
Load for five secs: 0%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *05:56:50.835 EDT Thu Nov 5 2009

Table 209: show diagnostic ood-status Field Descriptions

Field	Description
Slot	Identifies the slot on the router.
Card Description	A text explanation of the line card in the specified slot.
FDiag Support	Indicates whether the line card in the specific slot supports Field Diagnostic testing. <ul style="list-style-type: none"> • Yes—the line card in the slot supports Field Diagnostic testing. • No—the card in the slot does not support Field Diagnostic testing.
Loaded Image Type	Specifies the run-time image for each line card. <ul style="list-style-type: none"> • Field Diag—Indicates that the Field Diagnostic image is loaded on the line card. A line card will either have the Field Diagnostic or LCDOS image. • IOS—Specifies that the processor is running Cisco IOS. • LCDOS—Line card DOS. The LCDOS image is the image the line card is running during normal router operation. It is removed temporarily when a Field Diagnostic image is loaded onto the line card and loaded back onto a line card when a Field Diagnostic image is unloaded. <p>Note The LCDOS image is not loaded on cable line cards.</p>
Overall Diag Result	Displays the result of the last performed Field Diagnostic test, assuming the Field Diagnostic image has not been removed since the last test. <ul style="list-style-type: none"> • Pass—This line card passed the last diagnostic test. • Fail—At least one Field Diagnostic test failed during the last diagnostic test. • N/A—This line card has not been tested.
Current Card State	The current card state: <ul style="list-style-type: none"> • Diag Ready—A diagnostic image is loaded onto the line card and Field Diagnostic tests can be run. • Running Diag—A diagnostic image is loaded on to the line card and is currently being run. • Offline—The line card is not currently passing traffic and no Field Diagnostic image has been downloaded onto the line card. • Online—The line card is active and can pass traffic.

In the following sample output, the test results per line card is displayed when the **show diagnostic ood-status** command is used along with **subslot** and **detail** keywords. The output displays diagnostic status of the line card along with details of the tests being run and their status.

Table 210: show diagnostic ood-status subslot x/y detail Field Descriptions

Field	Description
Current card state	Specifies the card state.
ID	The test identification number.
Test Name	The name of the test.

Field	Description
Selected to Run	Specifies whether the test was specified to run. Y indicates the test will be run and N indicates the test will not be run.
Test Status	Provides the current test status.

Related Commands

Command	Description
diagnostic event-log size	Sets the size of the event table.
diagnostic load	Loads the Field Diagnostic image onto the line card.
diagnostic ondemand action-on-failure	Sets the number of errors allowed in the Field Diagnostic test before the Field Diagnostic test is stopped.
diagnostic ondemand iterations	Sets the number of times each specific Field Diagnostic test will be run when a Field Diagnostic test is initiated.
diagnostic start	Starts Field Diagnostic testing on the line card.
diagnostic stop	Stops an in-progress Field Diagnostic test.
diagnostic unload	Unloads the Field Diagnostic image from the line card and restores normal line card operation.
show diag	Shows information of all the line cards in the uBR10012 router, per slot, per subslot.
show diagnostic content	Shows the Field Diagnostic test list for a particular line card.
show diagnostic events	Displays the history of Field Diagnostic events since the last system reload.

show diagnostic result

To display the diagnostic test results for a module, use the **show diagnostic result** command in user EXEC or privileged EXEC mode.

show diagnostic result [{**bay** *slot/bay* | **slot** *slot-no* | **subslot** *slot/subslot*}] [**detail** | **test** {*test-id**test-id-range* | **all**}] | **all**}]

Syntax Description

bay <i>slot/bay</i>	(Optional) Indicates the card slot and bay number for which the diagnostic test results are displayed. The bay keyword is used to refer a SPA on Cisco uBR10012 Universal Broadband Router. The valid range to specify slot is 1 to 8 and the valid range for bay is 0 to 3.
slot <i>slot-no</i>	(Optional) Indicates the slot number of the full-height line card for which the diagnostic test results have to be displayed. The slot keyword is used to refer a full-height line card on Cisco uBR10012 Universal Broadband Router. The valid range for the slot number is from 1 to 8.
subslot <i>slot/sub-slot</i>	(Optional) Indicates the slot and subslot number of the half-height line card for which the diagnostic test results have to be displayed. The subslot keyword is used to refer a half-height line card on Cisco uBR10012 Router. The valid range to specify slot is 1 to 8 and the valid range for sub-slot is 0 to 1.
all	(Optional) Displays diagnostic test results for all the SPAs, full-height line cards, and half-height line cards.
<i>list</i>	List of modules in the following format: <ul style="list-style-type: none"> • Entries separated by a comma, for example, 1,4,6-10. • Ranges specified with a hyphen, for example, 1-4,6-10.
<i>slot</i>	Single module by slot number.
<i>slot/subslot</i>	Single sub module by slot number and subslot or bay within the module.
detail	(Optional) Displays the detailed test results. The detail keyword is used along with the bay, slot, or subslot keywords to provide detailed test result information for a SPA, full-height line card, or half-height line card.
test <i>test-id</i>	(Optional) Displays test results only for the specified test-ids.
test <i>test-id-range</i>	(Optional) Displays test results for the specified range of test ids.
test <i>all</i>	(Optional) Displays the test results for all the tests running on the SPA, full-height line card, or half-height line card.

Command History

Release	Modification
12.2(33)SCC	The command was introduced in this release to support the Generic Online Diagnostics (GOLD) functionality on the Cisco uBR10012 Universal Broadband Router. The keywords bay , slot , and subslot were added for the Cisco uBR10012 Universal Broadband Router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

In the command output, the possible testing results are as follows:

- Passed (.)
- Failed (F)
- Untested (U)

To display the results of a specific diagnostic test, specify the *test-id* number using the **test test-id** keyword and argument. The *test-id* numbers for available diagnostic tests are displayed in the output of the **show diagnostic content** command.

You can use the **show diagnostic description** command to see a detailed description of a diagnostic test.

The command syntax to refer a line card or SPAs is different on Cisco uBR10012 Router. The keyword is **slot x** for a full-height line card, **slot x/y** for a half-height card, and **bay x/y** for a SPA.

Note To view the diagnostic test results for a SPA, full-height line card, or half-height line card use the **show diagnostic result** command along with the **bay**, **slot**, or **subslot** keywords respectively.

The GOLD test cases used to poll for system errors in Cisco IOS Software Release 12.2(33)SCC are Low Latency Queueing (LLQ) drop, Cable Line Card (CLC) memory leak, and Guardian index leak tests.

Examples

The following example shows a sample output of the **show diagnostic result all** command. The output displays a summary of test results on all the SPAs, full-height line cards, and half-height line cards on the Cisco uBR10012 Router:

```
Router# show diagnostic result all
Current bootup diagnostic level: minimal
Slot 1: 2jacket-1 SerialNo : CAT1146E05
Overall diagnostic result: UNTESTED
Diagnostic level at card bootup: minimal
Test results: (. = Pass, F = Fail, U = Untested)
  1) TestJacketSample -----> U
     Bay 1/0: 2jacket-1 SerialNo : N/A
     Overall diagnostic result: PASS
     Diagnostic level at card bootup: minimal
     Test results: (. = Pass, F = Fail, U = Untested)
       1) TestModenaSample -----> U
       2) TestModenaLLQDrops -----> .
Subslot 5/0: 5cable-mc520u-d, 5 ports SerialNo : CAT10210T9
Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal
Test results: (. = Pass, F = Fail, U = Untested)
  1) TestSampleProxy -----> U
  2) Test520LLQDrops:
     Port  0  1  2  3  4
     -----
```

show diagnostic result

```

. . . . .
3) TestBlazeIndexLeak -----> U
4) TestMemLeaks -----> .
Subslot 8/0: 5cable-mc520u-d, 5 ports SerialNo : CAT08410SS
Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal
Test results: (. = Pass, F = Fail, U = Untested)
1) TestSampleProxy -----> U
2) Test520LLQDrops:
   Port 0 1 2 3 4
   -----
. . . . .
3) TestBlazeIndexLeak -----> .
4) TestMemLeaks -----> .
Subslot 8/1: 5cable-mc520u-d, 5 ports SerialNo : CAT10251S2
Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal
Test results: (. = Pass, F = Fail, U = Untested)
1) TestSampleProxy -----> U
2) Test520LLQDrops:
   Port 0 1 2 3 4
   -----
. . . . .
3) TestBlazeIndexLeak -----> U
4) TestMemLeaks -----> .

```

The following example shows a sample output of the **show diagnostic result subslot 5/0 detail** command. The command output provides useful details such as overall diagnostic results and the time-related values of various important parameters, which help in identifying and resolving the issue:

```

Router# show diagnostic result subslot 5/0 detail
Current bootup diagnostic level: minimal
Subslot 5/0: 5cable-mc520u-d, 5 ports SerialNo : CAT10210T9
Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal
Test results: (. = Pass, F = Fail, U = Untested)

-----
1) TestSampleProxy -----> U
   Error code -----> 0 (DIAG_SUCCESS)
   Total run count -----> 0
   Last test execution time -----> n/a
   First test failure time -----> n/a
   Last test failure time -----> n/a
   Last test pass time -----> n/a
   Total failure count -----> 0
   Consecutive failure count -----> 0
-----

2) Test520LLQDrops:
   Port 0 1 2 3 4
   -----
. . . . .
   Error code -----> 0 (DIAG_SUCCESS)
   Total run count -----> 17
   Last test execution time -----> Aug 11 2009 09:42:22
   First test failure time -----> n/a
   Last test failure time -----> n/a
   Last test pass time -----> Aug 11 2009 09:42:22
   Total failure count -----> 0
   Consecutive failure count -----> 0
-----

3) TestBlazeIndexLeak -----> U
   Error code -----> 0 (DIAG_SUCCESS)

```

```

Total run count -----> 1
Last test execution time -----> Aug 11 2009 00:42:19
First test failure time -----> n/a
Last test failure time -----> n/a
Last test pass time -----> Aug 11 2009 00:42:19
Total failure count -----> 0
Consecutive failure count -----> 0

```

```

4) TestMemLeaks -----> .
Error code -----> 0 (DIAG_SUCCESS)
Total run count -----> 7
Last test execution time -----> Aug 11 2009 06:42:19
First test failure time -----> n/a
Last test failure time -----> n/a
Last test pass time -----> Aug 11 2009 06:42:19
Total failure count -----> 0
Consecutive failure count -----> 0

```

Related Commands

Command	Description
show diagnostic content	Displays the available diagnostic tests.
show diagnostic description	Describes the diagnostic tests.
show diagnostic bootup	Displays the configured diagnostics level at bootup.
show diagnostic events	Displays the diagnostic event log.
show diagnostic ondemand settings	Displays the settings for the on-demand diagnostics.
show diagnostic result	Displays the diagnostic test results for a module.
show diagnostic schedule	Displays the current scheduled diagnostic tasks.
show diagnostic status	Displays the running diagnostics tests.
diagnostic start	Runs the specified diagnostic test.
diagnostic stop	Stops the testing process.
show diagnostic content module	Displays the available diagnostic tests.
diagnostic bootup level	Configures the diagnostic bootup level.
diagnostic event-log size	Modifies the diagnostic event-log size dynamically.
diagnostic monitor	Configures the health-monitoring diagnostic testing.
diagnostic ondemand	Configures the on-demand diagnostics.
diagnostic schedule	Sets the scheduling of diagnostic testing for a specific bay, slot, or subslot.

show diagnostic schedule

To display the scheduled diagnostic tasks, use the **show diagnostic schedule** command in user EXEC or privileged EXEC mode.

show diagnostic schedule [{**all** | **bay** *slot/bay* | **slot** *slot-no* | **subslot** *slot/subslot*}]

Syntax Description		
all		Displays the scheduled diagnostic tasks for all the installed SPAs, full-height line cards, and half-height line cards on the Cisco uBR10012 Universal Broadband Router.
bay <i>slot/bay</i>		(Optional) Indicates the card slot and bay number for which the scheduled diagnostic tasks is displayed. The bay keyword is used to refer a SPA on the router. The valid range for the slot number is from 1 to 8 and 0 to 3 for the bay number.
slot <i>slot-no</i>		(Optional) Indicates the slot number of the full-height line card for which the scheduled diagnostic tasks is displayed. The slot keyword is used to refer a full-height line card on the router. The valid range for slot is 1 to 8.
subslot <i>slot/sub-slot</i>		(Optional) Indicates the slot and subslot number of the half-height line card for which the scheduled diagnostic tasks have to be displayed. The subslot keyword is used to refer a half-height line card on the router. The valid range for the slot number is from 1 to 8 and 0 to 1 for the subslot.

Command Default None

Command Modes
User EXEC (>)
Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCC	The command was introduced in this release to support Generic Online Diagnostics (GOLD) functionality for Cisco uBR10012 Universal Broadband Router. The keywords bay , slot , and subslot were added for the Cisco uBR10012 Universal Broadband Router.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines Diagnostic tests for a specific bay, slot, or subslot can be scheduled daily, weekly, or on specific dates and time using the **diagnostic schedule** command from global configuration mode. The **show diagnostic schedule** command output displays the diagnostic tests that have been scheduled for the bay, slot, or subslot using the command **diagnostic schedule**.

Examples

This example shows a sample output of the show diagnostic schedule slot 1 command that displays diagnostic tasks scheduled for slot 1 on the Cisco uBR10012 Universal Broadband Router:

```
Router# show diagnostic schedule slot 1
Current Time = 13:55:35 EST Tue Aug 11 2009
Diagnostic for Slot 1:
Schedule #1:
```

```
To be run on September 1 2009 12:00
Test ID(s) to be executed: 1.
```

This example shows a sample output of how to display the diagnostic tasks scheduled for all the bays, full-height line cards, and half-height line cards installed on the Cisco uBR10012 Universal Broadband Router:

```
Router# show diagnostic schedule all
Current Time = 14:05:41 EST Tue Aug 11 2009
Diagnostic for Slot 1:
Schedule #1:
    To be run on September 1 2009 12:00
    Test ID(s) to be executed: 1.
Diagnostic for Bay 1/0 is not scheduled.
Diagnostic for Subslot 5/0 is not scheduled.
Diagnostic for Subslot 8/0:
Schedule #1:
    To be run daily 12:00
    Test ID(s) to be executed: 2.
Diagnostic for Subslot 8/1:
Schedule #1:
    To be run weekly Sunday 12:00
    Test ID(s) to be executed: 3.
```

Related Commands

Command	Description
diagnostic schedule	Sets the diagnostic test schedule for a particular bay, slot, or subslot.
show diagnostic description	Provides the description for the diagnostic tests.
diagnostic start	Runs the specified diagnostic test.
diagnostic stop	Stops the testing process.
show diagnostic content module	Displays the available diagnostic tests.
diagnostic bootup level	Configures the diagnostic bootup level.
diagnostic event-log size	Modifies the diagnostic event-log size dynamically.
diagnostic monitor	Configures the health-monitoring diagnostic testing.
diagnostic ondemand	Configures the on-demand diagnostics.
show diagnostic bootup	Displays the configured diagnostics level at bootup.
show diagnostic events	Displays the diagnostic event log.
show diagnostic ondemand settings	Displays the settings for the on-demand diagnostics.
show diagnostic result	Displays the diagnostic test results for a module.
show diagnostic schedule	Displays the current scheduled diagnostic tasks.
show diagnostic status	Displays the running diagnostics tests.

show diagnostic status

This command is not supported in the cBR-8 router.

show facility-alarm status

To display the current temperature thresholds that will trigger a facility alarm, use the **show facility-alarm status** command in user EXEC or privileged EXEC mode.

show facility-alarm status [{critical | major | minor | info | phy-index}]

Syntax Description		
critical	(Optional)	Only critical alarms are shown.
major	(Optional)	All major and critical facility alarms are shown.
minor	(Optional)	All minor, major, and critical facility alarms are shown.
info	(Optional)	All facility alarms are shown. The default severity level is info.
phy-index	(Optional)	All facility alarms for the specified physical index entity are shown.

Command Default All alarms are shown.

Command Modes User EXEC, Privileged EXEC (#)

Command History	Release	Modification
	12.2(1)XF1	This command was introduced for the Cisco uBR10012 router.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
	12.2(33)SCE4	This command was modified. The phy-index keyword was added to the command for the Cisco uBR7200 series and uBR10012 routers.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines When a severity level is identified, statuses of alarms at that level and higher are shown. For example, when you set a severity of major, all major and critical alarms are shown.

The **show facility-alarm status** command does not show the real status of the upstream channel connector when frequency stacking is configured on the upstream channel.

The **show facility-alarm status** command does not show the critical alarm temperature thresholds. You can display these values using the **show running-config | include facility** command. If this does not display any commands for critical alarms, then the temperature thresholds are set at their default values.

For additional information on Frequency Stacking feature, refer to the [Virtual Interfaces and Frequency Stacking Configuration on MC5x20S and MC28U Linecards](#) document on Cisco.com.

Starting from Cisco IOS XE Gibraltar 16.10.1g and 16.12.1w release, if the link redundancy is enabled, **show facility-alarm status** will not report physical port link down on the interface unless both ports assigned to this interface are down, and transceiver missing on either port, active or standby, will be a critical alarm.

Examples

The following example shows a typical display of the **show facility-alarm status** command:

```
Router# show facility-alarm status

Thresholds:
Intake minor 40 major 49 critical 72
Core   minor 45 major 53 critical 85
System Totals  Critical: 0 Major: 0 Minor: 77
Source          Severity      ACO      Description [Index]
-----
chassis                MINOR      NORMAL   Core minor temperature limi]
Cable5/0-MAC0          INFO       NORMAL   Physical Port Administrativ]
Cable5/0-MAC1          INFO       NORMAL   Physical Port Administrativ]
Cable5/0-MAC2          INFO       NORMAL   Physical Port Administrativ]
Cable5/0-MAC3          INFO       NORMAL   Physical Port Administrativ]
Cable5/0-MAC4          INFO       NORMAL   Physical Port Administrativ]
Cable5/0-US0           MINOR      NORMAL   Physical Port Link Down [0]
Cable5/0-US1           MINOR      NORMAL   Physical Port Link Down [0]
Cable5/0-US2           MINOR      NORMAL   Physical Port Link Down [0]
Router#
```

The following example shows a typical display of the **show facility-alarm status phy-index** command:

```
Router# show facility-alarm status phy-index

Intake minor 40 major 49 critical 72
Core   minor 45 major 53 critical 85
System Totals  Critical: 4 Major: 1 Minor: 0
PhyIdx   Source          Severity      ACO      Description [Index]
-----
28       RP A                MAJOR        NORMAL   Secondary failure [2]
46       GigE1H 3/0/0        CRITICAL     NORMAL   Physical Port Link Down [0]
48       GigE1H 3/1/0        CRITICAL     NORMAL   Physical Port Link Down [0]
5510     Cable5/1-US4        INFO         NORMAL   Physical Port Administrative
State Down [1]
5511     Cable5/1-US5        INFO         NORMAL   Physical Port Administrative
State Down [1]
Router#
```

Table 211: show facility-alarm status Field Descriptions

Field	Description
System Totals	Total number of alarms generated, identified by severity.
PhyIdx	The entity physical index for a specific alarm node.
Source	Interface from which the alarm was generated.
Severity	Severity level of the alarm generated.
ACO	Alarm cutoff. It could be "NORMAL" or "CLEARED".
Description [Index]	Type of the alarm and the index of the alarm type. The index can be any number based on the number of alarm types that the device supports.

Related Commands

Command	Description
clear facility-alarm	Clears some or all of the facility alarms on the Cisco uBR10012 router.
facility-alarm	Sets the temperature thresholds at which the processor generates a critical, major, or minor alarm to warn of potential equipment damage.

show frame-clocks

To display information about the midplane time-division multiplexing (TDM) clock reference, use the **show frame-clocks** command in privileged EXEC mode.

show frame-clocks

Syntax Description

This command has no keywords or arguments.

Command Modes

Privileged EXEC

Command History

Release	Modification
12.0(T)	This command was introduced.
12.1(1a)T1	This command was modified to include the cable clock card as the current clock source.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following sample output from the **show frame-clocks** command shows that there are no clock sources configured and the clock card is the default clock source:

```
Router# show frame-clocks

Priority 1 clock source:not configured input:none
Priority 2 clock source:not configured input:none
Priority 3 clock source:not configured input:none
Priority 4 clock source:not configured input:none
Current clock source:Clockcard, input:Primary, priority:5
```

Table 212: show frame-clocks Field Descriptions

Field	Description
Priority 1-4 clock source	The configuration of the four network clock sources.
Current clock source	The current clock source, its input, and priority. In this example, the clock card is providing the clock source.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
show cable clock	Displays status information for the clock card.
show controllers clock-reference	Displays the clock card's hardware information.

show hardware pxf

In Cisco IOS Release 12.2(15)BC2 and later releases, all **show hardware pxf** commands were renamed as **show pxf**, as follows:

- **show pxf cable**
- **show pxf cable interface**
- **show pxf cpu**
- **show pxf dma**
- **show pxf microcode**
- **show pxf xcm**

The functionality of each command remains the same. See the above commands for more information.

In Cisco IOS-XE Release IOS-XE 3.15.0S, the **show hardware pxf** commands are not supported on the Cisco cBR Series Converged Broadband Routers.

show hccp

To display information about HCCP groups associated with cable interfaces, use the **show hccp** command in user EXEC or privileged EXEC mode.

show hccp [{*group* | **brief** | **channel-switch** | **detail** | **event-history** | **interface** | **linecard**}]

Syntax Description

<i>group</i>	(Optional) Specifies a group number to be displayed. The valid range is 1 to 255. It is a 1-based MAC domain number and hence on a: <ul style="list-style-type: none"> • Cisco uBR10-MC5X20 and Cisco UBR-MC20X20V line card, the group range is from 1 to 5. • Cisco uBR-MC3GX60V line card, the group range is from 1 to 15.
brief	(Optional) Displays a brief summary of the groups, configuration types, member numbers, and status for cable interfaces. You can also use this option when displaying information for a specific group.
channel-switch	(Optional) Displays information about the channel-switch configuration.
detail	(Optional) Displays a detailed summary of the groups, configuration types, member numbers, and status for cable interfaces, as well as the CLI commands that are being synchronized across interfaces.
event-history	(Optional) Displays information about switchover and sync events.
interface	(Optional) Displays a summary on each interface.
linecard	(Optional) Displays line card-level HCCP information.

Command Modes

User EXEC, Privileged EXEC (#)

Command History

Release	Modification
12.1(3a)EC	This command was introduced.
12.2(4)BC1	The detail option was added.
12.2(8)BC2	The current time to resync and current wait to restore values were added to the display for the brief option.
12.2(11)BC1	Support was added for the Cisco uBR-RFSW N+1 (1:n) RF Switch with the Cisco uBR7246VXR router and Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C cards.
12.2(15)BC2	The output of the show hccp detail command was changed to show separate lists of the critical and non-critical CLI commands that are being synchronized for each Working and Protect interface and subinterface.

Release	Modification
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB and the output of the show hccp detail command was changed to show CMTS interface pre-critical config information.
12.2(33)SCC	This command was integrated into Cisco IOS Release 12.2(33)SCC.
12.2(33)SCE	This command was modified. The line card keyword was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following examples are from the **show hccp** and **show hccp brief** commands for the entire chassis:

```
Router# show hccp

Cable4/0 - Group 1 Protect, enabled, blocking
authentication md5, key-chain "cisco1"
hello time 2000 msec, hold time 6000 msec
Member 1 standby
ip addr: working 10.20.111.11, protect 10.20.111.10
downstream wavecom (10.1.11.3/1, 10.1.11.3/2), upstream none
Router# show hccp brief
```

```
Interface Config   Grp Mbr Status
Ca5/0/0   Protect    1   3   standby
Ca7/0/0   Working    1   3   active
```

In Cisco IOS Release 12.2(8)BC2 and later 12.2 BC releases, the **brief** option also shows the amount of time left before the next resynchronization and the time left before a restore:

```
Router# show hccp brief

Interface Config   Grp Mbr Status           WaitToResync   WaitToRestore
Ca5/0/0   Protect    1   3   standby           00:01:50.892
Ca7/0/0   Working    1   3   active            00:00:50.892
Router#
```

The following example shows a sample output for the **show hccp channel-switch** command, displaying the groups and module numbers for each configured member:

```
Router# show hccp channel-switch

Grp 1 Mbr 1 Working channel-switch:
"uc" - enabled, frequency 555000000 Hz
"rfswitch" - module 1, normal
module 3, normal
module 5, normal
module 7, normal
module 11, normal
Grp 2 Mbr 1 Working channel-switch:
"uc" - enabled, frequency 555000000 Hz
"rfswitch" - module 2, normal
module 4, normal
module 6, normal
module 9, normal
module 13, normal
```

```

Grp 1 Mbr 7 Protect channel-switch:
  "uc" - disabled, frequency 555000000 Hz
  "rfswitch" - module 1, normal
  module 3, normal
  module 5, normal
  module 7, normal
  module 11, normal
Grp 1 Mbr 5 Protect channel-switch:
  "uc" - disabled, frequency 555000000 Hz
  "rfswitch" - module 1, normal
  module 3, normal
  module 5, normal
  module 7, normal
  module 11, normal
Router#

```

The following example shows the first part of the display for the **detail** option of this command, which first displays chassis-wide configuration information. The command then displays the CLI configuration commands that are being synchronized for each subinterface.

```

Router# show hccp detail

HCCP software version 3.0
Cable3/0 - Group 1 Protect, enabled, blocking
  authentication none
  hello time 2000 msec, hold time 6000 msec, revertive
  track interfaces: Cable3/0

Router#

```

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

The following example shows a detailed display for the Cisco uBR10-MC5X20S cable interface line card:

```

Router# show hccp detail

mac-address 0005.00e4.1236
cmts config:
resolve sid, dci-response success,
downstream - frequency 441000000, channel id 0
downstream - insertion_invl auto min = 60, max = 480
downstream - rf-shutdown, rf-power 48
upstream 0 - frequency 11408000, power level 0
upstream 0 - modulation-profile 1, channel-width 3200000
upstream 0 - cnr-profile1 25, cnr-profile2 15
                corr-fec 1, uncorr-fec 1

```

Note For cable interfaces with an integrated upconverter, the line showing the RF power will show **rf-shutdown** when the upconverter has been powered off.

Related Commands

Command	Description
show hccp interface	Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured.
show hccp linecard	Displays line card-level HCCP information.
show hccp group	Displays group information.

show hccp channel-switch

To display channel-switch hccp information, use the **show hccp channel-switch** command in privileged EXEC mode.

show hccp channel-switch [{**command-history local** | **counter** | **image** | **state** | **version**}]

Syntax Description

command-history local	Displays the command history on the Cisco CMTS router.
counter	Displays the counters on the Cisco NGRFSW-ADV.
image	Displays the image list on the Cisco NGRFSW-ADV.
state	Displays the current state of the Cisco NGRFSW-ADV.
version	Displays the version of the Cisco NGRFSW-ADV.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example is a sample output of the **show hccp channel-switch command-history local** command showing the command history output.

```
Router# show hccp channel-switch command-history local
timestamp          state      command
2010-06-13 07:47:17 Succ      type:FILE_OPEN, slot:1, group:0x00
2010-06-13 07:47:27 Succ      type:FILE_CLOSE, slot:0, group:0x00
2010-06-13 07:48:11 Succ      type:FILE_OPEN, slot:2, group:0x00
2010-06-13 07:48:51 Fail      type:FILE_CLOSE, slot:0, group:0x00
2010-06-13 09:46:01 Succ      type:RESET_SLOT, slot:7, group:0x1F
2010-06-13 09:48:17 Succ      type:RESET_SLOT, slot:7, group:0x1F
2010-06-13 18:47:23 Succ      type:RESET_SLOT, slot:4, group:0x1F
```

The following example is a sample output of the **show hccp channel-switch counter** command showing the counter statistics.

```
Router# show hccp channel-switch counter
The counter of switchover for all slot/group in rf switch.
 slot id group 1 group 2 group 3 group 4 group 5
 0      16491 16491 16491 16491 16491
 1      2383  2383  2383  2383  2383
 2      2360  2360  2360  2360  2360
 3      2351  2351  2351  2351  2351

Table 213: show hccp channel-switch Field Descriptions

Field	Description
timestamp	Time at which a command was executed.
State	State of the switch card.
command	List of commands executed on the Cisco CMTS router.
Module Id	Switchover module identifier in the Cisco NGRFSW-ADV.

Field	Description
Ctrl Version	Version of the Controller.
Switch Version	Version of the Switch.
Bootload Version	Version of the bootload in the Cisco NGRFSW-ADV.
Watchdog Error	Watchdog error number.
Temperature	Temperature of the switch card.
Voltage Monitoring	Voltage value.
Uptime	Uptime of the switch card.
Serial	Serial string for the controller and switchover cards.
Type	Type of the switch card (upstream or downstream).
Slot ID	Slot number of the switch card.
TotalPower Cycle	Power cycle number for the switchover card.
Relay pos	Relay position register. It is a 11-bit value, where 's' represents a set bit, 'R' represents a reset bit, and '-' is for an unused bit.
Coil Fail Register	Coil failure register in the switchover cards. It is a 11-bit value, where 'P' represents a normal bit, 'F' represents a failed bit and '-' is for an unused bit.
TotalRelay Cycle	Relay cycle number for the switchover card.

Related Commands

Command	Description
show hccp	Displays Hot Standby Connection-to-Connection Protocol (HCCP) information.

show hccp group

To display information about groups associated with cable interfaces, use the **show hccp group** command in user EXEC or privileged EXEC mode.

```
show hccp group member {CGD | mac-address {classifier | l2vpn} | channel-switch | detail |
event-history | host [ipv6] | mcast sid | mlist | modem [ipv6] | multicast-session | qosparam | service-flow
[sfid [classifier]] | sid }
```

Syntax Description

group	(Optional) Specifies a group number to be displayed. The valid range is from 1 to 255.
<i>member</i>	(Optional, when displaying information for a particular group) Specifies the member ID of the Inter-database for the specified group. Each <i>member</i> denotes a working line card. For example, 50 is the member ID for slot 5/0, 51 is the member ID for slot 5/1, 81 is the member ID for slot 8/1. The valid range is from 1 to 255.
CGD	(Optional) Displays the channel group domain (CGD) information synchronized from the active line card to the standby line card. This information is saved in the Inter-database on the standby line card.
<i>mac-address classifier</i>	(Optional) Displays classifier information for the specified MAC address.
<i>mac-address l2vpn</i>	(Optional) Displays l2vpn information for the specified MAC address.
channel-switch	(Optional) Displays channel-switch information for this particular group and member.
detail	(Optional) Displays a detailed summary of the groups, configuration types, member numbers, and status for cable interfaces, as well as the CLI commands that are being synchronized across interfaces.
event-history	(Optional) Displays HCCP event history information.
host	(Optional) Displays host information for this particular group and member.
mcast sid	(Optional) Displays the modular or integrated cable interface multicast service ID (SID) information synchronized from the active line card to the standby line card. This information is saved in the Inter-database on the standby line card.
mlist	(Optional) Displays ACL-MSAID information.
modem	(Optional) Displays cable modem information for this particular group and member.
multicast-session	(Optional) Displays multicast session information.
qosparam	(Optional) Displays quality of service (QoS) parameter information for this particular group and member.

service-flow <i>sfid</i> classifier	(Optional) Displays service flow and classifier information for the specified service flow ID (SFID) for this particular group and member.
sid	(Optional) Displays service ID (SID) information for this particular group and member.

Command Modes

User EXEC, Privileged EXEC (#)

Command History

Release	Modification
12.1(3a)EC	This command was introduced.
12.2(4)BC1	The detail option was added.
12.2(8)BC2	The current time to resync and current wait to restore values were added to the display for the brief option.
12.2(11)BC1	Support was added for the Cisco uBR-RFSW N+1 (1:n) RF Switch with the Cisco uBR7246VXR router and Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C cards.
12.2(15)BC2	The output of the show hccp detail command was changed to show separate lists of the critical and non-critical CLI commands that are being synchronized for each Working and Protect interface and subinterface.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB and the output of the show hccp detail command was changed to show CMTS interface pre-critical config information.
12.2(33)SCC	This command was integrated into Cisco IOS Release 12.2(33)SCC.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following shows an example of the show hccp command to display QoS parameters for a particular member of a particular group:

```
Router# show hccp 1 1 qosparam

Cable5/0/0:
Index Name           Dir  Sched  Prio MaxSusRate  MaxBurst  MinRsvRate
1         US    BE    0    64000       0         0
2         DS    BE    0    1000000     0         0
3         US    BE    7    1024000     1522      0
4         DS    BE    0    10000000    1522      0
Router#
```

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

The following example shows the service flow information for a cable interface line card on group 2 member 50:

show hccp group

```

Router# show hccp 2 50 service-flow
Cable8/0/1[grp:2, mem:50, P]:[HCCP inter-db: service flow]
Sfid Sid   Mac Address      QoS Param Index  Type  Dir  Curr
      Sid   Address          Prov  Adm  Act   Type Dir  State

```

The following example shows the cable modem information for a cable interface line card on group 2 member 50:

```

Router# show hccp 2 50 modem
Cable8/0/1[grp:2, mem:50, P]:[HCCP inter-db: CM]
MAC Address      IP Address      MAC          State      Prim Sid  Timing Offset Num  BPI  Prio
001a.c3ff.d198  10.10.2.1      001a.c3ff.d198 w-online   1     1978  0    no  Data(0)
001a.c3ff.d59e  10.10.2.2      001a.c3ff.d59e w-online   2     1978  0    no  Data(0)
001a.c3ff.d6a8  10.10.2.3      001a.c3ff.d6a8 w-online   4     1978  0    no  Data(5)
0019.474a.d592  10.10.2.4      0019.474a.d592 w-online   14    1576  0    no  Data(1)
001e.6bfa.f5bc  10.10.2.5      001e.6bfa.f5bc w-online   3     1976  0    no  Data(5)

```

Related Commands

Command	Description
show hccp	Displays HCCP group information for a specific cable interface.
show hccp interface	Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured.

show hccp interface

To display information on all Hot Standby Connection-to-Connection Protocol (HCCP) groups associated with a specific cable interface, use the **show hccp interface** command in user EXEC or privileged EXEC mode.

```
show hccp interface interface [{brief | detail}]
```

Syntax Description	
<i>interface</i>	The cable interface for which you want to display HCCP group information. The information presented includes HCCP groups, configuration types, member numbers, status, authentication algorithms, authentication key chains, HCCP timers, Ip address assignments, and downstream switch designations for the specified cable interface.
brief	(Option) Displays a brief summary of the HCCP groups, configuration types, member numbers, and status for a specified cable interface.
detail	(Option) Displays a detailed summary of the HCCP groups, configuration types, member numbers, and status for a specified cable interface.

Command Modes

User EXEC, Privileged EXEC

Command History

Release	Modification
12.1(3a)EC	This command was introduced.
12.2(4)BC1	The detail option was added.
12.2(8)BC2	The current time to resync and current wait to restore was added to the brief option.
12.2(11)BC1	Support was added for the N+1 (1:n) RF Switch with the Cisco uBR7246VXR router and Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C cards.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following examples are from the **show hccp interface cable 4/0** and **show hccp interface cable 4/0 brief** commands:

```
Router# show hccp interface cable 4/0

Cable4/0 - Group 1 Protect, enabled, blocking
authentication md5, key-chain "cisco1"
hello time 2000 msec, hold time 6000 msec
Member 1 standby
ip addr: working 10.20.111.11, protect 10.20.111.10
downstream wavecom (10.1.11.3/1, 10.1.11.3/2), upstream none
Router# show hccp interface cable 4/0 brief

Interface Config   Grp Mbr Status
Ca4/0      Protect    1   1  standby
Router#
```

show hccp interface

In Cisco IOS Release 12.2(8)BC2 and later 12.2 BC releases, the **brief** option also shows the amount of time left before the next resynchronization and the time left before a restore:

```
Router# show hccp interface cable 4/0 brief

Interface Config  Grp Mbr Status          WaitToResync  WaitToRestore
Ca4/0      Protect   1   1  standby          00:00:50.892  00:01:50.892
Router#
```

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
show hccp	Displays information for all cable interfaces on which one or more HCCP groups and authentication modes have been configured.

show hccp linecard

To display information about groups associated with cable interfaces, use the **show hccp linecard** command in user EXEC or privileged EXEC mode.

show hccp linecard {**brief** | **channel-switch** | **detail** | **fsm** | **nullfsm** | **subslot** *slot/subslot* {**channel-switch** | **detail** | **modem summary total**}}

Syntax Description		
brief	(Optional) Displays a brief summary of HCCP for each line card.	
channel-switch	(Optional) Displays channel-switch information for each line card.	
detail	(Optional) Displays a detailed summary of HCCP for each line card.	
fsm	(Optional) Displays the complete state transition flow. Each line card member in an HCCP group is controlled by a state machine, which controls the startup and switchover flow.	
nullfsm	(Optional) Displays the HCCP members that received unused or nonmeaningful event. This is used only for debugging.	
subslot <i>slot / subslot</i>	(Optional) Specifies the subslot for the line card.	
channel-switch	(Optional) Displays line card-level channel switch summary.	
detail	(Optional) Displays details of the line card-level HCCP.	
modem summary total	(Optional) Displays modem information.	

Command Default None.

Command Modes User EXEC, Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCE	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **show hccp linecard subslot slot/subslot modem summary total** command is used to show the modem summary information in the peer Inter-database and to check if the modem has successfully synchronized with the standby.

Examples This example shows the **brief** and **fsm** information for a cable interface line card:

```
Router# show hccp linecard brief
Card      Config  Mbr Role      State          WaitToResync  WaitToRestore
card 5/1  Protect 50 Standby  Standby Warm      never
card 5/0  Working 50 Active   Active Warm      never
```

show hccp linecard

```

Router# show hccp linecard fsm

```

Related Commands

Command	Description
show hccp	Displays HCCP group information for a specific cable interface.
show hccp interface	Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured.

show hdd-devices summary

To view a summary of all the system HDD devices(SSD), use **show usb-devices summary** command in privileged Exec mode.

show hdd-devices summary

Syntax Description This command has no arguments or keywords.

Command Default None

Command Modes Privileged Exec (#)

Command History	Release	Modification
	Cisco IOS XE Dublin 17.12.1	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to display a summary of all the system HDD devices(SSD) on an active SUP. An Active SUP shows both active SSDs and standby SSDs.

```
Router# show hdd-devices summary
Load for five secs: 3%/0%; one minute: 4%; five minutes: 4%
Time source is NTP, 21:37:16.729 EDT Mon Jun 26 2023

[Active Harddisk] Model: Micron P400m-MTFDDAK100MAN SN:MSA192505JN
[Standby Harddisk] Model: Micron_M500DC_MTFDDAK120MBB SN:MSA211203X3
```

Examples

The following example shows how to display a summary of all the system HDD devices(SSD) on a Standby SUP. A Standby SUP shows only local SSDs.

```
Router# show hdd-devices summary
Load for five secs: 3%/0%; one minute: 4%; five minutes: 4%
Time source is NTP, 22:38:16.729 EDT Mon Jun 26 2023

[Local Harddisk] Model: Micron_M500DC_MTFDDAK120MBB SN:MSA211203X3
```

Related Commands	Command	Description
	show usb-devices summary	Displays a summary of all the system USB devices (eUSB Flash)

show hw-module bay

To display information about the wideband channels or RF channels on a Wideband SPA, use the **show hw-module bay** command in privileged EXEC mode.

Cisco IOS Releases 12.3(23)BC and 12.2(33)SCA

```
show hw-module bay {slot/subslot/bay | all} show-type {wideband-channel | rf-channel |
modular-channel} [device-index] [verbose]
```

Cisco IOS Release 12.2(33)SCB

```
show hw-module bay {slot/bay/port | all} show-type {wideband-channel | rf-channel |
modular-channel} [device-index] [verbose]
```

Syntax Description

<i>slot</i>	The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs.
<i>subslot</i>	The subslot where a SIP resides. On the Cisco uBR10012 router, subslot 0 is always specified.
bay	The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).
<i>port</i>	Specifies the interface number on the SPA.
all	Specifies that the displayed information will be for both bay 1 and bay 0 if Wideband SPAs are installed in both bays.
<i>show-type</i>	The type of information to display. Valid values are association , config , counters , and mapping . See the Usage Guidelines for more information on show types.
wideband-channel	Displays information for the wideband channel indicated by <i>device-index</i> .
rf-channel	Displays information for the RF channel indicated by <i>device-index</i> .
modular-channel	Displays information for the narrowband channel indicated by <i>device-index</i> .
<i>device-index</i>	(Optional) The wideband channel number or RF channel number or Baseline Privacy Interface (BPI) index number. <ul style="list-style-type: none"> When the wideband-channel keyword is specified, valid values for <i>device-index</i> are 0 to 11. When the rf-channel keyword is specified, valid values for <i>device-index</i> are 0 to 23 depending on how the Wideband SPA is configured with the annex modulation command.
verbose	(Optional) Used with the config keyword. Shows more configuration information on the wideband channel or RF channel.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.3(23)BC	The modular-channel keyword was added. MC BW % column was added to the rf-channel keyword output.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. This command was modified to change the addressing format for a SPA from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> .
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The type of information that **show hw-module bay** displays is determined by the value of the *show-type* argument. The table below describes the information shown for each *show-type*. In the table, the Allowed with Keyword column indicates whether the *show-type* can be used with the keyword wideband-channel, rf-channel or modular-channel.

If *device-index* is omitted from **show hw-module bay**, the command displays information for all wideband channels, RF channels, or BPI+ indexes depending on the keywords used.

The **association** *show-type* displays wideband-to-narrowband (traditional DOCSIS) channel association information only when the cable interface line card and Wideband SPA are physically present in the CMTS.

Note If you do not specify the **verbose** keyword, less detailed configuration information is displayed.

- Changes in Cisco IOS release 12.3(23)BC are not supported in Cisco IOS release 12.2(33)SCA.
- Effective with Cisco IOS Release 12.2(33)SCB, the **show hw-module bay** command displays an exclamation point (!) for the RF channels that are suspended by the Cisco CMTS. For more information on the suspended RF channels, see [Wideband Modem Resiliency](#).

Table 214: Values for show-type

<i>show-type</i>	Allowed with Keyword	Description
association	wideband-channel	Displays wideband-to-narrowband (traditional DOCSIS) channel association information. The association of a wideband channel to a traditional DOCSIS downstream channel is made when a primary downstream channel for the fiber node is configured with the downstream command.
config	wideband-channel or rf-channel	Displays wideband channel or RF channel configuration information depending on the keyword specified.
counters	wideband-channel or rf-channel	Displays wideband channel or RF channel statistics depending on the keyword specified.

<i>show-type</i>	Allowed with Keyword	Description
mapping	wideband-channel, rf-channel, or modular-channel	Displays mapping of wideband channels to RF channels depending on the keyword specified.

For additional information, refer to the following documents on Cisco.com:

- *Cisco uBR10012 Universal Broadband Router SIP and SPA Software Configuration Guide*
- *Cisco uBR10012 Universal Broadband Router SIP and SPA Hardware Installation Guide*

Examples

The following examples display sample output for the **show hw-module bay** command for wideband channel 0 on the Wideband SPA located in slot 1, subslot 0, bay 0:

```
Router# show hw-module bay 1/0/0 counters wideband-channel 0
SPA      WB channel  Tx packets      Tx octets
1/0/0    0              29069                4032392
Router# show hw-module bay 1/0/0 mapping wideband-channel 0
SPA      WB          RF          BW %
        channel channel
1/0/0    0           0           100
          1           1           100
          2           2           100
          3           3           100
          4           4           100
          5           5           100
          6           6           100
```

```
Router# show hw-module bay
1/0/0 association wideband-channel 0
WB      BG      Bundle  NB      NB chan  Reserved  Total
channel ID      num      channel ID      CIR      CIR
Wideband-Cable1/0/0:0  1      1      Cable6/0/0  251      0      42064200
```

The following example shows sample output for the **show hw-module bay** command in Cisco IOS Release 12.3(21)BC:

```
Router# show hw-module bay 1/0/0 association wideband-channel 0
WB      BG      Bundle  NB      NB chan  Reserved Avail
channel ID      num      channel ID      CIR      CIR
Wideband-Cable1/0/0:0  1      1      Cable6/0/0  251      0      0
```

The following example shows sample output for the **show hw-module bay** command in Cisco IOS Release 12.3(23)BC:

```
Router# show hw-module bay 1/0/0 association wideband-channel 0
WB      BG      Bundle  NB      NB chan  Reserved  Total
channel ID      num      channel ID      CIR      CIR
Wideband-Cable1/0/0:0  1      140     Cable6/0/0  30      0      42064200
Router# show hw-module bay 3/0/0 mapping rf-channel
SPA      RF      MC      WB      WB
        channel BW %      channel BW %
3/0/0    0        2        0        90
          1        2        1        2
3/0/0    1        2        0        90
          1        2
3/0/0    3        0        3        50
3/0/0    4        0        3        100
```

In the preceding example, the following information is displayed for each wideband channel when the **association** keyword is specified.

- WB channel—Wideband-cable interface (wideband channel).
- BG ID— Bonding Group ID for the wideband channel.
- MC BW %—Percentage of rf-channel bandwidth assigned to the corresponding modular-cable interface.
- Bundle num—The number of the virtual bundle interface in which the wideband channel is a member.
- NB channel—The slot/subslot/port of the primary downstream channel (narrowband channel or traditional DOCSIS channel) for the wideband channel.
- NB channel ID—Channel ID for the primary downstream channel.
- Reserved CIR—The reserved committed information rate (CIR).
- Total CIR—The total CIR that is available.

Note For Cisco IOS Release 12.3(21)BC, the descriptions for the Reserved CIR and Available CIR fields are as follows: Reserved CIR—The reserved committed information rate (CIR). Because QoS is currently best effort for wideband traffic, reserved CIR is always 0. Avail CIR—The part of the CIR that is available. Because QoS is currently best effort for wideband traffic, available CIR is always 0.

The following example shows a suspended RF channel in the output of the **show hw-module bay** command in Cisco IOS Release 12.2(33)SCB:

```
Router# show hw-module bay 1/0/0 mapping rf-channel
SPA      RF      MC      MC Rem.  WB      WB      WB Rem.
         channel BW %    Ratio   channel BW %    Ratio
1/0/0    0       20     1        3       10     1      4      10
  1
1/0/0    1       20     1        3       10     1      4      10
  1
1/0/0    2       20     1        3       10     1      4      10
  1
1/0/0    3       20     1        3       10     1      4      10
  1
1/0/0    4!      20     1        3       10     1

1/0/0    6       20     1        3       10     1
1/0/0    7       20     1        3       10     1
```

The following examples display **show hw-module bay** command output for wideband channels (0 to 11) on the Wideband SPA located in slot 1, subslot 0, bay 0:

```
Router# show hw-module bay 1/0/0 counters wideband-channel

SPA      WB channel  Tx packets  Tx octets
1/0/0    0           395         31590
1/0/0    1           0           0
1/0/0    2           0           0
1/0/0    3           0           0
1/0/0    4           0           0
1/0/0    5           0           0
1/0/0    6           0           0
1/0/0    7           0           0
```

show hw-module bay

```

1/0/0    8          0          0
1/0/0    9          0          0
1/0/0   10          0          0
1/0/0   11          0          0
Router# show hw-module bay 1/0/0 config wideband-channel
WB          BG      Bundle  WB Host      Primary
channel     ID      num     Slot/Subslot  BG
Wideband-Cable1/0/0:0  24     123     5/0          Yes
Wideband-Cable1/0/0:1  25     123     5/0          Yes
Wideband-Cable1/0/0:2  26     123     5/0          Yes
Wideband-Cable1/0/0:3  27     123     5/0          Yes
Wideband-Cable1/0/0:4  28     123     5/0          Yes
Wideband-Cable1/0/0:5  29     123     5/0          Yes
Wideband-Cable1/0/0:6  30     123     5/0          Yes
Wideband-Cable1/0/0:7  31     123     5/0          Yes
Wideband-Cable1/0/0:8  32     0       5/0          Yes
Wideband-Cable1/0/0:9  33     0       5/0          Yes
Wideband-Cable1/0/0:10 34     0       5/0          Yes

```

In the preceding example, the following information is displayed for each wideband channel when the **config** keyword is specified.

- **WB Channel**—Specifies the wideband channel slot, sub-slot, bay and wideband channel number.
- **BG ID**—Bonding Group ID.
- **Bundle num**—The number of the virtual bundle interface to which the wideband channel is a member.
- **WB Host Slot/Subslot**—The cable interface line card that has been configured for Wideband protocol operations. See the command **modular-host**.
- **Primary BG**—Yes indicates that the wideband channel is a primary bonding group (primary wideband channel).

The following examples display **show hw-module bay** command output for RF channel 0 on the Wideband SPA located in slot 1, subslot 0, bay 0:

```

Router# show hw-module bay 1/0/0 config rf-channel 0
SPA      RF      Freq      Mod      Annex  IP Address      MAC Address      UDP
channel                                     port
1/0/0    0       699000000 64qam    B      192.168.200.30 0011.920e.a9ff 49152

```

In the preceding output, these fields provide information on the edge QAM device that is associated with the RF channel:

- **IP Address**—The IP address of the edge QAM device.
- **MAC address**—The MAC address of the next-hop device or edge QAM device.
- **UDP port**—The UDP port number for the edge QAM device that will be used for this RF channel.

```
Router# show hw-module bay 1/0/0 config rf-channel 0 verbose
```

```

SPA                               : Wideband-Cable 1/0/0
RF channel number                  : 0
Frequency                          : 699000000 Hz
Modulation                         : 64qam
Annex                              : B
IP address of next hop             : 192.168.200.30
MAC address of EQAM                : 000c.3033.2cbf
UDP port number                    : 49152
EQAM headroom                      : 0

```

The following example displays the **show hw-module bay counters rf-channel** command output for the RF channels of a Cisco Wideband SPA. Activity is seen on channels 1,2, and 3 as the MPEG Mbps field shows they are each transmitting at about 29 Mbps. Channel 1 is primary-capable as it is transmitting SYNC packets.

```
Router# show hw-module bay 3/3/0 counters rf-channel
SPA      RF      MPEG
          Chan  Packets Tx      MPEG      MPEG      Sync      MAP
          Chan  Packets Tx      bps        Mbps      Packets Tx  Packets Tx
3/3/0    0      0
3/3/0    1      4612111        29755888  29.755    32042     151486

3/3/0    3      4542709        29688759  29.688    0         154
3/3/0    4      0
3/3/0    5      0
3/3/0    6      0
3/3/0    7      0
3/3/0    8      0
3/3/0    9      0
3/3/0    10     0
3/3/0    11     0
3/3/0    12     0
3/3/0    13     0
3/3/0    14     0
3/3/0    15     0
3/3/0    16     0
3/3/0    17     0
3/3/0    18     0
3/3/0    19     0
3/3/0    20     0
3/3/0    21     0
3/3/0    22     0
3/3/0    23     0
Router# show hw-module bay 1/0/0 mapping rf-channel 0
SPA      RF      WB      BW %
          channel channel
1/0/0    0      0      100
```

The following example displays **show hw-module bay** command output for RF channels on the Wideband SPA located at slot 1, subslot 0, bay 0. In the example, the output is for only RF channels 0 to 8 because only those RF channels have been associated with a wideband channel. The BW % column is the percent of the RF channel bandwidth that is assigned to the wideband channel with the **cable rf-channel** command.

```
Router# show hw-module bay 1/0/0 mapping rf-channel

SPA      RF      WB      BW %
          channel channel
1/0/0    0      0      100
1/0/0    1      0      100
1/0/0    2      0      100
1/0/0    3      0      100
1/0/0    4      0      100
1/0/0    5      0      100
1/0/0    6      0      100
1/0/0    7      2      100
1/0/0    8      1      100
```

show hw-module bay**Related Commands**

Command	Description
show hw-module bay oir	Displays the operational status of a Wideband SPA.

show hw-module bay oir

To display the operational status of a SPA, use the **show hw-module bay oir** command in privileged EXEC mode.

Cisco IOS Releases 12.3(23)BC and 12.2(33)SCA

show hw-module bay {*slot/subslot/bay* | **all**} **oir** [**internal**]

Cisco IOS Release 12.2(33)SCB

show hw-module bay {*slot/bay/port* | **all**} **oir** [**internal**]

Syntax Description

<i>slot</i>	The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for a SIP.
<i>subslot</i>	The subslot where the Wideband SIP resides. On the Cisco uBR10012 router, subslot 0 is always specified.
<i>bay</i>	The bay in the SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).
<i>port</i>	Specifies the interface number on the SPA.
all	Displays OIR status for all Wideband SPAs in the system.
internal	(Optional) Displays detailed diagnostic information. This option is intended for internal diagnostic use with Cisco technical support personnel.

Command Default

If you do not specify the **internal** keyword, detailed diagnostic information is not displayed.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCB	This command was modified to change the addressing format for a SPA from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> .
IOS-XE 3.15.0S	This command was replaced by the show hw-module subslot oir command on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use the **show hw-module bay oir** command to obtain operational status information about a Wideband SPA. To display information for a specific SPA, specify *slot/subslot/bay* for the SPA. To display information for all SPAs in the router, use the **all** keyword.

The optional **internal** keyword displays detailed diagnostic information that is recommended only for use with Cisco technical support personnel.

Table 0-1 describes the possible values for the Operational Status field in the output.

Table 215: Operational Status Field Descriptions

Operational Status	Description
admin down	SPA is administratively disabled by the hw-module bay shutdown global configuration command.
booting	SPA is initializing.
missing	SPA is not present in the SIP bay.
ok	SPA is operational.
out of service (<i>reason</i>)	<p>The SPA is out of service for one of the following reasons:</p> <p>Note The following reasons are not applicable to every SPA and can be platform-specific.</p> <ul style="list-style-type: none"> • Analyze failed—Failed to create a SPA data structure, most likely due to a memory allocation problem. • Authentication failed—SPA has failed hardware validation. • Data structure create error—Failed to create a SPA data structure, most likely due to a memory allocation problem. • Event corrupt—A SPA online insertion and removal (OIR) event has been corrupted. This could be caused by a corrupted message between the SIP and the Route Processor (RP) or some other software or hardware problem. • Event sequence error—A SPA OIR event was received out of sequence. This could be caused by a corrupted message between the SIP and the Route Processor (RP) or some other software or hardware problem. • Fail code not set—Failure code could not be read from a SPA OIR event message. This could be caused by a corrupted message between the SIP and the RP or some other software or hardware problem. • Failed too many times—SPA is disabled because it has failed more than the allowable limit on the platform. • FPD upgrade failed—A field-programmable device (FPD), such as the Field-Programmable Gate Array (FPGA), failed to automatically upgrade. • H/W signal deasserted—The SPA_OK or PWR_OK hardware signal indicating that the SPA is accessible is no longer asserted. • Heartbeat failed—Occurs when intelligent SPAs encounter heartbeat failures. • Incompatible FPD—An FPGA version mismatch with the Cisco IOS software has been detected for the SPA.

Operational Status	Description
	<ul style="list-style-type: none"> • Init timeout—Time limit has been reached during initialization of a SPA. • Read SPA type failed—A read from the hardware for the SPA type failed. • Reload request—SPA reload is in progress from the hw-module subslot reload command. • SPA h/w error—The SPA software driver has detected a hardware error. • SPA ready timeout—A timeout occurred on the RP while waiting for the SPA to become operational. • SPA type mismatch—Occurs when you have pre-configured a SPA of one type, but have inserted a SPA of a different type. • SPA unrecognized—SPA is not supported by the Cisco IOS software release. • Start failed—Failed to start interfaces on SPA. • Unexpected inserted event—The SPA OIR software has received a SPA insertion event when the OIR software considered the SPA already present. • Wait h/w ok timeout—A timeout occurred while waiting for the SPA_OK and PWR_OK hardware signals to be asserted. • Wait start timeout—A timeout occurred on the SIP while waiting for permission from the RP to bring up the SPA.
stopped	SPA has been gracefully deactivated using the hw-module subslot stop privileged EXEC command.

Examples

The following example shows the operational status of a Wideband SPA:

```
Router# show hw-module bay 1/0/0 oir
Module      Model              Operational Status
-----
bay 1/0/0   SPA-24XDS-SFP     ok
```

The following example shows the operational status of a Wideband SPA when the **internal** keyword is specified:

```
Router# show hw-module bay 1/0/0 oir internal

Related Commands

Command	Description
show hw-module bay	Displays information about the wideband channels or RF channels on a Wideband SPA.

show hw-module bay transceiver

To display information about the pluggable transceiver module, use the **show hw-module bay transceiver** command in privileged EXEC mode.

show hw-module bay *slot/subslot* / {*bayport*} **transceiver** *transceiver-port-number* [{**idprom** | **status**}]

Syntax	Description
<i>slot</i>	Slot where a SIP or cable line card resides. <ul style="list-style-type: none"> • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR10012 router—The valid range for: <ul style="list-style-type: none"> • Cable line card is from 5 to 8 • SIPs is 1 and 3
<i>subslot</i>	Subslot where a SIP or cable line card resides. <ul style="list-style-type: none"> • Cisco uBR10012 router—The valid value for: <ul style="list-style-type: none"> • Cable line card is 0 or 1 • SPAs in a SIP, prior to Cisco IOS Release 12.2(33)SCB is 0 or 1. For Cisco IOS Release 12.2(33)SCB and later releases, the value of subslot is not specified.
<i>bay</i>	Bay in a SIP where a SPA is located. The valid values are 0 (upper bay) and 1 (lower bay).
<i>port</i>	Port number. <ul style="list-style-type: none"> • Cisco uBR7246VXR router and Cisco uBR7225VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid value for: <ul style="list-style-type: none"> • Slots 1 and 3 is 0 • Slots 5 to 8 is from 0 to 4
transceiver	Specifies the pluggable transceiver module installed in the <i>slot/subslot/bay</i> .
<i>transceiver-port-number</i>	Transceiver-port-number of the transceiver. The valid value is 0 or 1.
idprom	Displays information for the transceiver identification programmable read only memory (idprom).
status	Displays information for the transceiver initialization status.

Command Default None

Command Modes Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCA	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example is a sample output of the **show hw-module bay transceiver** command for wideband channel 0 on the Wideband SPA located in slot 1, subslot 0, bay 0:

```
Router# show hw-module bay 1/0/0 transceiver 0 idprom
IDPROM for transceiver SPA_TYPE_ETHER_1x10GE_V2:
  Description                = XFP optics (type 6)
  Transceiver Type:         = DWDM XFP 1530.33 (138)
  Product Identifier (PID)   = DWDM-XFP-30.33
  Vendor Revision           = 04
  Serial Number (SN)        = FLJ1212G578
  Vendor Name               = CISCO
  Vendor OUI (IEEE company ID) = 00.00.0E (14)
  CLEI code                 = IP9IAAZCAA
  Cisco part number         = 10-2370-01
  Device State              = Enabled.
  Date code (yy/mm/dd)     = 08/03/25
  Connector type            = LC.
  Encoding                  = 64B/66B
                           SONET Scrambled
                           NRZ
  Minimum bit rate         = 9900 Mbits/s
  Maximum bit rate         = 11100 Mbits/s
```

Related Commands

Command	Description
show hw-module bay	Displays information about the wideband channels or RF channels on a Wideband SPA.
show hw-module bay oir	Displays the operational status of a Wideband SPA.

show hw-module subslot oir

To display the operational status of a SPA, use the **show hw-module subslot oir** command in privileged EXEC mode.

show hw-module subslot {*slot/subslot* | **all**} **oir** [**internal**]

Syntax Description	slot	The slot where a SIP resides. On the Cisco cBR-8 router, slots 0 to 9 can be used for a SIP.
	subslot	The subslot where the Wideband SIP resides. On the Cisco cBR-8 router, subslot 1 is always specified.
	all	Displays OIR status for all Wideband SPAs in the system.
	internal	(Optional) Displays detailed diagnostic information. This option is intended for internal diagnostic use with Cisco technical support personnel.

Command Default If you do not specify the **internal** keyword, detailed diagnostic information is not displayed.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the show hw-module bay oir command.

Usage Guidelines Use the **show hw-module bay oir** command to obtain operational status information about a Wideband SPA. To display information for a specific SPA, specify *slot/subslot/bay* for the SPA. To display information for all SPAs in the router, use the **all** keyword.

The optional **internal** keyword displays detailed diagnostic information that is recommended only for use with Cisco technical support personnel.

Table 0-1 describes the possible values for the Operational Status field in the output.

Table 216: Operational Status Field Descriptions

Operational Status	Description
admin down	SPA is administratively disabled by the hw-module bay shutdown global configuration command.
booting	SPA is initializing.
missing	SPA is not present in the SIP bay.
ok	SPA is operational.

Operational Status	Description
out of service (<i>reason</i>)	<p>The SPA is out of service for one of the following reasons:</p> <p>Note The following reasons are not applicable to every SPA and can be platform-specific.</p> <ul style="list-style-type: none"> • Analyze failed—Failed to create a SPA data structure, most likely due to a memory allocation problem. • Authentication failed—SPA has failed hardware validation. • Data structure create error—Failed to create a SPA data structure, most likely due to a memory allocation problem. • Event corrupt—A SPA online insertion and removal (OIR) event has been corrupted. This could be caused by a corrupted message between the SIP and the Route Processor (RP) or some other software or hardware problem. • Event sequence error—A SPA OIR event was received out of sequence. This could be caused by a corrupted message between the SIP and the Route Processor (RP) or some other software or hardware problem. • Fail code not set—Failure code could not be read from a SPA OIR event message. This could be caused by a corrupted message between the SIP and the RP or some other software or hardware problem. • Failed too many times—SPA is disabled because it has failed more than the allowable limit on the platform. • FPD upgrade failed—A field-programmable device (FPD), such as the Field-Programmable Gate Array (FPGA), failed to automatically upgrade. • H/W signal deasserted—The SPA_OK or PWR_OK hardware signal indicating that the SPA is accessible is no longer asserted. • Heartbeat failed—Occurs when intelligent SPAs encounter heartbeat failures. • Incompatible FPD—An FPGA version mismatch with the Cisco IOS software has been detected for the SPA.
	<ul style="list-style-type: none"> • Init timeout—Time limit has been reached during initialization of a SPA. • Read SPA type failed—A read from the hardware for the SPA type failed. • Reload request—SPA reload is in progress from the hw-module subslot reload command. • SPA h/w error—The SPA software driver has detected a hardware error. • SPA ready timeout—A timeout occurred on the RP while waiting for the SPA to become operational. • SPA type mismatch—Occurs when you have pre-configured a SPA of one type, but have inserted a SPA of a different type. • SPA unrecognized—SPA is not supported by the Cisco IOS software release. • Start failed—Failed to start interfaces on SPA. • Unexpected inserted event—The SPA OIR software has received a SPA insertion event when the OIR software considered the SPA already present. • Wait h/w ok timeout—A timeout occurred while waiting for the SPA_OK and PWR_OK hardware signals to be asserted. • Wait start timeout—A timeout occurred on the SIP while waiting for permission from the RP to bring up the SPA.

Operational Status	Description
stopped	SPA has been gracefully deactivated using the hw-module subslot stop privileged EXEC command.

Examples

The following example shows the operational status of a Wideband SPA:

```
Router# show hw-module subslot 4/1 oir
Module           Model           Operational Status
-----
subslot 4/1     CBR-SUP-8X10G-PIC  ok
```

The following example shows the operational status of a Wideband SPA when the **internal** keyword is specified:

```
Router# show hw-module subslot 4/1 oir internal

WARNING: This command is not intended for production use

fib_bandwidth usage(DS) < 1% tib bandwidth usage(US) < 1%
Current bandwidth threshold 90% message interval 2min
Default bandwidth threshold 90% message interval 2min
```

Related Commands

Command	Description
cable sip ib-stats	Configures the Ironbus throughput warning message threshold.

show interface bundle

To display information about a specific virtual cable bundle, use the **show interface bundle** command in privileged EXEC mode.

Cisco uBR Series Router

```
show interface bundle number [{accounting | controller | counters protocol status | crb | description
| fair-queue | intercept | irb | mac-accounting | monitor interval | mpls-exp | precedence | random-detect
| stats | summary}]
```

Cisco cBR Series Router

```
show interface bundle number [{accounting | controller | counters protocol status | crb | description
| intercept | irb | mac-accounting | monitor interval | mpls-exp | multicast-sessions | precedence | stats |
summary}]
```

Syntax Description

<i>number</i>	Specific virtual bundle. The valid values range from 1 to 255.
accounting	Displays accounting information for the specified virtual interface bundle.
controller	Displays information about interface status, configuration, and controller status for the specified virtual interface bundle.
protocol	Displays information about interface protocol counters for the specified virtual interface bundle.
status	Displays information about the current status of enabled protocols.
crb	Displays the interface routing and bridging information.
description	Displays the specified virtual interface bundle description.
fair-queue	For uBR series routers, displays the interface bundle Weighted Fair Queueing (WFQ) information.
intercept	Displays the intercept streams information on the specified virtual interface bundle.
irb	Displays the interface bundle routing and bridging information.
mac-accounting	Displays the interface bundle MAC accounting information.
monitor interval	Monitors the specified interface bundle continuously at the specified interval.
mpls-exp	Displays the MPLS experimental accounting information on the specified interface bundle.
multicast-sessions	Displays the configuration parameters for multicast sessions on a specific bundle.
precedence	Displays the interface precedence accounting information.

random-detect	For uBR series routers, displays the interface Weighted Random Early Detection (WRED) information.
stats	Displays interface packets and octets, in and out, by the switching path.
summary	Displays the summary of activity on the specified interface bundle.

Command Default

No default behavior or values for this command.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCA	This command was introduced.
12.2(33)SCB	Support for the multicast-sessions keyword was removed. Running the command with the multicast-sessions keyword does not display an output.
12.2(33)SCE	The multicast-sessions keyword was removed.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The fair-queue and random-detect keywords are removed.
IOS-XE 3.15.0S	The multicast-sessions keyword was removed. It is not available on the Cisco cBR Series Converged Broadband Routers .

Examples

The following is an example of the **show interface bundle** command for bundle 1:

```
Router# show interface bundle 1
Load for five secs: 2%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:03:45.483 EDT Wed Oct 12 2011
Bundle1 is up, line protocol is up
  Hardware is Cable Virtual-bundle interface, address is 0013.5f03.a4e3 (bia 000
0.0000.0000)
  Internet address is 5.65.0.1/16
  MTU 1500 bytes, BW 26000 Kbit, DLY 1000 usec,
    reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation MCNS, loopback not set
  Keepalive set (10 sec)
  ARP type: ARPA, ARP Timeout 04:00:00
  Last input 00:00:25, output never, output hang never
  Last clearing of "show interface" counters never
  Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
  Interface Bundle1 queueing strategy: fifo
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 0 bits/sec, 0 packets/sec
  1676 packets input, 283993 bytes, 0 no buffer
  Received 601 broadcasts (0 IP multicasts)
  0 runts, 0 giants, 0 throttles
  51 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
  4163 packets output, 379783 bytes, 0 underruns
  0 output errors, 0 collisions, 0 interface resets
  0 output buffer failures, 0 output buffers swapped out
```

The following is an example of the **show interface bundle accounting** command for bundle 1:

```
Router# show interface bundle 1 accounting
Load for five secs: 1%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:04:41.271 EDT Wed Oct 12 2011
Bundle1
      Protocol    Pkts In   Chars In   Pkts Out   Chars Out

  Last input 00:00:17, output never, output hang never
  Last clearing of "show interface" counters never
  Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
  Interface Bundle1 queueing strategy: fifo
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 1000 bits/sec, 1 packets/sec
  1707 packets input, 289077 bytes, 0 no buffer
  Received 613 broadcasts (0 IP multicasts)
  0 runts, 0 giants, 0 throttles
  51 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
  4224 packets output, 386306 bytes, 0 underruns
  0 output errors, 0 collisions, 0 interface resets
  0 output buffer failures, 0 output buffers swapped out
```

The following is an example of the **show interface bundle counter protocol** command for bundle 1:

```
Router# show interface bundle 1 counters protocol status
Load for five secs: 0%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:05:30.695 EDT Wed Oct 12 2011
Protocols allocated:
  Bundle1: Other, IP, ARP
```

The following is an example of the **show interface bundle crb** command for bundle 1:

```
Router# show interface bundle 1 crb
Load for five secs: 2%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:05:57.267 EDT Wed Oct 12 2011
Bundle1
  Routed protocols on Bundle1:
  ip
```

The following is an example of the **show interface bundle description** command for bundle 1:

```
Router# show interface bundle 1 description
Load for five secs: 0%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:06:22.243 EDT Wed Oct 12 2011
```

show interface bundle

```

Interface                Status      Protocol Description
Bul                       up          up

```

The following is an example of the **show interface bundle intercept** command for bundle 1:

```

Router# show interface bundle 1 intercept
Load for five secs: 2%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *06:06:56.763 EDT Wed Oct 12 2011
No interception active

```

The following is an example of the **show interface bundle multicast-sessions** command for bundle 1:

```

Router# show interface bundle 1 multicast-sessions
Multicast Sessions on Bundle1
  Group          Interface    GC  SAID SFID  GQC GEn RefCount GC-Interface State
  224.1.1.45     Bundle1.1   1   8193 ---  1  5  1      Bundle1    ACTIVE

Related Commands

Command	Description
show interface cable	Displays configuration and status information for the cable interface.
show interface cable modem	Displays information about cable modems and associated customer premises equipment (CPE) devices connected to a particular cable interface.

show interface cable

To display the current configuration and status of a cable interface, use the show interface cable command in privileged EXEC mode.

```
show interface cable {slot/port | slot/subslot/port} [options]
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable {slot/cable-interface-index | slot/subslot/cable-interface-index} [options]
```

Cisco cBR Series Converged Broadband Router

```
show interface cable slot/subslot/cable-interface-index [options]
```

Syntax	Description
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR router—The valid range is 0 to 3 and 6 to 9.
<i>subslot</i>	Secondary slot number of the cable interface line card. Cisco uBR10012 only —The valid subslots are 0 or 1. Cisco cBR router—The valid value is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. Cisco cBR router—The valid range is 0 to 15.

<i>options</i>	<p>Cable-specific options are documented in their own command reference pages:</p> <ul style="list-style-type: none"> • show interface cable downstream • show interface cable intercept • show interface cable mac-scheduler • show interface cable monitor • show interface cable qos paramset • show interface cable service-flow • show interface cable sid • show interface cable signal-quality • show interface cable upstream • show interface cable <i>slot/subslot/port</i> mac-scheduler uschan-number-in-mac-domain <p>A number of non-cable-specific options are also supported (but not all are meaningful for cable interfaces):</p> <p>accounting—Displays the number of packets of each protocol type that was sent through the interface. crb—Displays routing and bridging information. description—Displays the description entered for the interface. fair-queue—Displays distributed weighted fair queuing (DWFQ) statistics. irb—Displays integrated routing bridge information. mac-accounting—Displays Ethernet MAC accounting information. random-detect—Displays weighted random early detection (WRED) information. rate-limit—Displays rate-limit information. shape—Displays Traffic Shape information. stats—Displays numbers of packets that were switched.</p>
----------------	---

Note For information on the non-cable specific options, see the Cisco IOS Release 12.2 documentation on Cisco.com and the Customer Documentation CD-ROM.

Command History

Release	Modification
11.3 XA	This command was introduced.
12.0(3)T	This command was ported to the mainline release.
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Release	Modification
IOS XE 16.7.1	This command option was implemented on the Cisco cBR Series Converged Broadband Router: show interface cable slot/subslot/port mac-scheduler uschan-number-in-mac-domain

Examples

This example shows the output for the **show interface cable** command:

```
Router# show interface cable 1/0/0
Cable1/0 is up, line protocol is up
  Hardware is BCM3210 ASIC, address is 000a.13e8.1ca8 (bia 000a.13e8.1a60)
  Internet address is 10.1.1.3/24
  MTU 1500 bytes, BW 27000 Kbit, DLY 1000 usec, rely 255/255, load 1/255
  Encapsulation, loopback not set, keepalive not set
  ARP type: ARPA, ARP Timeout 04:00:00
  Last input 4d07h, output 00:00:00, output hang never
  Last clearing of "show interface" counters never
  Queueing strategy: fifo
  Output queue 0/40, 0 drops; input queue 0/75, 0 drops
  5 minute input rate 1834000 bits/sec, 2385 packets/sec
  5 minute output rate 1982000 bits/sec, 2431 packets/sec
    24461542 packets input, 2348214388 bytes, 0 no buffer
    Received 1979 broadcasts, 0 runts, 0 giants, 0 throttles
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
  24854257 packets output, 2536222931 bytes, 0 underruns
    0 output errors, 0 collisions, 0 interface resets
    0 output buffer failures, 0 output buffers swapped out
```

Table 217: show interface cable Field Descriptions

Field	Description
Cable slot/cable-interface-index is up/...administratively down	Indicates whether the interface hardware is currently active or taken down by the administrator.
line protocol is up/...administratively down	Indicates whether the software processes that handle the line protocol believe the interface is usable or if it has been taken down by the administrator.
hardware	Hardware type and address.
Internet address	Internet address followed by subnet mask.
MTU	Maximum transmission unit (MTU) of the interface.
BW	Bandwidth of the interface in kilobits per second.
DLY	Delay of the interface in microseconds.
rely	Reliability of the interface as a fraction of 255, calculated as an exponential average over 5 minutes. (For example, 255/255 is 100 percent reliability.)
load	Load on the interface as a fraction of 255, calculated as an exponential average over 5 minutes. (For example, 255/255 is complete saturation.)

Field	Description
Encapsulation	Encapsulation method assigned to this interface.
ARP type	Type of Address Resolution Protocol (ARP) and timeout value assigned.
Last input	Number of hours, minutes, and seconds since the last packet was successfully received by an interface.
output	Number of hours, minutes, and seconds since the last packet was successfully sent by an interface.
Last clearing of "show interface" counters	Time at which the counters that measure cumulative statistics (such as number of bytes sent and received) were last reset to zero.
Queueing strategy	Displays the type of queueing configured for this interface. In the following example output, the type of queueing configured is first-in first-out (FIFO).
Output queue	Number of packets in the output queue. The format of this number is A/B, where A indicates the number of packets in the queue, and B indicates the maximum number of packets allowed in the queue.
drops	Indicates the number of packets dropped because of a full queue.
input queue/drops	Number of packets in the input queue. The format of this number is A/B, where A indicates the number of packets in the queue, and B indicates the maximum number of packets allowed in the queue.
drops	Indicates the number of packets dropped because of a full queue.
Five minute input rate Five minute output rate	Average number of bits and packets sent per second in the last five minutes. The five-minute interval is the default time period for statistics collection and can be changed for each individual cable interface using the load-interval command in interface configuration mode.
Note	These statistics are calculated using a decayed averaging method, where only the average is stored over the interval period, not the individual samples. Every time a sample average is taken, a percentage of the sample and a percentage of the average are added together to create the new average. If traffic stops for a time period, these statistics do not immediately go to zero but drop with a decay rate of about 70 percent per time period. For example, if the interface is passing 1,000 packets per second (pps) before traffic stops, the show interface cable command shows the rate being 300 pps at the end of the first time interval. The rate then drops to 90 pps at the end of the second time interval, and so forth.
packets input	Total number of error-free packets received by the system.
bytes input	Total number of bytes, including data and MAC encapsulation, in the error-free packets received by the system.

Field	Description
Note	When using bundled cable interfaces on Cisco uBR7200 series routers, the input packet counters for the primary interface also include the packet counts for subordinate interfaces, except when using a Broadband Processing Engine (BPE) cable interface (such as the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X). On BPE cards and on the Cisco uBR10012 router, the input counters for primary and subordinate cable interfaces are not combined.
no buffer	Number of received packets discarded because there was no buffer space in the main system.
Received broadcast	Total number of broadcast or multicast packets received by the interface.
runts	Number of packets that are discarded because they are smaller than the medium's minimum packet size.
giants	Number of packets that are discarded because they are bigger than the standard Ethernet Maximum Transmission Unit (MTU) size. For Ethernet packets, RFC 1757 defines giants as "the total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed." Note In addition, to account for the different Ethernet and other packet encapsulations on the network, packets are considered giants when they exceed the configured MTU size plus 114 bytes.
input errors	Total number of errors received on the interface. This count includes runts and giants, which are shown above, as well as other errors, such as no buffers, and CRC, frame, overrun, and ignored counts. This count can also include DOCSIS protocol errors such as an invalid SID in the DOCSIS frame, a bad extended header length, corrupted concatenated packets, and invalid bandwidth requests.
CRC	Indicates the number of times the cyclic redundancy checksum (CRC) generated by the originating LAN station or far-end device does not match the checksum calculated from the data received.
frame	Number of packets received incorrectly having a CRC error and a non-integer number of octets.
overrun	Number of times the receiver hardware was unable to forward received data to a hardware buffer because the input rate exceeded the receiver's ability to handle the data.
ignored	Number of received packets ignored by the interface because the interface hardware ran low on internal buffers.
packets output	Total number of messages sent by the system.
bytes	Total number of bytes, including data and MAC encapsulation, sent by the system.

Field	Description
underruns	Number of times the sender has been running faster than the receiving device can handle.
output errors	Sum of all errors that prevented the final transmission of packets out of the interface being examined.
collisions	Not applicable.
interface resets	Number of times an interface has been completely reset.
output buffer failures	Number of times the output buffer has failed.
output buffer swapped out	Number of times the output buffer has been swapped out.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output for the **show interface cable** command:

```
Router#show interface cable 1/0/0
Cable1/0/0 is up, line protocol is up
Hardware is CMTS MD interface, address is c414.3c17.1dcb (bia c414.3c17.1dcb)
MTU 1500 bytes, BW 26000 Kbit/sec, DLY 1000 usec,
    reliability 255/255, txload 22/255, rxload 1/255
Encapsulation MCNS, loopback not set
Keepalive set (10 sec)
ARP type: ARPA, ARP Timeout 04:00:00
Last input never, output never, output hang never
Last clearing of "show interface" counters never
Input queue: 0/375/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: weighted fair
Output queue: 0/1000/64/0 (size/max total/threshold/drops)
    Conversations 0/0/256 (active/max active/max total)
    Reserved Conversations 0/0 (allocated/max allocated)
    Available Bandwidth 19500 kilobits/sec
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 2281000 bits/sec, 2854 packets/sec
27026 packets input, 2849227 bytes, 26 no buffer
Received 0 broadcasts (0 multicasts)
0 runts, 0 giants, 0 throttles
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
36755119 packets output, 3675867584 bytes, 0 underruns
0 output errors, 0 collisions, 1 interface resets
0 unknown protocol drops
0 output buffer failures, 0 output buffers swapped out
```

Related Commands

Command	Description
show interface cable downstream	Displays information about the downstream on the cable interface.
show interface cable sid	Displays information by service identifier (SID) of each CM on the network.
show interface cable signal-quality	Displays information about the cable signal quality.
show interface cable upstream	Displays information about one or all upstreams on the cable interface.

show interface cable admission-control reservation

To display service flows, categorizations, and bandwidth consumption on the Cisco CMTS, for the specified interface, and the specified service flow direction, use the **show interface cable admission-control reservation** command in privileged EXEC mode.

show interface cable *slot/subslot/port* **admission-control reservation** [{**downstream** | **upstream**}] *port-no*

Cisco IOS Release 12.2(33)SCE and later

show | **interface** | **cable** | {*slot/cable-interface-index*/*slot/subslot/cable-interface-index*} | **admission-control reservation** | [{**downstream** | **upstream**}] *port-no*

Cisco cBR Series Converged Broadband Router

show | **interface** | **cable** | {*slot/cable-interface-index*/*slot/subslot/cable-interface-index*} | **admission-control reservation** | [{**downstream** | **upstream** *port-no* | **us-bonding-group** *upstream -bonding-group-number*}]

Syntax Description

<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR router—The valid range is 0 to 3 and 6 to 9.
<i>subslot</i>	Secondary slot number of the cable interface line card. <p>Cisco uBR10012 only —The valid subslots are 0 or 1.</p> <p>Cisco cBR router—The valid value is 0.</p>
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p> <p>Cisco cBR router—The valid range is 0 to 15.</p>
downstream	Displays downstream service flow information for the designated cable interface.
upstream <i>port-no</i>	Displays upstream service flow information for the designated cable interface. The port number may be optionally specified here for more limited display.

us-bonding-group <i>upstream</i> <i>-bonding-group-number</i>	Displays the upstream bonding group service flow information.
--	---

Command Default

No default behavior or values for this command. However, Cisco IOS Release 12.3(21)BC supports default operation and non-default configuration for feature on the Cisco CMTS.

Command Modes

Privileged EXEC

Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router and the Cisco uBR7246VXR router.
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The us-bonding-group <i>upstream</i> <i>-bonding-group-number</i> keyword and variable was added.

Usage Guidelines

For additional information about using this command, refer to the following documents on Cisco.com:

- *Admission Control for the Cisco CMTS*
- *Service Flow Admission Control for the Cisco CMTS*

Use the **us-bonding-group** *upstream* *-bonding-group-number* keyword and variable to display the upstream bonding group service flow information.

Examples

This example shows the output and status of the Service Flow Admission Control feature, and the **show interface cable admission-control reservation { downstream | upstream } port-no** command.

```
Router# show interface cable 5/1/1 admission-control reservation downstream.
SfId   Mac Address      Bucket  Bucket Name      State  Current Reserv
4      0000.cad6.f052   8       8                 act    0
88     0000.cad6.f052   8       8                 act    2000
6      0000.cad6.eece   8       8                 act    0
21     0000.cad6.eece   8       8                 act    2000
8      0000.cad6.eebe   8       8                 act    0
24     0000.cad6.eebe   8       8                 act    2000
10     0000.cadb.30a6   8       8                 act    0
27     0000.cadb.30a6   8       8                 act    2000
```

This example illustrates further information for the Service Flow Admission Control feature with abbreviated command syntax. This example displays threshold levels and current reservation per bucket, and the oversubscribed bandwidth per bucket. Cisco IOS indicates implicitly calculated threshold with asterisk.

```
Router# sh cable admission-control interface ca 5/1/1 upstream 0
Interface Cable5/1/1
Upstream Bit Rate (bits per second) = 4096000
```

show interface cable admission-control reservation

Resource - Upstream Bandwidth

Examples for the Cisco cBR Series Converged Broadband Router

This example shows the output of the **show interface cable admission-control reservation** command with the **downstream** keyword on the Cisco cBR router:

```
Router#show interface cable 3/0/0 admission-control reservation downstream
SfId  Mac Address      Bucket  Bucket Name      State  Current Reserv
16    0025.2e2d.74f8   8       8                 Active 0
28    0025.2e2d.74f8   8       8                 Active 0
18    0025.2eaf.7f38   8       8                 Active 0
21    0025.2eaf.7f38   8       8                 Active 0
20    0025.2eaf.8302   8       8                 Active 0
22    0025.2eaf.8302   8       8                 Active 0
26    0025.2eaf.82f4   8       8                 Active 0
27    0025.2eaf.82f4   8       8                 Active 0
30    0025.2e2d.75be   8       8                 Active 0
32    0025.2e2d.75be   8       8                 Active 0
```

Router#

This example shows the output of the **show interface cable admission-control reservation** command with the **upstream** keyword on the Cisco cBR router:

```
Router#show interface cable 3/0/0 admission-control reservation upstream 0
Interface Cable3/0/0 Upstream Port 0
SfId  Mac Address      Bucket  Bucket Name      State  Current Reserv
15    0025.2e2d.74f8   8       8                 Active 0
19    0025.2eaf.8302   8       8                 Active 0
29    0025.2e2d.75be   8       8                 Active 0
```

Router#

This example shows the output of the **show interface cable admission-control reservation** command with the **us-bonding-group** keyword on the Cisco cBR router:

```
Router#show interface cable 3/0/0 admission-control reservation us-bonding-group 1
Interface Cable3/0/0 Upstream bonding group 1
SfId  Mac Address      Bucket  Bucket Name      State  Current Reserv
```

Router#

Related Commands	Command	Description
	cable admission-control ds-bandwidth	Sets minor, major and exclusive thresholds for downstream voice or data bandwidth for each or all interfaces on the Cisco CMTS
	cable admission-control preempt priority-voice	Changes the default PacketCable Emergency 911 call preemption functions on the Cisco CMTS, supporting throughput and bandwidth requirements for Emergency 911 calls above all other buckets on the Cisco CMTS.
	cable admission-control us-bandwidth	Configures global or interface-level upstream bandwidth thresholds and exclusive or non-exclusive resources on the Cisco CMTS.
	cable application-type include	Associates an application type with a specific and prioritized bucket on the Cisco CMTS.
	cable application-type name	Assigns an alpha-numeric name for the specified bucket.
	debug cable admission-control flow-categorization	Displays service flow categorization results, enabled when a service flow is classified.
	show application-buckets	Displays rules for any or all buckets supporting Service Flow Admission Control on the Cisco CMTS.
	show interface cable admission-control reservation	Displays service flows, categorizations, and bandwidth consumption on the Cisco CMTS, for the specified interface, and the specified service flow direction.

show interface cable cable-monitor

To display cable monitor flow information, use the **show interface cable cable-monitor** command in privileged EXEC mode.

show interface cable *{slot/port | slot/subslot/port}* **cable-monitor**

Cisco IOS Release 12.2(33)SCE and later

show interface cable *{slot/cable-interface-index | slot/subslot/cable-interface-index}* **cable-monitor** [*{cam | verbose}*]

Syntax Description

<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p>
cam	(Optional) Displays detailed content addressable memory (CAM) information.
verbose	(Optional) Displays detailed monitor flow information.

Table 218: show interface cable monitor Field Descriptions

Field	Description
DS	Downstream. Indicates that only downstream flows are monitored.
UP	Upstream. Indicates that only upstream flows are monitored.
ALL	Indicates that all flows are monitored.
Time Stmp	“Yes” indicates that forwarded packets have been time-stamped, with appended 4 bytes. “No” indicates that forwarded packets have not been time-stamped.
Outbound Interface	Identifies the interfaces where the packets have been forwarded to (Ethernet or Fast Ethernet).
Flow Type	Identifies the selected flow type, MAC-address, access-list number, or upstream port number.
Flow Type Identifier	MAC address, access-list number, or service ID.
Flow Extn.	“Yes” indicates that extended filters are configured, and “no” indicates that no extended filters have been configured.
MAC Type	Not applicable.

Field	Description
Encap	DOCSIS encapsulation.
Type	Forwarded packets with Ethernet encapsulation.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable monitor	Enables the forwarding of selected packets on the cable interface to an external LAN analyzer.

show interface cable controller

To display the interface status, configuration and controller status, use the show interface cable controller command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show interface cable *slot/subslot/cable-interface-index* **controller**

Syntax Description

<i>slot/subslot/cable-interface-index</i>	Identifies the cable interface on the Cisco cBR Series Converged Broadband Router.
---	--

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.
IOS-XE 3.18.0SP	This command was modified on the Cisco cBR Series Converged Broadband Router. MD OCD and MD DPD statistics were added in the command output.

Examples

This example shows the output of the show interface cable controller command with the MD DPD statistics:

```
Router# show interface cable 3/0/0 controller | beg MD DPD
*** MD DPD Statistics ****

show interface cable downstream

To display information about the downstreams on a cable interface, use the **show interface cable downstream** command in privileged EXEC mode.

show interface cable *{slot/port | slot/subslot/port}* **downstream**

Cisco IOS Release 12.2(33)SCE and later

show interface cable *{slot/cable-interface-index | slot/subslot/cable-interface-index}* **downstream**

Syntax Description

<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p>

Command Default

No default behavior or values

Command Modes

Privileged EXEC

Command History

Release	Modification
11.3 XA	This command was introduced.
12.0(3)T	Command ported to the mainline release.
12.1(4)CX	Output was expanded for show interface cable downstream command for DOCSIS 1.1 operation.
12.2(4)BC1	Support was added to the Release 12.2 BC train.

Release	Modification
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Examples

The following example is sample output from the show interface cable downstream command for Cisco IOS releases that support only DOCSIS 1.0 or 1.0+ operation:

```
Router# show interface cable 6/0 downstream
Cable6/0: Downstream is up
      111947771 packets output, 1579682655 bytes, 0 discarded
      0 output errors
```

The following is sample output from the show interface cable downstream command for Cisco IOS releases that support only DOCSIS 1.1 operation:

```
Router# show interface cable 4/0 downstream

Cable4/0:Downstream is up
      54335436 packets output, 2854290447 bytes, 0 discarded
      0 output errors
      1 total active devices, 1 active modems
Total downstream bandwidth: 27000000 bps
Total downstream reserved bandwidth: 1000000 bps
Worst case latency for low latency queue: 0 usecs
Current Upper limit for worst case latency: 0 usecs
Router#
```

Table 219: show interface cable downstream Field Descriptions

Field	Description
Cable	Indicates the location of the downstream interface.
Downstream is up/...administratively down	Indicates the administrative state of the interface.
packets output	Total number of data packets that have been transmitted on this downstream cable interface.
bytes	The number of bytes for data packets that have been transmitted on this downstream cable interface.
discarded	Total number of packets that were not transmitted on the downstream, because of an error, such as a buffer overrun, the Cisco CMTS running out of memory, or the frame being larger than the cable interface's MTU value.
output errors	Total number of packets that could not be transmitted on this downstream cable interface because of all errors.
total active devices	Total number of active cable modems and customer premises equipment (CPE) devices that are connected to this downstream cable interface.

show interface cable downstream

Field	Description
active modems	Total number of active cable modems that are connected to this downstream cable interface.
Total downstream bandwidth	Total bandwidth associated with this downstream cable interface, in bits per second.
Total downstream reserved bandwidth	Total bandwidth on this downstream cable interface that has been reserved by specifying a value for the Min Reserved Traffic Rate field for the downstream service flow in the cable modems' DOCSIS configuration files.
Worst case latency for low latency queue	Worst case latency value, in microseconds, that is allowed on this downstream cable interface, as determined by the Max DS Latency field for the downstream service flow in the cable modems' DOCSIS configuration files.
Current Upper limit for worst case latency	<p>Lowest worst case latency value, in microseconds, that is allowed on this downstream cable interface. The Cisco CMTS uses the lowest specified Max DS Latency value that has been specified for a downstream service flow in any of the DOCSIS configuration files being used by cable modems on this downstream.</p> <p>If a cable modem tries to register a downstream service flow that uses a worst case latency that is greater than this value, the Cisco CMTS will refuse to admit that service flow.</p>

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
show interface cable	Displays configuration and status information for the cable interface.
show interface cable sid	Displays information by service identifier (SID) of each CM on the network.
show interface cable signal-quality	Displays information about the cable signal quality.
show interface cable upstream	Displays information about one or all upstreams on the cable interface.

show interface cable dsg downstream

To display interface configuration and status information for Advanced-mode DOCSIS Set-top Gateway (A-DSG) downstreams on a Cisco CMTS router, use the show interface cable dsg downstream command in privileged EXEC mode.

```
show interface cable {slot/port | slot/subslot/port} dsg downstream [{dcd | rule rule-id [{cfr | clients | verbose}] | tunnel tunnel-id}]
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable {slot/cable-interface-index | slot/subslot/cable-interface-index} dsg downstream [{dcd | rule rule-id [{cfr | clients | verbose}] | tunnel tunnel-id}]
```

Cisco cBR Series Converged Broadband Router

```
show interface cable {slot/subslot/cable-interface-index} dsg downstream [{dcd | tunnel tunnel-id}]
```

Syntax Description

 cable 	<i>Specifies details of a cable interface line card:</i> <ul style="list-style-type: none"> • <i>slot</i>—Slot where the line card resides. • <i>subslot</i>—(Cisco uBR10012 only) Secondary slot number of the line card. • <i>port</i>—Downstream port number of the line card. • <i>cable-interface-index</i>—Downstream port or MAC domain index of the line card.
 cableslot/subslot/cable-interface-index 	For the Cisco cBR router— <ul style="list-style-type: none"> • The valid range for the <i>slot</i> is 0 to 3 and 6 to 9. • The valid value for the <i>subslot</i> is 0. • The valid range for <i>cable-interface-index</i> is 0 to 15.
 dcd 	(Optional) Displays downstream channel descriptor (DCD) messages for the A-DSG interface.
 rule rule-id 	(Optional) Displays interface-level information for A-DSG rules on the Cisco CMTS router, such as rule state, tunnels, classifiers, client information, upstream channel identifier, and the number of vendors associated to a rule on a given downstream.
 cfr 	(Optional) Displays the list of classifiers associated to the A-DSG rule, such as classifiers associated with the rule-id under the interface.
 clients 	(Optional) Displays clients associated with the rule-id under the interface.
 verbose 	(Optional) Displays A-DSG downstream rule detail information.
 tunnel tunnel-id 	(Optional) Displays interface-level A-DSG downstream tunnel information. The valid range is from 1 to 65535.

Command Default Displays configuration information for all DSG downstream channels on a cable interface.

Command Modes Privileged EXEC (#)

Release	Modification
12.3(13a)BC	This command was introduced to support A-DSG 1.1 on the Cisco uBR10012 router and Cisco uBR7200 series routers.
12.3(17a)BC	This command was modified to support A-DSG 1.2 with the following changes: <ul style="list-style-type: none"> • The rule keyword option is obsolete. • The tunnel group ID field (“TG id”) was added to the show interfaces cable dsg downstream tunnel form of the command. • The output display column headings of the show interfaces cable dsg downstream tunnel form of the command were changed.
12.2SCA	This command was integrated into Cisco IOS Release 12.2SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCB4	This command was modified. The show interface cable dsg downstream dcd command output is changed to display interface level DCD statistics for all interfaces in the mac-domain such as cable interfaces, modular cable interfaces, and IC interfaces. The field IF name is added to the output to indicate the interface.
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.
12.2(33)SCG	This command was modified. Support for the following keywords was removed: <ul style="list-style-type: none"> • rule <i>rule-id</i> • cfr • clients • verbose
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The following options were removed: <ul style="list-style-type: none"> • rule <i>rule-id</i> • cfr • clients • verbose

Usage Guidelines To use the **show interface cable dsg downstream** command, the tunnel group must be configured globally and also at the cable interface.

Table 220: Interface Density Information

CMTS Router	Line Card	Slot	Subslot	Port	Cable Interface Index
Cisco uBR10012	Cisco uBR-MC3GX60V	5 to 8	0 or 1	0 to 4	0 to 14
	Cisco UBR-MC20X20V				0 to 4
	Cisco uBR10-MC5X20				
Cisco uBR7225VXR	All	1 or 2	—	0 or 1	—
Cisco uBR7246VXR	All	3 to 6	—	0 or 1	—

Examples

Example: Displaying Information for all A-DSG Downstreams on a Cable Interface

The following example illustrates A-DSG downstream configuration information and the number of DSG tunnels, classifiers, clients and vender specific parameters.

```
Router# show interface cable 6/0 dsg downstream
chan chFreq chan timer init oper twoWay oneWay num num num num num
list index freq index timeout timeout timer timer rule tunnel cfr client vsp
1 2 666 1 1 2 3 4 9 6 4 6 2
3 500
```

Example: Displaying DCD Information for all A-DSG Downstreams on a Cable Interface

The following example illustrates the DCD statistics for the given downstream channel for A-DSG version 1.1. DCD TLV information displays if the debug cable dsg command is active. This output was changed in Cisco IOS Release 12.3(17a)BC for A-DSG version 1.2.

```
Router# show interface cable 6/0 dsg downstream dcd
dcd num of dcd num of dcd num of dcd num of
state sent fail change cnt fragment
en 282 0 1 1
```

The following example shows the output for A-DSG debugging while running the same command:

```
Router# debug cable dsg
Router# show interface cable 6/0 dsg downstream dcd
dcd num of dcd num of dcd num of dcd num of
state sent fail change cnt fragment
en 2139 0 1 1
Router#

08030022 22

```

Beginning in Cisco IOS Release 12.3(17a)BC, this output was modified to add the “dcd Tx” field in support of A-DSG version 1.2 as shown below:

```

Router# show interfaces cable 5/0 dsg downstream dcd
dcd    dcd
      num of dcd          num of dcd          num of dcd  num of
state Tx
      sent              fail              change cnt  fragment
en    on    6502              0              28          1

```

The following output displays the DCD statistics on all the cable and modular interfaces. The “IF Name” field displays the interface type:

```

Router#show interface cable 5/1/0 dsg downstream dcd
IF      dcd  dcd  num of dcd  num of dcd  num of dcd  num of
Name    state Tx  sent  fail  change cnt  fragment
-----
Ca5/1/0  en   on   70        0         2           1
Mo1/0/0:0 en   on   70        0         2           1

```

Example: Displaying Rule Information for all A-DSG Downstreams on a Cable Interface

Note This command is obsolete beginning in Cisco IOS Release 12.3(17a)BC.

```

Example: Displaying Tunnel Information for all A-DSG Downstreams on a Cable Interface

The following examples shows output for tunnels on A-DSG version 1.1 downstreams. This output was changed in Cisco IOS Release 12.3(17a)BC for A-DSG version 1.2.

```
Router# show interface cable 6/0 dsg downstream tunnel
```

tunnel id	tunnel state	tunnel mac-addr	cfr id	cfr state	rule id	rule state	client listId	service class
1	en	0100.5e01.0114	1	en	1	en	2	SI
			5	en	7	en	10	
			11	en	8	en	2	
			14	en	20	en	2	
2	en	0100.5e01.011e	2	en	2	en	2	NDS-CA
			10	en				
3	en	0100.5e01.0128	3	en	3	en	3	NDS-APP
4	en	0100.5e01.0132	4	en	4	en	4	MOTO-CA
5	en	0100.5e01.013c	9	en	5	en	5	MOTO-APP
6	dis	0100.5e01.0146			6	en	6	SA-CA

Beginning in Cisco IOS Release 12.3(17a)BC, this output was modified to add the “TG id” field in support of A-DSG version 1.2, and modifies the output column headings as shown below:

```
Router# show interfaces cable 5/0 dsg downstream tunnel
```

tunnel id	tunnel state	tunnel mac-addr	TG id	cfr id	cfr state	rule id	rule state	client listId	service class
1	en	0100.5e01.0001	1	1	en	1	en	1	DSG-Rate1

6	en	0002.0002.0003	2	9	en	6	en	21	

Example: Displaying Information for a Specified Tunnel on A-DSG Downstreams on a Cable Interface

The following examples shows output for a specified tunnel on A-DSG version 1.1 downstreams. This output was changed in Cisco IOS Release 12.3(17a)BC for A-DSG version 1.2.

```
Router# show interface cable 6/0 dsg downstream tunnel 1

tunnel tunnel tunnel          cfr  cfr  rule rule  client service
id      state mac-addr        id  state id  state listId class
1       en   0100.5e01.0114    1   en   1   en   2     SI
                    5   en   7   en   10
                    11  en   8   en   2
                    14  en   20  en   2
```

Beginning in Cisco IOS Release 12.3(17a)BC, this output was modified to add the “TG id” field in support of A-DSG version 1.2, and modifies the output column headings as shown below:

```
Router# show interfaces cable 5/0 dsg downstream tunnel 1
      tunnel          TG          cfr          rule
      client service
id  state mac-addr      id  id  state id  state
listId class
1   en  0100.5e01.0001  1   1   en  1   en  1   DSG-Rate1
                    6   en
                    7   en
                    8   en
```

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output for the **show interface cable dsg downstream** command:

```
Router#show interface cable 3/0/0 dsg downstream
chan chan chan timer init      oper      twoWay oneWay num  num  num  num  num
list index freq index timeout timeout timer  timer rule tunnel cfr  client vsp
-----
                                0  0  0  0  0

Router#
```

This example shows the output for the **show interface cable dsg downstream dcd** command:

```
Router#show intweface cable 3/0/0 dsg downstream dcd

IF      dcd  dcd  dsg  num of dcd  num of dcd  num of dcd  num of
Name    state Tx  fwd  sent         fail         change cnt  frag
-----
In3/0/0:8  dis  n/a  en   0           0           0           0
In3/0/0:16 dis  n/a  en   0           0           0           0
In3/0/0:24 dis  n/a  en   0           0           0           0
In3/0/0:32 dis  n/a  en   0           0           0           0
In3/0/0:33 dis  n/a  en   0           0           0           0
In3/0/0:40 dis  n/a  en   0           0           0           0

Router#
```

This example shows the output for the **show interface cable dsg downstream tunnel** command when a tunnel is not associated to an interface:

show interface cable dsg downstream

```
Router#show interface cable 3/0/0 dsg downstream tunnel 1
% DSG tunnel 1 not associated to interface.
```

```
Router#
```

Related Commands

Command	Description
debug cable dsg	Enables general, DCD or packet-related debugging.
show interface	Displays general interface information for the specified or all interfaces.
show interface cable dsg downstream tg	Displays information for A-DSG downstream tunnel groups on a Cisco CMTS router.

show interface cable dsg downstream tg

To display information for Advanced-mode DOCSIS Set-top Gateway (A-DSG) downstream tunnel groups on a Cisco CMTS router, use the `show interface cable dsg downstream tg` command in privileged EXEC mode.

```
show interface cable {slot/port | slot/subslot/port} dsg downstream tg [channel channel-id]
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable {slot/cable-interface-index | slot/subslot/cable-interface-index} dsg downstream tg [channel channel-id]
```

Cisco cBR Series Converged Broadband Router

```
show interface cable {slot/cable-interface-index | slot/subslot/cable-interface-index} dsg downstream tg tunnel-id
```

Syntax	Description
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR router—The valid range is 0 to 3 and 6 to 9.
<i>subslot</i>	Secondary slot number of the cable interface line card. Cisco uBR10012 only —The valid subslots are 0 or 1. Cisco cBR router—The valid value is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. Cisco cBR router—The valid range is 0 to 15.
channel <i>channel-id</i>	(Optional) Specifies the downstream channel identifier as a number from 1–65535. This option is not supported on the Cisco cBR router.

show interface cable dsg downstream tg

<i>tunnel-group id</i>	(Optional Cisco cBR router) Specifies the DSG tunnel group identifier as a number from 1–65535.
------------------------	---

Command History

Release	Modification
12.3(17a)BC	This command was introduced to support A-DSG on the Cisco uBR10012 router and Cisco uBR7200 series routers.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCD5	This command was modified. The output of the show interface cable dsg downstream tg command was changed.
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The channel keyword is removed.

Usage Guidelines

To use the **show interface cable dsg downstream tg** command, the tunnel group must be configured globally and also at the cable interface.

Examples**Example: Displaying Information for all A-DSG Downstream Tunnel Groups on a Cable Interface**

The following example shows output for all A-DSG downstream tunnel groups:

```
Router# show interfaces cable 5/0 dsg downstream tg
TG: 1      Chan: 1      state: en pri: 16 Vendor: 1      UCID: 1 2 3 4
           rule       tunnel                cfr                                client
I/F      id state id state mac-addr      id state dest-ip      In-DCD listId
C5/0    1   en 1   en 0101.5e01.0001 1   en 230.1.0.1      yes   1
                                     6   en 231.1.1.6      no
                                     7   en 231.1.1.7      no
                                     8   en 231.1.1.8      no
           2   en 2   en 0101.5e01.0002 2   en 230.1.0.2      yes   2

```

Example: Displaying Information for a Specified A-DSG Downstream Tunnel Group on a Cable Interface

The following example shows output for a specified A-DSG downstream tunnel group:

```
Router# show interfaces cable 5/0 dsg downstream tg 1 channel 1
TG: 1      Chan: 1      state: en pri: 16 Vendor: 1      UCID: 1 2 3 4
      rule      tunnel
I/F      id state id state mac-addr      id state dest-ip      In-DCD listId
C5/0    1      en 1      en 0101.5e01.0001 1      en 230.1.0.1      yes 1
                                     6      en 231.1.1.6      no
                                     7      en 231.1.1.7      no
                                     8      en 231.1.1.8      no
      2      en 2      en 0101.5e01.0002 2      en 230.1.0.2      yes 2
      3      en 3      en 0101.5e01.0003 3      en 230.1.0.3      yes 3
```

Example: Displaying Information for a Specified A-DSG Downstream Tunnel Group on a Cable Interface for Cisco IOS Release 12.2(33)SCD5

The following example shows the output of the **show interfaces cable dsg downstream tg** command that displays the ignore option, introduced in Cisco IOS Release 12.2(33)SCD5, under the 'In DCD' column.

```
Router# show interfaces cable 7/0/0 dsg downstream tg
TG: 1      Chan: 1      State: en Pri: 0      Vendor:      UCID:
      rule      tunnel
id state id state mac-addr      id state dest-ip      In clients
-----
1      en 1      en 0100.5e01.0101 1      en 230.1.1.1      ign 1
```

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output for the **show interface cable dsg downstream tg** command:

Related Commands

Command	Description
debug cable dsg	Enables general, DCD or packet-related debugging.
show interface	Displays general interface information for the specified or all interfaces.
show interface cable dsg downstream	Displays interface configuration and status information for A-DSG downstreams on a Cisco CMTS router.

show interface cable dynamic-service statistics

To display dynamic service statistics based on the cable interface, use the `show interface cable dynamic-service statistics` command in privileged EXEC mode.

show interface cable *{slot/cable-interface-index | slot/subslot/cable-interface-index}* **dynamic-service statistics**

Syntax Description

<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR router—The valid range is 0 to 3 and 6 to 9.
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR router—The valid range is 0 to 15.
<i>subslot</i>	Secondary slot number of the cable interface line card. <p>Cisco uBR10012 only —The valid subslots are 0 or 1.</p> <p>Cisco cBR router—The valid value is 0.</p>

Release	Modification
Cisco IOS Release 12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Examples

The following is a sample output of the `show interface cable dynamic-service statistics` command that shows dynamic service statistics based on the cable interface specified on the Cisco uBR10012 router in Cisco IOS Release 12.2(33)SCF:

```
Router# show interface cable 7/1/0 dynamic-service statistics
Upstream      Downstream
```

```

DSA REQ      0          5
DSA RSP      5          0
DSA ACK      0          5
DSC REQ      0          5
DSC RSP      5          0
DSC ACK      0          5
DSD REQ      0          0
DSD RSP      0          0
Retransmission counts
              Upstream      Downstream
DSA REQ      0              0
DSA RSP      0              0
DSA ACK      0              0
DSC REQ      0              5
DSC RSP      5              0
DSC ACK      0              0
DSD REQ      0              0
DSD RSP      0              0

```

Table 221: show interface cable dynamic-service statistics Field Descriptions

Field	Description
Upstream	Dynamic service packets sent in the upstream direction.
Downstream	Dynamic service packets sent in the downstream direction.
DSA RSP	Dynamic service add response.
DSA ACK	Dynamic service add acknowledgement.
DSC REQ	Dynamic service change request.
DSC RSP	Dynamic service change response.
DSC ACK	Dynamic service change acknowledgement.
DSD REQ	Dynamic service delete request.
DSD RSP	Dynamic service delete response.

Examples for Cisco cBR Series Converged Broadband Router

Related Commands

Command	Description
show interface cable packetcable statistics	Displays PacketCable interprocess communication (IPC) statistics based on the specified cable interface.

show interface cable intercept

To display the cable modems for which traffic is currently being intercepted and forwarded to a data collector, use the **show interface cable intercept** command in privileged EXEC mode.

show interface cable {*slot/port* | *slot/subslot/portbundle*} **intercept**

Cisco IOS Release 12.2(33)SCE and later

show interface cable {*slot/cable-interface-index* | *slot/subslot/cable-interface-indexbundle*} **intercept**

Syntax Description

<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.
<i>bundle</i>	Identifies the bundle ID on the Cisco uBR7100 series, the Cisco uBR7200 series and the Cisco uBR10000 series routers where the interface has been configured to be a member of a virtual interface bundle. The valid range is 1 to 255.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.0(5)T1	This command was introduced.
12.0(6)SC	This command was introduced on the 12.0 SC train.

Release	Modification
12.1(2)EC	This command was introduced on 12.1 EC train.
12.2(4)BC1	This command was introduced on the 12.2 BC train.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Examples

The following shows a display after a CM has been added to the intercept list:

```
router# configure terminal
router#(config) interface c6/0
router(config-if)# cable intercept 0080.fcaa.aabb 10.12.13.8 512
router(config-if)# exit
router(config)# exit
router# show interface c6/0 intercept
Destination      Destination
MAC Address      IP Address      UDP Port
0080.fcaa.aabb  3.12.13.8      512
```

The following shows a display when no CMs have been added to the intercept list:

```
router# show interface c6/0 intercept
No interception active
```

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable intercept	Specifies that a copy of all traffic for a particular CM should be forwarded to a data collector.

show interface cable mac-scheduler

To display the current time-slot scheduling state, statistics, and weighted fair queuing (WFQ) parameters, use the **show interface cable mac-scheduler** command in privileged EXEC mode.

show interface cable *{slot/port | slot/subslot/port}* **mac-scheduler** [*n*]

Cisco IOS Release 12.2(33)SCE and later

show interface cable *{slot/cable-interface-index | slot/subslot/cable-interface-index}* **mac-scheduler** [*n*]

Cisco IOS Release 12.2(33)SCE and later

show interface cable *{slot/cable-interface-index | slot/subslot/cable-interface-index}* **mac-scheduler** [*n*]

Cisco cBR Series Converged Broadband Router

show interface cable *{slot/subslot/cable-interface-index}* **mac-scheduler** [*n*]

Syntax Description

<i>slot/port</i>	<p>Cable interface and downstream port on the Cisco uBR7200 series routers:</p> <ul style="list-style-type: none"> • <i>slot</i>—Slot where the line card resides: <ul style="list-style-type: none"> • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR7225VXR router—The valid value is 1 or 2. • <i>port</i>—Downstream port number: <ul style="list-style-type: none"> • Cisco uBR7246VXR and Cisco uBR7225VXR routers— The valid value is 0 or 1.
<i>slot/subslot/port</i>	<p>Cable interface on the Cisco uBR10012 router:</p> <ul style="list-style-type: none"> • <i>slot</i> —Chassis slot number of the cable interface line card. The valid range is from 5 to 8. • <i>subslot</i> —Secondary slot number of the cable interface line card. The valid range is 0 or 1. • <i>port</i> —Downstream port number. The valid ports are from 0 to 4, depending on the cable interface line card.
<i>cable-interface-index</i>	<p>Downstream port of the Cisco uBR10-MC5X20U/H and Cisco uBR-MC28U line cards or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards.</p> <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1. • Cisco uBR10012 router: <ul style="list-style-type: none"> • Cisco UBR-MC20X20V and Cisco uBR10-MC5X20U/H line cards—The valid range is from 0 to 4. • Cisco uBR-MC3GX60V line card—The valid range is from 0 to 14.

<i>slot/subslot/cable-interface-index</i>	For the Cisco cBR router— <ul style="list-style-type: none"> • The valid range for the <i>slot</i> is 0 to 3 and 6 to 9. • The valid value for the <i>subslot</i> is 0. • The valid range for <i>cable-interface-index</i> is 0 to 15.
<i>n</i>	(Optional) Specific upstream to be displayed. The valid values start with 0 for the first upstream port on the cable interface line card. For the Cisco cBR router—The valid range is 0 to 7.

Command Default

If no upstream port is identified, the command displays information for all upstreams on the specified cable interface. If no logical-index is identified, the command displays all the logical channels under the physical port.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.1(4)CX	This command was introduced. (Much of the information shown in this command was previously shown by the show interface cable and show interface cable upstream commands.)
12.2(4)BC1	Support was added to the Cisco IOS Release 12.2 BC train.
12.2(15)CX	Support was added for the Cisco uBR-MC28U/X cable interface line card, including additional information about DOCSIS 2.0 A-TDMA and mixed modulation profiles.
12.2(15)BC2	Additional information was added to the display for DOCSIS 2.0 A-TDMA and mixed modulation profiles on the Cisco uBR10-MC5X20S cable interface line card.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCC	This command was modified. The command output was modified to show logical channels information when multiple logical channels are configured.
12.2(33)SCD2	This command was modified. The command output was modified to show weighted fair queuing (WFQ) parameters configured for upstream service flows.
12.2(33)SCE	This command was modified. The command output was modified to show the upstream scheduler output for a MAC domain configured with DPON. The port parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

In releases prior to Cisco IOS Release 12.2 BC, information for the MAC scheduler was displayed using the **show interface cable** and **show interface cable upstream** commands. In Cisco IOS Release 12.2 BC, the MAC scheduler information is moved to this command.

Example of the show interface cable mac-scheduler Command Output for the Cisco uBR7246VXR and Cisco uBR7225VXR Routers

This example shows the output of the **show interface cable mac-scheduler** command for the upstream port 0 on the indicated cable interface:

```
Router# show interface cable 3/0 mac-scheduler 0

DOCSIS 1.1 MAC scheduler for Cable3/0/U0
Queue[Rng Polls] 0/64, 0 drops

Example of the **show interface cable mac-scheduler**

Command Output When Multiple Logical Channels are Configured for the Cisco uBR10012 Routers

OFDMA upstreams is calculated based on maximum single modem upstream performance. Actual performance can vary depending upon cable modem capabilities, possible congestion in the network, and other conditions.

This example shows the output of the **show interface cable mac-scheduler** command when multiple logical channels are configured on the indicated cable interface:

```
Router# show interface cable 7/1/0 mac-scheduler 0

DOCSIS 1.1 MAC scheduler for Cable7/1/0/U0: rate 2560000

Table 222: show interface cable mac-scheduler Field Descriptions

Field	Description
wfq	WFQ parameters: class, activity, and custom weights for service flow priorities.

Field	Description
Queue...	<p>State of the first-in, first-out (FIFO) priority queues for each scheduler. For each queue, the command displays the following:</p> <ul style="list-style-type: none"> • Name of the queue. The following queues are available: <ul style="list-style-type: none"> • Rng Polls—Queue used for ranging requests. • CIR Grants—Queue used for committed information rate (CIR) grants, which is used for Unsolicited Grant Service (UGS) and UGS with Activity Detection (UGS-AD) service flows. • BE(x) Grants—One of the eight queues used for Best-Effort(BE) service flows. • Number of currently occupied slots over the total number of slots available (which is hardcoded to 64 for each queue). For example, 3/64 indicates that the queue has a depth of 64 slots available and that 3 are currently in use. • Number of packets dropped because the queue already had 64 requests pending and a free slot was therefore not available.
Req Slots	Counter showing the number of slots advertised on this upstream port for bandwidth request opportunities since the last reset of the router or the counter.
Req/Data	Counter showing the number of slots advertised on this upstream port for request and data transmission opportunities since the last reset of the router or the counter.
Init Mtn Slots	Number of slots granted on this upstream port for initial maintenance requests (initial ranging) since the last reset of the router or the counter.
Stn Mtn Slots	Number of slots granted on this upstream port for station maintenance requests (unicast ranging) since the last reset of the router or the counter.
Short Grant Slots	Number of slots granted on this upstream port for short data requests since the last reset of the router or the counter.
Long Grant Slots	Number of slots granted on this upstream port for long data requests since the last reset of the router or the counter.
Adv Phy Short Grant Slots	Number of slots granted on this upstream port for short advanced physical data requests.
Adv Phy Long Grant Slots	Number of slots granted on this upstream port for long advanced physical data requests.
Adv Phy UGS Grant Slots	Number of UGS slots granted on this upstream port.
Awacs Slots	Number of awacs slots granted on this upstream port.
Fragmentation count	Number of frames received on this upstream port fragmented according to the DOCSIS 1.1 fragmentation technique.

Field	Description
Fragmentation test	Fragmentation statistics. If fragmentation is disabled, no statistics are available. If fragmentation is enabled, the fragmentation mode is displayed (multiple grant mode or piggyback mode), and the display shows the fragmentation threshold in the number of bytes and minislots.
Avg upstream channel utilization	Total upstream bandwidth currently used for upstream data traffic and DOCSIS management traffic, expressed as a short-term average percentage of total minislots used. Note See table below for the theoretical maximum possible bandwidth for an upstream, based on the channel width and modulation scheme.
Avg percent contention slots	Approximate average unused capacity in the network. This field shows the total upstream bandwidth that is currently dedicated to providing bandwidth request opportunities, expressed as an average percentage of total minislots used. This value is calculated by dividing the number of scheduled contention slots by the total number of minislots. Note This value is approximately 100 percent minus the percentage of slots being used for upstream data, management traffic, and initial ranging slots.
Avg percent initial ranging slots	Total upstream bandwidth currently used on an average for initial ranging requests for cable modems coming online, expressed as an average percentage of total minislots used.
Avg percent minislots lost on late MAPs	Total upstream bandwidth currently lost and unused because the bandwidth allocation MAP message was sent late. This field shows how often allocation gaps occur in the MAP scheduler, where the Cisco CMTS allows significant amounts of time to pass before it schedules a new MAP. Ideally, the CMTS should schedule MAPs consecutively, so that no gaps occur between the MAPs. However, when a large number of cable modems are using different service flow schedules, gaps can appear in the MAP scheduler, resulting in wasted scheduling time. Tip A typical value is only a few percentage points. If this field shows larger values than this, use the debug cable startalloc command to display the number of minislots that are skipped every time the Cisco CMTS has to adjust its MAP scheduler timer.
Sched Table Rsv-State	Current status of reserved service flows (which typically indicates the number of voice grants): <ul style="list-style-type: none"> • Grants—Number of admitted UGS style upstream service flows. • Reqpolls—Number of admitted Real Time Polling Service (RTPS) style upstream service flows.

Field	Description
Sched Table Adm-State	Current status of admitted service flows (which typically indicates the number of voice grants): <ul style="list-style-type: none"> • Grants—Number of admitted UGS style upstream service flows. • Reqpolls—Number of admitted RTPS style upstream service flows. • Percentage of channel utilization that is associated with these service flows.
UGS	Number of service IDs (SIDs) used for UGS service flows, and the current bandwidth reserved by these SIDs, in bits per second.
UGS-AD	Number of SIDs used for UGS with Activity Detection (UGS-AD) service flows, and the current bandwidth reserved by these SIDs, in bits per second.
RTPS	Number of SIDs used for RTPS service flows, and the current bandwidth reserved by these SIDs, in bits per second.
NRTPS	Number of SIDs used for non-RTPS (NRTPS) service flows, and the current bandwidth reserved by these SIDs, in bits per second.
BE	Number of SIDs used for best-effort (BE) service flows, and the current bandwidth reserved by these SIDs, in bits per second.
MAP TSS	MAP timestamp snapshot.

Note The sum of *Avg upstream channel utilization* and *Avg percent contention slots* need not be 100 percentage when rate-adapt is configured. These parameters may be in single digit when the remaining contention slots are assigned to other users and are not using any bandwidth.

The table below shows the maximum usable bandwidth (total bandwidth minus header and MAC-layer overhead) for an upstream that is using a specific channel width and modulation scheme combination.

Table 223: Maximum Potential Upstream Bandwidth

Channel Width (MHz)	Modulation Scheme	Raw Speed (Mbps)	Usable Bandwidth (Mbps)
1.6	QPSK	2.56	2.2
1.6	16 QAM	5.12	4.4
3.2	16 QAM	10.24	8.9
3.2	64 QAM	15.36	13.5
6.4	16 QAM	20.48	18
6.4	64 QAM	30.72	27.2

For example, if the upstream is configured for a 3.2 MHz channel width and is using 16 QAM modulation, its maximum usable bandwidth is 8.9 Mbps. If the average channel utilization field

shows that the upstream is at 50 percent, it indicates that cable modems on that upstream are currently using 0.5 * 8.9 Mbps or 4.45 Mbps.

Tip In Cisco IOS Release 12.1(12)EC, Cisco IOS Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in the line configuration mode.

Related Commands

Command	Description
show interface cable	Displays the configuration and status information for the cable interface.
show interface cable sid	Displays SID information of each CM on the network.
show interface cable signal-quality	Displays the cable signal quality information.
show interface cable upstream	Displays one or all of the cable interface upstream information.

show interface cable modem

To display information about cable modems (CMs) and customer premise equipment (CPE) behind a CM on a specified cable interface, use the **show interface cable modem** command in privileged EXEC mode.

```
show interface cable {slot/port | slot/subslot/port} modem [{sid | ipv6}]
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable {slot/cable-interface-index | slot/subslot/cable-interface-index} modem [{sid | ipv6}]
```

Cisco cBR Series Converged Broadband Router

```
show interface cable {slot/subslot/cable-interface-index} modem [{sid | ipv6}]
```

Syntax Description	
<code>cableslot/subslot/cable-interface-index</code>	<p>Specifies details of a cable interface line card:</p> <ul style="list-style-type: none"> <i>slot</i>—Slot where the line card resides. <i>subslot</i>—(Cisco uBR10012 and Cisco cBR-8) Secondary slot number of the line card. <i>port</i>—Downstream port number of the line card. <i>cable-interface-index</i>—Downstream port or MAC domain index of the line card. <p>For the Cisco cBR series router:</p> <ul style="list-style-type: none"> <i>slot</i>—Slot where the card resides. The valid range is from 0 to 3 and 6 to 9 on the Cisco cBR-8 router. <i>subslot</i>—Subslot where the card resides. The valid value is 0 on the Cisco cBR-8 router. <i>cable-interface-index</i>—cable interface index number. The valid values are from 0 to 15 on the Cisco cBR-8 router.
<code>sid</code>	(Optional) Specifies the service ID (SID) to be displayed. The valid range is from 0 to 8176.
<code>ipv6</code>	(Optional) Specifies an IPv6 cable modem and connected host state.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(11)BC2	This command was introduced.

Release	Modification
12.2(33)SCA	<p>This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes:</p> <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • The “Dual IP” output field was added to indicate support of both IPv4 and IPv6 addressing. • Multicast information was added to the output. • The following new initialization states were added to show initialization of CMs and CPEs supporting IPv6: <ul style="list-style-type: none"> • init6(s)—CMTS router has seen SOLICIT message • init6(a)—CMTS router has seen ADVERTISE message • init6(r)—CMTS router has seen REQUEST message • init6(i)—CMTS router has seen REPLY message • init6(o)—CMTS router has seen version 6 TFTP request • init6(t)—CMTS router has seen version 6 TOD request
12.2(33)SCE	<p>This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.</p>
12.2(33)SCG	<p>The ipv6 keyword was added to this command.</p>
IOS-XE 3.15.0S	<p>This command was implemented on the Cisco cBR Series Converged Broadband Router.</p>

Usage Guidelines

The **show interface cable modem** command displays the cable modems that are known to be using or were last using the specified cable interface. When a cable modem goes offline, it remains associated with its last known cable interface and is shown as “offline” in the command’s display for 24 hours.

The CPE devices associated with offline cable modems remain in the command’s display either until their cable modem has been offline for 24 hours or until the device’s Address Resolution Protocol (ARP) entry times out (the default value is 4 hours), whichever comes first.

The **show interface cable modem** command shows similar information to the **show cable modem** command, but adds information about the privacy bits and IP addressing method.

The **show interface cable modem** command with the **ipv6** keyword also displays the IPv4 CM in the output if an IPv6 or dual stack CPE is behind the IPv4-only cable modem. In all other cases, only IPv6 data of a CM or CPE is displayed.

The IPv6 output of the **show interface cable modem** command differs from the IPv4 command. The privacy bits and the dual IP flag of the IPv4 command output are not present in the output of the **show interface cable modem** command.

Table 224: Interface Density Information

CMTS Router	Line Card	Slot	Subslot	Port	Cable Interface Index
Cisco uBR10012	Cisco uBR-MC3GX60V	5 to 8	0 or 1	0 to 4	0 to 14
	Cisco UBR-MC20X20V				0 to 4
	Cisco uBR10-MC5X20				
Cisco uBR7225VXR	All	1 or 2	—	0 or 1	—
Cisco uBR7246VXR	All	3 to 6	—	0 or 1	—

Examples

This example shows output from the **show interface cable modem** command for all SIDs on a particular cable interface on a Cisco 7200 series router.

```
Router# show interface cable 6/0 modem
SID   Priv bits  Type      State      IP address  method  MAC address
1     11         modem     online(pt) 1.2.3.2    dhcp    0050.7366.1837
2     11         modem     online(pt) 1.2.3.3    dhcp    0010.7b6b.71fd
3     11         modem     online(pt) 1.2.3.4    dhcp    0010.7bb3.fc3d
4     00         modem     init(r1)   1.2.3.238  dhcp    0010.7b6b.71a9
5     11         modem     online(pt) 1.2.3.5    dhcp    0010.7bed.a731
6     11         modem     online(pt) 1.2.3.20   dhcp    0010.7bed.ab4b
7     11         modem     online(pt) 1.2.3.18   dhcp    0010.7b6b.71e3
8     11         modem     online(pt) 1.2.3.13   dhcp    0010.7bed.ab6f
9     11         modem     online(pt) 1.2.3.21   dhcp    0010.7bed.a52f
10    11         modem     online(pt) 1.2.3.14   dhcp    0010.7b6b.7191
11    11         modem     online(pt) 1.2.3.6    dhcp    0010.7bed.ab57
```

This example shows output from the **show interface cable modem** command for an individual SID on a particular cable interface on a Cisco 7200 series router.

```
Router# show interface cable 6/0 modem 9
SID   Priv bits  Type      State      IP address  method  MAC address
9     11         modem     online(pt) 1.2.3.21   dhcp    0010.7bed.a52f
```

This example shows output from the **show interface cable modem** command in Cisco IOS release 12.2(33)SCA on a particular cable interface on a Cisco uBR10012 router. None of the CMs or CPEs are supporting both IPv4 and IPv6 addressing, which is indicated by the “N” in the Dual IP output field.

```
Router# show interface cable 8/0/0 modem 0
SID   Priv Type      State      IP address  method  MAC address  Dual
      bits
1     11  modem     online(pt) 10.3.134.12  dhcp    0008.0da6.1c47  N
1     11  host      unknown    10.3.134.74  static  000b.bf95.f555  N
2     00  modem     init(o)    10.3.225.26  dhcp    0007.0e07.27d7  N
3     00  modem     init(i)    10.3.225.19  dhcp    0007.0e06.c769  N
4     11  modem     online(pt) 10.3.134.3   dhcp    0008.0da6.3447  N
5     11  modem     online(pt) 10.3.134.38  dhcp    0011.8065.e78e  N
6     00  modem     init6(i)   unavailable  0018.6835.27dd  N
7     11  modem     online(pt) 10.3.134.10  dhcp    0011.8065.e7a6  N
8     00  modem     init(i)    10.3.134.9   dhcp    0006.53b6.57f5  N
9     11  modem     online(pt) 10.3.134.27  dhcp    0006.53b6.581d  N
10    11  modem     online(pt) 10.3.134.5   dhcp    0007.0e04.ebfd  N
```

This example shows the output from the **show interface cable modem** command that shows multicast information:

```
Router# show interface cable 6/1/0 modem
SID   Priv Type      State      IP address      method  MAC address      Dual
      bits
  9    11  modem    online(pt)  101.1.0.6      dhcp    0006.28f9.8c79  N
  9    11  host     unknown     111.1.1.45     dhcp    0018.1952.a859  N
 10    10  modem    online(pt)  101.1.0.5      dhcp    0006.5305.ac19  N
 10    10  host     unknown     111.1.0.3      dhcp    0018.1952.a85a  N
 13    10  modem    online(pt)  101.1.0.3      dhcp    0014.f8c1.fd1c  N
8195  10  multicast unknown     224.1.1.51     static  0000.0000.0000  N
8195  10  multicast unknown     224.1.1.49     static  0000.0000.0000  N
8195  10  multicast unknown     224.1.1.50     static  0000.0000.0000  N
```

This example shows the output of the **show interface cable modem** command with the **ipv6** keyword in Cisco IOS Release 12.2(33)SCG:

```
Router# show interface cable 7/0/0 modem ipv6
SID  Type State      IPv6 Address      M MAC address
 11  CM  online  2001:420:3800:809:3519:5F9C:B96A:D31  D 0025.2e2d.743a
 11  CPE unknown 2001:420:3800:809:3DB2:8A6C:115F:41D8  D 0011.2544.f33b
```

This example shows the output of the **show interface cable modem** on the Cisco cBR-8 router:

```
Router#show interface cable 1/0/0 modem
SID   Priv Type      State      IP address      method  MAC address      D
      bits
  1    00  modem    online      10.10.20.8      dhcp    0025.2eaf.82e4  Y
  2    00  modem    online      10.10.20.9      dhcp    0025.2eaf.82f4  Y
  3    00  modem    online      10.10.20.110    dhcp    0025.2e2d.74f8  Y
  4    00  modem    online      10.10.20.4      dhcp    0025.2e2d.75be  Y
  5    00  modem    online      10.10.20.7      dhcp    0025.2eaf.7f38  Y
  5    00  host     unknown     10.10.20.10     dhcp    b8c7.5dcd.04cd  N
  6    00  modem    online      10.10.20.6      dhcp    0025.2eaf.8302  Y

Active modems      : 6
Total active devices : 7
```

Table 225: show interface cable modem Field Descriptions

Field	Description
SID	Identifies a SID currently defined and in use on this particular cable interface.

Field	Description
Priv bits	<p>Identifies the current settings of the two privacy bits in the Extended Header (EH) that is used for BPI-encrypted packets.</p> <ul style="list-style-type: none"> • First bit—Enable bit. Set to 1 when BPI or BPI+ is enabled. • Second bit—Toggle bit. Matches the least significant bit (LSB) of the Key Sequence Number (KSN) in the EH. <p>For example, a value of “00” indicates that BPI is not enabled. A value of “10” indicates that BPI is enabled and that the KSN is an even number. A value of “11” indicates that BPI is enabled and that the KSN is an odd number.</p> <p>Note For more information on these bits, see the DOCSIS Baseline Privacy Interface Plus Interface Specification (SP-BPI+-I08-020301 or later).</p>
Type	<p>Identifies the use for this SID:</p> <ul style="list-style-type: none"> • host—SID is used for a CPE device. • modem—SID is used for a CM. • multicast—SID is used for a multicast broadcast.
State	The current state of the MAC layer for this SID and CM. For hosts or multicast broadcasts, the state will always be unknown.
IP address	IP address for the CM using this SID.
IPv6 Address	IPv6 address of the CM or CPE.
method or m	<p>Identifies the way that the IP address was assigned:</p> <ul style="list-style-type: none"> • dhcp—The Cisco CMTS first learned of this IP address through a DHCP packet that assigned the address to this device. This IP address is therefore assumed to have been dynamically assigned to the cable modem or CPE device by a DHCP server. (Per the DOCSIS specifications, DHCP is the only valid method for cable modems.) • pppoe—(CPE device only) IP addressing for the CPE device was handled by the Point-to-Point Protocol over Ethernet (PPPoE) protocol. • static—(CPE device only) The Cisco CMTS first learned of this IP address from non-DHCP traffic sent to or from this CPE device. This IP address is therefore assumed to be statically assigned to this particular CPE device. <p>Note The Cisco CMTS could identify a CPE device as having a static IP address, if the Cisco CMTS has been rebooted after the CPE device received its IP address from the DHCP server.</p>
MAC address	Identifies the hardware (MAC) address for the CM using this SID.
Dual IP (On Cisco cBR series router) DIP	Identifies whether or not (“Y” or “N”) the CM or CPE supports both IPv4 and IPv6 addressing.
Active modems	Total number of active cable modems that are connected to the cable interface.

Field	Description
Total active devices	Total number of active cable modems and customer premises equipment (CPE) devices that are connected to the cable interface.

Table 226: Descriptions for the MAC State Field The CM MAC state field can also be retrieved using SNMP by getting the value of the `cdxCmtsCmStatusValue` object in the `CISCO-DOCS-EXT-MIB`.

MAC State Value	Description
Registration and Provisioning Status Conditions for Devices Using IPv4 Addressing	
init(r1)	The CM sent initial ranging.
init(r2)	The CM is ranging. The CMTS received initial ranging from the CM and has sent RF power, timing offset, and frequency adjustments to the CM.
init(rc)	Ranging has completed. Note If a CM appears to be stuck in this state, it could be that the CM is able to communicate successfully on the cable network, but that the upstream is at capacity and does not have any additional bandwidth to allow the CM to finish registration and come online. Either manually move one or more CMs to other upstreams, or enable load balancing on the upstream using the cable load-balance group commands.
init(d)	The DHCP request was received, as DHCPDISCOVER. This also indicates that the first IP broadcast packet has been received from the CM.
init(dr)	The DHCP request has been sent to the cable modem.
init(i)	The cable modem has received the DHCP OFFER reply (DHCPACK) from the DHCP server that has assigned an IP address to the modem, but the modem has not yet replied with a DHCPREQUEST message requesting that particular IP address, nor has it sent an IP packet with that IP address. Note If a CM appears to be stuck in this state, the CM has likely received the DHCP OFFER reply from the DHCP server, but this reply might have contained one or more invalid options for that particular CM.
init(io)	The Cisco CMTS has seen the DHCP offer as sent to the cable modem from the DHCP server that has assigned an IP address to the modem.
init(o)	The CM has begun to download the option file (DOCSIS configuration file) using the Trivial File Transfer Protocol (TFTP), as specified in the DHCP response. If the CM remains in this state, it indicates that the download has failed.
init(t)	Time-of-day (TOD) exchange has started.
resetting	The CM is being reset and will shortly restart the registration process.
Registration and Provisioning Status Conditions for Devices Using IPv6 Addressing	
init6(s)	The Cisco CMTS router has seen the DHCPv6 SOLICIT message from the CM.

MAC State Value	Description
init6(a)	The Cisco CMTS router has seen the ADVERTISE message from the DHCPv6 server to the CM.
init6(r)	The Cisco CMTS router has seen the REQUEST response from the CM to the DHCPv6 server.
init6(i)	The Cisco CMTS router has seen the REPLY message from the DHCPv6 server to the CM.
init6(o)	The Cisco CMTS router has seen the REQEST message from the CM to the TFTP server.
init6(t)	The Cisco CMTS router has seen the REQUEST message from the CM to the TOD server.
Non-error Status Conditions	
cc(r1)	The CM had registered and was online, but has received a Downstream Channel Change (DCC) or Upstream Channel Change (UCC) request message from the CMTS. The CM has begun moving to the new channel, and the CMTS has received the CM's initial ranging on the new downstream or upstream channel. At the MAC layer, the CM is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.
cc(r2)	This state should normally follow cc(r1) and indicates that the CM has finished its initial ranging on the new channel, and is currently performing continuous ranging on the new channel. At the MAC layer, the CM is considered offline because it is not yet passing traffic on the new channel, but this state does not trigger the flap-list counters.
offline	The CM is considered offline (disconnected or powered down).
online	The CM has registered and is enabled to pass data on the network.
online(d)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. The CM does not forward traffic to or from the CPE devices, but the CMTS can continue to communicate with the CM using DOCSIS messages and IP traffic (such as SNMP commands). Note If BPI was enabled in the DOCSIS configuration file sent to the CM, assume that the CM is using BPI encryption, unless other messages show that the BPI negotiation and key assignments have failed.
online(pkd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and KEK is assigned. Note This state is equivalent to the online(d) and online(pk) states.

MAC State Value	Description
online(ptd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note This state is equivalent to the online(d) and online(pt) states.
online(pk)	The CM registered, BPI is enabled and KEK is assigned.
online(pt)	The CM registered, BPI is enabled and TEK is assigned. BPI encryption is now being performed. Note If network access was disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows online(d) instead of online(pt) even when BPI encryption is enabled and operational.
Note	If an exclamation point (!) appears in front of one of the online states, it indicates that the cable dynamic-secret command has been used with either the mark or reject option, and that the cable modem has failed the dynamic secret authentication check.
expire(pk)	The CM registered, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value.
expire(pkd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, KEK was assigned, but the current KEK expired before the CM could successfully renew a new KEK value. Note This state is equivalent to the online(d) and expire(pk) states.
expire(pt)	The CM registered, BPI is enabled, TEK was assigned, but the current TEK expired before the CM could successfully renew a new KEK value.
expire(ptd)	The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI is enabled, TEK was assigned, but the current TEK expired before the CM could successfully renew a new KEK value. Note This state is equivalent to the online(d) and expire(pt) states.
Error Status Conditions	
reject(m)	The CM attempted to register but registration was refused due to a bad Message Integrity Check (MIC) value. This also could indicate that the shared secret in the DOCSIS configuration file does not match the value configured on the CMTS with the cable shared-secret command. In Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases, this could also indicate that the cable tftp-enforce command has been used to require that a CM attempt a TFTP download of the DOCSIS configuration file before registering, but the CM did not do so.

MAC State Value	Description
reject(c)	<p>The CM attempted to register, but registration was refused due to a a number of possible errors:</p> <ul style="list-style-type: none"> • The CM attempted to register with a minimum guaranteed upstream bandwidth that would exceed the limits imposed by the cable upstream admission-control command. • The CM has been disabled because of a security violation. • A bad class of service (COS) value in the DOCSIS configuration file. • The CM attempted to create a new COS configuration but the CMTS is configured to not permit such changes. • The CM failed the timestamp check for its DOCSIS configuration file. (This could indicate a possible theft-of-service attempt, or a problem with the synchronization of the clocks on the CM and CMTS.)
reject(pk)	KEK key assignment is rejected, BPI encryption has not been established.
reject(pkd)	<p>The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because KEK key assignment was rejected.</p> <p>Note This state is equivalent to the online(d) and reject(pk) states.</p>
reject(pt)	TEK key assignment is rejected, BPI encryption has not been established.
reject(ptd)	<p>The CM registered, but network access for CPE devices using this CM has been disabled through the DOCSIS configuration file. In addition, BPI encryption was not established because TEK key assignment was rejected.</p> <p>Note This state is equivalent to the online(d) and reject(pt) states.</p>
Note	<p>In Cisco IOS Release 12.1(20)EC, Cisco IOS Release 12.2(15)BC1, and earlier releases, when network access is disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows online(d) even if BPI encryption fails. Use the show cable modem mac-address command to confirm whether BPI is enabled or disabled for a particular cable modem.</p>
reject(ts)	The CM attempted to register, but registration failed because the TFTP server timestamp in the CM registration request did not match the timestamp maintained by the CMTS. This might indicate that the CM attempted to register by replaying an old DOCSIS configuration file used during a prior registration attempt.
reject(ip)	The CM attempted to register, but registration failed because the IP address in the CM request did not match the IP address that the TFTP server recorded when it sent the DOCSIS configuration file to the CM. IP spoofing could be occurring.
reject(na)	The CM attempted to register, but registration failed because the CM did not send a Registration-Acknowledgement (REG-ACK) message in reply to the Registration-Response (REG-RSP) message sent by the CMTS. A Registration-NonAcknowledgement (REG-NACK) is assumed.

Related Commands

Command	Description
show cable modem	Displays information for the registered and unregistered CMs.

show interface cable monitor

Note Effective with Cisco IOS Release 12.2(33)SCA the **show interface cable monitor** command is replaced by the **show interface cable cable-monitor** command.

To display cable monitor information, use the **show interface cable monitor** command in privileged EXEC mode.

show interface cable {*slot/port* | *slot/subslot/port*} **monitor**

Syntax Description	
<i>slot/port</i>	<p>Displays information for all CMs on the specified cable interface and downstream port on the Cisco uBR7100 series and Cisco uBR7200 series routers, where:</p> <ul style="list-style-type: none"> • <i>slot</i>—Specifies the chassis slot number of the cable interface line card. • <i>port</i>—Specifies the downstream port number. <p>Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering.</p>
<i>slot/subslot/port</i>	<p>Displays information for all CMs on the specified cable interface on a Cisco uBR10012 router, where:</p> <ul style="list-style-type: none"> • <i>slot</i>—Specifies the chassis slot number of the cable interface line card. Valid slots are 5 to 8. • <i>subslot</i>—Specifies the secondary slot number of the cable interface line card. Valid subslots are 0 or 1. • <i>port</i>—Specifies the downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.1(3a)EC	This command was introduced.
12.2(4)XF	Support was added for the Cisco uBR10012 universal broadband router.
12.2(4)BC1	Support was added to the Release 12.2 BC train.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command is replaced by the show interface cable-monitor command.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Examples

The following is sample output from the **show interface cable monitor** command:

```

Router# show interface cable 5/0 monitor
US/ Time Outbound Flow      Flow Type      Flow Packet MAC   MAC   Encap
DS Stmp Interface Type      Identifier      Extn. Type      Extn. Type      Type
us  no      Et1/2  us-port  0              yes  data  no    -      docsis
all no      Et1/2  acc-list 103           yes  data  no    -      docsis
all yes     Et1/2  mac-addr 0050.0000.0000 yes  mac   no    -      -

```

Table 227: show interface cable monitor Field Descriptions

Field	Description
DS	Downstream. Indicates that only downstream flows are monitored.
UP	Upstream. Indicates that only upstream flows are monitored.
ALL	Indicates that all flows are monitored.
Time Stmp	“Yes” indicates that forwarded packets have been time-stamped, with appended 4 bytes. “No” indicates that forwarded packets have not been time-stamped.
Outbound Interface	Identifies the interfaces where the packets have been forwarded to (Ethernet or Fast Ethernet).
Flow Type	Identifies the selected flow type, MAC-address, access-list number, or upstream port number.
Flow Type Identifier	MAC address, access-list number, or service ID.
Flow Extn.	“Yes” indicates that extended filters are configured, and “no” indicates that no extended filters have been configured.
MAC Type	Not applicable.
Encap	DOCSIS encapsulation.
Type	Forwarded packets with Ethernet encapsulation.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
cable monitor	Enables the forwarding of selected packets on the cable interface to an external LAN analyzer.

show interface cable multicast-sessions

To display information about the multicast sessions on a specific cable interface, use the **show interface cable multicast-sessions** command in privileged EXEC mode.

show interface cable {*slot/port* | *slot/subslot/port*} **multicast-sessions**

Cisco IOS Release 12.2(33)SCE and later releases

show interface cable {*slot/cable-interface-index* | *slot/subslot/cable-interface-index*} **multicast-sessions** [**group** [{*ipv4-MQoS-group* | *ipv6-MQoS-group*}] | **latency** | **sid** [*MQoS-sid*]]

Syntax	Description
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot of the cable interface line card. The valid subslots are 0 or 1.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.
group [<i>ipv4-MQoS-group</i> <i>ipv6-MQoS-group</i>]	Displays information about the specified IPv4 or IPv6 multicast quality of service (MQoS) group.
latency	Displays information about the multicast session latency.
sid [<i>MQoS-sid</i>]	Displays information about the MQoS service identifier (SID). The value of the SID ranges from 8192 to 12272.

Command Default None

Command Modes Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCA	This command was introduced.
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the downstream port of the Cisco uBR10-MC5X20 or the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.
12.2(33)SCF	This command was modified. The latency keyword was added.
IOS-XE 3.15.0S	This command was removed. It is not available on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example is a sample output from the **show interface cable multicast-sessions** command:

```
Router# show interface cable 7/0/0 multicast-sessions
Default Multicast Service Flow 3 on Cable7/0/0
Multicast Sessions on Cable7/0/0

Command History

Release	Modification
Cisco IOS Release 12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

The **show interface cable packetcable statistics** command provides IPC statistics for the PacketCable module for debugging purpose.

Examples

The following is a sample output of the **show interface cable packetcable statistics** command that shows PacketCable IPC statistics based on the cable interface specified on the Cisco uBR10012 router in Cisco IOS Release 12.2(33)SCF:

```
Router# show interface cable 7/1/0 packetcable statistics
Packetcable IPC Statistics on RP
Msg   create   gate   gate   gate set  dsd
      gie     set    del    notify   notify
Sent  0         10    0      0        0
Rcvd  0         0     0      10       0
Packetcable IPC Statistics on LC
Msg   create   gate   gate   gate set  dsd
      gie     set    del    notify   notify
Sent  0         0     0      10       0
Rcvd  0         10    0      0        0
```

The table describes the significant fields shown in the show interface cable packetcable statistics command display.

Table 228: show interface cable packetcable statistics Field Descriptions

Field	Description
Msg	IPC messages sent and received.
create gie	Gate create request.
gate set	Gate set request.
gate del	Gate delete request.
gate set notify	Gate set notification.
dsd notify	Dynamic service delete notification.

Examples for the Cisco cBR Series Converged Broadband Router

This example shows the output of the **show interface cable packetcable statistics** command on the Cisco cBR router:

```
Router#show interface cable 1/0/0 packetcable statistics
Packetcable IPC Statistics on RP
Msg   create   gate   gate   gate set  dsd
      gie     set    del    notify   notify
Sent  0         0     0      0        0
Rcvd  0         0     0      0        0

Router#
```

show interface cable packetcable statistics**Related Commands**

Command	Description
show interface cable dynamic-qos statistics	Displays dynamic service statistics based on the specified cable interface.

show interface cable privacy

To display the baseline privacy information, use the show interface cable privacy command in privileged EXEC mode.

```
show interface cable {slot/portslot/subslot/port} privacy {all | eae-policy | tek | kek | hotlist}
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable {slot/cable-interface-indexslot/subslot/cable-interface-index} privacy {all | eae-policy | tek | kek}
```

Cisco cBR Series Converged Broadband Router

```
show interface cable {slot/cable-interface-indexslot/subslot/cable-interface-index} privacy {all | eae-policy | tek | kek}
```

Syntax	Description
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR router—The valid range is 0 to 3 and 6 to 9.
<i>subslot</i>	Secondary slot number of the cable interface line card. <p>Cisco uBR10012 only—The valid subslots are 0 or 1.</p> <p>Cisco cBR router—The valid value is 0.</p>
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR router—The valid range is 0 to 15.
all	Displays all privacy configuration details.
eae-policy	Displays early authentication and encryption (EAE) configuration details.
tek	Displays the traffic encryption key (tek) values.
kek	Displays the key encryption key (kek) values.

hotlist	Displays a list of cable modems detected as clones.
----------------	---

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
12.2(33)SCD	A new keyword, hotlist , was added to display the cable modems detected as clones.
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. The hotlist keyword was removed from this command and added to the show cable privacy command.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

The show interface cable privacy command is available only in IOS images that support Baseline Privacy Interface (BPI) and BPI+ encryption.

Examples

This example shows the output of the show interface cable privacy command with the **tek** keyword:

```
Router#
show interface cable 3/0 privacy tek
Configured TEK life-time value = 56000
```

This example shows the output of the show interface cable privacy command with the **kek** keyword:

```
Router#
show interface cable 3/0 privacy kek
Configured KEK life-time value = 750000
```

This example shows the output of the show interface cable privacy command with the hotlist keyword:

```
Router#
show interface cable 5/1/0 privacy hotlist
Last
MAC Address           Ranged On           Type
00a0.73b0.4c43        Oct 27 21:57:39     Permanent
001a.c3ff.d2d4        Oct 27 21:57:40     Permanent
0018.6852.7746        Never                Permanent
000e.9bb3.b946        Never                Permanent
```

This example shows the output of the show interface cable privacy command with the eae-policy keyword:

```
Router#
show interface cable 5/1/0 privacy eae-policy
EAE Configuration
Policy: EAE Ranging Enforcement
```

This example shows the output of the **show interface cable privacy** command with the **all** keyword:

```

Router#
  show interface cable 5/1/0 privacy all
EAE Configuration
  Policy: EAE Ranging Enforcement
KEK Configuration
  KEK lifetime: 604800
  Auth Infos: 0
  Auth Requests: 0, Auth Replies: 0
  Auth Rejects: 0, Auth Invalids: 0
  Packet Buffer Failures: 0
  Unrecoverable SPA Key Failures: 0
TEK Configuration
  TEK lifetime: 43200
  TEK Requests: 0, TEK Replies: 0
  TEK Rejects: 0, TEK Invalids: 0

  SAMap Rejects: 0
Interface Configuration
  SelfSigned Trust: Untrusted
  Check Cert Validity Periods: True

```

Table 229: show interface cable privacy Command Field Description

Field	Description
Configured TEK life-time value =	Number of seconds defining the length of the traffic encryption key lifetime. The valid range is from 1,800 to 6,048,000 seconds. The default value is 43,200 seconds (12 hours).
Configured KEK life-time value =	Number of seconds defining the length of the key encryption key lifetime. The valid range is from 86,400 to 6,048,000 seconds. The default value is 604,800 seconds (7 days).
MAC Address	MAC address of the cloned cable modem.
Last Ranged On	Displays the time stamp when the cable modem last attempted registration on that interface. This value helps gauge the frequency with which the MAC address is attempting to be cloned, and manage the hotlist accordingly.
Type	<ul style="list-style-type: none"> • Permanent—The cable modem entry can be configured as a permanent clone from the CLI by executing the cable privacy hotlist cable modem command. A cable modem marked as a permanent clone can only be removed from the hotlist by executing the no form of the cable privacy hotlist cable modem command. • Temporary—The Cisco CMTS detects a duplicate cable modem MAC address. This duplicate MAC address is flagged as a clone and is prevented from coming online for 180 seconds.

This example shows the output of the **show interface cable privacy** command with the **all** keyword:

```

Router#show interface cable 1/0/0 privacy all
EAE Configuration
  Policy: EAE Enforcement disabled

KEK Configuration
  KEK lifetime: 604800

Related Commands

Command	Description
cable privacy	Enables the operation of BPI/BPI+ encryption on the Cisco CMTS router.
cable privacy eae-exclude	Forces a cable modem to register without an early authentication and encryption (EAE) policy.
cable privacy eae-policy	Enables an early authentication and encryption policy for a cable modem registraion.
cable privacy hotlist	Marks a CA certificate or cable modem certificate of a manufacturer as untrusted and adds it to the Cisco CMTS hotlist of invalid certificates.
cable privacy kek	Sets the KEK lifetime values for baseline privacy.
cable privacy tek	Sets the TEK lifetime values for baseline privacy.
show cable privacy	Displays the BPI certificate information.

show interface cable qos paramset

To display the attributes of the service flow quality of service (QoS) parameter set, use the **show interface cable qos paramset** command in privileged EXEC mode.

```
show interface cable {slot/port | slot/subslot/port} qos paramset [paramset-index] [verbose]
```

Cisco IOS Release 12.2(33)SCE and later releases

```
show interface cable {slot/cable-interface-index | slot/subslot/cable-interface-index} qos paramset [{paramset-index | total}] [verbose]
```

Cisco cBR Series Converged Broadband Router

```
show interface cable slot/subslot/cable-interface-index qos paramset [{paramset-index | total}] [verbose]
```

Syntax	Description
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR router—The valid range is 0 to 3 and 6 to 9.
<i>subslot</i>	Secondary slot number of the cable interface line card. Cisco uBR10012 only —The valid subslots are 0 or 1. Cisco cBR router—The valid value is 0.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. Cisco cBR router—The valid range is 0 to 15.
<i>paramset-index</i>	(Optional) Service template index (1 to 255).
total	(Optional) Displays the total number of service flows per service template.
verbose	(Optional) Displays full details about the QoS parameter set.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.1(4)CX	This command replaces the show cable qos profile command for DOCSIS 1.1 operation.
12.2(4)BC1	Support was added to the Release 12.2 BC train.
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.
12.2(33)SCF	This command was modified. The total keyword was added to display the total number of service flows per service template.
12.2(33)SCG	The command output was modified to display the scheduling type as “N/A” for all downstream service flows.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

The **show interface cable qos paramset** command displays the QoS parameter set for all the service flows on a particular cable interface.

Note Parameter sets that contain a service-class name string are not in an “expanded” state and serve as provisioning envelopes of class-based service flows. The actual attributes of such parameter sets depend on the service class that is referenced at the time the parameter sets are expanded.

Note Starting with Cisco IOS Release 12.2(33)SCG, the output of the **show interface cable qos paramset** command displays the scheduling type of all downstream service flows (DS-SF) as “N/A” to indicate that the DS-SFs do not have any scheduling type.

Examples**Example of the show interface cable qos paramset Command Output**

The following is a sample output of the **show interface cable qos paramset** command:

```
Router# show interface c6/0 qos paramset

Index Name          Dir  Sched  Prio  MaxSusRate  MaxBurst  MinRsvRate
1           US    BE     0    64000       0          0
2           DS    BE     0   1000000     0          0
3           US    BE     7   1000000    1522       0
4           DS    BE     0   10000000    3044       0
128         US    BE     7   1000000    1522       0
129         DS    BE     0   10000000    3044       0
```

Note In Cisco IOS Release 12.2(11)BC3 and later releases, the Cisco CMTS automatically maps the non-default DOCSIS 1.0 QoS profiles to profile numbers starting at 128, to facilitate their use in DOCSIS 1.1 networks.

Example of the show interface cable qos paramset verbose Command Output

The following is a sample output for the **verbose** form of the **show interface cable qos paramset** command:

```
Router# show interface c6/0 qos paramset 1 verbose
```

```

Index:                1
Name:
Direction:           Upstream
Traffic Priority:     0
Maximum Sustained Rate: 64000 bits/sec
Max Burst:            0 bytes
Minimum Reserved Rate: 0 bits/sec
Minimum Packet Size  0 bytes
Maximum Concatenated Burst: 1522
Scheduling Type:     Best Effort
Request/Transmission Policy: 0x0
Nominal Polling Interval: 0
Tolerated Poll Jitter: 0

```

Example of the show interface cable qos paramset total Command in Cisco IOS Release 12.2(33)SCF

The following is a sample output for the **total** option of the **show interface cable qos paramset** command:

```

Router# show interfaces cable 6/1/0 qos paramset total
Index SrvClassName   Dir  Sched  MaxSusRate  MaxBurst  MinRsvRate  Total
1      1                  US   BE     64000       0          0           50669
2      2                  DS   BE     1000000     0          0           50669
3      def_sclass         DS   BE     10000000    3044       0            6
4      us_srvclass_ts1   US   BE     0           3044       0            4
5      us_srvclass_ts1   US   BE     0           3044       0            8
6      us_srvclass_ts2   US   BE     0           3044       0            4
7      us_srvclass_ts2   US   BE     0           3044       0            8
8      ds_srvclass_ts1   DS   BE     0           3044       0           12
9      ds_srvclass_ts2   DS   BE     0           3044       0           12

```

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Table 230: show interface cable qos paramset Field Descriptions

Field	Description
Dir	Downstream (DS) or upstream (US) service flow.
Sched	Identifies scheduling type of the service flow: <ul style="list-style-type: none"> • BE—Best-Effort • N/A—Scheduling type is not applicable to a service flow. • NRTPS—Non-Real-Time Polling Service • RTPS—Real-Time Polling Service • RSVD—Reserved but not yet in use • UGS_AD—Unsolicited Grant Service with Activity Detection • UGS—Unsolicited Grant Service • UNDEF—Not yet defined.
Prio	Traffic priority (0 to 7) given to this service flow.
MaxSusRate	Maximum sustained rate value, in bits per second.
MaxBrst	Maximum burst value, in bytes.
MinRsvRate	Minimum reserved rate, in bits per second.
SrvClassName	Service class name associated with the service flow.
Total	Total number of service flows per service template.

Examples for Cisco cBR Series Converged Broadband Router

Related Commands

show cable qos permission	Displays the status of permissions for changing QoS tables.
show cable modem qos	Displays quality of service (QoS) and service flow information for a particular CM.
show cable qos profile	Displays the QoS profiles that have been defined.

show interface cable service-flow

To display the attributes of DOCSIS service flows on a cable interface, use the **show interface cable service-flow** command in privileged EXEC mode.

```
show interface cable {slot/port|slot/subslot/port} service-flow [sfid [{queue|classifiers|counters|phs|qos [{ds|us}]]] [verbose]]
```

Cisco IOS Release 12.2(33)SCE and later releases

```
show interface cable {slot/subslot/cable-interface-index} service-flow [sfid [{qos [{ds|service-class|us}]] | [zero-hwflow-index]]]
```

Cisco cBR Series Converged Broadband Router

```
show interface cable slot/subslot/cable-interface-index service-flow [sfid [{classifiers classifier-id|counters|qos|verbose}]] [qos [{ds|service-class|us}]] [zero-hwflow-index]
```

Syntax Description

<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR router—The valid range is 0 to 3 and 6 to 9.
<i>subslot</i>	Secondary slot number of the cable interface line card. <p>Cisco uBR10012 only —The valid subslots are 0 or 1.</p> <p>Cisco cBR router—The valid value is 0.</p>
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p> <p>Cisco cBR router—The valid range is 0 to 15.</p>
<i>sfid</i>	(Optional) Identifies the service flow index (1 to 65535).

queue	(Optional, Cisco 7100 and 7200 series routers only) Displays the downstream hierarchical queueing framework (HQF) queue information associated with this interface. To display detailed information of all the queues under this service flow, use the verbose option with this queue. This keyword is not supported on the Cisco cBR router.
classifiers <i>classifier-id</i>	(Optional) Displays all classifiers associated with this service flow or optionally display information only for the specified classifier ID (<i>clid</i> , 1 to 65535).
counters	(Optional) Displays the real-time counters for the service flow for a specific SFID, to include the number of matches when used with the verbose keyword. This counter remains initialized for upstream service flows. The match count for upstream classifiers is not supported and is replaced with null value - in such cases.
phs	(Optional) Displays packet header suppression rules and packet counters for the service flow for a specific SFID. The PHS packet counters are not supported on the Cisco uBR10-MC5X20 card and always shows 0 or N/A, depending on the software release. This keyword is not supported on the Cisco cBR router.
qos	(Optional) Displays QoS information for the service flow for all service flows or for a specific SFID.
ds	(Optional) Displays QoS information for all the downstream service flows on the interface.
service-class	(Optional) Displays service class names, along with other QoS information, for all the service flows on the interface.
us	(Optional) Displays QoS information for all the upstream service flows on the interface.
verbose	(Optional) Displays detailed information on the service flow for a specific SFID.
zero-hwflow-index	Displays the service flows with zero hardware flow index.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.1(4)CX	This command was introduced.
12.2(4)BC1	The command was changed so that the optional keywords are supported only when displaying information for a specific service flow index.
12.2(8)BC1	The command was changed to remove the ability to display all service flows, and a service flow index must now be specified.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.

Release	Modification
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCB	This command was modified to display either the downstream (DS) channel ID or the bonding group (BG) ID of the forwarding interface assigned to the downstream service flow.
12.2(33)SCC	This command was modified to display bonded service flow information.
12.2(33)SCD	This command was modified. The queue keyword was added to display downstream HQF queue information for the interface.
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco UBR-MC20X20V, Cisco uBR-MC5X20 and Cisco uBR-MC3GX60V cable interface line cards.
12.2(33)SCF	This command was modified. The service-class keyword was added to display service class names for all the service flows on an interface.
12.2(33)SCG	The command output was modified to display the scheduling type as “N/A” for all downstream service flows.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The following keywords were removed: <ul style="list-style-type: none"> • queue • phs

Usage Guidelines

In Cisco IOS Release 12.2(4)BC1 and later, the optional keywords **classifiers**, **counters**, **phs**, **qos**, and **verbose** can be used only when requesting information for a specific service flow ID. When a service flow ID is specified, the **verbose** keyword can be used by itself or by any of the other optional keywords.

Note When using the **counters** keyword with the **verbose** keyword, this command displays the number of matches for the classifier match counter. However, this counter remains initialized for upstream service flows when using the **verbose** keyword. The match count for upstream classifiers is not supported and is replaced with null value - in such cases.

Note Starting with Cisco IOS Release 12.2(33)SCG, the output of the **show interface cable service-flow qos** command displays the scheduling type of all downstream service flows (DS-SF) as “N/A” to indicate that the DS-SFs do not have any scheduling type.

The following two **show** command examples illustrate counter information, with null value for the number of matches for the upstream service flow, when the **show interface cable service-flow** command is used with **verbose** keyword:

```
Router# show interface cable 6/0 service-flow 30191 verbose
```

show interface cable service-flow

Examples

This example shows the output of the **show interface cable service-flow** command.

Router# **show interface c3/0 service-flow**

Sfid	Sid	Mac Address	QoS	Param	Index	Type	Dir	Curr	Active	BG / CH
			Prov	Adm	Act			State	Time	
12	N/A	0014.0496.3f9e	4	4	4	prim	DS	act	3h17m	CH 1
11	5	0014.0496.3f9e	3	3	3	prim	US	act	3h17m	
14	N/A	0014.0496.3f76	4	4	4	prim	DS	act	3h17m	BG 102
13	6	0014.0496.3f76	3	3	3	prim	US	act	3h17m	
16	N/A	0007.0e07.24af	4	4	4	prim	DS	act	3h17m	CH 1
15	7	0007.0e07.24af	3	3	3	prim	US	act	3h17m	
18	N/A	0007.0e06.e1b5	4	4	4	prim	DS	act	3h17m	CH 3
17	8	0007.0e06.e1b5	3	3	3	prim	US	act	3h17m	

Per normal operation, the counter in the Number of Matches field is not initialized for working dynamic service flows. For upstream service flows, the classifier match count is not updated for upstream packet classifiers, and displays no results.

```
Router# show interface c6/0 service-flow 30191 verbose
Sfid : 30191
Mac Address : 000a.739e.140a

  Source Port Low : 53456
  Source Port High : 53456
  Destination Port Low : 7052
  Destination Port High : 7052
```

Note Per the DOCSIS 1.1 specification, the **show interface cable service-flow** command uses bytes allocated for a UGS service flow when calculating the throughput values for the service flow (see the Assumed Minimum Reserved Rate Packet Size parameter, TLV 11 in the upstream and downstream service flow configurations). Depending on the value of this parameter and the packet sizes of the actual traffic, this could result in throughput values that appear to be greater than the maximum sustained rate. You can use the **stats** option with the **show interface cable** command to display the actual byte counts.

Sample Downstream Flow

```
Router# show interface c4/0 service-flow 12 qos verbose

Sfid                               : 12
Current State                       : Active
Sid                                 : N/A
```

show interface cable service-flow

```
Traffic Priority           : 0
Maximum Sustained rate   : 1000000 bits/sec
Maximum Burst             : 0 bytes
Minimum Reserved rate    : 0 bits/sec
Minimum Packet Size      : 0 bytes
Maximum Latency          : 0 usecs
Current Throughput       : 0 bits/sec, 0 packets/sec
```

Sample Upstream Flow

```
Router# show interface c4/0 service-flow 11 qos verbose
```

```
Sfid                      : 11
Current State             : Active
Sid                       : 5
Traffic Priority          : 0
Maximum Sustained rate   : 64000 bits/sec
Maximum Burst             : 0 bytes
Minimum Reserved rate    : 0 bits/sec
Minimum Packet Size      : 0 bytes
Maximum Concatenated Burst : 1522
Scheduling Type           : Best Effort
Unsolicited Grant Size   : 0 bytes
Nominal Grant Interval   : 20000 usecs
Grants per interval      : 0
Tolerated Grant Jitter   : 0 usecs
Nominal Polling Interval : 0 usecs
Tolerated Polling Jitter : 0 usecs
Request/Transmission policy : 0x0
IP ToS Overwrite[AND-mask, OR-mask] : 0x0, 0x0
Current Throughput       : 0 bits/sec, 0 packets/sec
```

Tip When PacketCable services are enabled to allow PacketCable-based Voice over IP (VoIP) traffic, the Nominal Grant Interval reflects the packetization interval that is configured on the VoIP call agent.

```

```

Table 231: show interface cable service-flow Field Descriptions

Field	Description
Sfid	Service flow identification number. Note Primary service flow IDs are displayed even for offline CMs because they are needed for modem re-registration.
Sid	Service identification number (upstream service flows only).
Mac Address	MAC address of the CM.
QoS Parameter Index Prov	QoS parameter index for the Provisioned state of this flow.
QoS Parameter Index Adm	QoS parameter index for the Admitted state of this flow.
QoS Parameter Index Act	QoS parameter index for the Active state of this flow.
Type	Indicates if the service flow is the primary flow or a secondary service flow. Secondary service flows are also identified by an “S” (created statically at the time of registration, using the DOCSIS configuration file) or “D” (created dynamically by the exchange of dynamic service messages between the CM and CMTS).
Dir	Downstream (DS) or upstream (US) service flow.
Curr State	Current run-time state of the service flow.
Active Time	Length of time this service flow has been active.
BG/CH	BGID or the DS channel ID of the forwarding interface assigned to the downstream service flow.
Len/Limit Pkts	Length or limit of the packets.
Deqs Pkts	Dequeue packets
Drops Pkts	Dropped packets.
CIR Kbps	Committed information rate.
MIR/PR Kbps	Maximum information and peak rate.
Forwint	Forwarding interface.
SFID	Service flow identifier.

Field	Description
Sched Type	Identifies scheduling type of this service flow: <ul style="list-style-type: none"> • BE—Best-Effort • N/A—Scheduling type is not applicable to a service-flow. • NRTPS—Non-Real-Time Polling Service • RTPS—Real-Time Polling Service • RSVD—Reserved but not yet in use • UGS_AD—Unsolicited Grant Service with Activity Detection • UGS—Unsolicited Grant Service • UNDEF—Not yet defined.
Prio	Traffic priority (0 to 7) given to this service flow.
MaxSusRate	Maximum sustained rate value, in bits per second.
MaxBrst	Maximum burst value, in bytes.
MinRsvRate	Minimum reserved rate, in bits per second.
Throughput	Current throughput for this service flow, in packets per second.
SrvClassName	Service class name associated with the service flow.

Note The PHS packet counters are not supported on the Cisco uBR10-MC5X20 card and always shows 0 or N/A, depending on the software release.

The following example shows upstream bonding information on a cable interface line card in Cisco IOS Release 12.2(33)SCC:

```
Routeru# show interface cable 5/0/1 service-flow 3070 verbose
```

```
Sfid : 3070
Mac Address : 001a.c3ff.d59c
Type : Secondary(Static)
Direction : Upstream
Current State : Active
Current QoS Indexes [Prov, Adm, Act] : [6, 6, 6]
Active Time : 07:48
Required Attributes : 0x00000000
Forbidden Attributes : 0x00000000
Aggregate Attributes : 0x00000000
Sid : 720
Traffic Priority : 0
Maximum Sustained rate : 1000000 bits/sec
Maximum Burst : 1522 bytes
Minimum Reserved Rate : 0 bits/sec
Minimum Packet Size : 0 bytes
Admitted QoS Timeout : 200 seconds
Active QoS Timeout : 0 seconds
Packets : 58381
Bytes : 29891072
Rate Limit Delayed Grants : 63
Rate Limit Dropped Grants : 29058
```

The following example shows the output of the show interface cable service-flow counters command displaying the service flow counters on the cable interface at slot/subslot/port 7/1/0:

```

Router# show interface cable 7/1/0 service-flow 7 counters
Sfid Packets      Bytes      PacketDrop Bits/Sec  Packet/Sec
7     16          8384      0           0         0

```

Table 232: show interface cable service-flow phs Field Descriptions

Field	Description
Sfid	Service flow identification number. Note Primary service flow IDs are displayed even for offline CMs because they are needed for modem re-registration.
PHSI	PHS Index. Number that uniquely references the PHS rule.
PHSS	PHS Size. 8-bit value specifying the number of header bytes to be suppressed.
PHSV	PHS Verify. Indicates whether PHS verification is enabled.
PHSM	PHS Mask. 5-bit PHS mask that defines the header bytes that should be suppressed.
PHSF	PHS Field. 8-bit values that defines the header bytes that should be suppressed.

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show interface cable service-flow** command.

```

Router# show interface cable 3/0/0 service-flow

```

23    US  BE     1000000     1566     0
24    DS  N/A    2000000     3044     0
29    DS  N/A    3000000     3044     0
25    US  BE     1000000     1566     0
26    DS  N/A    2000000     3044     0
36    DS  N/A    3000000     3044     0
```

Related Commands

Command	Description
cable service class	Sets the parameters for DOCSIS 1.1 cable service class.
cable service flow inactivity-threshold	Sets the inactivity threshold value for service flows using Unsolicited Grant Service with Activity Detection (UGS-AD).
cable service-flow inactivity-timeout	Sets the amount of time a dynamic service-flow can be present in the system without any activity.
show cable qos permission	Displays the status of permissions for changing QoS tables.
show cable qos profile	Displays the QoS profiles that have been defined.

show interface cable sid

To display the service identifier (SID) information for a cable modem (CM), use the **show interface cable sid** command in privileged EXEC mode.

```
show interface cable {slot/portslot/subslot/port}sid id[ {association | connectivity | counters | qos |
secondary-ip | rate-adapt} ][ {verbose} ]
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable {slot/cable-interface-index slot/subslot/cable-interface-index }sid id[ {association |
connectivity | counters | qos | secondary-ip | rate-adapt} ][ {verbose} ]
```

Cisco cBR Series Converged Broadband Router

```
show interface cable slot/subslot/cable-interface-index sid sid[ {association | counters | qos} ][ {verbose} ]
```

Syntax	Description
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR router—The valid range is 0 to 3 and 6 to 9.
<i>subslot</i>	Secondary slot number of the cable interface line card. <p>Cisco uBR10012 only —The valid subslots are 0 or 1.</p> <p>Cisco cBR router—The valid value is 0.</p>
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p> <p>Cisco cBR router—The valid range is 0 to 15.</p>
<i>sid</i>	The service identification information number. The valid range is 1-8176.
association	Displays the virtual interfaces (VRF) or Interface Descriptor Blocks (IDBs).

connectivity	Displays the values of the per-SID connectivity statistics. (This option appears only in DOCSIS 1.0 and 1.0+ releases. Use the show cable modem connectivity command in DOCSIS 1.1 releases.) This keyword is not supported on the Cisco cBR router.
counters	Displays the values of the per-SID usage counters. Same as the keyword stats that appeared in Cisco IOS Release 11.3(5)NA and earlier releases.
qos	Displays the QoS characteristics received by each SID.
secondary-ip	Displays the secondary IP addresses associated with each SID. This keyword is not supported on the Cisco cBR router.
rate-adapt	(Cisco uBR7200 series and Cisco uBR10012 routers only) Displays the local or global upstream utilization optimization configuration parameters. This keyword is not supported on the Cisco cBR router.
verbose	Displays detailed information for the counters and qos options. Note The verbose option is supported by itself or with any of the other options, but it displays additional information only for the counters and qos options.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
11.3 XA	This command was introduced.
11.3(6)NA	The keyword stats was changed to counters .
12.0(4)XI	The primary SID information was added.
12.0(5)T	The command output was modified to identify secondary SIDs.
12.0(7)XR and 12.0(7)T	The verbose keyword was added to display additional information for the counters option.
12.1(4)CX, 12.2(1)XF, and 12.2(4)BC1	The qos keyword was added to display information on the QoS values received by the SID from the MAC scheduler. You can also use the verbose option with the qos keyword to display detailed information. Also, the connectivity option was removed and replaced by the show cable modem connectivity command.
12.1(11b)EC, 12.2(8)BC1	The association keyword was added.
12.2(8)BC2	An explicit error message was added if this command is used with a cable subinterface, instructing the user to use the main interface instead.
12.1(13)EC	The secondary-ip keyword was added for the Cisco uBR7100 series and Cisco uBR7200 series universal broadband routers.

Release	Modification
12.2(11)BC1	Support for the secondary-ip keyword was added for the Cisco uBR10012 universal broadband router.
12.2(11)CY, 12.2(11)BC3	Three codeword fields were added to the verbose counters display to support the Cisco uBR10-MC5X20S cable interface line card. These fields always display zero for the other cable interface line cards.
12.2(11)BC3	The counters option now displays the following counters: <ul style="list-style-type: none"> • Concatenated headers received • Fragmentation headers received • Fragmentation headers discarded <p>Note The Cisco uBR10-MC5X20S cable interface line card does not currently support these particular counters.</p>
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes: <ul style="list-style-type: none"> • Support for the Cisco uBR7225VXR router was added. • The “Dual IP” output field was added to indicate support of both IPv4 and IPv6 addressing.
12.3(23)BC2	This command was modified to add two rate-adapt output fields to the counters verbose form of the command.
12.2(33)SCB	The two rate-adapt output fields in the counters verbose form of the command were integrated into Cisco IOS Release 12.2(33)SCB.
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The following keywords were removed: <ul style="list-style-type: none"> • connectivity • secondary-ip • rate-adapt

Usage Guidelines

Data transport over the radio frequency (RF) link uses the registered SID address rather than the Ethernet address. This allows multiple hosts to access the network via a single CM.

The **verbose** keyword can be used with any of the other options or by itself, but it displays additional information only when used with the **counters**, **qos**, and **rate-adapt** options.

Note You can specify only a main interface with this command, not a subinterface.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Examples

This section shows the output from the different forms of the **show interface cable sid** command.

This example shows the error message that is displayed when you attempt to use this command on a subinterface:

```
Router# show interface cable 6/0.1 sid
Command not allowed on sub-interface
Please use main interface C6/0
```

show interface cable sid Examples

```
Router# show interface cable 4/0 sid

Sid  Prim  MAC Address      IP Address      Type Age      Admin  Sched  Sfid
     State Type
5     0010.7b6b.58c1 10.20.114.34   stat 2d1h36m enable BE    1
6     0010.7bed.9dc9 10.20.114.37   stat 2d1h36m enable BE    13
7     0010.7bed.9dbb 10.20.114.38   stat 2d1h36m enable BE    15
8     0010.7b6b.58bb 10.20.114.112  stat 2d1h34m enable BE    17
9     0010.7b6b.58bb 10.20.114.112  dyna 2d1h34m enable BE    19
```

This example shows the output from the **show interface cable modem** command in Cisco IOS Release 12.2(33)SCA for all SIDs on a particular cable interface on a Cisco uBR10012 router. None of the CMs or CPEs are supporting both IPv4 and IPv6 addressing, which is indicated by the “N” in the Dual IP output field.:

```
Router# show interface cable 8/0/0 sid

Sid  Prim  MAC Address      IP Address      Type Age      Admin  Sched  Sfid  Dual
     State Type
1     0008.0da6.1c47 50.3.134.12   stat 41:58 enable BE    3    N
2     0008.0da5.6e48 50.3.134.2    stat 41:58 enable BE    5    N
3     0008.0da6.0447 50.3.134.13   stat 41:55 enable BE    7    N
4     0008.0da6.3447 50.3.134.3    stat 41:56 enable BE    9    N
5     0011.8065.e78e 50.3.134.38   stat 40:52 enable BE   11    N
6     0000.cab7.8620 50.3.134.8    stat 41:25 enable BE   13    N
7     0011.8065.e7a6 50.3.134.10   stat 40:52 enable BE   15    N
8     0006.53b6.57f5 50.3.134.9    stat 41:34 enable BE   17    N
9     0006.53b6.581d 50.3.134.27   stat 41:08 enable BE   19    N
10    0007.0e04.ebfd 50.3.134.5    stat 41:04 enable BE   21    N
```

Table 233: show interface cable sid Field Descriptions

Field	Description
Sid	Service identification number.
Prim	The primary service identifier (SID) assigned to the modem.
MAC address	MAC address of the modem owning this SID.

Field	Description
IP address	IP address of the modem owning this SID.
Type	Indicates whether this SID was created statically (“stat”) at the time of registration, or dynamically (“dyna”) by the exchange of dynamic service messages between the CM and CMTS.
Age	Length of time that the SID has been enabled.
Admin State	Administrative state of the SID, where “Disable” means that the SID has been turned off. “Enable” is the normal state.
Sched Type	The service class schedule type, where: 2–Best-Effort Schedule Type 3–Non-Real-Time Polling Service Schedule Type 4–Real-Time Polling Service Schedule Type 5–Unsolicited Grant Service with Activity Detection Schedule Type 6–Unsolicited Grant Service Schedule Type
Sfid	Service flow identifier.
Dual IP	Identifies whether or not (“Y” or “N”) the CM or CPE supports both IPv4 and IPv6 addressing.

show interface cable sid qos Examples

```
Router# show interface cable 4/0 sid qos
```

```
Sid Pr MaxSusRate MinRsvRate Sched Grant Grant GPI Poll Thrput
      Type Size Intvl      Type Size Intvl      Intvl

```

show interface cable sid qos verbose Examples

```
Router# show interface cable 4/0 sid 5 qos verbose
```

```
Sid : 5
Traffic Priority : 0
Maximum Sustained Rate : 64000
Maximum Burst : 0
Minimum Reserved Rate : 0
Minimum Packet Size : 0
Maximum Concatenated Burst : 1522
Scheduling Type : Best Effort
Nominal Grant Interval : 0
Tolerated Grant Jitter : 0
Nominal Polling Interval : 0
```

show interface cable sid

```

Tolerated Polling Jitter           : 0
Unsolicited Grant Size             : 0
Grants per Interval                : 0
Request/Transmission Policy       : 0x0
IP ToS Overwrite [AND-mask, OR-mask] : 0x0, 0x0
Current Throughput                  : 0 bits/sec, 0 packets/sec

```

show interface cable sid counter Examples

When using DOCSIS 1.1 software, such as Cisco IOS Release 12.2 BC, the **show interface sid counter** command provides the following display:

```
Router# show interface cable 5/0 sid counter
```

Sid	Req-polls issued	BW-reqs received	Grants issued	Packets received	Frag complete	Concatpkts received
1	0	22	22	22	0	0
2	0	3	3	2	0	0
3	0	0	0	0	0	0

When using DOCSIS 1.0 software, such as Cisco IOS Release 12.1 EC, the **show interface sid counter** command provides the following display:

```
Router# show interface cable 5/0 sid counter
```

Sid	Inpackets	Inoctets	Outpackets	Outoctets	Ratelimit BWReqDrop	Ratelimit DSPktDrop
6	51	6559	42	3580	0	0
7	47	5993	40	3428	0	0
8	47	6136	36	3122	0	0
9	0	0	0	0	0	0

show interface cable sid counter verbose Examples

This example shows the typical verbose output for the SID counters on a Cisco uBR-MCxxC cable interface line card:

```
Router# show interface cable 4/0 sid 3 counter verbose
```

```

Sid                               : 3
Request polls issued              : 0
BW requests received              : 1
No grant buf BW request drops    : 0
Rate exceeded BW request drops   : 0
Grants issued                     : 1
Packets received                  : 0
Bytes received                    : 0
Fragment reassembly completed    : 0
Fragment reassembly incomplete   : 0
Concatenated packets received    : 0
Queue-indicator bit statistics   : 0 set, 0 granted
Good Codewords rx                 : 0
Corrected Codewords rx            : 0
Uncorrectable Codewords rx        : 0
Concatenated headers received    : 0
Fragmentation headers received   : 0
Fragmentation headers discarded  : 0

```

This example shows the typical verbose output for the SID counters on the Cisco uBR10-MC5X20S cable interface line card:

```
Router# show interface cable 4/0 sid 3 counters verbose

Sid : 1
Request polls issued : 0
BWReqs {Cont,Pigg,RPoll,Other} : 0, 1052, 1052, 0
No grant buf BW request drops : 0
Rate exceeded BW request drops : 0
Grants issued : 1052
Packets received : 0
Bytes received : 0
Fragment reassembly completed : N/A
Fragment reassembly incomplete : N/A
Concatenated packets received : N/A
Queue-indicator bit statistics : 0 set, 0 granted
Good Codewords rx : 53
Corrected Codewords rx : 6110
Uncorrectable Codewords rx : 8540896
Concatenated headers received : 235
Fragmentation headers received : 0
Fragmentation headers discarded: 0
```

Note Because the Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, and Cisco uBR10-MC5X20S/U/H cable interface line cards do not support the fragmentation and concatenation packet counters, these counters always show zero for these particular cable interfaces. However, these interfaces do accurately count the number of concatenation headers, as shown above.

show interface cable sid association Example

This example shows the typical output for the **association** keyword:

```
Router# show interface cable 5/0 sid association

Sid Prim Online IP Address MAC Address Interface VRF Name
1 online 192.168.129.20 0003.e38f.e993 Ca5/0.50 green
2 online 192.168.129.17 0003.e38f.e89d Ca5/0.50 green
3 init(t) 192.168.129.12 00d0.baa2.fb93 Ca5/0.50 green
```

Note The output of the **show interface cable sid association** command output will not display the updated interface name immediately after deleting a VRF. This is because the SID is not re-mapped automatically to the interface on which the CM comes online. If you want to view the updated interface name, reset the cable modem to re-map the interface name and then execute this show command.

This example shows the sample output for the **secondary-ip** keyword:

```
Router# show interface cable 5/0 sid secondary-ip

For sid 1 secondary ip list contains 2 address(es)
```

```

192.168.129.20
192.168.81.123
For sid 2 secondary ip list contains 2 address(es)
192.168.129.17
10.10.11.3

```

Tip One possible situation that might occur is if a CM first assigns a secondary IP address to one CPE device, but later that same IP address is assigned to another CPE device behind a different CM. If this happens, the IP address will continue to show up as a secondary IP address for the original CM until that CM renews its public keys. This will not affect network connectivity for either CPE or CM. You can, however, clear the unneeded secondary IP address from the CMTS database using the **clear cable secondary-ip** command.

Table 234: show interface cable sid Field Descriptions

Field	Description
Sid	Service identification number.
Prim Sid	The primary service identifier (SID) assigned to the modem.
Type	Indicates that this SID was created statically at the time of registration or dynamically by the exchange of dynamic service messages between the CM and CMTS.
Online State Offline State	“Online” means that the modem owning this SID is processing traffic. “Offline” means that the modem owning this SID is not processing traffic.
Admin Status	“Disable” means that the SID has been turned off. “Enable” is the normal state.
QoS	Quality of service.
Create time	When the SID was created, number of seconds since the system booted.
Input octets (In octets)	Number of octets received by using this SID.
Input packets (In packets)	Number of packets received by using this SID.
Output octets (Out octets)	Number of octets sent from this SID.
Output packets (Out packets)	Number of packets sent from this SID.
IP address	IP address of the modem owning this SID.
MAC address	MAC address of the modem owning this SID.
BW requests received	Number of bandwidth requests received by this SID.
Grants issued	Number of bandwidth requests granted by this SID.
Rate exceeded BW request drops	Number of bandwidth requests not granted by this SID.
Rate exceeded DS packet drops	Number of downstream packets lost by this SID.

Field	Description
Ratelimit BWReqDrop	Number of bandwidth requests not granted by this SID.
Ratelimit DSPktDrop	Number of downstream packets lost by this SID.
1st time online	Time at which the modem with this SID connected.
Times online	Number of times the modem with this SID connected.
% online	Percentage of time the modem with this SID has been connected.
Online time	The minimum, average, and maximum number of hours and minutes the modem with this SID has been connected. Note A CM is considered online when it has completed the registration process and has communicated with the DHCP, TFTP, and TOD servers.
Offline time	The minimum, average, and maximum number of hours and minutes the modem with this SID has been disconnected. Note A CM is considered offline after it has missed 16 consecutive station maintenance messages.
MaxSusRate	The maximum rate (0 to 4,294,967,295 bps).
MinRsvRate	The minimum guaranteed rate (0 to 4,294,967,295 bps).
Sched Type	The service class schedule type: 2–Best-Effort Schedule Type 3–Non-Real-Time Polling Service Schedule Type 4–Real-Time Polling Service Schedule Type 5–Unsolicited Grant Service with Activity Detection Schedule Type 6–Unsolicited Grant Service Schedule Type
Grant Size	The grant size (0 to 65535 bytes).
Grant Interval	The grant interval (0 to 4294967295 microseconds).
GPI	The grants per interval (0 to 127 grants).
Poll Interval	The poll interval (0 to 4294967295 microseconds).
Throughput	The overall throughput for this SID.
VRF Name	Name of the virtual interface that has been configured for Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) operation.
Fragment reassembly completed	Number of packets that were subject to DOCSIS fragmentation that were successfully reassembled. Note This counter is not supported on the Cisco uBR10-MC5X20 card and always shows 0 or N/A, depending on the software release.

Field	Description
Fragment reassembly incomplete	Number of packets that were subject to DOCSIS fragmentation that have not yet been successfully reassembled. Note This counter is not supported on the Cisco uBR10-MC5X20 card and always shows 0 or N/A, depending on the software release.
Concatenated packets received	Number of packets that were subject to DOCSIS concatenation that were successfully received. Note This counter is not supported on the Cisco uBR10-MC5X20 card and always shows 0 or N/A, depending on the software release.
Good Codewords rx	Number of FEC codewords received without error.
Corrected Codewords rx	Number of FEC codewords received with errors that could be corrected.
Uncorrectable Codewords rx	Number of FEC codewords received with errors that could not be corrected.
Concatenated packets received	Number of concatenation headers received on an upstream service flow. (This field always shows 0 for the Cisco uBR10012 router, but you can use the docsQosUpstreamConcatBursts attribute in DOCS-QOS-MIB to get a current count.)
Fragmentation headers received	Number of fragmentation headers received on an upstream service flow, regardless of whether the fragment was correctly reassembled into a valid packet. (See docsQosUpstreamFragments in DOCS-QOS-MIB.)
Fragmentation headers discarded	Number of upstream fragments discarded and not assembled into a valid upstream packet. (See docsQosUpstreamFragDiscards in DOCS-QOS-MIB.)

Examples for the Cisco cBR Series Converged Broadband Router

This example shows the output of the **show interface cable sid** command on the Cisco cBR router:

```
Router#show interface cable 1/0/0 sid
Sid  Prim  MAC Address      IP Address      Type Age      Admin  Sched  Sfid Dual
      State Type
1      0025.2e2d.74f8 10.1.2.110     BE 8h55m enable BE 15 Y
2      0025.2eaf.7f38 10.1.2.7       BE 20h26m enable BE 17 Y
3      0025.2eaf.8302 10.1.2.6       BE 20h26m enable BE 19 Y
4      0025.2eaf.82f4 10.1.2.9       BE 20h18m enable BE 25 Y
5      0025.2e2d.75be 10.1.2.4       BE 10h13m enable BE 29 Y

Router#
```

This example shows the output of the **show interface cable sid** command with the **association** on the Cisco cBR router:

```
Router#show interface cable 1/0/0 sid association
Sid Prim Online      IP Address      MAC Address      Interface      VRF Name      MPLS
TC
1          online      10.1.2.4        0025.2e2d.75be  Bu1            N/A
2          online      10.1.2.110     0025.2e2d.74f8  Bu1            N/A

Router#

Related Commands

Command	Description
clear cable secondary-ip	Clears the router's table that links secondary IP addresses to the devices that use them.
show cable modem connectivity	Displays connectivity statistics for one or more CMs.
show interface cable signal-quality	Displays information about the cable signal quality.

show interface cable signal-quality

To display information about the signal quality of a downstream port on a cable interface line card in a Cisco CMTS, use the **show interface cable signal-quality** command in privileged EXEC mode.

```
show interface cable {slot /port | slot /subslot /port} signal-quality [n]
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable {slot /cable-interface-index | slot /subslot /cable-interface-index} signal-quality [n]
```

Syntax Description		
<i>slot</i>	Slot where the line card resides.	<ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8.
<i>subslot</i>	Secondary slot number of the cable interface line card. Cisco uBR10012 only —The valid subslots are 0 or 1.	
<i>port</i>	Downstream port number.	<ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards.	<p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p>
<i>n</i>	(Optional) Identifies a particular upstream on the selected interface.	

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
11.3 XA	This command was introduced.
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.

show interface cable signal-quality

Release	Modification
IOS-XE 3.15.0S	This command is not supported on Cisco cBR Series Converged Broadband Router.

Examples

This example shows the output from the **show interface cable signal-quality** command:

```
Router# show interface cable 6/0 signal-quality
Cable6/0: Upstream 0 is up includes contention intervals: TRUE
```

This table describes the fields shown in the **show interface cable signal-quality** display.

Table 235: show interface cable signal-quality Field Descriptions

Field	Description
Cable	Interface name.
Upstream is up includes contention intervals	States whether this statement is true.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Related Commands

Command	Description
show interface cable downstream	Displays cable interface information.
show interface cable sid	Displays information by SID of each cable access router on the network.

show interface cable upstream

To display information about an upstream on a cable interface, use the **show interface cable upstream** command in privileged EXEC mode.

```
show interface cable {slot/port slot/subslot/port}upstream [{n}][{ugs statistics | rate-adapt}]
show interface cable {slot/port slot/subslot/port}upstream [{bonding-group}]
```

Cisco IOS Release 12.2(33)SCE and later releases

[{bonding-group}]
```

Cisco cBR Series Converged Broadband Router

```
show interface cable slot/subslot/cable-interface-indexupstream [{n}][{ugs statistics}]
```

Syntax	Description
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR router—The valid range is 0 to 3 and 6 to 9.
<i>subslot</i>	Secondary slot number of the cable interface line card. <p>Cisco uBR10012 —The valid subslots are 0 or 1.</p> <p>Cisco cBR router—The valid value is 0.</p>
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. <ul style="list-style-type: none"> • Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. • Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. • Cisco cBR router—The valid range is 0 to 15.
<i>n</i>	(Optional) Specific upstream to be displayed. Valid values start with 0 for the first upstream port on the cable interface line card.

ugs statistics	(Optional) Displays statistics related to Unsolicited Grant Service (UGS) flows on the upstream.
rate-adapt	(Optional) Displays whether a specific upstream is enabled or disabled for upstream utilization optimization. This keyword is not supported on the Cisco cBR router
bonding-group	(Optional) Displays the bonding groups configured on an upstream port. This keyword is not supported on the Cisco cBR router
<i>index</i>	(Optional) Bonding group index value. Valid values are from 1 to 65535. This variable is not supported on the Cisco cBR router

Command Default

If no upstream is specified, all upstreams on the given cable interface are shown.

Command Modes

Privileged EXEC (#)

Command History

BC Release	Modification
12.2(4)BC1	The MAC-related information in this command was moved to the show interface cable mac-scheduler command for DOCSIS 1.1 operations.
12.2(15)BC1a	The ugs statistics keywords were added to Cisco IOS Release 12.2BC.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.3(23)BC2	The rate-adapt keyword was added.
C Release	Modification
12.1(4)CX1	The MAC-related information in this command was moved to the show interface cable mac-scheduler command for DOCSIS 1.1 operations.
SC Release	Modification
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCB	The rate-adapt keyword was integrated into Cisco IOS Release 12.2(33)SCB.
12.2(33)SCC	This command was modified. The bonding-group keyword was added in Cisco IOS Release 12.2(33)SCC.
12.2(33)SCD2	This command was modified. The command output was modified to display the multiple transmit channel (MTC) mode cable modems that share a particular upstream channel in their transmit channel set (TCS).
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.

BC Release	Modification
12.2(33)SCE5	This command was modified. The show interface cable upstream command output was modified to display a warning message when no ports are configured on an upstream.
12.2(33)SCG	This command was modified. The <i>index</i> argument was added to the bonding-group keyword.
T Release	Modification
12.0(3)T	This command was integrated into Cisco IOS Release 12.0(3)T.
X Release	Modification
11.3XA	This command was introduced.
12.0(7)XR	The output was expanded.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The rate-adapt and the bonding-group keywords were removed.

Examples

This example shows the output of the **show interface cable upstream** command (DOCSIS 1.0 Cisco IOS software releases) for the upstream cable interface located in slot 6 and port 0:

```
Router# show interface cable 6/0 upstream 0
Cable6/0: Upstream 0 is up
Received 855 broadcasts, 147 multicasts, 408833 unicasts
0 discards, 925 errors, 0 unknown protocol
409835 packets input, 20 uncorrectable
884 noise, 0 microreflections
Total Modems On This Upstream Channel : 51 (51 active)
Default MAC scheduler
Queue[Rng Polls] 0/64, fifo queueing, 0 drops
Queue[Cont Mslots] 0/52, fifo queueing, 1 drops
Queue[CIR Grants] 0/64, fair queueing, 0 drops
Queue[BE Grants] 0/64, fair queueing, 0 drops
Queue[Grant Shpr] 0/64, calendar queueing, 0 drops
Reserved slot table currently has 0 CBR entries
Req IEs 8296144, Req/Data IEs 0
Init Mtn IEs 57962, Stn Mtn IEs 14413
Long Grant IEs 133168, Short Grant IEs 67845
Avg upstream channel utilization : 6%
Avg percent contention slots : 89%
Avg percent initial ranging slots : 2%
Avg percent minislots lost on late MAPs : 0%
Total channel bw reserved 0 bps
CIR admission control not enforced
Admission requests rejected 0
Current minislot count : 6788097 Flag: 0
Scheduled minislot count : 6788190 Flag: 0
```

This example shows the output of the **show interface cable upstream** command (DOCSIS 1.1 Cisco IOS software releases) for the upstream cable interface located in slot 6 and port 0:

```
Router# show interface cable 6/0 upstream 0

Upstream 0 is up
```

show interface cable upstream

```

Received 38085 broadcasts, 5758 multicasts, 17257229 unicasts
0 discards, 1451132592 errors, 0 unknown protocol
17301072 packets input, 48239157 uncorrectable
1071719720 noise, 0 microreflections
Total Modems On This Upstream Channel : 147 (142 active)

```

This example shows the output for the upstream cable interface located for the Cisco uBR10-MC5X20S and Cisco uBR-MC28U/X line cards, which provides information about the error counters maintained by the card onboard MAC controller for each upstream interface:

```

Router# show interface cable 6/1/0 upstream 0

Cable6/1/0: Upstream 3 is up
  Received 140 broadcasts, 2075 multicasts, 134502 unicasts
  0 discards, 144954 errors, 0 unknown protocol
  136717 packets input, 0 uncorrectable
  0 noise, 0 microreflections
  Total Modems On This Upstream Channel : 37 (35 active)
  JIB counters for ifInErrors:
    us_error_frame_drop 72477
    us_crc_error 4
    us_hcs_error 72473
    us_cont_collision 0
    us_uncorr_cw_rcvd 14

```

The following shows the sample output for the **ugs statistics** option:

```

Router# show interface cable 6/1/0 upstream 3 ugs statistics

UGS Statistics for Upstream 3
# of Active UGS on the Upstream : 4
          UGS Allocation Statistics
          max          min          avg
Last 1 Hour          14           3           4
Last 5 Min           12           5           5

```

The following shows the sample output for the **rate-adapt** option:

```

Router# show interface cable 6/1/0 upstream 0 rate-adapt

Global:Enabled US[0]:Enabled rate-adapt_total: 0
local:maps 500 pri 6, rate 150000 bcs 10 (10) fcms Off

```

The following example shows the segment information for upstream ports on cable interface 7/0/1:

```

Router#show interface cable 7/1/0 upstream
Cable7/1/0: Upstream 0 is up
  Received 1236 broadcasts, 0 multicasts, 312274 unicasts
  0 discards, 37623 errors, 0 unknown protocol
  313510 packets input
  Codewords: 315034 good 82 corrected 1 uncorrectable
  0 noise, 0 microreflections
  Total NON-MTC Modems On This Upstream Channel : 3 (3 active)
  Segments: 0 valid, 0 discarded
Cable7/1/0: Upstream 1 is up
  Received 0 broadcasts, 0 multicasts, 0 unicasts
  0 discards, 0 errors, 0 unknown protocol
  0 packets input
  Codewords: 0 good 0 corrected 0 uncorrectable
  0 noise, 0 microreflections
  Total NON-MTC Modems On This Upstream Channel : 0 (0 active)
  Segments: 0 valid, 0 discarded

```

Beginning in Cisco IOS Release 12.2(33)SCD2, the output of the **show interface cable upstream** command was modified to display the MTC mode cable modems that share a particular upstream channel in their TCS as shown in the following example:

```
Router# show interface cable 7/1/0 upstream 1
Cable7/1/0: Upstream 1 is up
  Received 1236 broadcasts, 0 multicasts, 312274 unicasts
  0 discards, 37623 errors, 0 unknown protocol
  313510 packets input
  Codewords: 315034 good 82 corrected 1 uncorrectable
  0 noise, 0 microreflections
  Total NON-MTC Modems On This Upstream Channel : 0(0 active)
  Total MTC Modems On This Upstream Channel : 3 (3 active)
  Segments: 0 valid, 0 discarded
```

The following example shows the bonding groups configured for upstream ports on the cable interface 7/0/1:

```
Router# show interface cable 7/1/0 upstream bonding-group
Cable7/1/0: Upstream Bonding Group 2
  0 packets input, 0 octets input
  Segments: 0 valid, 0 discarded, 0 lost
  Reserved Bandwidth Max : 0 bits/sec
  Reserved Bandwidth      : 0 bits/sec
  Available Bandwidth      : 2560000 bits/sec
  Total Service Flows On This Bonding Group: 0
Cable7/1/0: Upstream Bonding Group 12
  0 packets input, 0 octets input
  Segments: 0 valid, 0 discarded, 0 lost
  Reserved Bandwidth Max : 0 bits/sec
  Reserved Bandwidth      : 0 bits/sec
  Available Bandwidth      : 2560000 bits/sec
  Total Service Flows On This Bonding Group: 0
Cable7/1/0: Upstream Bonding Group 235
  0 packets input, 0 octets input
  Segments: 0 valid, 0 discarded, 0 lost
  Reserved Bandwidth Max : 0 bits/sec
  Reserved Bandwidth      : 0 bits/sec
  Available Bandwidth      : 15360000 bits/sec
  Total Service Flows On This Bonding Group: 0
```

Example of show interface cable upstream Command for Cisco IOS Release 12.2(33)SCE5

Starting with Cisco IOS Release 12.2(33)SCE5, the show interface cable upstream command output is modified to display a warning message when no ports are configured on an upstream.

The following example displays the output of the show interface cable upstream command for upstream 0:

```
Router# show interface cable 7/0/0 upstream 0
No upstream configured on mac-domain Cable7/0/0
```

The following example displays the output of the show interface cable upstream command with ugs statistics option:

```
Router# show interface cable 7/0/0 upstream 0 ugs statistics
No upstream configured on mac-domain Cable7/0/0
```

The following example displays the output of the show interface cable upstream command with rate-adapt option:

```
Router# show interface cable 7/0/0 upstream 0 rate-adapt
No upstream configured on mac-domain Cable7/0/0
```

Table 236: show interface cable upstream Field Descriptions

Field	Description
Cable	Location of the upstream interface.
Upstream is up/ ...administratively down	Administrative state of the upstream interface.
Received broadcasts	Number of broadcast packets received through this upstream interface.
multicasts	Number of multicast packets received through this upstream interface.
unicasts	Number of unicast packets received through this interface.
discards	Number of packets discarded by this interface, typically because of buffer overruns.
errors	<p>Total of all packets with errors that prevented the transmission of the packets through this upstream interface. This figure could include the following error packets:</p> <ul style="list-style-type: none"> • Collisions of request and request/data packets • Damaged frames received during request and request data requests or slots, typically because they had bad forward error correction (FEC) header checksums (HCS) • Damaged frames received from ranging requests • Data packets with unique word, collision, or no energy • Number of upstream bursts whose preamble or unique word could not be correctly received • Packets with at least one frame with an uncorrectable error <p>On Broadband Processing Engine (BPE) cable interface line cards, such as the Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, and Cisco uBR10-MC5X20S/U line cards, this counter also counts conditions such as HCS/CRC errors and collisions that occur during initial ranging requests and bandwidth requests. Compare this counter with the uncorrectable error counter from the show cable hop command to determine whether a problem with noise exists, or whether the counter is high only because a large number of CMs are trying to register.</p>
unknown protocol	Number of packets received that were using an unknown protocol (the packet was not an IP, ARP, or PPPoE packet). This counter also includes DOCSIS frames that could not be identified as DOCSIS frames because of malformed headers or invalid header options.
packets input	Number of frames received (broadcast, multicast, and unicast) through this upstream interface that were free from errors.

Field	Description
corrected	Number of frames received through this upstream interface that had errors that were corrected.
uncorrectable	<p>Number of frames received through this upstream interface that had errors that could not be corrected. This means the frame had at least one uncorrectable FEC block, making the whole frame uncorrectable. Nominally, you should expect at most 1 uncorrectable error per 10,000 packets, and typically, the uncorrectable error rate is much less in good environments.</p> <p>Note This counter is not supported on Broadband Processing Engine (BPE) cable interface line cards, such as the Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, and Cisco uBR10-MC5X20S/U/H line cards, because these line cards count only uncorrectable codewords, not frames. As a result, this field always shows 0 or N/A for these line cards, depending on the software release. Instead of this field, use the show cable hop command to display the number of uncorrectable errors per codeword.</p>
noise	Number of upstream packets of any type that were corrupted by line noise.
microreflections	<p>Approximate number of upstream packets corrupted by microreflections. Microreflections are a type of impairment that is caused by impedance mismatches between amplifiers, couples, cables, and other equipment in the cable plant. Microreflections create copies of a signal that arrive at the receiver with different amounts of delay and attenuation, generating intersymbol interference (ISI) that can cause the receiver to improperly detect the amplitude and phase of the incoming signal.</p> <p>Note This value is not exact but provides an approximate indication of the microreflections that have been received.</p>
Guaranteed-rate service queue depth	Number of bandwidth requests queued up in the Guarantee-rate queue. This queue is available only to CMs that have a reserved minimum upstream rate in their class of service (CoS).
Best-effort service queue depth	Number of bandwidth requests queued up in the Best-effort queue. This queue is available to all CMs that do not have any reserved rate on the upstream.
Total Modems On This Upstream Channel	Number of CMs currently sharing this upstream channel. This field also shows how many of these CMs are active.
Total NON-MTC Modems On This Upstream Channel	Number of non-MTC cable modems currently sharing this upstream channel. This field also shows how many of these CMs are active.
Total MTC Modems On This Upstream Channel	Number of MTC cable modems currently sharing this upstream channel. This field also shows how many of these CMs are active.
Segments	Valid segments and discarded segments transmitted on a logical channel interface will be added.

Field	Description
JIB counters for ifInErrors	<p>Error counters for the upstream interface that are maintained by the MAC controller that is onboard certain cable interface line cards (such as the Cisco uBR10-MC5X20S and Cisco uBR-MC28U/X line cards):</p> <ul style="list-style-type: none"> • us_error_frame_drop = Number of frames dropped from the upstream frame queue because the queue was already full with packets with various errors, such as cyclic redundancy check (CRC), header checksum (HCS), fragmentation, concatenation, and unrecognized frame errors. • us_crc_error = Number of packets with CRC errors that were received on the upstream. • us_hcs_error = Number of packets with HCS errors that were received on the upstream. • us_cont_collision = Number of packets that were received with a collision detected during contention transmit opportunity. • us_uncorr_cw_rcvd = Number of packets with uncorrectable codewords that were received on the upstream.
Rng Polls	MAC scheduler queue showing number of ranging polls.
Cont Mslots	MAC scheduler queue showing number of forced contention request slots in MAP.
CIR Grants	MAC scheduler queue showing number of CIR grants pending.
BE Grants	MAC scheduler queue showing number of Best-Effort grants pending.
Grant Shpr	MAC scheduler queue showing number of grants buffered for traffic shaping.
Reserved slot table	Number of slots that the MAC scheduler has placed in the reserved slot table at the time that the command was made.
Req IEs	Counter of Request IEs sent in MAP.
Req/Data IEs	Counter of Request/Data IEs sent in MAP.
Init Mtn IEs	Counter of Initial Maintenance IEs.
Stn Mtn IEs	Number of station maintenance (ranging poll) IEs.
Long Grant IEs	Number of long grant IEs.
ShortGrmg IEs	Number of short grant IEs.
Avg upstream channel utilization	Average percent of the upstream channel bandwidth being used for user (Ethernet) traffic. This does not include DOCSIS MAC-layer packets.
Avg percent contention slots	Average percent of slots available for CMs to request bandwidth using contention mechanisms. Also indicates the amount of unused capacity in the network.
Avg percent initial ranging slots	Average percent of slots in the initial ranging state.

Field	Description
Avg percent minislots lost on late MAP	Average percent of slots that were lost because a MAP interrupt was too late.
Current Total Bandwidth Reserved	Total amount of bandwidth reserved by all CMs sharing this upstream channel that require bandwidth reservation. The CoS for these CMs specifies some nonzero value for the guaranteed-upstream rate. When one of these CMs is admitted on the upstream, this field value is incremented by this guaranteed-upstream rate value.
CIR admission control	Status of admission control on the upstream channel. ENFORCED status allows users to enable admission control on a per-port basis. This controls how limited bandwidth is allocated. NOT ENFORCED status indicates that there is no admission control. Every modem that registers with a class of service (COS) specifying a minimum upstream rate is admitted by the CMTS, regardless of how much aggregate bandwidth is actually available. Users enable admission control via the admission control command-line interface (CLI).
Subscription Level	Amount of oversubscription to allow on this upstream channel, as configured with the cable upstream admission-control command. Oversubscription is expressed as a percentage of the raw capacity of the channel.
Reservation Limit (with Oversubscription)	Maximum cumulative bandwidth reservation allowable before rejecting new CMs.
Admission requests rejected	Number of CMs that attempted to register on this interface but were rejected because of the admission control policy that has been configured with the cable upstream admission-control command.
Virtual channel bw	Maximum virtual bandwidth of this capacity, in bits per second (b/s), when admission control is enabled.
Last Minislot Stamp (current_time_base)	Current minislot count at the CMTS. FLAG indicates the timebase reference. This field is used only by developers.
Last Minislot Stamp (scheduler_time_base)	Furthest minislot count allocated at the indicated time. FLAG indicates the timebase reference. This field is used by developers.
# of Active UGS on the Upstream	Number of Unsolicited Grant Service (UGS) flows that are currently active on the upstream.
UGS Allocation Statistics (max, min, avg)	Maximum number of UGS service flows, minimum number of UGS service flows, and average number of UGS service flows that have been allocated on the upstream over the last hour and last five minute period.

Field	Description
Rate-adapt	Rate-adapt is enabled and any local upstream (US) configuration information: <ul style="list-style-type: none"> • global—Rate-adapt is enabled globally. • US—Rate-adapt is enabled locally on a specific US. • pri—Indicates the priority setting for the local US. • rate—Indicates the minimum max-rate setting for the local US. • bcs—Indicates the number of broadcast contention minislots.

Table 237: show interface cable upstream bonding-group Field Descriptions

Field	Description
packets input	Number of drops, errors, and total number of packets received on each upstream.
octets input	Number of octets received on the upstream.
Segments	Number of valid segments, discarded segments and lost segments transmitted on a bonding group.
Reserved Bandwidth Max	Maximum amount of bandwidth reserved for a bonding group.
Reserved Bandwidth	Amount of bandwidth reserved by all CMs sharing this upstream channel.
Available Bandwidth	Amount of bandwidth available on a bonding group.
Total Service Flows on this Bonding Group	Number of service flows assigned to a particular bonding group.

Tip In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a time stamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

This example shows the output of the **show interface cable upstream bonding-group** command showing bonding group 2 configuration on the cable interface 7/0/1 in Cisco IOS Release 12.2(33)SCG:

```
Router# show interface cable 7/1/0 upstream bonding-group 2
30 seconds input rate 515470 bits/sec, 1000 packets/sec.
```

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show interface cable upstream** command on the Cisco cBR router:

```
Router#show interface cable 1/0/0 upstream
MAC domain upstream impairment report: 0x0
```

```
Cable1/0/0: Upstream 0 is up
  Description: UC3/0/0:U0
  Received 20 broadcasts, 1710 multicasts, 10882 unicasts
  0 discards, 0 errors, 0 unknown protocol
  12612 packets input
  Codewords: 15234 good 0 corrected 0 uncorrectable
  0 noise, 0 microreflections
  Total NON-MTC Modems On This Upstream Channel : 3 (3 active)
  Total MTC Modems On This Upstream Channel : 0 (0 active)
  Segments: 0 valid, 0 discarded
Cable1/0/0: Upstream 1 is up
  Description: UC3/0/0:U1
  Received 28 broadcasts, 3916 multicasts, 12806 unicasts
  0 discards, 0 errors, 0 unknown protocol
  16750 packets input
  Codewords: 30419 good 0 corrected 0 uncorrectable
  0 noise, 0 microreflections
  Total NON-MTC Modems On This Upstream Channel : 2 (2 active)
  Total MTC Modems On This Upstream Channel : 0 (0 active)
  Segments: 0 valid, 0 discarded
Cable1/0/0: Upstream 2 is down
  Received 0 broadcasts, 0 multicasts, 0 unicasts
  0 discards, 0 errors, 0 unknown protocol
  0 packets input
  Codewords: 0 good 0 corrected 0 uncorrectable

Router#

```

This example shows the output of the **show interface cable upstream** command for a specific upstream port on the Cisco cBR router:

```

Router#show interface cable 1/0/0 upstream 1

MAC domain upstream impairment report: 0x0
Cable1/0/0: Upstream 1 is up
Description: UC1/0/0:U1
Received 28 broadcasts, 3949 multicasts, 12906 unicasts
0 discards, 0 errors, 0 unknown protocol
16883 packets input
Codewords: 30658 good 0 corrected 0 uncorrectable
0 noise, 0 microreflections
Total NON-MTC Modems On This Upstream Channel : 2 (2 active)
Total MTC Modems On This Upstream Channel : 0 (0 active)
Segments: 0 valid, 0 discarded
Router#

```

This example also shows the output of the **show interface cable upstream** command for a specific upstream port on the Cisco cBR router:

```

Router#show interfaces cable1/0/0 upstream 0

MAC domain upstream impairment report: 0x0
Cable1/0/0: Upstream 0 is up
Description: UC1/0/0:U0
Received 3807 broadcasts, 0 multicasts, 750999 unicasts
0 discards, 0 errors, 0 unknown protocol
754806 packets input
Codewords: 1394549 good 0 corrected 0 uncorrectable
0 noise, 0 microreflections
Total NON-MTC Modems On This Upstream Channel : 14 (14 active)
Total MTC Modems On This Upstream Channel : 52 (52 active)
Segments: 199946 valid, 0 discarded

```

This example shows the output of the **show interface cable upstream** command with the **ugs statistics** keyword on the Cisco cBR router:

```

Router#show interface cable 1/0/0 upstream 1 ugs statistics

UGS Statistics for Upstream 1
# of Active UGS on the Upstream : 0

UGS Allocation Statistics
max      min      avg
Last 1 Hour    0        0        0
Last 5 Min     0        0        0

```

Router#

Related Commands	Command	Description
	show interface cable	Displays configuration and status information for the cable interface.
	show interface cable downstream	Displays information about the downstream cable interface.
	show interface cable sid	Displays information by service identifier (SID) of each cable modem on the network.
	show interface cable signal-quality	Displays information about the cable signal quality.

show interface cable upstream debug

To display information about the Service ID (SID) tracking on a cable interface, use the **show interface cable upstream debug** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

On the Cisco cBR router, use the **show interface cable upstream debug** command with the **sf-tracking** keyword on the Cisco line card to display the Service Flow (SF) tracking information.

```
show interface cable {slot/port slot/subslot/port} upstream debug sid-tracking sid-value start-index
count-number {summary | verbose}
```

```
show interface cable {slot/port slot/subslot/port} upstream debug sid-tracking sid-value clear
```

Cisco IOS Release 12.2(33)SCE and later

```
show interface cable {slot/subslot/cable-interface-index} upstream debug sid-tracking sid-value start-index
count-number {summary | verbose}
```

```
show interface cable {slot/subslot/cable-interface-index} upstream debug sid-tracking sid-value clear
```

Cisco cBR Series Converged Broadband Router

```
show interface cable {slot/subslot/cable-interface-index} upstream debug sf-tracking sfid-value start-index
count-number [summary | verbose]
```

```
show interface cable {slot/subslot/cable-interface-index} upstream debug sid-tracking sfid-value clear
```

Syntax Description

<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR router—The valid range is 0 to 3 and 6 to 9.
<i>subslot</i>	Secondary slot number of the cable interface line card. <p>Cisco uBR10012 —The valid subslots are 0 or 1.</p> <p>Cisco cBR router—The valid value is 0.</p>
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).

<i>cable-interface-index</i>	Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards. Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1. Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14. Cisco cBR router—The valid range is 0 to 15.
sid-tracking <i>sid-value</i>	Specifies the SID number for which SID tracking details are displayed. The valid range is from 1 to 8191.
sf-tracking <i>sfid-value</i>	On the Cisco cBR router— Specifies the SFID number for which the tracking details are required to be displayed. The valid range is from 1 to 65536.
<i>start-index</i>	First event you want to display. Cisco uBR10012 router—The valid range is from 0 to 40000 Cisco cBR router—Valid values are from 0 to 4294967295.
<i>count-number</i>	Total number of events you want to display. Cisco uBR10012 router—The valid range is from 0 to 40000 Cisco cBR router—Valid values are from 0 to 4294967295.
summary	(Optional) Displays the summary of events.
verbose	(Optional) Displays queuing and token bucket information for bandwidth requests.
clear	Clears the SID tracking data.

Command Modes

Privileged EXEC (#)

Line card slot (Slot-x-0#)

Command History

Release	Modification
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

The **show interface cable upstream debug** command with the **sf-tracking** keyword must be used on the Cisco cBR line card. To enter the line card mode, do the following:

In the Privileged EXEC (#) mode, use the **request platform software console attach slot/subslot** command. This example displays how to go to the line card Slot mode:

```
Router#request platform software console attach 1/0

#
# Connecting to the CLC console on 1/0.
# Enter Control-C to exit the console connection.
#
Slot-1-0> en
Slot-1-0#
```

See the examples for information on how to use the **show interface cable upstream debug sf-tracking** command in the line card Slot mode.

Examples

The following is a sample output of the **show interface cable upstream debug** command on a cable interface line card in slot 5, subslot 0, and port 1:

```
Router# show cable 5/0/1 upstream debug sid-tracking 35 0 40000 [19 ]:BWREQ_2
 2662273505 4594-usecs bytes:2987 req_id:0 sid:35
[63 ]:BWREQ_2 2662361817 4905-usecs bytes:2987 req_id:0 sid:35
[108 ]:BWREQ_2 2662450105 5190-usecs bytes:2987 req_id:0 sid:35
[151 ]:BWREQ_2 2662535807 4893-usecs bytes:2987 req_id:0 sid:35
[196 ]:BWREQ_2 2662624956 4043-usecs bytes:2987 req_id:0 sid:35
[240 ]:BWREQ_2 2662713320 4407-usecs bytes:2987 req_id:0 sid:35
[284 ]:BWREQ_2 2662801603 4682-usecs bytes:2987 req_id:0 sid:35
[328 ]:BWREQ_2 2662889928 5006-usecs bytes:2987 req_id:0 sid:35
[373 ]:BWREQ_2 2662978229 5304-usecs bytes:2987 req_id:0 sid:35
[417 ]:BWREQ_2 2663067305 4381-usecs bytes:2987 req_id:0 sid:35
[461 ]:BWREQ_2 2663155618 4694-usecs bytes:2987 req_id:0 sid:35
[505 ]:BWREQ_2 2663243945 5020-usecs bytes:2987 req_id:0 sid:35
```

Examples for the Cisco cBR Series Converged Broadband Router

This example shows the output of the **show interface cable upstream debug sf-tracking** command with the **summary** keyword on the Cisco cBR line card:

```
Slot-1-0#show interface cable 1/0/0 upstream debug sf-tracking 1 1 10 summary
Show tracking (1 .. 11) for SFID 1 in Cable1/0/0
cmts_mac_sched_sf_id_track_show: md 0 sfid 1 start 1 count 10, tx-status 1
Slot-1-0#
```

This example shows the output of the **show interface cable upstream debug sf-tracking** command with the **verbose** keyword on the Cisco cBR line card:

```
Slot-1-0#show interface cable 1/0/0 upstream debug sf-tracking 1 1 10 verbose
Show tracking (1 .. 11) for SFID 1 in Cable1/0/0
cmts_mac_sched_sf_id_track_show: md 0 sfid 1 start 1 count 10, tx-status 1
Slot-1-0#
```

Related Commands

Command	Description
debug cable interface	Displays debugging messages for a specific cable interface, or for traffic related to a specific MAC address or Service ID on that cable interface.
show interface cable	Displays configuration and status information for the cable interface.

show interface gigabitethernet

To display status of the gigabitethernet interface, its MAC and IP address details, and information about the Downstream External PHY Interface (DEPI) traffic, use the **show interface gigabitethernet** command in privilege EXEC mode.

show interface gigabitethernet *slot/subslot*{*bayport*}

Syntax Description

<i>slot</i>	The slot where a SIP or cable line card resides. <ul style="list-style-type: none"> • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR7225VXR router—The valid range is from 1 to 2. • Cisco uBR10012 router—The valid range for: <ul style="list-style-type: none"> • Cable line card is from 5 to 8 • SIP is 1 and 3
<i>subslot</i>	The subslot where a SIP or cable line card resides. <ul style="list-style-type: none"> • Cisco uBR10012 router—The valid value for: <ul style="list-style-type: none"> • Cable line card in slot 5 to 8 is 0 or 1 • SPAs in a SIP in slot 1 or 3, prior to Cisco IOS Release 12.2(33)SCB is 0 or 1. For Cisco IOS Release 12.2(33)SCB and later, subslot is not specified.
<i>bay</i>	The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).
<i>port</i>	Specifies the port number. <ul style="list-style-type: none"> • Cisco uBR7246VXR router and Cisco uBR7225VXR router—The valid range is from 0 to 1. • Cisco uBR10012 router—The valid value for: <ul style="list-style-type: none"> • Slot 1 and 3 is 0 • Slot 5 to 8 is from 0 to 4

Command Default

Command History

Release	Modification
12.2(33)SCE	This command was introduced.
12.2(33)SCG	This command was modified. The status of the output flow-control and input flow-control in the output is displayed as on or off.

Examples

This is a sample output for the **show interface gigabitethernet** command:

```

Router# show interface gigabitethernet 6/1/0
GigabitEthernet6/1/0 is up, line protocol is up
Hardware is Gigabit Ethernet MAC Controller, address is 0013.5f06.7f74 (bia 0013.5f06.7f74)
Internet address is 56.1.1.1/24
MTU 1500 bytes, BW 10000 Kbit, DLY 10 usec,
    reliability 255/255, txload 1/255, rxload 1/255
    Encapsulation ARPA, loopback not set
    Keepalive not set
    Full Duplex, 1000Mbps, link type is auto, media type is SX
    output flow-control is unsupported, input flow-control is unsupported
    ARP type: ARPA, ARP Timeout 04:00:00
    Last input 00:00:01, output 00:00:00, output hang never
    Last clearing of "show interface" counters never
    Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 8
    Interface GigabitEthernet6/1/0 queueing strategy: PXF Class-based
    5 minute input rate 0 bits/sec, 0 packets/sec
    5 minute output rate 0 bits/sec, 0 packets/sec
    2557 packets input, 541995 bytes, 0 no buffer
    Received 0 broadcasts (0 IP multicasts)
    0 runts, 0 giants, 0 throttles
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
    0 watchdog, 0 multicast, 0 pause input
    723 packets output, 52113 bytes, 0 underruns
    0 output errors, 0 collisions, 1 interface resets
    0 babbles, 0 late collision, 0 deferred
    0 lost carrier, 0 no carrier, 0 pause output
    0 output buffer failures, 0 output buffers swapped out
Router#

```

Effective with Cisco IOS Release 12.2(33)SCG, the **show interface gigabitethernet** command was modified to display the correct status of the output and input flow-control parameters as on or off. This change is applicable only to Cisco SPA-5X1G and Cisco SPA-1X10G shared port adapters.

The following example shows the changed output of the **show interface gigabitethernet** command:

```

Router# show interface gigabitethernet1/2/3
Load for five secs: 5%/0%; one minute: 8%; five minutes: 8%
Time source is NTP, 14:25:51.761 CST Wed Feb 20 2013
GigabitEthernet1/2/3 is down, line protocol is down
Hardware is GigEther SPA, address is 649e.f366.b71d (bia 649e.f366.b71d)
MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec,
    reliability 255/255, txload 1/255, rxload 1/255
    Encapsulation ARPA, loopback not set
    Keepalive set (10 sec)
    Full Duplex, 1000Mbps, link type is auto, media type is LX
    output flow-control is on, input flow-control is on
    ARP type: ARPA, ARP Timeout 04:00:00
    Last input never, output never, output hang never
    Last clearing of "show interface" counters never
    Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
    Interface GigabitEthernet1/2/3 queueing strategy: PXF Class-based
    30 second input rate 0 bits/sec, 0 packets/sec
    30 second output rate 0 bits/sec, 0 packets/sec
    0 packets input, 0 bytes, 0 no buffer
    Received 0 broadcasts (0 IP multicasts)
    0 runts, 0 giants, 0 throttles
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
    0 watchdog, 0 multicast, 0 pause input
    0 packets output, 0 bytes, 0 underruns
    0 output errors, 0 collisions, 0 interface resets
    0 babbles, 0 late collision, 0 deferred
    0 lost carrier, 0 no carrier, 0 pause output

```

```
show interface gigabitethernet
```

```
0 output buffer failures, 0 output buffers swapped out  
Router#
```

Related Commands

Command	Description
show controller gigabitethernet	Displays information about the Gigabit Ethernet interface used by the DEPI.

show interface integrated-cable

To display the current configuration and status for an integrated channel, use the **show interface integrated-cable** command in privileged EXEC mode.

Cisco uBR10012 Router

show integrated interface-cable *slot/subslot/port: interface-number* [{options}]

Cisco uBR7246VXR and Cisco uBR7225VXR Routers

show integrated interface-cable *slot/port: interface-number* [{options}]

Cisco cBR Series Converged Broadband Router

show integrated interface-cable *slot/subslot/port: integrated-Cable-interface-number* [{options}]

Syntax	Description
<i>slot/subslot/port</i>	<ul style="list-style-type: none"> • <i>slot</i>—Slot where the line card resides. The valid range is from 5 to 8. • <i>subslot</i>—Subslot where the line card resides. The available slots are 0 or 1. • <i>port</i>—Downstream controller number on the line card. The valid <i>port</i> values are 0 to 4. <p>Cisco cBR router—</p> <ul style="list-style-type: none"> • <i>slot</i>—The valid range is 0 to 3 and 6 to 9. • <i>subslot</i>—Subslot where the line card resides. The valid value is 0. • <i>port</i>—Downstream controller number on the line card. The valid range is from 0 to 7.
<i>slot/port</i>	<p>On the Cisco uBR7225VXR or Cisco uBR7246VXR routers:</p> <ul style="list-style-type: none"> • <i>slot</i>—Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid range is from 1 to 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • <i>port</i>—Downstream controller number on the line card. The valid values are 0 or 1.
<i>integrated-Cable-interface-number</i>	<p>Integrated cable interface number. The valid range is from 0 to 3.</p> <p>Cisco cBR router—The valid range is from 0 to 162.</p>

<i>options</i>	<p>The following non-cable specific options generate information for integrated cable interfaces:</p> <ul style="list-style-type: none"> • accounting—Displays the number of packets of each protocol type that is sent through the interface. • controller—Displays the status of the interface, configuration, and controller. • counters—Displays the integrated cable interface counters. • crb—Displays the interface routing and bridging information. • dbs—Displays the Dynamic Bandwidth Sharing (DBS) scheduler information. • description—Displays the description entered for the interface. • dlm—Displays the DEPI Latency Measurement (DLM) statistics. This keyword is not supported on the Cisco cBR router. • downstream—Displays the downstream information. • history—Displays the interface history on the Cisco cBR router. • human-readable—Displays the interfaces output with larger numbers separated by comma(s) on the Cisco cBR router. • fair-queue—Displays the integrated cable interface Weighted Fair Queuing (WFQ) information. This keyword is not supported on the Cisco cBR router. • irb—Displays the interface routing and bridging information. • mac-accounting—Displays the interface MAC accounting information. • monitor—Displays the status of the interface continuously. • mpls-exp—Displays the interface Multiprotocol Label Switching (MPLS) experimental accounting information. • multicast-gcr—Displays the multicast QoS (MQoS) GCR details. • multicast-sessions—Displays information about the multicast sessions on the integrated-cable interface. • precedence—Displays interface precedence accounting information. • privacy—Displays privacy group information. This keyword is not supported on the Cisco cBR router. • random-detect—Displays the interface Weighted Random Early Detection (WRED) information. This keyword is not supported on the Cisco cBR router. • stats—Displays packets that are switched. • summary—Displays interface summary information. • switching—Displays interface switching information. This keyword is not supported on the Cisco cBR router.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCC	This command was introduced on the Cisco uBR10012 router.

Release	Modification
12.2(33)SCD	This command was integrated on the Cisco uBR7246VXR and Cisco uBR7225VXR routers.
12.2(33)SCF	This command was modified. The downstream keyword was enhanced to capture fairness across DOCSIS interfaces related information.
IOS-XE 3.15.0S	<p>This command was implemented on the Cisco cBR Series Converged Broadband Router.</p> <p>The following keywords were removed:</p> <ul style="list-style-type: none"> • dln • fair-queue • privacy • random-detect • switching <p>The following keywords were added:</p> <ul style="list-style-type: none"> • history • human-readable

Usage Guidelines

Some other non-cable specific options do not generate any meaningful information for integrated-cable interfaces. For information on the non-cable specific options, see the Cisco IOS Release 12.3 documentation on Cisco.com.

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to the **show** commands using the **exec prompt timestamp** command in line configuration mode.

Examples

This example shows the output of the **show interface integrated-cable accounting** command:

```
Router# showshow interface integrated-cable 7/0/0:0 accounting
Protocol    Pkts In   Chars In   Pkts Out   Chars Out
IP          0         0         280        41606
```

This example shows the output of the **show interface integrated-cable dbs** command:

```
Router# show interface integrated-cable 3/0:0 dbs
Dynamic Bandwidth Sharing is enabled
active 0
RF 0: tokens 23342, active 0, policer 4687 KB/s, max_tokens 23435
      deficit counter 0, quantum 6000
      ticks_limit: 62500, max_ticks:625000, policer(ticks): 312
```

The following is the sample output of the **show interface integrated-cable description** command:

```
Router# show interface integrated-cable 7/0/0:0 description
Interface           Status           Protocol Description

Related Commands

Command	Description
show interface integrated-cable queue	Displays the downstream hierarchical queuing framework (HQF) queue information for an integrated cable interface.

show interface integrated-cable queue

To display the downstream hierarchical queuing framework (HQF) queue information for an integrated cable interface, use the **show interface integrated-cable queue** command in privileged EXEC mode.

show interface integrated-cable *slot/port:sub-interface* **queue** [{**verbose** | **cblt** [{*cblt_index*priority}]} | **pblt**}]

Syntax Description

<i>slot/port</i>	<ul style="list-style-type: none"> <i>slot</i>—Slot where the line card resides. <ul style="list-style-type: none"> Cisco uBR7225VXR router—The valid range is from 1 to 2. Cisco uBR7246VXR router—The valid range is from 3 to 6. <i>port</i>—Downstream controller number on the line card. The valid <i>port</i> values are 0 or 1.
verbose	(Optional) Displays detailed information for all queues
cblt	(Optional) Displays detailed class layer bandwidth limited traffic (CBLT) stream information for normal downstream HQF queues.
<i>cblt_index</i>	CBLT index information.
<i>priority</i>	Displays CBLT information for priority HQF queues. Priority queues do not have any indexes.
pblt	(Optional) Displays detailed physical layer bandwidth limited traffic (PBLT) stream information for this interface.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCD	This command was introduced for the Cisco uBR7246VXR and Cisco uBR7225VXR routers.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Table 238: show interface integrated-cable – Field Description

Field	Description
Len/Limit Pkts	Queue length and limit in packets.
Deqs Pkts	Dequeue packets
Drops Pkts	Dropped packets.
CIR Kbps	Committed information rate, in kilobytes per second.
MIR/PR Kbps	Maximum information and peak rate, in kilobytes per second.
Forwint	Forwarding interface.
BE Queues	Best effort queues.
CIR Queues	Committed information rate queues.
Low Latency Queues	Low latency queues.
sfid	Service flow identification number.

Related Commands

Command	Description
show interface cable downstream	Displays information about the downstream on the cable interface.
show interface cable sid	Displays the service identifier (SID) information of each CM on the network.
show interface cable signal-quality	Displays information about the cable signal quality.
show interface cable upstream	Displays information about one or all upstreams on the cable interface.

Command	Description
show interface wideband-cable	Displays information about wideband channels.

show interface modular-cable

To display the current configuration and status of a modular cable interface, use the **show interface modular-cable** command in privileged EXEC mode.

Cisco IOS Releases 12.3(23)BC and 12.2(33)SCA

show interface modular-cable *slot/subslot/bay:nb-channel-number*

Cisco IOS Release 12.2(33)SCB

show interface modular-cable *slot/bay/port:nb-channel-number*

Cisco IOS Release 12.2(33)SCF

show interface modular-cable *slot/subslot/port:nb-channel-number*

Syntax Description

<i>slot</i>	Slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs.
<i>subslot</i>	Subslot where a SIP resides. On the Cisco uBR10012 router, subslot 0 is always specified.
<i>bay</i>	Bay in a SIP where a SPA is located. The valid values are 0 (upper bay) and 1 (lower bay).
<i>port</i>	Interface number on the SPA.
<i>unit</i>	Controller unit number.
<i>nb-channel-number</i>	Narrowband channel number.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(23)BC	This command was introduced.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. This command was modified to change the addressing format for a modular cable interface from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> .
12.2(33)SCF	This command was modified. The downstream keyword was enhanced to capture fairness across DOCSIS interfaces related information.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Examples

The following is sample output of the **show interface modular-cable** command:

```
Router# show interface modular-cable 1/0/0:0
Modular-Cable3/0/0:0 is up, line protocol is up
  Hardware is CMTS MC interface, address is 0011.9221.84be (bia 0011.9221.84be)
```

show interface modular-cable

  Total downstream guaranteed/non-guaranteed bonus bandwidth: 10644/10643 Kbps

```

Related Commands

Command	Description
show interface modular-cable accounting	Displays interface accounting information.
show interface modular-cable description	Displays a description for the interface.
show interface modular-cable downstream	Displays downstream information for the narrowband channel.
show interface modular-cable dsg	Displays DOCSIS Set-Top Gateway (DSG) information per interface.
show interface modular-cable intercept	Displays intercept stream information.
show interface modular-cable stats	Displays interface packets and octets that were switched.
show interface modular-cable summary	Displays interface summary information.
show interface modular-cable switching	Displays interface switching information.

show interface modular-cable accounting

To display interface accounting information, use the **show interface modular-cable accounting** command in privileged EXEC mode.

Cisco IOS Releases 12.3(23)BC and 12.2(33)SCA

show interface modular-cable {*slot/subslot/bay:nb-channel-number*} **accounting**

Cisco IOS Release 12.2(33)SCB

show interface modular-cable {*slot/bay/port:nb-channel-number*} **accounting**

Syntax Description

<i>slot</i>	The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs.
<i>subslot</i>	The subslot where a SIP resides. On the Cisco uBR10012 router, subslot 0 is always specified.
<i>bay</i>	The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).
<i>port</i>	Specifies the interface number on the SPA.
<i>nb-channel-number</i>	Represents the narrowband channel number.

Command Default

No default values or behavior

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. This command was modified to change the addressing format for a modular cable interface from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> .
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Examples

The following is sample output from the **show interface modular-cable accounting** command for the modular-cable interface in slot 1, subslot 0, bay 0, and narrowband channel number 0:

```
Router# show interface modular-cable 1/0/0:0 accounting
Modular-Cable1/0/0:0
          Protocol    Pkts In   Chars In   Pkts Out   Chars Out
          IP           0         0         1286       131092
```

Related Commands

12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Examples

The following is sample output of the **show interface modular-cable dlm** command for the modular cable interface in slot 1, bay 0, port 0, and modular-cable interface number 6:

```
Router# show interface Modular-Cable 1/0/0:6 dlm
DEPI Latency Measurements for Modular-Cable1/0/0:6
Current CIN Delay: 146 usecs
Current DLM: 4566
Average DLM (last 10): 1514
Max DLM: 5115
Min DLM: 913
Ingress DLM
#           SysUpTime           Delay (Ticks)
x-----x-----x-----
0           831149             949
1           831159             1168
2           831170             4566
3           831076             1005
4           831087             983
5           831097             1185
6           831108             1139
7           831118             1144
8           831128             2013
9           831139             996
```

Table 239: show interface modular-cable Field Descriptions

Field	Description
Current CIN Delay	Current CIN delay value.
Current DLM	Current DLM value.
Average DLM (last 10)	Average DLM value.
Max DLM	Maximum DLM .
Min DLM	Minimum DLM.
SysUpTime	The system up or active time.
Delay (Ticks)	The delay measured as number of ticks.

show interface modular-cable stats	Displays interface packets and octets that were switched.
show interface modular-cable summary	Displays interface summary information.
show interface modular-cable switching	Displays interface switching information.

show interface modular-cable multicast-sessions

To display information about multicast sessions on a specific modular-cable interface, use the **show interface modular-cable multicast-sessions** command in privileged EXEC mode.

```
show interface modular-cable slot/ {subslot bay}/port:wideband-channel [ {group | [ {ipv4-MQoS-group
ipv6-MQoS-group} ] | latency | sid [ {MQoS-sid} ] }
```

Syntax Description	
<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8.
<i>subslot</i>	(Cisco uBR10012 only) Secondary slot of the cable interface line card. The valid subslots are 0 or 1.
<i>bay</i>	Bay where the Cisco Wideband SPA is located. The valid range is from 0 to 3.
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>interface-number</i>	Modular-cable interface number. The valid range is from 0 to 23.
group [<i>ipv4-MQoS-group</i> <i>ipv6-MQoS-group</i>]	Displays information about the specified IPv4 or IPv6 multicast quality of service (MQoS) group.
latency	Displays information about the multicast session latency.
sid [<i>MQoS-sid</i>]	Displays information about the MQoS service identifier (SID). The value of the SID ranges from 8192 to 12272.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. This command was modified to change the addressing format for a modular cable interface from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> .
	12.2(33)SCF	This command was modified. The latency keyword was added.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Examples

The following is a sample output from the **show interface modular-cable multicast-sessions** command:

```
Router# show interface modular-cable 1/1/0:0 multicast-sessions
Default Multicast Service Flow 7 on Modular-Cable1/1/0:0
Multicast Group : 230.1.2.5

show interface modular-cable stats	Displays interface packets and octets that were switched.
show interface modular-cable summary	Displays interface summary information.

show interface multicast-gcr

To display the details of the Group Classifier Rule, use the **show interface multicast-gcr** command in privileged EXEC mode.

show interface { **cable** *slot/subslot/port* | **modular-cable** *slot/bay/port:channel* | **wideband-cable** *slot/bay/port:channel* } **multicast-gcr**

Cisco cBR Series Converged Broadband Router

show interface { **cable** *slot/subslot/cable-interface-index* | **wideband-cable** *slot/bay/port:channel* } **multicast-gcr**

Syntax Description		
cable <i>slot/subslot/port</i>	Identifies the cable interface for which information should be displayed, where:	<ul style="list-style-type: none"> • slot—0 to 8 • subslot—0 or 1 • port—0 to 4
cable <i>slot/subslot/cable-interface-index</i>	On the Cisco cBR Series Converged Broadband Router:	<ul style="list-style-type: none"> • <i>slot</i>—0 to 3, and 6 to 9. • <i>subslot</i>—0 • <i>cable-interface-index</i>—0 to 15.
modular-cable <i>slot/bay/port:channel</i>	Identifies the cable interface for which information should be displayed, where:	<ul style="list-style-type: none"> • slot—0 to 8 • bay—0 or 1 • port—0 • channel—0
wideband-cable <i>slot/bay/port:channel</i>	Identifies the wideband cable interface for which information should be displayed, where:	<ul style="list-style-type: none"> • slot—0 to 8 • bay—0 or 1 • port—0 • channel—0

Command Default No default behavior or values.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.

Release	Modification
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The modular-cable keyword was removed.

Usage Guidelines

Use this command to display the details of the Group Classifier Rule.

Examples

The following example shows a sample output for the **show interface multicast-gcr** command:

```
Router# show interface wideband-cable 1/1/0:0 multicast-gcr
Group Classifier Rules on Wideband-Cable1/1/0:0:
Classifier_id  Group_id  Group_Qos_id  Sid  SFID  ref_count
7             1         1             8196 10    1
8             2         1             8197 11    1
```

Table 240: show interface multicast-gcr Field Descriptions

Field	Description
Classifier_id	Displays group classifier ID.
Group_id	Displays group ID number of the Group Classifier Rules.
Group_Qos_id	Displays group QoS ID number of the Group Classifier Rules.
Sid	Displays information for the service identifier on the cable interface.
SFID	Displays service flow identifier (SFID).
ref_count	Displays the reference count.

Related Commands

Command	Description
show interface cable service-flow	Displays the attributes of DOCSIS service flows on a given cable interface.
show cable multicast db	Displays the contents of multicast explicit tracking database.
show cable multicast qos	Displays the configuration information for MQoS, (Group-Config, Group-QoS-Config, and Group-Encryption-Config).

show interface port-channel

To display the EtherChannel interfaces and channel identifiers, with their mode and operational status, use the **show interface port-channel** command in privileged EXEC mode.

show interface port-channel *number*

Syntax Description

<i>number</i>	Optional value enables the display of information for one port channel interface number. The range is from 1 to 64.
---------------	---

Command Default

No default behaviors or values.

Command Modes

Privileged EXEC

Command History

Release	Modification
12.2(11)BC3	This command was introduced on the Cisco uBR7246VXR router.
12.2(9a)BC	This command was introduced on the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Examples

The following example illustrates Gigabit EtherChannel (GEC) information for the port-channel interface of 2 as configured on a Cisco uBR10012 router with the PRE2 performance routing engine model.

This configuration is comprised of three GEC port channels as follows:

Member 0 is the GEC interface bundle primary.

Member 2 is the final subordinate interface in this GEC group.

These three port-channel interfaces (members) comprise one GEC group that is set up with a GEC peer on the network.

```
Router# show interface port-channel 2
Port-channel2 is up, line protocol is up
  Hardware is GEChannel, address is 8888.8888.8888 (bia 0000.0000.0000)
  Internet address is 101.101.101.1/16
  MTU 1500 bytes, BW 3000000 Kbit, DLY 10 usec,
    reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation ARPA, loopback not set
  Keepalive set (10 sec)
  ARP type: ARPA, ARP Timeout 04:00:00
  No. of members in this channel: 3
  No. of configured members in this channel: 3
  No. of passive members in this channel: 0
  No. of active members in this channel: 3
    Member 0 : GigabitEthernet1/0/0 , Full-duplex, 1000Mb/s
    Member 1 : GigabitEthernet3/0/0 , Full-duplex, 1000Mb/s
    Member 2 : GigabitEthernet2/0/0 , Full-duplex, 1000Mb/s
  No. of Non-active members in this channel: 0
```

```

Last input 00:00:02, output never, output hang never
Last clearing of "show interface" counters never
Input queue: 0/225/0/0 (size/max/drops/flushes); Total output drops: 0

```

show interface rf-status

To display the logical UP and DOWN state for each of the configured RF channels for a wideband interface, use the **show interface rf-status** command in privileged EXEC mode.

Cisco uBR7225VXR and Cisco uBR7246VXR Universal Broadband Routers

show interface wideband-cable slot/port:wideband-channel rf-status

Cisco uBR10012 Universal Broadband Router

show interface wideband-cable slot/bay/port:wideband-channel rf-status

Syntax Description	
<i>slot</i>	Slot where the line card resides. Cisco uBR7246VXR router—The valid range is from 3 to 6. Cisco uBR7225VXR router—The valid range is from 1 to 2. Cisco uBR10012 router—The valid range is from 5 to 8. Slots 1 and 3 can be used for SIPs.
<i>bay</i>	The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).
<i>port</i>	Specifies the downstream port number.
<i>wideband-channel</i>	Represents the wideband channel number.

Command Default The default logical state of each channel is UP.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	12.2(33)SCD	This command was modified. Support was added for Cisco uBR7225VXR and Cisco uBR7246VXR routers.
	IOS-XE 3.15.0S	This command was replaced by the show interfaces resil-rf-status command on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines The default logical state of each channel is UP. The state is set to DOWN when the threshold configured using **cable rf-change-trigger** command is reached.

Examples The following is a sample output of the **show interface rf-status** command on a wideband cable interface on a Cisco uBR10012 router:

```
Router# show interface wideband-cable 1/0/0:3 rf-status
Logical
```

show interface rf-status

```
RF  Status
--  -----
17  UP
18  UP
19  UP
```

The following is a sample output of the **show interface rf-status** command on a wideband cable interface on a Cisco uBR7225VXR router:

```
Router# show interface Wideband-Cable 5/1:0 rf-status
                Logical
Resource      RF  Status
-----
5/1           0  UP
              1  UP
              2  UP
```

Table 241: show interface rf-status Field Descriptions

Field	Description
Resource	The interface information.
RF	Cable interface line card or SPA downstream channel number.
Logical Status	The logical status of the RF channel. Default is UP.

Related Commands

Command	Description
show cable rf-status	Displays the logical state of all RF channels.

show interface resil-rf-status

To display the logical UP and DOWN state for each of the configured RF channels for a wideband interface, use the **show interface resil-rf-status** command in privileged EXEC mode.

show interface wideband-cable slot/bay/port:wideband-channel resil-rf-status

Syntax Description	slot	Slot where the line card resides. The valid range is 0 to 3 and 6 to 9.
	bay	The bay in a SIP where a SPA is located. Valid value is 0.
	port	Specifies the downstream port number. Valid range is 0 to 7
	wideband-channel	Represents the wideband channel number. The valid range is 0-63.

Command Default The default logical state of each channel is UP.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Router. This command replaces the show interface rf-status command.

Usage Guidelines The default logical state of each channel is UP. The state is set to DOWN when the threshold configured using **cable rf-change-trigger** command is reached.

Examples This example show the output of the **show interface rf-status** command on a wideband cable interface on Cisco cBR-8 router:

```
Router# show interfaces Wideband-Cable 1/0/0:0 resil-rf-status
  Load for five secs: 1%/0%; one minute: 3%; five minutes: 2%
  Time source is user configuration, 04:21:17.800 EDT Wed May 20 2015

Resource      RF      Logical
-----
3/0/0         0      UP
              1      UP
              2      UP
              3      UP
              4      UP
              5      UP
              6      UP
              7      UP
```

Table 242: show interface rf-status Field Descriptions

Field	Description
Resource	The interface information.
RF	Cable interface line card or SPA downstream channel number.
Logical Status	The logical status of the RF channel. Default is UP.

show interfaces tengigabitethernet

To display the ten gigabit ethernet interface information, use the **show interface tengigabitethernet** command in privileged EXEC mode.

```
show interface tengigabitethernet interface/port/-adapter/interface
[{accounting | controller | counters protocol status | crb | dampening | description | etherchannel |
history [ { 60min | 60sec | 72hour | all | both | input | output } ] | human-readable | irb | mac-accounting
| monitor interval seconds | mpls-exp | plim qos | precedence | stats | summary }]
```

Syntax Description

<i>slot/port/interface</i>	Slot where the line card resides. <i>slot</i> —The valid range is from 0 to 9. <i>port</i> —The valid range is from 0 to 1. <i>interface</i> —The valid range is from 0 to 63.
accounting	Displays the interface accounting.
controller	Displays the interface status, configuration and controller status.
counters protocol status	Displays the interface counters.
crb	Displays the interface routing or bridging information.
dampening	Displays the interface dampening information.
description	Displays the interface description.
etherchannel	Displays the interface etherchannel information.
history	Displays the interface history.
human-readable	Displays the output interfaces information.
irb	Displays the interface routing/bridging information.
mac-accounting	Displays the interface MAC accounting information.
monitor interval <i>seconds</i>	Displays the interfaces with the specified interval.
mpls-exp	Displays the interface MPLS experimental accounting information.
plim qos	Displays the tenGiga eth module plim commands.
precedence	Displays the interface precedence accounting information.
stats	Displays the interface packets and octets by switching path.
summary	Displays the interface summary.

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command displays the ten gigabit ethernet interface information.

Examples

The following is a sample output of the **show interface tengigabitethernet** command on a Cisco cBR-8 router:

```
Router# show interfaces tengigabitethernet 4/1/0 accounting
TenGigabitEthernet 4/1/0
      Protocol    Pkts In   Chars In   Pkts Out   Chars Out
      Other              15        1155        1814       109078
      IP 8038262210 9404766785700      0           0
      DEC MOP          15         1155         14         1078
      ARP              0           0           1           60
```

Related Commands

Command	Description
logical-edge-device	Define a logical edge device.
protocol	Specifies the protocol used in the logical edge device.
vei-bundle	Bundles the virtual edge inputs for a particular LED.
vcg	Specifies the virtual carrier group assigned to the logical edge device

show interfaces video accounting

To display the video service interface information, use the **show interface video accounting** command in privileged EXEC mode.

show interface video *slot/port/interface* **accounting**

Syntax Description	slot	Slot where the line card resides. The valid range is from 0 to 15.
	port	The bay in a SIP where a SPA is located. The valid values are 0 and 1.
	interface	Specifies the video interface number. The valid range is from 0 to 63.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command displays the video service interface information.

Examples The following is a sample output of the **show interface video accounting** command on a Cisco cBR-8 router:

```
Router# show interface video 3/0/0 accounting
Video3/0/0
          Protocol    Pkts In   Chars In   Pkts Out   Chars Out
          IP           0         0          8849       857276
          DEC MOP      0         0          269        16947
          ARP          0         0           4          112
```

Related Commands	Command	Description
	logical-edge-device	Define a logical edge device.
	protocol	Specifies the protocol used in the logical edge device.
	vei-bundle	Bundles the virtual edge inputs for a particular LED.

show interfaces VirtualPortGroup

To verify the VirtualPortGroup interface state, use the **show interfaces VirtualPortGroup** command in privileged EXEC mode.

show interfaces VirtualPortGroup *number*

Syntax Description	<i>number</i> Displays the information of the VirtualPortGroup with this number.
---------------------------	--

Command Default	None.
------------------------	-------

Command Modes	Privileged EXEC (#)

Syntax Description

<i>slot</i>	Slot where a SIP or line card resides. <ul style="list-style-type: none"> • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR7225VXR router—The valid range is from 1 to 2. • Cisco uBR10012 router—The valid range is from 5 to 8, and slots 1 and 3 can be used for SIP. • Cisco cBR router—The valid range is 0 to 3 and 6 to 9.
<i>subslot</i>	Secondary slot number of the SIP or a cable interface line card. Cisco uBR10012 —The valid subslots is 0. Cisco cBR router—The valid value is 0.
<i>bay</i>	Bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).
<i>port</i>	Specifies the port number. <ul style="list-style-type: none"> • Cisco uBR7246VXR router and Cisco uBR7225VXR router—The valid range is from 0 to 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface). • Cisco cBR router—The valid range is 0 to 15.
<i>wideband-channel</i>	Represents the wideband channel number. Valid values are from 0 to 31. On the Cisco uBR7246VXR and Cisco uBR7225VXR routers, the valid values are from 0 to 5.

<i>options</i>	<p>The following non-cable specific options generate information for wideband cable interfaces:</p> <ul style="list-style-type: none"> • accounting—Displays the number of packets of each protocol type that was sent through the interface. • description—Displays the description entered for the interface. • dbs—Displays DBS scheduler information. The dbs option is available only on the Cisco uBR7225VXR and Cisco uBR7246VXR routers. • downstream—Displays the downstream information. • multicast-sessions—Displays information about the multicast sessions on a specific wideband-cable interface. • privacy—Displays privacy group information. • service-flow—Displays the attribute-based assignment of service flows on a cable interface. • stats—Displays packets that were switched. • summary—Displays interface summary information. <p>The following additional non-cable specific options generate information for wideband cable interfaces on the Cisco cBR router:</p> <ul style="list-style-type: none"> • controller—Displays the status of the interface, configuration, and controller. • counters—Displays the wideband cable interface counters. • crb—Displays the interface routing and bridging information. • dbs—Displays the Dynamic Bandwidth Sharing (DBS) scheduler information. • history—Displays the interface history on the Cisco cBR router. • human-readable—Displays the interfaces output with larger numbers separated by comma(s) on the Cisco cBR router. • irb—Displays the interface routing and bridging information. • mac-accounting—Displays the interface MAC accounting information. • monitor—Displays the status of the interface continuously. • mpls-exp—Displays the interface Multiprotocol Label Switching (MPLS) experimental accounting information. • multicast-gcr—Displays the multicast QoS (MQoS) GCR details. • precedence—Displays interface precedence accounting information. • stats—Displays packets that are switched. • summary—Displays interface summary information.

Command History

Release	Modification
12.3(21)BC	This command was introduced on the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCB	This command was modified to change the addressing format for a wideband cable interface from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> .

Release	Modification
12.2(33)SCD	This command was modified. Support was added for Cisco uBR7225VXR and Cisco uBR7246VXR routers. The dbs, and service-flow keywords were added.
12.2(33)SCF	This command was modified. The downstream keyword was enhanced to capture fairness across DOCSIS interfaces related information.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The following keywords were added: <ul style="list-style-type: none"> • controller • counters • crb • history • human-readable • irb • mac-accounting • monitor • mpls-exp • multicast-gcr • precedence • stats— • summary

Usage Guidelines

Some of the non-cable specific options do not generate any meaningful information for wideband cable interfaces. For information on the non-cable specific options, see the Cisco IOS Release 12.3 documentation on Cisco.com.

In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

Examples

This example shows the output for the **show interface wideband-cable** command:

```
Router# show interface wideband-cable 1/0/0:1

Wideband-Cable1/0/0:1 is up, line protocol is up
  Hardware is Wideband CMTS Cable interface, address is 0012.001a.8897 (bia 0012.001a.8897)

  MTU 1500 bytes, BW 74730 Kbit, DLY 1000 usec,
    reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation MCNS, loopback not set
  Keepalive set (10 sec)
  ARP type: ARPA, ARP Timeout 04:00:00
  Last input never, output 00:00:09, output hang never
  Last clearing of "show interface" counters never
  Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
  Queueing strategy: fifo
  Output queue: 0/40 (size/max)
  30 second input rate 0 bits/sec, 0 packets/sec
  30 second output rate 0 bits/sec, 0 packets/sec
    0 packets input, 0 bytes, 0 no buffer
    Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
```

```

0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
24224 packets output, 1222002 bytes, 0 underruns
0 output errors, 0 collisions, 0 interface resets
0 output buffer failures, 0 output buffers swapped out

```

This example shows the output for the **show interface wideband-cable accounting** command:

```

Router# show interface wideband-cable 1/0/0:0 accounting
Wideband-Cable1/0/0:1
          Protocol    Pkts In   Chars In   Pkts Out   Chars Out
          IP          0         0         56493807  7909133546

```

This example shows the output for the **show interface wideband-cable description** command:

```

Router# show interface wideband-cable 1/0/0:0 description
Interface          Status      Protocol Description
Wi1/0/0:1          up          up

```

This example shows the output for the **show interface wideband-cable dbs** command:

```

Router# show interface wideband-cable 3/0:0 dbs
Dynamic Bandwidth Sharing is enabled
bg_rf_channel_bitmap_local B, active 0
RF 0: tokens 23254, active 0, policer 4687 KB/s, max_tokens 23435
      deficit counter 0, quantum 2000
      ticks_limit: 62500, max_ticks:625000, policer(ticks): 312
RF 1: tokens 23249, active 0, policer 4687 KB/s, max_tokens 23435
      deficit counter 0, quantum 5000
      ticks_limit: 62500, max_ticks:625000, policer(ticks): 312
RF 3: tokens 23249, active 0, policer 4687 KB/s, max_tokens 23435
      deficit counter 0, quantum 10000

```

This example shows the output for the **show interface wideband-cable service-flow** command:

```

Router# show interface wideband-cable 3/0:0 service-flow
Sfid Sid  Mac Address      QoS Param Index Type  Dir Curr  Active  DS-ForwIf/
          Prov  Adm  Act
          State  Time  US-BG/CH
3      8193  ffff.ffff.ffff  3    3    3    S(s)  DS  act   2h06m  Wi5/1:0

```

This example shows the output for the **show interface wideband-cable privacy** command:

```

Router# show interface wideband-cable 1/0/0:1 privacy all
EAE Configuration
  Policy: EAE Enforcement disabled
KEK Configuration
  KEK lifetime: 604800
  Auth Infos: 0
  Auth Requests: 0, Auth Replies: 0
  Auth Rejects: 0, Auth Invalids: 0
  Packet Buffer Failures: 0
TEK Configuration
  TEK lifetime: 43200
  TEK Requests: 0, TEK Replies: 0
  TEK Rejects: 0, TEK Invalids: 0
  SAMap Requests: 0, SAMap Replies: 0
  SAMap Rejects: 0
Interface Configuration
  SelfSigned Trust: Untrusted
  Check Cert Validity Periods: True

```

This example shows the output for the **show interface wideband-cable stats** command:

show interface wideband-cable

```
Router# show interface wideband-cable 1/0/0:1 stats
Wideband-Cable1/0/0:1
      Switching path   Pkts In   Chars In   Pkts Out   Chars Out
      Processor        0         0         0         0
      Route cache      0         0   56493807  7909133546
      Total            0         0   56493807  7909133546
```

This example shows the output for the **show interface wideband-cable summary** command:

```
Router# show interface wideband-cable 1/0/0:1 summary
*: interface is up
  IHQ: pkts in input hold queue      IQD: pkts dropped from input queue
  OHQ: pkts in output hold queue     OQD: pkts dropped from output queue
  RXBS: rx rate (bits/sec)           RXPS: rx rate (pkts/sec)
  TXBS: tx rate (bits/sec)           TXPS: tx rate (pkts/sec)
  TRTL: throttle count

  Interface           IHQ      IQD      OHQ      OQD      RXBS      R
  XPS      TXBS      TXPS      TRTL

```

Table 243: show interface wideband-cable Field Descriptions

Field	Description
Wideband-Cable slot/subslot/bay:wb-channel is up/...administratively down	Indicates whether the interface hardware is currently active or taken down by the administrator.
line protocol is up/...administratively down	Indicates whether the software processes that handle the line protocol believe the interface is usable or if it has been taken down by the administrator.
hardware	Hardware type and address.
Internet address	Internet address followed by subnet mask.
MTU	Maximum transmission unit (MTU) of the interface.
BW	Bandwidth of the interface in kilobits per second.
DLY	Delay of the interface in microseconds.

Field	Description
rely	Reliability of the interface as a fraction of 255, calculated as an exponential average over 5 minutes. (For example, 255/255 is 100 percent reliability.)
load	Load on the interface as a fraction of 255, calculated as an exponential average over 5 minutes. (For example, 255/255 is complete saturation.)
Encapsulation	Encapsulation method assigned to this interface.
Keepalive set	Keepalive time interval.
ARP type	Type of Address Resolution Protocol (ARP) and timeout value assigned.
Last input	Number of hours, minutes, and seconds since the last packet was successfully received by an interface.
output	Number of hours, minutes, and seconds since the last packet was successfully sent by an interface.
Last clearing of "show interface" counters	Time at which the counters that measure cumulative statistics (such as number of bytes sent and received) were last reset to zero.
Queueing strategy	Displays the type of queueing configured for this interface. In the following example output, the type of queueing configured is first-in first-out (FIFO).
Output queue	Number of packets in the output queue. The format of this number is A/B, where A indicates the number of packets in the queue, and B indicates the maximum number of packets allowed in the queue.
drops	Indicates the number of packets dropped because of a full queue.
input queue/drops	Number of packets in the input queue. The format of this number is A/B, where A indicates the number of packets in the queue, and B indicates the maximum number of packets allowed in the queue.
drops	Indicates the number of packets dropped because of a full queue.
Five minute input rate Five minute output rate	Average number of bits and packets sent per second in the last five minutes. The five-minute interval is the default time period for statistics collection and can be changed for each individual cable interface using the load-interval command in interface configuration mode.

Field	Description
<p>Note</p> <p>These statistics are calculated using a decayed averaging method, where only the average is stored over the interval period, not the individual samples. Every time a sample average is taken, a percentage of the sample and a percentage of the average are added together to create the new average. If traffic stops for a time period, these statistics do not immediately go to zero but drop with a decay rate of about 70 percent per time period. For example, if the interface is passing 1,000 packets per second (pps) before traffic stops, the show interface cable command shows the rate being 300 pps at the end of the first time interval. The rate then drops to 90 pps at the end of the second time interval, and so forth.</p>	
packets input	Total number of error-free packets received by the system.
bytes input	Total number of bytes, including data and MAC encapsulation, in the error-free packets received by the system.
no buffer	Number of received packets discarded because there was no buffer space in the main system.
Received broadcast	Total number of broadcast or multicast packets received by the interface.
runts	Number of packets that are discarded because they are smaller than the medium's minimum packet size.

Field	Description
giants	<p>Number of packets that are discarded because they are bigger than the standard Ethernet Maximum Transmission Unit (MTU) size. For Ethernet packets, RFC 1757 defines giants as “the total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.”</p> <p>Note In addition, to account for the different Ethernet and other packet encapsulations on the network, packets are considered giants when they exceed the configured MTU size plus 114 bytes.</p>
input errors	Total number of errors received on the interface. This count includes runts and giants, which are shown above, as well as other errors, such as no buffers, and CRC, frame, overrun, and ignored counts. This count can also include DOCSIS protocol errors such as an invalid SID in the DOCSIS frame, a bad extended header length, corrupted concatenated packets, and invalid bandwidth requests.
CRC	Indicates the number of times the cyclic redundancy checksum (CRC) generated by the originating LAN station or far-end device does not match the checksum calculated from the data received.
frame	Number of packets received incorrectly having a CRC error and a non-integer number of octets.
overrun	Number of times the receiver hardware was unable to forward received data to a hardware buffer because the input rate exceeded the receiver’s ability to handle the data.
ignored	Number of received packets ignored by the interface because the interface hardware ran low on internal buffers.
packets output	Total number of messages sent by the system.
bytes	Total number of bytes, including data and MAC encapsulation, sent by the system.
underruns	Number of times the sender has been running faster than the receiving device can handle.
output errors	Sum of all errors that prevented the final transmission of packets out of the interface being examined.
collisions	Not applicable.
interface resets	Number of times an interface has been completely reset.
output buffer failures	Number of times the output buffer has failed.
output buffer swapped out	Number of times the output buffer has been swapped out.
sfid	Service flow identification number.

Field	Description
sid	Service identification number (upstream service flows only).
QoS Prov	QoS parameter index for the provisioned state of this flow.
Param Adm	QoS parameter index for the Admitted state of this flow.
Index Act	QoS parameter index for the Active state of this flow.
Type	Indicates if the service flow is the primary flow or a secondary service flow. Secondary service flows are identified by an "S" (created statically at the time of registration, using the DOCSIS configuration file) or "D" (created dynamically by the exchange of dynamic service messages between the CM and CMTS).
Dir	Indicates if this service flow is downstream (DS) or upstream (US).
Curr State	Current run-time state of the service flow.
Active Time	Length of time this service flow has been active.
DS-ForwIf/US-BG/CH	Bonding group ID or the downstream RFID of the forwarding interface assigned to the downstream service flow.

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output for the **show interface wideband-cable human-readable** command:

```
Router#show interface wideband-cable 3/0/0:0 human-readable
Wideband-Cable3/0/0:0 is up, line protocol is up
  Hardware is CMTS WB interface, address is c414.3c17.1dcb (bia c414.3c17.1dcb)
  MTU 1500 bytes, BW 150000 Kbit/sec, DLY 1000 usec,
    reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation MCNS, loopback not set
  Keepalive set (10 sec)
  ARP type: ARPA, ARP Timeout 04:00:00
  Last input never, output never, output hang never
  Last clearing of "show interface" counters never
  Input queue: 0/375/0/0 (size/max/drops/flushes); Total output drops: 0
  Queueing strategy: weighted fair
  Output queue: 0/1000/64/0 (size/max total/threshold/drops)
    Conversations 0/0/256 (active/max active/max total)
    Reserved Conversations 0/0 (allocated/max allocated)
    Available Bandwidth 112500 kilobits/sec
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 0 bits/sec, 0 packets/sec
    0 packets input, 0 bytes, 0 no buffer
    Received 0 broadcasts (0 multicasts)
    0 runts, 0 giants, 0 throttles
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
    0 packets output, 0 bytes, 0 underruns
    0 output errors, 0 collisions, 1 interface resets
    0 unknown protocol drops
    0 output buffer failures, 0 output buffers swapped out
Router#
```

Related Commands

Command	Description
show interface cable downstream	Displays information about the downstream on the cable interface.
show interface cable sid	Displays information by service identifier (SID) of each CM on the network.
show interface cable signal-quality	Displays information about the cable signal quality.
show interface cable upstream	Displays information about one or all upstreams on the cable interface.

show interface wideband-cable multicast-sessions

To display information about multicast sessions on a specific wideband-cable interface, use the **show interface wideband-cable multicast-sessions** command in privileged EXEC mode.

```
show interface wideband-cable slot/ {subslot bay}/port:wideband-channel [{group | [{ipv4-MQoS-group
ipv6-MQoS-group}]] | latency | sid [ {MQoS-sid} ]}]
```

Cisco cBR Series Converged Broadband Router

```
show interface wideband-cable slot/ {subslot bay}/port:wideband-channel
```

Syntax Description

<i>slot</i>	Slot where the line card resides. <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR router—The valid range is 0 to 3, and 6 to 9.
<i>subslot</i>	Subslot where a SIP resides. On the Cisco uBR10012 router, the subslot 0 is always specified. On the Cisco cBR router, the subslot is always 0.
<i>bay</i>	Bay in a SIP where a SPA is located. The valid values are 0 (upper bay) and 1 (lower bay).
<i>port</i>	Downstream port number. <ul style="list-style-type: none"> • Cisco uBR7246VXR router and Cisco uBR7225VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface). • Cisco cBR router—The valid range is 0 to 7.
<i>wideband-channel</i>	Wideband channel number. The valid range is from 0 to 11. On the Cisco uBR7246VXR and Cisco uBR7225VXR routers, the valid range is from 0 to 5.
<i>wideband-cable-interface</i>	Wideband cable interface On the Cisco cBR router, the valid range is 0 to 63.
group [<i>ipv4-MQoS-group</i> <i>ipv6-MQoS-group</i>]	Displays information about the specified IPv4 or IPv6 multicast quality of service (MQoS) group.
latency	Displays information about the multicast session latency.
sid [<i>MQoS-sid</i>]	Displays information about the MQoS service identifier (SID). The value of the SID ranges from 8192 to 12272.

Command Default

Command History

Release	Modification
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. This command was modified to change the addressing format for a wideband cable interface from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> .
12.2(33)SCF	This command was modified. The latency keyword was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The <i>wideband-channel</i> variable was removed and the <i>wideband-cable-interface</i> was added. The group , latency and sid keywords was also removed.

Examples

The following is a sample output from the **show interface wideband-cable multicast-sessions** command:

```
Router# show interface wideband-cable 1/0/0:0 multicast-sessions
Default Multicast Service Flow 3 on Wideband-Cable1/1/0:0

```

show interface wideband-cable multicast-sessions

1 8196 4 0 1 0

Related Commands

Command	Description
show interface modular-cable multicast-sessions	Displays the information about multicast sessions on a specific modular-cable interface.
show interface cable multicast-sessions	Displays the information about the multicast sessions on a specific cable interface.
show interface wideband-cable	Displays the current configuration and status for a wideband channel.

show interface wideband-cable queue

To display the downstream hierarchical queueing framework (HQF) queue information for a wideband channel, use the **show interface wideband-cable queue** command in privileged EXEC mode.

```
show interface wideband-cable slot/port:wideband-channel [{queue} | [{cblt} | {cblt-index} | priority} | pblt | verbose]]]
```

Syntax Description	
<i>slot/port</i>	<ul style="list-style-type: none"> Slot on the Cisco uBR7246VXR router. The valid values are: <ul style="list-style-type: none"> slot—3 to 6 port—0 or 1 (depending on the cable interface) Slot on the Cisco uBR7225VXR router. The valid values are: <ul style="list-style-type: none"> slot—1 and 2 port—0 or 1 (depending on the cable interface)
<i>wideband-channel</i>	Wideband channel number. Valid values range from 0 to 7.
queue	(Optional) Displays downstream HQF queue information.
cblt	(Optional) Displays detailed class layer bandwidth limited traffic (CBLT) stream information for normal downstream HQF queues.
<i>cblt-index</i>	CBLT index information.
priority	Displays CBLT information for priority HQF queues. Priority queues do not have any indexes.
pblt	(Optional) Displays detailed physical layer bandwidth limited traffic (PBLT) stream information for normal HQF queues.
verbose	(Optional) Displays detailed information for all queues.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCD	This command was introduced for the Cisco uBR7246VXR and Cisco uBR7225VXR routers.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Examples

The following is a sample output of the **show interface wideband-cable queue** command:

```
Router# show interface wideband-cable 3/0:0 queue
*  idx/gqid  Len/Limit  Deqs  Drops  CIR  MIR/PR  SFID  ForwInt

The table below describes the fields shown in the **show interface wideband-cable queue** command display.

Table 244: show interface wideband-cable queue Field Descriptions

Field	Description
Len/Limit Pkts	Queue length and limit in packets.
Deqs Pkts	Dequeue packets
Drops Pkts	Dropped packets.
CIR Kbps	Committed information rate.
MIR/PR Kbps	Maximum information and peak rate.
Forwint	Forwarding interface.
BE Queues	Best effort queues.
CIR Queues	Committed information rate queues.
Low Latency Queues	Low latency queues.

Related Commands

Command	Description
show interface cable	Displays the configuration and status of a cable interface.
show interface modular-cable	Displays the configuration and status of a modular cable interface.
show interface wideband-cable	Displays the configuration and status of a wideband channel.

show ip arp vrf

To view which virtual routing and forwarding (VRF) instance contains a specific cable modem in the Address Resolution Protocol (ARP) cache table, use the **show ip arp vrf** command in privileged EXEC mode.

show ip arp vrf WORD

Syntax Description

<i>WORD</i>	VRF name.
-------------	-----------

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCF	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Examples

The following is sample output from the **show ip arp vrf** command:

Router # **show ip arp vrf vrfa**

```

Protocol  Address                Age (min)  Hardware Addr  Type   Interface
Internet  203.0.113.1            0          0018.742c.6e00 ARPA   FastEthernet0/0/0

```

The table describes the significant fields shown in the display.

Table 245: show ip arp vrf Field Descriptions

Field	Description
Protocol	Protocol for network address in the Address field.
Address	The network address that corresponds to the IPv4 address.
Age (min)	Age of the cache entry (in minutes). A hyphen (-) means the address is local.
Hardware Addr	LAN hardware address of a MAC address that corresponds to the network address.

Field	Description
Type	Encapsulation type for the network address. The valid values include: <ul style="list-style-type: none"> • ARPA • SNAP • SAP
Interface	Interface associated with the specified network address.

This example shows the output of the **show ip arp vrf** command for the Cisco cBR router.

Related Commands

Command	Description
cable source-route	Configures the VRF source route on the cable modem in subinterface configuration mode.
cable vrf-steering cable-modem	Steers or directs the cable modems to the specified VRF.
ip vrf	Defines a VRF instance and enters the interface configuration mode.

show ip interface brief

To display a brief summary of an interface's IP information and status, to include virtual interface bundle information, use the **show ip interface brief** command in privileged EXEC mode.

show ip interface brief

Syntax Description

This command has no additional keywords or arguments.

Command Default

Virtual Interface Bundling is enabled by default in Cisco IOS Release 12.3(21)BC and later releases.

Command Modes

Privileged EXEC

Command History

Release	Modification
12.3(21)BC	Support was added for virtual interface bundling configured with upgrade to Cisco IOS Release 12.3(21)BC and later releases.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

Refer to the following document on Cisco.com for additional information about cable interface bundling and virtual interface bundling on the Cisco CMTS:

- *Cable Interface Bundling and Virtual Interface Bundling on the Cisco CMTS*

Examples

The following example illustrates a virtual interface bundle with the **show ip interface brief** command:

```
Router# show ip interface brief
Interface                IP-Address      OK? Method Status          Protocol
FastEthernet0/0/0       209.165.200.225 YES NVRAM   up              up
POS1/0/0                 unassigned      YES NVRAM   up              up
GigabitEthernet2/0/0    209.165.201.1   YES NVRAM   up              up
GigabitEthernet1/0/0    209.165.201.2   YES NVRAM   up              up
GigabitEthernet4/0/0    209.165.201.6   YES NVRAM   down            down
Cable8/1/0              unassigned      YES NVRAM   up              up
Cable8/1/1              unassigned      YES NVRAM   up              up
Cable8/1/2              unassigned      YES NVRAM   up              up
Cable8/1/3              unassigned      YES NVRAM   up              up
Cable8/1/4              unassigned      YES NVRAM   up              up
Bundle1                 209.165.202.129 YES TFTP   up              up
Router#
```

This example shows the output of the **show ip interface brief** command on the Cisco cBR Series Converged Broadband Router:

```
Router#show ip interface brief

Related Commands

Command	Description
cable bundle	Configures a cable interface to belong to an interface bundle or virtual interface bundle.
show arp	Displays the entries in the router's ARP table.
show cable bundle number forwarding-table	Displays the MAC forwarding table for the specified bundle, showing the MAC addresses of each cable modem in a bundle and the physical cable interface that it is currently using.
show cable modem	Displays the cable modems that are online both before and after cable interface bundling has been configured.
show running-config interface cable	Displays the configuration for the specified cable interface.

show ipdr collector

To display the list of sessions that the Collector is associated, use the `show ipdr collector` command in the privileged EXEC mode.

show ipdr collector collector_name

Syntax Description	
<i>collector_name</i>	The name of the Collector.

Command Default No default behavior or values.

Command Modes Privileged EXEC mode

Command History	Release	Modification
	12.2(33)SCB	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines The `show ipdr collector` command displays the collector information, message statistics and event for all the sessions that are associated with the collector .

Examples The following example shows the sample output for the `show ipdr collector` command.

```
Router#show ipdr collector federal
Collector Name: federal, IP: 192.0.2.0, Port: 0
2001-07-05T19:28:22 Collector in session 1 Statistics:
  Transmitted 12658 Acknowledged 12658 Enqueued 12658 Lost 0
  Last Event: Event Id 1 IPDR_EVENT_SERVER_CONNECTED - INCOMING
Router(config)#
```

This example shows the output of the `show ipdr collector` command for the Cisco cBR router.

```
Router#show ipdr collector doc_test
Collector Name: doc_test, IP: 209.165.202.129, Port: 1
2012-01-13T21:08:27 Collector in session 1 Statistics:
  Transmitted 0 Acknowledged 0 Enqueued 0 Lost 0
  Last Event: N/A
Router#
```

Related Commands	Command	Description
	<code>show ipdr exporter</code>	Displays information about the IPDR Exporter state.
	<code>ipdr collector</code>	Configures the Internet Protocol Detail Record (IPDR) Collector details.

show ipdr exporter

To display information about the state of the IPDR Exporter, use the **show ipdr exporter** command in the privileged EXEC mode.

show ipdr exporter

Syntax Description This command has no keywords or arguments.

Command Default No default behavior or values.

Command Modes Privileged EXEC mode

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.
IOS XE Gibraltar 16.12.1	The output of this command was update to indicate the active or passive mode.

Usage Guidelines

The **show ipdr exporter** command displays information about the IPDR Exporter state. The information displayed indicates the Exporter states that are listed below.

- started
- not started
- not initialized

Starting from Cisco IOS XE Gibraltar 16.12.1, the output of this command is updated to include active and passive mode for IPDR exporter.

Examples

The following example shows the sample output for the **show ipdr exporter** command.

```
Router#show ipdr exporter
IPDR exporter is started.
```

This example shows the sample output for the **show ipdr exporter** command on the Cisco cBR router:

```
Router#show ipdr exporter
IPDR exporter is not started.
```

This example shows the sample output for the show ipdr exporter command on the Cisco cBR router starting from Cisco IOS XE Gibraltar 16.12.1:

```
Router# show ipdr exporter
Load for five secs: 7%/0%; one minute: 7%; five minutes:
7%
No time source, *15:52:25.468 CST Thu May 23 2019
IPDR exporter is started in passive
mode. Current parameters:
KeepAliveInterval :300
AckTimeInterval 60
AckSequenceInterval :200
```

Related Commands

Command	Description
show ipdr collector	Displays the collector information, message statistics and event for all the sessions that are associated with the collector.
ipdr exporter start	Starts the IPDR Exporter and connects to the collector.

show ipdr session

To display the list of sessions and session details, use the `show ipdr session` command in the privileged EXEC mode.

show ipdr session {*allsession_id*}

Syntax Description

all	Displays all the associated sessions and session details such as the session ID, description, and the session state.
<i>session_id</i>	Displays session details for a specific session ID. The valid range is 1 to 255.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC mode

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

The **show ipdr session** command displays the session details such as the session ID, description, and the session state for all sessions as well as for a specific session.

Examples

The following example shows the sample output for the `all` option for the **show ipdr session** command.

```
Router#show ipdr session all
Session ID: 1, Name: utilsta, Descr: test, Started: False
```

The following example shows the sample output for the `session_id` option for the **show ipdr session** command.

```
Router#show ipdr session 1
Session ID: 1, Name: utilsta, Descr: test, Started: False
2001-07-05T19:36:28 Statistics:
Transmitted 0 Acknowledged 0 Enqueued 0 Lost 0
queuedOutstanding 0 queuedUnacknowledged 0
1 Collectors in the session:
Name: federal, IPAddr: 192.0.2.0, Port: 0, Priority: 1
```

This example shows the sample output for the **show ipdr session** command on the Cisco cBR router:

```
Router#show ipdr session 1
Session ID: 1, Name: doc_test, Descr: DOC TEST, Started: False

Session Type: Ad-hoc.
```

Session Wrapper PID: N/A. Exporting not started.

2012-01-13T21:13:34 Statistics:
 Transmitted 0 Acknowledged 0 Enqueued 0 Lost 0
 queuedOutstanding 0 queuedUnacknowledged 0

1 Collectors in the session:
 Name: doc_test, IPAddr: 10.12.0.210, Port: 1, Priority: 1[DISCONNECTED]

Router#**show ipdr session all**
 Session ID: 1, Name: doc_test, Descr: DOC TEST, Started: False
 Router#

Related Commands

Command	Description
show ipdr exporter	Displays information about the IPDR Exporter state.
ipdr collector	Configures the Internet Protocol Detail Record (IPDR) Collector details.
ipdr session	Adds a session to the IPDR Exporter.
ipdr exporter start	Starts the IPDR Exporter and connects to the collector.

show ipdr session collector

To display the details of a collector that is associated with a specific session, use the `show ipdr session collector` command in the privileged EXEC mode.

show ipdr session *session_id* **collector** *collector_name*

Syntax Description

<i>session_id</i>	The IPDR session ID. The valid range is 1 to 255.
<i>collector_name</i>	The name of the Collector.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC mode

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

The **show ipdr session collector** command displays the details of a collector that is associated with a specific session. Since there can be multiple collectors associated to a session, this command is used to show a specific session-collector pair.

Examples

This example shows the output for the **show ipdr session collector** command.

```
Router#show ipdr session 1 collector federal
Session ID: 1, Name: utilsta, Descr: test, Started: False
Collecotr Name: federal, IP: 192.0.2.0, Port: 0
2001-07-05T19:38:02 Collector in session 1 Statistics:
  Transmitted 0 Acknowledged 0 Enqueued 0 Lost 0
  Last Event: Event Id 0 WRONG_EVENT_ID
```

This example shows the output for the **show ipdr session collector** command on the Cisco cBR router:

```
Router#show ipdr session 1 collector collector 1
Session ID: 1, Name: TI-CM-STATUS, Descr: TI-CM-STATUS, Started: True
Collector Name: collector1, IP: 20.1.0.6, Port: 4737

2015-05-23T01:22:38 Collector in session 1 Statistics:
  Transmitted 0 Acknowledged 0 Enqueued 0 Lost 0
  Last Event: N/A
```

Related Commands

Command	Description
show ipdr session	Displays the list of sessions and session details.
show ipdr collector	Displays the list of sessions that the Collector is associated.
ipdr session	Adds a session to the IPDR Exporter.

show ipdr session template

To display the list of all active templates supported by a specific session, use the **show ipdr session template** command in the privileged EXEC mode.

show ipdr session *session_id* template

Syntax Description

<i>session_id</i>	The IPDR session ID. The valid range is 1 to 255.
-------------------	---

Command Default

None

Command Modes

Privileged EXEC mode

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

The **show ipdr session template** command displays the list of all active templates supported by a specific session.

Examples

This example shows the output for the **show ipdr session template** command.

```
Router#show ipdr session 1 template
Template ID: 2, Name: , Type: DOCSIS-Type, KeyNumber: 22
Session 1 has totally 1 templates.
```

This example shows the output for the **show ipdr session template** command on the Cisco cBR router:

```
Router#show ipdr session 1 template
Template ID: 8, Name:
http://www.cablelabs.com/namespaces/DOCSIS/3.0/xsd/ipdr/DOCSIS-CMIS-CM-REG-STATUS-TYPE/DOCSIS-CMIS-CM-REG-STATUS-TYPE_3.5.1-A.1.xsd,
Type: CMTS-CM-REG-STATUS-TYPE, KeyNumber: 18
Session 1 has a total of 1 templates.
```

Related Commands

Command	Description
show ipdr session	Displays the list of sessions and session details.
ipdr template	Adds an IPDR template to the IPDR Session.
ipdr session	Adds a session to the IPDR Exporter.

show lacp

To display Link Aggregation Control Protocol (LACP) information, use the **show lacp** command in either user EXEC or privileged EXEC mode.

```
show lacp {channel-group-number {counters | internal [detail] | neighbor [detail] | sys-id}}
```

Syntax Description	
<i>channel-group-number</i>	Number of the channel group. The range is from 1 to 128.
counters	Displays information about the LACP traffic statistics.
internal	Displays LACP internal information.
neighbor	Displays information about the LACP neighbor.
detail	(Optional) Displays detailed internal information when used with the internal keyword and detailed LACP neighbor information when used with the neighbor keyword.
sys-id	Displays the LACP system identification. It is a combination of the port priority and the MAC address of the device

Command Modes User EXEC (>) Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS 12.2(33)SCJ	This command was introduced.

Usage Guidelines Use the **show lacp** command to troubleshoot problems related to LACP in a network.

If you do not specify a value for the argument *channel-group-number*, all channel groups are displayed.

show lacp sys-id Example

This example shows how to display the LACP system identification using the **show lacp sys-id** command:

```
Device> show lacp sys-id
```

```
8000,AC-12-34-56-78-90
```

The system identification is made up of the system priority and the system MAC address. The first two bytes are the system priority, and the last six bytes are the globally administered individual MAC address that is associated to the system.

LACP Statistics for a Specific Channel Group Examples

This example shows how to display the LACP statistics for a specific channel group:

```
Device# show lacp 1 counters
```

```

          LACPDUs          Marker          LACPDUs
Port      Sent   Recv      Sent   Recv      Pkts Err
-----
Channel group: 1
Fa4/1     8     15         0     0         3     0
Fa4/2    14     18         0     0         3     0
Fa4/3    14     18         0     0         0
Fa4/4    13     18         0     0         0

```

The output displays the following information:

- The LACPDUs Sent and Recv columns display the LACPDUs that are sent and received on each specific interface.
- The LACPDUs Pkts and Err columns display the marker-protocol packets.

The following example shows output from a **show lacp channel-group-number counters** command:

```
Device1# show lacp 5 counters
```

```

          LACPDUs          Marker          Marker Response          LACPDUs
Port      Sent   Recv      Sent   Recv      Sent   Recv      Pkts Err
-----
Channel group: 5
Gi5/0/0   21    18         0     0         0     0         0

```

The following table describes the significant fields shown in the display.

Table 246: show lacp channel-group-number counters Field Descriptions

Field	Description
LACPDUs Sent Recv	Number of LACP PDUs sent and received.
Marker Sent Recv	Attempts to avoid data loss when a member link is removed from an LACP bundle.
Marker Response Sent Recv	Cisco IOS response to the Marker protocol.
LACPDUs Pkts Err	Number of LACP PDU packets transmitted and the number of packet errors.

The following example shows output from a **show lacp internal** command:

```
Device1# show lacp 5 internal
```

```

Flags:  S - Device is requesting Slow LACPDUs
        F - Device is requesting Fast LACPDUs
        A - Device is in Active mode           P - Device is in Passive mode
Channel group 5

Port      Flags  State  LACP port  Admin  Oper  Port  Port
Gi5/0/0   SA     bndl   32768      0x5    0x5   0x42  0x3D

```

The following table describes the significant fields shown in the display.

Table 247: show lacp internal Field Descriptions

Field	Description
Flags	Meanings of each flag value, which indicates a device activity.
Port	Port on which link bundling is configured.
Flags	Indicators of device activity.
State	Activity state of the port. States can be any of the following: <ul style="list-style-type: none"> • Bndl--Port is attached to an aggregator and bundled with other ports. • Susp--Port is in suspended state, so it is not attached to any aggregator. • Indep--Port is in independent state (not bundled but able to switch data traffic). This condition differs from the previous state because in this case LACP is not running on the partner port. • Hot-sby--Port is in hot standby state. • Down--Port is down.
LACP port Priority	Priority assigned to the port.
Admin Key	Defines the ability of a port to aggregate with other ports.
Oper Key	Determines the aggregation capability of the link.
Port Number	Number of the port.
Port State	State variables for the port that are encoded as individual bits within a single octet with the following meaning: <ul style="list-style-type: none"> • bit0: LACP_Activity • bit1: LACP_Timeout • bit2: Aggregation • bit3: Synchronization • bit4: Collecting • bit5: Distributing • bit6: Defaulted • bit7: Expired

Internal Information About a Specific Channel Group Example

This example shows how to display internal information for the interfaces that belong to a specific channel:

```
Device# show lacp 1 internal
```

```
Flags: S - Device sends PDUs at slow rate. F - Device sends PDUs at fast rate.
       A - Device is in Active mode.           P - Device is in Passive mode.
Channel group 1
```

Port	Flags	State	LACPDU Interval	LACP Port Priority	Admin Key	Oper Key	Port Number	Port State
Fa4/1	saC	bndl	30s	32768	100	100	0xc1	0x75
Fa4/2	saC	bndl	30s	32768	100	100	0xc2	0x75
Fa4/3	saC	bndl	30s	32768	100	100	0xc3	0x75
Fa4/4	saC	bndl	30s	32768	100	100	0xc4	0x75

```
Device#
```

The following table describes the significant fields shown in the display.

Table 248: show lacp internal Field Descriptions

Field	Description
State	<p>Current state of the port; allowed values are as follows:</p> <ul style="list-style-type: none"> • bndl--Port is attached to an aggregator and bundled with other ports. • susp--Port is in a suspended state; it is not attached to any aggregator. • indep--Port is in an independent state (not bundled but able to switch data traffic. In this case, LACP is not running on the partner port). • hot-sby--Port is in a hot-standby state. • down--Port is down.
LACPDU Interval	Interval setting.
LACP Port Priority	Port-priority setting.
Admin Key	Defines the ability of a port to aggregate with other ports.
Oper Key	Determines the aggregation capability of the link.
Port Number	Port number.
Port State	<p>Activity state of the port.</p> <ul style="list-style-type: none"> • See the Port State description in the show lacp internal Field Descriptions table for state variables.

Information About LACP Neighbors for a Specific Port Example

This example shows how to display the information about the LACP neighbors for a specific port channel:

```
Device# show lacp 1 neighbors
```

```
Flags: S - Device sends PDUs at slow rate. F - Device sends PDUs at fast rate.
       A - Device is in Active mode.           P - Device is in Passive mode.
```

```

Channel group 1 neighbors
      Partner
Port   System ID          Partner
Fa4/1  8000,00b0.c23e.d84e   0x81   Age   Flags
      8000,00b0.c23e.d84e   0x82   29s   P

Fa4/3  32768   200    200    0x81
Fa4/4  32768   200    200    0x81
Device#

```

The following table describes the significant fields shown in the display.

Table 249: show lacp neighbors Field Descriptions

Field	Description
Port	Port on which link bundling is configured.
Partner System ID	Peer's LACP system identification (sys-id). It is a combination of the system priority and the MAC address of the peer device.
Partner Port Number	Port number on the peer device
Age	Number of seconds since the last LACP PDU was received on the port.
Flags	Indicators of device activity.
Port Priority	Port priority setting.
Admin Key	Defines the ability of a port to aggregate with other ports.
Oper Key	Determines the aggregation capability of the link.
Port State	Activity state of the port. See the Port State description in the show lacp internal Field Descriptions table for state variables.

If no PDUs have been received, the default administrative information is displayed in braces.

Related Commands

Command	Description
clear lacp counters	Clears the statistics for all interfaces belonging to a specific channel group.
lacp port-priority	Sets the priority for the physical interfaces.
lacp system-priority	Sets the priority of the system.

show lcha logging

To display the information about the cable line card switchover event and state logs, use **show lcha logging** command in privileged EXEC mode.

```
show lcha logging level { error [ { sort using { { slot slot number } | {transaction transaction number } } ] } | {info [ { sort using { { slot slot number } | {transaction transaction number } } ] } | {noise [ { sort using { { slot slot number } | {transaction transaction number } } ] } | {notice [ { sort using { { slot slot number } | {transaction transaction number } } ] } | {warning [ { sort using { { slot slot number } | {transaction transaction number } } ] } ] }
```

Syntax Description

error	Displays all error logs.
sort using	Sorts the records.
slot slot number	The line card slot number. Valid range is from 0 to 13.
transaction transaction number	The line card transaction number. Valid range is from 0 to 65535.
info	Displays information, notice, warning and error logs.
noise	Displays noise and other related error logs.
notice	Displays notice and other related error logs.
warning	Displays all warning and error logs.

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE Release 3.16.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to display the cable modem line card logs.

```
Router# show lcha logging level noise
11:02:03.313 CST Tue Nov 18 2014 [error] [slot=3] [txn=229] Peer-Up Message [tag=1011]
to slot 3 complete [36144 ms]; status=nak response
11:02:03.313 CST Tue Nov 18 2014 [error] [slot=0] [txn=229] Slot 0 downloaded
configuration for slot 3; result=peer-up notification failed

11:02:03.316 CST Tue Nov 18 2014 [noise] [slot=0] [txn=none]
lcha_plfm_get_starting_port_index: slot 0 starting port count is 0
11:02:03.331 CST Tue Nov 18 2014 [note] [slot=0] [txn=none] Slot 0 is being reset
11:02:04.352 CST Tue Nov 18 2014 [note] [slot=0] [txn=none] slot 0 removed
```

Related Commands

Command	Description
show lcha rfsw	Displays the internal RF switch PIC state information.

show lcha rfs

To display the internal RF switch PIC state information, use **show lcha rfs** command in privileged Exec mode.

show lcha rfs

Syntax Description This command has no arguments or keywords.

Command Default None

Command Modes Privileged Exec (#)

Release	Modification
IOS-XE Release 3.16.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to display the internal RF switch PIC state information:

```
Router# show lcha rfs
Slot 0 =====
Type : Secondary PIC State: normal
Slot 1 =====
Type : Primary PIC State: normal
```

Command	Description
show lcha logging	Displays information about the cable line card switchover event and state logs.

show license summary

To display the 10G and 100G WAN license information summary.

show license summary

Syntax Description This command has no arguments or keywords.

Command Default Disabled

Command Modes Privileged EXEC (#)

Release	Modification
IOS-XE 16.8.1	This command was introduced.

The command displays the following information, depending on the **cable license 100G-conversion** configuration.

- With the **cable license 100G-conversion**, the **show license summary** would display:

```
Router(config)# show license summary
-----
Smart Licensing is ENABLED

Registration:
  Status: REGISTERED
  Smart Account: CBR8_DEV_1
  Virtual Account: cbr8-dev-test
  Export-Controlled Functionality: Allowed
  Last Renewal Attempt: None
  Next Renewal Attempt: Jun 13 00:47:13 2018 CST

License Authorization:
  Status: AUTHORIZED

```

show logging onboard

To view the OBFL logging information, use the **show logging onboard** command in privileged EXEC mode. To clear the OBFL logging information, use the **clear logging onboard** command.

show logging onboard

```
{slot|module|bay} {slotnumber {subslotnumber {modulenumbe {dram|message|serdes|status|temperature|uptime|voltage|firmware}
```

clear logging onboard

```
{slot|module|bay} {slotnumber {subslotnumber {modulenumbe {dram|message|serdes|status|temperature|uptime|voltage|firmware}
```

Syntax Description

<i>slotnumber</i>	Displays the slot information.
<i>subslotnumber</i>	Displays the sub slot information.
<i>modulenumber</i>	Displays the module information.
dram	Displays slot information.
message	Displays or clears the DRAM ECC error log.
serdes	Displays or clears the onboard serdes log.
status	Displays whether onboard logging is enabled or disabled.
uptime	Displays information such as the time when you powered on the card, the number of times the card was reset, the number of times you moved a card from one slot to another, the reason why a card was reset, the current slot in which you installed the card, and the last time when you powered on the card.
temperature	Displays the onboard temperature information.
voltage	Displays the onboard voltage information.
firmware	Displays firmware versions of slot cards such as SUP and LC and PIC cards such as SUP-PIC, RF-PIC, D-PIC and so on.

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 16.8.1	The firmware keyword was added. Using the uptime keyword, you can view additional information such as: <ul style="list-style-type: none"> • the time when you powered on the card • the number of times the card was reset • the number of times you moved a card from one slot to another • the reason why a card was reset • the current slot in which you installed the card • the last time when you powered on the card
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use **show logging onboard slot *slot* message** to check OBFL messages. Use this command to identify the hardware or software-related failures.

Examples

The following is a sample output of the **show logging onboard slot *slot* message** command:

```
Router# show logging onboard slot 8 message
timestamp message
```

```
03/09/15 18:35:29 US-PHY 1 SN Unknown Mg0 TGC-verify not sampled at frame-sync
pulse 0x4a900046, 520 times
03/09/15 18:35:29 US-PHY 1 SN Unknown Mg1 TGC-verify not sampled at frame-sync

```

show nls

To display the Network Layer Signalling (NLS) functionality state, use the **show nls** command in privileged EXEC mode.

```
show nls [{ag-id | flow}]
```

Command Default Information for the NLS state is displayed.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.3(21a)BC3	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Examples

The following example shows the output of the **show nls** command:

```
Router# show nls
NLS enabled
NLS Authentication enabled
NLS resp-timeout 45
```

Examples

The following example shows the output of the **show nls ag-id** command:

```
Router# show nls ag-id
Auth Group Id
12345
```

The following example shows the output of the **show nls flow** command:

```
Router# show nls flow
NLS flowid CPE IP CR Type CR ID NLS State
4294967295 16.16.1.1 1 1 PEND_B_RESP
```

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show nls** command:

```
Router# show nls
NLS Enabled
NLS Authentication Enabled
NLS resp-timeout 20
```

This example shows the output of the **show nls ag-id** command for the Cisco cBR Series Converged Broadband Router:

```
Router#show nls ag-id
Auth Group Id
100

Router#
```

This example shows the output of the **show nls flow** command for the Cisco cBR Series Converged Broadband Router:

```
Router# show nls flow
NLS flowid CPE IP CR Type CR ID NLS State
4294967295 16.16.1.1 1 1 PEND_B_RESP
```

Related Commands

Command	Description
cpd	Enables CPD.
nls	Enables NLS.

show nls ag-id

To display authorization group ID information, use the **show nls ag-id** command in privileged EXEC mode.

show nls ag-id

Command Default

Authorization group ID information is displayed. The authentication key is saved encrypted and is not displayed.

Command Modes

Privileged EXEC

Command History

Release	Modification
12.3(21a)BC3	This command was introduced.

Examples

The following example shows the output of the **show nls-sg-id** command:

```
Router# show nls ag-id
Auth Group Id
12345
```

Related Commands

Command	Description
cpd	Enables CPD.

show nls flow

To display NLS active flow information, use the **show nls flow** command in privileged EXEC mode.

show nls flow

Command Default Information for NLS active flows are displayed.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.3(21a)BC3	This command was introduced.

Examples The following example shows the output of the show cpd command:

```
Router# show nls flow
NLS flowid CPE IP CR Type CR ID NLS State
4294967295 16.16.1.1 1 1 PEND_B_RESP
```

Related Commands	Command	Description
	cpd	Enables CPD.

show cable oudp-leak-detect

See the [OFDMA OUDP Leak Detection Configuration](#) section in the configuration guide for the EXEC, Global configuration, Configuration and Show commands.

To display information related to OUDP leakage detection test sessions, use the **show cable oudp-leak-detect** command.

```
show cable oudp-leak-detect { settings | test-sessions }
```

```
show cable oudp-leak-detect session-id OUDP parent test session id { detail | cm-stats }
```

```
show cable oudp-leak-detect { system-boot-holdoff | burst-profiles | schedules | rf-detector | docsis-clock slot CLC slot }
```

Syntax Description

settings	Displays the values of OUDP global configuration parameters and the CBR-8 capabilities (specifically the OSSI SupportsNumBurstsNotReceived—We support RxNoEnergy stat.)
test-sessions	Displays summary of the test session that includes parent/child IDs, start/stop times, interfaces, and status.
detail	Displays the parent or child test session details. Includes OSSI information pertaining to: <ul style="list-style-type: none"> • LeakageDetectionTestSessionStatus • LeakageDetectionTestChannelStatus
cm-stats	Displays the child test session CM stats for BurstGrants, BurstRx, BurstNoEnergyRx, and BytesRx. Includes OSSI information pertaining to: <ul style="list-style-type: none"> • LeakageDetectionTestSessionStats All child session CM stats are displayed when the parent session-id is entered.
system-boot-holdoff	Time delay during system boot to allow OFDMA channels to reach up state and CMs to reach online. After this holdoff time expires, OUDP test sessions will begin.
burst-profiles	Displays persistent OUDP burst profiles configured in NVRAM (startup-config).
schedules	Displays persistent OUDP schedules configured in NVRAM (startup-config).
rf-detector	Displays currently available OFDMA channels and frequencies in the system. Useful for identifying OFDMA channel participation for a given OUDP frequency range.
docsis-clock slot <i>CLC slot</i>	Displays the timing reference information of the SUP and selected CLC slot.

Command Modes

Privileged EXEC (#)

Release	Modification
17.6.1z	This command was introduced.

show packetcable cms

To display all gate controllers that are connected to the PacketCable client, use the **show packetcable cms** command in privileged EXEC mode.

show packetcable cms [{**all** | **verbose**}]

Syntax Description	all	(Optional) Specifies all gate controllers including the Common Open Policy Service (COPS) servers for which the PacketCable connection is gone down.
	<i>verbose</i>	(Optional) Provides detailed output with statistics for all gate controllers that are connected to the PacketCable client.

Command Default All gate controllers currently connected to the PacketCable client are displayed.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS Release 12.2(33)SCF	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines The **show packetcable cms** command displays various PacketCable counters including message exchanges and error frequency details to help detect any PacketCable errors. This command output can be periodically monitored to validate the overall health of a PacketCable solution.

In normal circumstances, the output of the **show packetcable cms all** command is not different from the output of the **show packetcable cms** command (default form of the command). However, the **show packetcable cms** command with the **all** keyword is used to capture all COPS servers including the servers for which the PacketCable connection is gone down.

Examples

The following is a sample output of the **show packetcable cms** command that shows all gate controllers that are currently connected to the PacketCable client in Cisco IOS Release 12.2(33)SCF:

```
Router# show packetcable cms
GC-Addr      GC-Port  Client-Addr  COPS-handle  Version  PSID  Key  PDD-Cfg
1.100.30.2   47236    2.39.34.1    0x2FF9E268/1  4.0     0     0     0
2.39.26.19   55390    2.39.34.1    0x2FF9D890/1  1.0     0     0     2
```

The following is a sample output of the **show packetcable cms** command with the **all** keyword in Cisco IOS Release 12.2(33)SCF:

```
Router# show packetcable cms all
GC-Addr      GC-Port  Client-Addr  COPS-handle  Version  PSID  Key  PDD-Cfg
1.100.30.2   47236    2.39.34.1    0x2FF9E268/1  4.0     0     0     0
2.39.26.19   55390    2.39.34.1    0x2FF9D890/1  1.0     0     0     2
1.10.30.22   42307    2.39.34.1    0x0          /0       4.0     0     0     0
```

The following is a sample output of the **show packetcable cms** command with the **verbose** keyword. This output provides additional information with statistics for all gate controllers that are connected to the PacketCable client.

```
Router# show packetcable cms verbose

Table below describes the significant fields shown in the **show packetcable cms** command display.

Table 250: show packetcable cms Field Descriptions

Field	Description
GC-Addr	Gate controller IP address.
GC-Port	Port number of the gate controller.
Client-Addr	PacketCable client IP address.
COPS-handle	Unique value to identify a Common Open Policy Service (COPS) connection.
PSID	Policy server ID.

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show packetcable cms** command with the **all** keyword:

```
Router#show packetcable cms all
GC-Addr      GC-Port  Client-Addr  COPS-handle  Version  PSID  Key  PDD-Cfg
```

```

1.100.30.2      45140      2.39.23.23      0x7F07E87170D0/1  4.0      0      0      0
1.100.30.2      45143      2.38.40.14      0x7F07E8717000/1  4.0      0      0      0
2.39.26.19      34934      2.39.23.23      0x7F079F594380/1  4.0      0      0      0

Related Commands

Command	Description
cable dynamic-qos trace	Enables call trace functionality on the Cisco CMTS router for PacketCable or PacketCable Multimedia gates.
debug cable dynamic-qos subscriber	Enables debugging of the call trace functionality on the Cisco CMTS router for a particular subscriber.
debug cable dynamic-qos trace	Enables call trace debugging on the Cisco CMTS router for all the subscribers for whom call trace is configured.
show cable dynamic-qos trace	Displays the number of subscribers for whom call trace is configured on the Cisco CMTS router.

show packetcable event

To display information the PacketCable event message (EM) server, use the **show packetcable event** command in user EXEC or privileged EXEC mode.

show packetcable event {**df-group** | **radius-server** | **rks-group**}

Syntax Description	df-group	radius-server	rks-group
	Displays information about the Communications Assistance for Law Enforcement Act (CALEA) Delivery Function (DF) server groups that are configured on the router.	Displays information about the EM Remote Authentication Dial In User Service (RADIUS) servers that are configured on the router.	Displays information about the Record Keeping Server (RKS) groups that are configured on the router.

Command Modes

User EXEC, Privileged EXEC

Command History

Release	Modification
12.2(15)BC2	This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

This command displays information about the authentication, authorization, and accounting (AAA) servers that are configured on the Cisco CMTS router for PacketCable operations. These include DF servers (used for CALEA redirection of event messages and traffic), RADIUS servers (used for authentication), and RKS servers (used for billing).

Examples

The following example shows typical output for the **show packetcable event df-group** command, which shows the IP address and UDP port of the DF server to which event messages are being forwarded for CALEA electronic surveillance.

```
Router# show packetcable event df-group
CDC-address      CDC-port
1.9.62.12       1816
Router#
```

The following example shows a typical display for the **show packetcable event radius-server** command, which shows the IP address for each RADIUS server that is configured on the router for PacketCable operations, along with the UDP port number that it is using.

```
Router# show packetcable event radius-server
\
Server-address  Port
10.9.62.12     1816
10.9.62.20     1813
```

```
10.9.62.12      1813
Router#
```

The following example shows a typical display for the **show packetcable event rks-group** command.

```
Router# show packetcable event rks-group
Pri-addr      Pri-port  Sec-addr      Sec-port  Ref-cnt  Batch-cnt
1.9.62.12     1813     1.9.62.20     1813     2        0
Router#
```

Table below describes the major fields shown in the **show packetcable event rks-group** display.

Table 251: show packetcable event rks-group Field Display

Field	Description
Pri-addr	IP address for the primary RKS server.
Pri-port	UDP port for the primary RKS server.
Sec-addr	IP address for the secondary RKS server.
Sec-port	UDP port for the secondary RKS server.
Ref-cnt	Number of times that the router send single event messages to the RKS server.
Batch-cnt	Number of times that the router sent batch messages (multiple Event Messages within a single RADIUS message) to the RKS server.

Tip For complete information about PacketCable event messaging, see the *PacketCable Event Messages Specification*, which is available at the PacketCable Event Messages Specification PacketCable web site at the following URL : <http://www.packetcable.com>

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show packetcable event** command:

```
Router# show packetcable event df-group
CDC-address    CDC-port
1.9.62.12      1816
Router#
```

```
Router# show packetcable event radius-server
Server-address  Port
10.9.62.12     1816
10.9.62.20     1813
10.9.62.12     1813
Router#
```

```

Router# show packetcable event rks-group
Pri-addr      Pri-port  Sec-addr      Sec-port  Ref-cnt  Batch-cnt
1.9.62.12     1813     1.9.62.20     1813     2        0
Router#

```

Related Commands

Command	Description
clear packetcable gate counter commit	Resets the counters that track the total number of committed gates.
packetcable	Enables PacketCable operations on the Cisco CMTS.
show packetcable gate counter commit	Displays the total number of committed gates since system reset or since the counter was last cleared.
show packetcable global	Displays the current PacketCable configuration.

show packetcable gate

To display information about one or more gates in the gate database, use the **show packetcable gate** command in user EXEC or privileged EXEC mode.

```
show packetcable gate [{downstream | upstream}] {summarygate-id}
```

```
show packetcable gate [{downstream | upstream | dqos | ipv6 | multimedia}] {summarygate-id}
```

Syntax Description

downstream	(Optional) Display information only for gates in the downstream direction.
upstream	(Optional) Display information only for gates in the upstream direction.
summary	Display a summary containing the gate ID, subscriber ID, subscriber IP address, and current state information.
<i>gate-id</i>	Display information for a specific gate ID. The valid range is 0 to 4294967295.

Command Default

Displays information about gates on both upstreams and downstreams, if **upstream** or **downstream** is not specified.

Command Modes

User EXEC, Privileged EXEC

Command History

Release	Modification
12.2(8)BC2	This command was introduced for the Cisco uBR7200 series universal broadband router.
12.2(11)BC3	The output for the summary option was enhanced to display the cable interface and service flow IDs (SFIDs) associated with each PacketCable gate.
12.2(15)BC1	Support was added for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

This command displays information about one or more gates in the gate database on the Cisco CMTS. You can display a summary for all currently active gates, for all downstream or all upstream gates, or you can display detailed information about a specific gate.

Examples

The following example shows typical output for the **show packetcable gate summary** command, which displays all current gates on the CMTS:

```
Router# show packetcable gate summary
GateID   Slot SubscriberID  GC-Addr      State  SFID   SFID
          (us)          (ds)
-----
2566     2/0   3.18.1.4         172.22.87.45 COMMIT  9      10
18950    2/0   3.18.1.5         172.22.87.45 COMMIT  7      8
Total number of gates = 2
Total Gates committed(since bootup or clear counter) = 2
```

The following example shows a typical display for a specific gate. Both downstream and upstream gates are shown unless you also specify either the **downstream** or **upstream** option.

```
Router# show packetcable gate 196

GateID                : 196

Table below describes the major fields shown in the **show packetcable gate** display.

Table 252: show packetcable gate Field Display

Field	Description
GateID	Unique number identifying the local gate.
Slot	Cable interface on the Cisco CMTS.
Subscriber ID	IP address for the subscriber for this service request.
GC-Addr	IP address for the gate controller that is responsible for this gate.

Field	Description
State	<p>Describes the current state of the gate in both the upstream and downstream directions. The possible state values are:</p> <ul style="list-style-type: none"> • ALLOC = The CMTS has received a Gate-Alloc command from the gate controller and has created the gate in response. The CMTS must now wait for the request to be authorized. • AUTH = The CMTS has received a Gate-Set command from the gate controller that authorizes the resources needed for the gate request. The CMTS must now wait for the actual resources to be reserved. • RSVD = All required resources for the gate have been reserved. • COMMIT = All resources have been committed at both the local CMTS and remote CMTS. The local CMTS has also received a commit notification from the local MTA and has finished all gate coordination with the remote end. The gate can now pass traffic. • INVLD = The gate is invalid, typically because of an error condition or lack of resources. The CMTS will eventually delete the gate. • UNKWN = The gate is an unknown state.
SFID (us)	SFID for the upstream associated with this PacketCable gate.
SFID (ds)	SFID for the downstream associated with this PacketCable gate.
Total number of gates	Displays the total number of gates that are currently allocated, authorized, reserved, or committed.
Total Gates committed	Displays the total number of gates that the CMTS has committed since the CMTS was last reset or since the counters were last cleared.

Tip For complete information about the State field, see section 5.4, Gate Control Protocol Operation, in the *PacketCable Dynamic Quality-of-Service Specification* (PKT-SP-DQOS-I03-020116).

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show packetcable gate** command:

```
Router#show packetcable gate summary
GateID      i/f          SubscriberID  GC-Addr      State   Type  SFID(us) SFID(ds)
16383      Ca3/0/1      45.45.0.145  2.39.23.117 COMMIT     MM    815

Total number of gates = 1
Total Gates committed(since bootup or clear counter) = 1
```

This example shows the output of the **show packetcable gate** command for a specific gate ID:

```
Router#show packetcable gate 16383
GateID : 16383
Subscriber ID : 192.0.2.199
```

```

Related Commands

Command	Description
clear packetcable gate counter commit	Resets the counters that track the total number of committed gates.
packetcable	Enables PacketCable operations on the Cisco CMTS.
show packetcable gate counter commit	Displays the total number of committed gates since system reset or since the counter was last cleared.
show packetcable global	Displays the current PacketCable configuration.

show packetcable gate counter commit

To display the total number of gates that the CMTS has put into the COMMITTED state since the CMTS was last reset or since the counter was last cleared, use the **show packetcable gate counter commit** command in user EXEC or privileged EXEC mode.

show packetcable gate counter commit

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes User EXEC, Privileged EXEC

Release	Modification
12.2(8)BC2	This command was introduced for the Cisco uBR7200 series universal broadband router.
12.2(15)BC1	Support was added for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines This command displays the total number of gates that have been committed since the Cisco uBR7200 series router was restarted or since the counter was last cleared with the **clear packetcable gate counter commit** command.

Note This command displays only the count of committed gates. It does not include gates that were allocated, authorized, and reserved but that were not put into the COMMITTED state.

Examples

The following example shows that 132 gates have been committed since the Cisco CMTS was last reset or since the counters were last cleared:

```
Router# show packetcable gate counter commit

Total Gates committed (since bootup or clear counter) = 132
Router#
```

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show packetcable gate counter commit** command:

```
Router#show packetcable gate counter commit
Total gates committed(since bootup or clear counter) = 4
```

Related Commands

Command	Description
clear packetcable gate counter commit	Resets the counters that track the total number of committed gates.
packetcable	Enables PacketCable operations on the Cisco CMTS.
show packetcable gate	Displays information about one or more gates in the gate database.
show packetcable global	Displays the current PacketCable configuration.

show packetcable gate ipv6

To display information about one or more PacketCable gates associated with IPv6 subscriber IDs in the gate database, use the **show packetcable gate ipv6** command in privileged EXEC mode.

show packetcable gate ipv6 summary [**downstream** {*gate-id*|**ipv6 summary**}] [**upstream** {*gate-id*|**ipv6 summary**}]

Syntax Description

ipv6	Specifies IPv6 subscriber IDs.
summary	Displays a summary of gates containing the gate ID, subscriber ID, subscriber IPv6 address, and the state information.
downstream <i>gate-id</i>	(Optional) Displays information for the specified gate ID in the downstream direction. The valid range is from 0 to 4294967295.
upstream <i>gate-id</i>	(Optional) Displays information for the specified gate ID in the upstream direction. The valid range is from 0 to 4294967295.

Command Default

None

Command Modes

Privileged EXEC(#)

Command History

Release	Modification
12.2(33)SCE	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines

This command provides a summary of all active gates (downstream or upstream gates) for IPv6 subscribers.

Examples

The following is a sample output of the **show packetcable gateipv6** command that shows a **summary of all the active downstream and upstream gates for IPv6** subscribers on a Cisco CMTS router:

```
Router# show packetcable gate ipv6 summary
GateID      i/f                SubscriberID          State  SFID(us) SFID(ds)
13582      Ca8/1/0            2001:40:1:42:C0B4:84E5:5081:9B5C  COMMIT  74
29962      Ca8/1/0            2001:40:1:42:C0B4:84E5:5081:9B5C  COMMIT  73
46354      Ca8/1/0            2001:40:1:42:C0B4:84E5:5081:9B5C  COMMIT  72
62738      Ca8/1/0            2001:40:1:42:C0B4:84E5:5081:9B5C  COMMIT                      69
```

```
TTotal number of gates = 4
Total Gates committed(since bootup or clear counter) = 8
```

The following is a sample output of the **show packetcable gateipv6** command that shows a **summary of all downstream gates for IPv6** subscribers on a Cisco CMTS router:

```
Router# show packetcable gate downstream ipv6 summary
GateID      i/f                SubscriberID      State  SFID(us) SFID(ds)
62738      Ca8/1/0           2001:40:1:42:C0B4:84E5:5081:9B5C  COMMIT 74        69
```

```
Total number of DS gates = 1
Total Gates committed(since bootup or clear counter) = 8
```

The following is a sample output of the **show packetcable gateipv6** command that shows a **summary of all upstream gates for IPv6** subscribers on the Cisco CMTS router:

```
Router# show packetcable gate upstream ipv6 summary
GateID      i/f                SubscriberID      State  SFID(us) SFID(ds)
13582      Ca8/1/0           2001:40:1:42:C0B4:84E5:5081:9B5C  COMMIT 74
29962      Ca8/1/0           2001:40:1:42:C0B4:84E5:5081:9B5C  COMMIT 73
46354      Ca8/1/0           2001:40:1:42:C0B4:84E5:5081:9B5C  COMMIT 72
Total number of US gates = 3
Total Gates committed(since bootup or clear counter) = 8
```

Table below describes the significant fields shown in the **command** display.

Table 253: show packetcable gate Field Display

Field	Description
GateID	Unique number identifying the local gate.
i/f	Cable interface on the Cisco CMTS.
Subscriber ID	IPv6 address of the subscriber for this service request.
State	Describes the state of the gate in both the upstream and downstream directions. The possible state values are: <ul style="list-style-type: none"> • ALLOC—The CMTS has received a Gate-Alloc command from the gate controller and has created the gate in response. The CMTS must now wait for the request to be authorized. • AUTH—The CMTS has received a Gate-Set command from the gate controller that authorizes the resources needed for the gate request. The CMTS must now wait for the actual resources to be reserved. • RSVD—All required resources for the gate have been reserved. • COMMIT—All resources are committed at both the local CMTS and remote CMTS. The local CMTS has also received a commit notification from the local MTA and has completed all gate coordination with the remote end. The gate can now pass traffic. • INVLD—The gate is invalid, typically because of an error condition or lack of resources. The CMTS will eventually delete the gate. • UNKWN—The gate is in an unknown state.
SFID (us)	SFID for the upstream associated with this PacketCable gate.
SFID (ds)	SFID for the downstream associated with this PacketCable gate.
Total number of gates	Displays the total number of PCMM gates that are allocated, authorized, reserved, or committed.

Field	Description
Total Gates committed (since bootup or clear counter)	Displays the total number of PCMM gates that the CMTS has committed since the CMTS was last reset or since the counters were last cleared.

Related Commands

Command	Description
packetcable	Enables PacketCable operations on a Cisco CMTS router.
show packetcable gate	Displays information about one or more PacketCable gates in the gate database.
show packetcable gate counter commit	Displays the total number of committed PacketCable gates since system reset or since the counter was last cleared.
show packetcable global	Displays the PacketCable configuration.

show packetcable gate multimedia

On Cisco uBR10012 router, to display information about the total number of PacketCable Multimedia (PCMM) multicast gates, use the **show packetcable gate multimedia** command in privileged EXEC mode.

On Cisco cBR-8 router, to display information about the total number of PacketCable Multimedia (PCMM) gates, use the **show packetcable gate multimedia** command in privileged EXEC mode.

show packetcable gate multimedia [**summary**]

Cisco cBR Series Converged Broadband Router

show packetcable gate multimedia[**{downstream | upstream}**]**summary**

Syntax Description

downstream	(Optional) Display information only for Packetcable multimedia downstream gate.
upstream	(Optional) Display information only for Packetcable multimedia upstream gate.
multicast	(Optional for Cisco uBR10012 router) Displays PCMM information.
summary	For Cisco uBR10012 router— Provides a summary of PCMM multicast gate ID, subscriber ID, gate controller address, and current state information. For Cisco cBR-8 router— Provides a summary of PCMM gate ID, subscriber ID, gate controller address, and current state information.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCE	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The downstream and upstream keywords were added. PCMM Multicast option is not supported on the Cisco cBR Series Converged Broadband Router.

Examples

The following is a sample output of the **show packetcable gate multimedia** command on a Cisco CMTS router:

```
Router# show packetcable gate multimedia multicast summary
GateID      i/f          SubscriberID  GC-Addr      State      Type  SFID(us)  SFID(ds)
134         Ca5/0/0      60.1.1.202   2.39.26.19   COMMIT    MM    4          4
Total number of Multimedia-MCAST gates = 1
Total Gates committed(since bootup or clear counter) = 1
```

Table below describes the significant fields shown in the display.

Table 254: show packetcable gate multimedia Field Descriptions

Field	Description
GateID	Unique number identifying the local PCMM multicast gate.
i/f	Cable interface on the Cisco CMTS router.
Subscriber ID	IP address of the subscriber for this service request.
GC-Addr	IP address of the gate controller that is responsible for the gate.
State	<p>Describes the current state of the gate in the downstream direction. The possible state values are:</p> <ul style="list-style-type: none"> • ALLOC—The CMTS has received a Gate-Alloc command from the gate controller and has created the gate in response. The CMTS must now wait for the request to be authorized. • AUTH—The CMTS has received a Gate-Set command from the gate controller that authorizes the resources needed for the gate request. The CMTS must now wait for the actual resources to be reserved. • RSVD—All required resources for the gate have been reserved. • COMMIT—All resources are committed at both the local CMTS and remote CMTS. The local CMTS has also received a commit notification from the local MTA and has completed all gate coordination with the remote end. The gate can now pass traffic. • INVLD—The gate is invalid, typically because of an error condition or lack of resources. The CMTS will eventually delete the gate. • UNKWN—The gate is in an unknown state.
SFID (us)	Service flow ID (SFID) for the upstream associated with this PCMM multicast gate.
SFID (ds)	SFID for the downstream associated with this PCMM multicast gate.
Total number of Multimedia-MCAST gates	Total number of PCMM multicast gates that are currently allocated, authorized, reserved, or committed.
Total Gates committed (since bootup or clear counter)	Total number of PCMM multicast gates that are committed since the Cisco CMTS router was last reset or since the counters were last cleared.

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show packetcable gate multimedia** command with the **summary** option:

```
Router#show packetcable gate multimedia summary
GateID i/f      SubscriberID GC-Addr  State  Type SFID(us) SFID(ds)
81919  Cal/0/4      24.232.100.16 1.2.0.101 COMMIT MM      363
98303  Cal/0/4      24.232.100.16 1.2.0.101 COMMIT MM      364
114687 Cal/0/0      24.232.100.46 1.2.0.101 COMMIT MM      301
131071 Cal/0/0      24.232.100.46 1.2.0.101 COMMIT MM      302
```

```

147455 Ca1/0/4 24.232.100.17 1.2.0.101 COMMIT MM          365
163839 Ca1/0/4 24.232.100.17 1.2.0.101 COMMIT MM          366
180223 Ca1/0/4 24.232.100.32 1.2.0.101 COMMIT MM          367
196607 Ca1/0/4 24.232.100.32 1.2.0.101 COMMIT MM          368
212991 Ca1/0/0 24.232.100.47 1.2.0.101 COMMIT MM          303
229375 Ca1/0/0 24.232.100.47 1.2.0.101 COMMIT MM          304
245759 Ca1/0/0 24.232.100.48 1.2.0.101 COMMIT MM          305
262143 Ca1/0/0 24.232.100.48 1.2.0.101 COMMIT MM          306

```

```

Total number of Multimedia gates = 12
Total Gates committed(since bootup or clear counter) = 12

```

This example shows the output of the **show packetcable gate multimedia** command with the **upstream summary** option:

```

Router#show packetcable gate multimedia upstream summary
GateID i/f      SubscriberID GC-Addr  State  Type SFID(us) SFID(ds)
81919  Ca1/0/4  24.232.100.16 1.2.0.101 COMMIT MM  363
131071 Ca1/0/0  24.232.100.46 1.2.0.101 COMMIT MM  302
147455 Ca1/0/4  24.232.100.17 1.2.0.101 COMMIT MM  365
180223 Ca1/0/4  24.232.100.32 1.2.0.101 COMMIT MM  367
229375 Ca1/0/0  24.232.100.47 1.2.0.101 COMMIT MM  304
245759 Ca1/0/0  24.232.100.48 1.2.0.101 COMMIT MM  305

```

```

Total number of Multimedia-US gates = 6
Total Gates committed(since bootup or clear counter) = 12

```

This example shows the output of the **show packetcable gate multimedia** command with the **downstream summary** option:

```

Router#show packetcable gate multimedia downstream summary
GateID i/f      SubscriberID GC-Addr  State  Type SFID(us) SFID(ds)
98303  Ca1/0/4  24.232.100.16 1.2.0.101 COMMIT MM  364
114687 Ca1/0/0  24.232.100.46 1.2.0.101 COMMIT MM  301
163839 Ca1/0/4  24.232.100.17 1.2.0.101 COMMIT MM  366
196607 Ca1/0/4  24.232.100.32 1.2.0.101 COMMIT MM  368
212991 Ca1/0/0  24.232.100.47 1.2.0.101 COMMIT MM  303
262143 Ca1/0/0  24.232.100.48 1.2.0.101 COMMIT MM  306

```

```

Total number of Multimedia-DS gates = 6
Total Gates committed(since bootup or clear counter) = 12

```

Table 255: show packetcable gate multimedia Field Descriptions for Cisco cBR Series Converged Broadband Router

Field	Description
GateID	Unique number identifying the local PCMM gate.
i/f	Cable interface on the Cisco CMTS router.
Subscriber ID	IP address of the subscriber for this service request.
GC-Addr	IP address of the gate controller that is responsible for the gate.

Field	Description
State	<p>Describes the current state of the gate in the downstream direction. The possible state values are:</p> <ul style="list-style-type: none"> • ALLOC—The CMTS has received a Gate-Alloc command from the gate controller and has created the gate in response. The CMTS must now wait for the request to be authorized. • AUTH—The CMTS has received a Gate-Set command from the gate controller that authorizes the resources needed for the gate request. The CMTS must now wait for the actual resources to be reserved. • RSVD—All required resources for the gate have been reserved. • COMMIT—All resources are committed at both the local CMTS and remote CMTS. The local CMTS has also received a commit notification from the local MTA and has completed all gate coordination with the remote end. The gate can now pass traffic. • INVLD—The gate is invalid, typically because of an error condition or lack of resources. The CMTS will eventually delete the gate. • UNKWN—The gate is in an unknown state.
SFID (us)	Service flow ID (SFID) for the upstream associated with this PCMM gate.
SFID (ds)	SFID for the downstream associated with this PCMM gate.
Total number of Multimedia-xx gates	<p>Total number of PCMM gates that are currently allocated, authorized, reserved, or committed.</p> <p>The "Total number of Multimedia-xx gates" depends on the options used. The field is given as:</p> <ul style="list-style-type: none"> • If no option is used—"Total number of Multimedia gates" , • For option multicast—"Total number of Multimedia-MCAST gates" • For option downstream—"Total number of Multimedia-DS gates" • For option upstream—"Total number of Multimedia-US gates"
Total Gates committed (since bootup or clear counter)	Total number of PCMM gates that are committed since the Cisco CMTS router was last reset or since the counters were last cleared.

Related Commands

Command	Description
cable multicast source	Configures a multicast session range for a PCMM multicast group on a Cisco CMTS router.
show cable multicast db	Displays the contents of the multicast explicit tracking database.

show packetcable global

To display the current PacketCable configuration, including the maximum number of gates, the Element ID, and the DQoS timer values, use the **show packetcable global** command in user EXEC or privileged EXEC mode.

show packetcable global

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes User EXEC, Privileged EXEC

Command History	Release	Modification
	12.2(8)BC2	This command was introduced for the Cisco uBR7200 series universal broadband router.
	12.2(11)BC1	Support was added to display the Element ID for the CMTS.
	12.2(11)BC2	Support was added to display whether non-PacketCable UGS service flows are authorized or not. The T2 and T5 timers were removed from the display to conform to the requirements of the PacketCable DQoS Engineering Change Notice (ECN) 02148.
	12.2(15)BC1	Support was added for the Cisco uBR10012 router.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Examples

The following example shows a typical PacketCable configuration that is enabled and has the default values for all configurable parameters, except for the Element ID:

```
Router# show packetcable global
Packet Cable Global configuration:
Enabled      : Yes
Element ID: 12456
Max Gates   : 1048576
Allow non-PacketCable UGS
Default Timer value -
  T0        : 30000 msec
  T1        : 300000 msec
Router#
```

Table below describes the fields shown in the **show packetcable global** display.

Table 256: show packetcable global Field Display

Field	Description
Enabled	Displays whether PacketCable operation is enabled or disabled. (See the packetcable command.)

Field	Description
Element ID	Displays the Element ID for the CMTS. If you do not manually configure this parameter with the packetcable element-id command, it defaults to a random value between 0 and 99,999 when PacketCable operations is enabled.
Max Gates	Displays the maximum number of gates that the CMTS supports. (See the packetcable gate maxcount command.)
Allow non-PacketCable UGS or Not Allow non-PacketCable UGS	Displays whether non-PacketCable, DOCSIS-style UGS service flows are allowed when PacketCable operations are enabled. (See the packetcable authorize vanilla-docsis-mta command.)
Default Timer value	Displays the current values of the following DQoS timers that the CMTS maintains. (See the packetcable timer command.)
T0	T0 specifies the amount of time that a gate ID can remain allocated without any specified gate parameters. The timer begins counting when a gate is allocated with a Gate-Alloc command. The timer stops when a Gate-Set command marks the gate as Authorized. If the timer expires without a Gate-Set command being received, the gate is deleted. The valid range is 1 to 1,000,000,000 milliseconds, with a default value of 30000 milliseconds (30 seconds).
T1	T1 specifies the amount of time that an authorization for a gate can remain valid. It begins counting when the CMTS creates a gate with a Gate-Set command and puts the gate in the Authorized state. The timer stops when the gate is put into the committed state. If the timer expires without the gate being committed, the CMTS must close the gate and release all associated resources. The valid range is 1 to 1,000,000,000 milliseconds, with a default value of 200000 milliseconds (200 seconds).

Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show packetcable gate counter commit** command:

```
Router#show packetcable global
Packet Cable Global configuration:
Packetcable DQoS Enabled : Yes
Packetcable Multimedia Enabled : Yes
Element ID: 49137
Max Gates : 512000
Not Allow non-PacketCable UGS
Default Multimedia Timer value -
T1 : 200000 msec
Persistent gate : 0 hour
Volume Limit : RUNNING
Default DQoS Timer value -
T0 : 30000 msec
T1 : 300000 msec
Client Accept Timer: Disabled
Client Accept Timer Expired: 0
```

```
Packetcable DQOS Gate Send SubscriberID Enabled: No
```

Table 257: show packetcable global Field Display

Field	Description
Packetcable DQOS Enabled	For Cisco cBR router— Displays whether PacketCable DQOS operation is enabled or disabled. (See the packetcable command.)
Packetcable Multimedia Enabled	For Cisco cBR router— Displays whether PacketCable multimedia operation is enabled or disabled.
Element ID	Displays the Element ID for the CMTS. If you do not manually configure this parameter with the packetcable element-id command, it defaults to a random value between 0 and 99,999 when PacketCable operations is enabled.
Max Gates	Displays the maximum number of gates that the CMTS supports. (See the packetcable gate maxcount command.)
Allow non-PacketCable UGS or Not Allow non-PacketCable UGS	Displays whether non-PacketCable, DOCSIS-style UGS service flows are allowed when PacketCable operations are enabled. (See the packetcable authorize vanilla-docsis-mta command.)
Default Timer value	Displays the current values of the following DQoS timers that the CMTS maintains. (See the packetcable timer command.)
T0	T0 specifies the amount of time that a gate ID can remain allocated without any specified gate parameters. The timer begins counting when a gate is allocated with a Gate-Alloc command. The timer stops when a Gate-Set command marks the gate as Authorized. If the timer expires without a Gate-Set command being received, the gate is deleted. The valid range is 1 to 1,000,000,000 milliseconds, with a default value of 30000 milliseconds (30 seconds).
T1	T1 specifies the amount of time that an authorization for a gate can remain valid. It begins counting when the CMTS creates a gate with a Gate-Set command and puts the gate in the Authorized state. The timer stops when the gate is put into the committed state. If the timer expires without the gate being committed, the CMTS must close the gate and release all associated resources. The valid range is 1 to 1,000,000,000 milliseconds, with a default value of 200000 milliseconds (200 seconds).
Client Accept Timer	For Cisco cBR router— Displays whether the Client Accept Timer is enabled.
Client Accept Timer Expired	For Cisco cBR router— Displays the time expired on the Client Accept Timer.
Packetcable DQOS Gate Send SubscriberID Enabled	For Cisco cBR router— Displays whether the Packetcable DQOS Gate Send SubscriberID operation is enabled.

Related Commands

Command	Description
packetcable	Enables PacketCable operations on the Cisco CMTS.
packetcable authorize vanilla-docsis-mta	Allows Unsolicited Grant Service (UGS) service flows without a proper PacketCable gate ID when PacketCable operations are enabled on the Cisco CMTS.
packetcable element-id	Configures the PacketCable Event Message Element ID on the Cisco CMTS.
packetcable gate maxcount	Changes the maximum number of PacketCable gate IDs in the gate database on the Cisco CMTS.
packetcable timer	Changes the value of the different PacketCable DQoS timers.
show packetcable gate	Displays information about one or more gates in the gate database.
show packetcable gate counter commit	Displays the total number of committed gates since system reset or since the counter was last cleared.

show platform hardware diagnostic status

To displays the field diagnostic tests status, use the **show platform hardware diagnostic status slot *slot-id*** command in Privileged EXEC mode.

show platform hardware diagnostic status slot *slot-id*

Syntax Description	slot <i>slot-id</i>	Specifies the slot performing field diagnostic test.
---------------------------	-------------------------------	--

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **show platform hardware diagnostic status slot *slot-id*** command displays field diagnostic test status.

Examples The following example shows a typical display for the **show platform hardware diagnostic status slot *slot-id*** command:

```
Router# show platform hardware diagnostic status slot 0
Online Offline Diagnostic Status (P=Passed, F=Failed, U=Untested)
State           Overall Test Num      Test Done Num      Test Result
-----
Running Auto Test      75                   70                 P:69 F:1 U:5
```

Related Commands	Command	Description
	request platform hardware diagnostic load	Loads the field diagnostic image and starts field diagnostic test.
	request platform hardware diagnostic unload	Unload the field diagnostic image from the line card.

show platform hardware dpic

To display information with regard to the Digital Physical Interface Card, use the **show platform hardware dpic slot-id** command in Privileged EXEC mode.

show platform hardware dpic slot-id

slot <i>slot-id</i>	Specifies the slot for which the information is displayed.
-------------------------------	--

Command Default None.

Command Modes Privileged EXEC (#)

Release	Modification
IOS-XE 16.10.1d	This command was introduced on Cisco cBR Series Converged Broadband Routers.

The **show platform hardware dpic slot-id** command displays information on the status of the DPIC.

```
Router# show pl hardware dpic subslot 4/2 transceiver 1 show status
Load for five secs: 6%/0%; one minute: 6%; five minutes: 8%
Time source is NTP, 11:13:49.865 CST Mon Mar 4 2019
```

```
The Transceiver in slot 2 subslot 1 port 1 is enabled.

```

show platform hardware qfp active cable dpic-lcha if-name

To display DPIC LCHA interface subblock information, use the **show platform hardware qfp [active | standby] cable dpic-lcha if-name *interface-name*** command in privileged EXEC mode.

The commands display the peer interface info. The output displays when protect Line Card becomes active. The same peer interface displays on both SUPs.

show platform hardware qfp [active | standby] cable dpic-lcha if-name *interface-name*

Syntax Description

Syntax Description	dpic-lcha	Display DPIC LCHA interface subblock information.
	if-name <i>interface-name</i>	Enter the interface name.

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Dublin 17.12.1w	This command is introduced for the Cisco cBR Series Converged Broadband routers.

Usage Guidelines

The **show platform hardware qfp active cable dpic-lcha if-name *interface-name*** command displays DPIC LCHA interface subblock information.

Examples

The following example shows a typical display for the **show platform hardware qfp active cable us-dpic-lcha** command:

```
router#show platform hardware qfp active cable dpic-lcha if-name te6/1/0
if_h: 30
ppe_addr: 0x3c99dc04
rsrc_h: 0x1ea6770049901803
peer_uidb in client: 261554
peer_uidb in exmem: 261554
```

The output line `peer uidb in client: 261554` refers to TE9/1/0 interface.

```
router#show platform hardware qfp active cable dpic-lcha if-name te9/1/0
if_h: 590
ppe_addr: 0x3c99dc00
rsrc_h: 0x1ea6770009901803
peer_uidb in client: 262114
peer_uidb in exmem: 262114
```

The output line `peer uidb in client: 262114` refers to TE6/1/0 interface.

```
router#show platform hardware qfp active interface if-handle 30 | i Name | Tx uidb
Interface Name: TenGigabitEthernet6/1/0
Tx uidb: 262114
```

```
router#show platform hardware qfp active interface if-handle 590 | i Name|Tx uidb
Interface Name: TenGigabitEthernet9/1/0
Tx uidb: 261554
router#
```

show platform hardware qfp active cable us-mpls-tc

To display MPLS TC bits marking information, use the **show platform hardware qfp active cable us-mpls-tc** command in Privileged EXEC mode.

show platform hardware qfp active cable us-mpls-tc vslot vslot_number md md_number uflow-idx uflow_index

Syntax Description	Parameter	Description
	vslot vslot_number	Specifies the virtual slot in which the linecard is inserted.
	md md_number	Specifies the MAC domain.
	uflow-idx uflow_index	Specifies the SID of the upstream service flow.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.17.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **show platform hardware qfp active cable us-mpls-tc** command displays MPLS TC bits marking information.

Examples

The following example shows a typical display for the **show platform hardware qfp active cable us-mpls-tc** command:

```
Router# show cable modem
c8fb.26a5.5402 31.89.0.9      C3/0/0/U2      w-online(pt)    19    -4.50  1781   0    Y
c8fb.26a5.5730 31.89.0.29     C3/0/0/U0      w-online(pt)    20     1.50  1781   0    Y
c8fb.26a5.530c 31.89.0.14     C3/0/0/U3      w-online(pt)    21    -0.50  1782   0    Y

Related Commands

Command	Description
show platform hardware qfp active feature docsis mpls_tc-precfy db	Displays MPLS TC bits classification informaiton.

show platform hardware qfp active feature docsis bf

To display DOCSIS bundle-flood feature information, use the **show platform hardware qfp active feature docsis bf** command in Privileged EXEC mode.

show platform hardware qfp active feature docsis bf *bundle-interface-handle* { **replist** | **subblock detail** }

Syntax Description

bf	Specifies the DOCSIS bundle-flood feature.
<i>bundle-interface-handle</i>	Specifies the bundle interface handle. The valid range is from 1 to 2147483647.
replist	Specifies the bundle-flood replication list.
subblock	Specifies the bundle-flood subblock.

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **show platform hardware qfp active feature docsis bf** command displays DOCSIS bundle-flood information.

Examples

The following example shows a typical display for the **show platform hardware qfp active feature docsis bf** command:

```
Router# platform hardware qfp active interface if-name Bundle1
General interface information
  Interface Name: Bundle1
  Interface state: VALID
  Platform interface handle: 3689
  QFP interface handle: 7
. . .

show platform hardware qfp active infrastructure punt sbrl

To display and clear the Source-Based Rate Limiting (SBRL) statistics, use the **show platform hardware qfp active infrastructure punt sbrl** command in privileged EXEC mode.

show platform hardware qfp active infrastructure punt sbrl [**sub-mac-addr** | **sub-cm** | **wan-ipv4** | **wan-ipv6**] [**threshold** *threshold_value*] [**clear**]

Syntax Description

sub-mac-addr	(Optional) Displays only the SBRL subscriber-side MAC-address statistics.
sub-cm	(Optional) Displays only the SBRL subscriber-side cable modem statistics.
wan-ipv4	(Optional) Display only the SBRL WAN-side IPv4 statistics.
wan-ipv6	(Optional) Display only the SBRL WAN-side IPv6 statistics.
threshold <i>threshold_value</i>	(Optional) Specifies the threshold for displaying SBRL statistics. Rows which have a drop-cnt greater than or equal to the threshold are displayed. The default threshold is 1.
clear	(Optional) Clears the SBRL statistics.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the clear pxf statistics drl cable-wan-ip command.

Usage Guidelines

The SBRL statistics algorithm stores data for the worst offenders. Sources with small drop counts may be overwritten if the *drop-cnt* is not continually increasing. The *evict-cnt* increases in tandem with *drop-cnt*, and decreases when a source is no longer active. When the *evict-cnt* is below 10, the record may be overwritten.

In the WAN-IPv4 and WAN-IPv6 statistics, the *quar value* is either 1 or 0, where 1 indicates that the source is in quarantine. The *quar value* is updated only when a packet from the source is dropped, so if a source enters quarantine but then stops sending packets, the quar value will remain at 1 even after the source exits quarantine. However, the *drop-cnt* fails to increment.

The statistics can be displayed all at once, or individually. The **threshold** and **clear** keywords can be entered in any order. Only non-zero statistics are displayed.

Examples

The following example shows a typical display for the **show platform hardware qfp active infrastructure punt sbrl** command:

```
Router# show platform hardware qfp active infrastructure punt sbrl
SBRL statistics

Subscriber CM
  drop-cnt  evict-cnt  SID  Interface
```

```

-----

-----

```

Table 258: show platform hardware qfp active infrastructure punt sbrl Field Descriptions

Field	Description
drop-cnt	Counter for dropped packets.
SID	Service ID.
Interface	Cable interface.
quar	Quarantine status. The value is either 1 or 0, where 1 indicates that the source is in quarantine.
cause	Punt cause.
IP-address	WAN-IPv4 and WAN-IPv6 IP address.

Related Commands

Command	Description
show platform hardware qfp active infrastructure punt summary	Displays the summary of punt-path rate-limiting statistics.
platform punt-sbri	Rate-limits the packet streams identified by the Source-Based Rate-Limit (SBRL).

show platform hardware qfp active infrastructure punt summary

To display and clear the summary of punt-path rate-limiting statistics, use the **show platform hardware qfp active infrastructure punt summary** command in privileged EXEC mode.

show platform hardware qfp active infrastructure punt summary [**threshold** *threshold_value*]
[**clear**]

Syntax Description

threshold <i>threshold_value</i>	(Optional) Specifies the threshold for displaying the summary statistics. Rows which have a CPP punt value greater than or equal to the threshold are displayed. The default threshold is 1.
clear	(Optional) Clears the summary statistics.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The summary statistics provide a fast way to determine the status of punt-path rate-limiting. When the Supervisor is receiving an excessive number of punted packets, **clear** and **show** the summary statistics to determine how to configure SBRL and/or punt-policing. The **threshold** and **clear** keywords can be entered in any order. The default behavior is to display only non-zero statistics.

Examples

The following example shows a typical display for the **show platform hardware qfp active infrastructure punt summary** command:

```
Router# show platform hardware qfp active infrastructure punt summary threshold 10
Punt Path Rate-Limiting summary statistics

show platform software cable

To display the out-of-band information for downstream and upstream channels, use the **show platform software cable** command in privileged EXEC mode.

Show commands for OOB downstream channel:

- Shows OOB DS FMAN table details:

```
show platform software cable slot-number oob-ds
```

- Shows OOB DS FMAN table statistics status:

```
show platform software cable slot-number oob-ds statistics
```

- Shows OOB DS FMAN table details of the group:

```
show platform software cable slot-number oob-ds group G2 address
```

Show commands for OOB upstream channel:

- Shows OOB US FMAN table details:

```
show platform software cable slot-number oob-us
```

- Shows OOB DS FMAN table statistics status:

```
show platform software cable slot-number oob-us statistics
```

- Shows OOB DS FMAN table details of the source ID:

```
show platform software cable slot-number oob-us source-id RPD source ID
```

- Shows information on Upstream RF ports , 55-1 channels, and packet count information of the UEPI sessions.

```
show platform software cable fp active oob-chn-pkts
```

Syntax Description	<i>slot-number</i>	The line card that is present in the specified slot. Valid numbers range 0–9, F0 to F1 and R0 to R1.
	statistics	Displays the FMAN table statistics status.
	group	Displays the line card groups.
	<i>RPD source ID</i>	RPD source ID

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
	Cisco IOS XE Amsterdam 17.3.1x	The output of the option fp active oob-chn-pkts was modified to include more 55-1 us oob debug information.

Usage Guidelines

Use this command to display the out-of-band information for downstream or upstream channels:

Displays the OOB Information for Upstream Channels

Use the following commands to verify the US details.

```
show platform software cable F0 oob-us
show platform software cable F0 oob-us statistics
clear platform software cable F0 oob-us statistics
show platform software cable F0 oob-us source-id <RPD source id>
```

Displays the OOB Information for Downstream Channels

Use the following commands to verify the US details.

```
show platform software cable F0 oob-ds
show platform software cable F0 oob-ds statistics
clear platform software cable F0 oob-ds statistics
show platform software cable F0 oob-ds group <G2 address>
```

The following example shows a sample output for the command **show platform software cable fp active oob-chn-pkts**:

```
Router#show platform software cable fp active oob-chn-pkts
cable OOB US PACKET table information
```

Session ID	rfport	chn_Id	demodId	Total Cells	Perfect Cells	Corrected Cells
Uncorrected Cells	Power Level		Min Power Lvl	Max Power Lvl

show platform software iomd

To verify the MAC filtering status, use the **show platform software iomd** command in privileged EXEC mode.

```
show platform software iomd slot/bay mac-filter
```

Syntax Description

<i>slot/bay</i>	The SUP slot and SUP-PIC bay number.
-----------------	--------------------------------------

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.18.1SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following example shows a typical display for the **show platform software iomd** command:

```
Router# show platform software iomd 4/4 mac-filter

show platform software ios/cdman ipccl

To display information about IPC Client Library (IPCCL) on cable device manager, use the **show platform software** command in privileged EXEC mode. Use **cdman** keyword to display cable device manager's IPCCL statistics on linecards or use **ios** keyword to display IOS IPCCL statistics on Route Processor's or linecards.

```
show platform software {ios | cdman} slot-id ipccl { log-history { port-id } | outstanding { client
[port-id client-id] | port {port-id} } | statistics {client { port-id client-id } | {port { port-id
[rx-msg-stat] } } | { service {port-id [svc-id apps] } } }
```

Syntax Description

cdman <i>slot-id</i>	Specifies the cable linecard slot number. The valid linecard slot range is 0-3 and 6- 9.
ios <i>slot-id</i>	Specifies the cable linecard slot number. The valid linecard slot range is 0-3, 6-9,R0, R1 and RP active/standby.
log-history	Specifies the log-history.
<i>port-id</i>	Specifies the port layer to which IPC messages are sent and received. The port-id values are for IOS are: <ul style="list-style-type: none"> • 1 - CABLE_IPCCL_PORT_DOCSIS The port-id values are for IOS-CLC are: <ul style="list-style-type: none"> • 1 - CABLE_IPCCL_PORT_DOCSIS • 2 - CABLE_IPCCL_PORT_CDMAN_NORMAL • 3 - CABLE_IPCCL_PORT_VIDMAN • 4 - CABLE_IPCCL_PORT_IDB_SYNC The port-id values for cable device manager is: <ul style="list-style-type: none"> • 2 - CABLE_IPCCL_PORT_CDMAN_NORMAL
outstanding	Specifies the statistics of outstanding messages.
client	Specifies the client statistics.
port	Specifies the port statistics.

<i>client-id</i>	<p>Specifies client statistics. Different client's will use different services and ports:</p> <ul style="list-style-type: none"> • CABLE_IPCCL_TEST_CLIENT = 1 • CABLE_IPCCL_APP_CLIENT_DUMMY = 2 • CABLE_IPCCL_DOCSIS_APP_CLIENT = 3 • CABLE_IPCCL_DOC_CDM_APP_CLIENT = 4 • CABLE_IPCCL_CDMAN_BINOS_APP_CLIENT = 5 • CABLE_IPCCL_UMP_APP_CLIENT = 6 • CABLE_IPCCL_DMP_APP_CLIENT = 7 • CABLE_IPCCL_MD_APP_CLIENT = 8 • CABLE_IPCCL_MD_CDMAN_APP_CLIENT = 9 • CABLE_IPCCL_DSBG_APP_CLIENT = 10 • CABLE_IPCCL_UCM_APP_CLIENT = 11 • CABLE_IPCCL_DCM_APP_CLIENT = 12 • CABLE_IPCCL_DCM_CDMAN_APP_CLIENT = 13 • CABLE_IPCCL_DSNB_APP_CLIENT = 14 • CABLE_IPCCL_PLAT_CLI_CLIENT = 15 • CABLE_IPCCL_STATS_APP_CLIENT = 16 • CABLE_IPCCL_SNMP_APP_CLIENT = 17 • CABLE_IPCCL_CMTS_IPC_APP_CLIENT = 18 • CABLE_IPCCL_SPECMGMT_APP_CLIENT = 19 • CABLE_IPCCL_SPECSVL_APP_CLIENT = 20 • CABLE_IPCCL_SPECSVL_CDMAN_APP_CLIENT = 21 • CABLE_IPCCL_RFCE_APP_CLIENT = 22 <p>The valid client-id values for cable device manager is:</p> <ul style="list-style-type: none"> • 2 - CABLE_IPCCL_PORT_CDMAN_NORMAL
statistics	Specifies statistics on route processor.
rx-msg-stat	(Optional) Specifies the RX message statistics based on TDL message type.
service	Specifies the service statistics
<i>svc-id</i>	<p>Specifies the service-id used by clients grouped under service layer. The valid values are:</p> <ul style="list-style-type: none"> • 0 - Normal • 1 - High • 4 - SNMP_NORMAL
apps	Specifies the list of application used by this service.

Command Default None

Command Modes Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **show platform software ios slot ipcc1** command displays information about IPC Client Library (IPCCL) on cable device manager.

Examples

The following example shows a typical display for the **show platform software cdman ipcc1** command:

```
Router# show platform software cdman 2 ipcc1 ?
log-history log history
outstanding statistics of outstanding messages
statistics statistics on Route Processor
```

Related Commands

Command	Description
show platform software infrastructure bipc summary	Displays the IOS XE BIPC summary.
show platform software infrastructure bipc identifier	Displays detailed information about the the BIPC identifier.

show platform software ios ipccl

To display information about the IPC Client Library (IPCCL) relative statistics, use the **show platform software ios ipccl** command in privileged EXEC mode.

```
show platform software ios slot ipccl { {outstanding {port [port_number] [peer_slot_number] }
| {client port_number client_id peer_slot_number } } | {statistics {port [port_number]
[peer_slot_number] [rx-msg-stat] } | {client port_number peer_slot_number } | {service
port_number service_id peer_slot_number } } | {log-history port port_number peer_slot_number } }
```

Syntax Description

<i>slot</i>	The cable line card Supervisor slot number.
outstanding	Displays statistics of outstanding messages.
port	Displays the port statistics.
<i>port_number</i>	The IPCCL predefined internal port ID.
<i>peer_slot_number</i>	The slot number of IPCCL peer session.
client	Displays the client statistics.
<i>client_id</i>	The IPCCL registered internal client ID.
statistics	Displays statistics on route processor.
rx-msg-stat	(Optional) Specifies the RX message statistics based on TDL message type.
service	Displays the service statistics.
<i>service_id</i>	The IPCCL predefined internal service ID.
log-history	Displays the log history.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **show platform software ios slot ipccl** command displays the IPCCL statistics on Supervisor or line card.

Note To enable the log-history feature, use the **platform ipccl log-history** command in global configuration mode. To enable the rx-msg-stat feature, use the **platform ipccl rx-stat** command in global configuration mode.

Examples

The following example shows a typical display for the **show platform software ios slot ipcc1** command for all cable interfaces:

```
Router# show platform software ios R0 ipcc1 statistics ?
client      client statistics
port        port statistics

Client ID              : 0
Message Receive Count  : 0
Message Receive Bytes  : 0
-----

Session Slot           : 3
Socket FD              : 86
Client ID              : 1
Message Receive Count  : 29611
Message Receive Bytes  : 69782901
```

show platform software patch

To display the patch version for each sub package, use the **show platform software patch** command in privileged EXEC mode.

```
show platform software patch slot info
```

To display the detailed patch information for all the field replaceable units (FRUs), use the **show platform software patch info** command in privileged EXEC mode.

```
show platform software patch info
```

Syntax Description

<i>slot</i>	The cable line card slot number.
-------------	----------------------------------

Command Default

None.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.18.0SP	This command was modified on the Cisco cBR Series converged Broadband Routers. Only the show platform software patch info can be used to get the detailed patch information for all the FRUs.

Usage Guidelines

The **show platform software patch slot info** command is used to determine the patch information for each sub package on a particular slot.

The **show platform software patch info** command is used to determine the detailed patch information for all the FRUs. For example, to see the patch info for thirteen FRUs, you need not execute the **show platform software patch slot info** command thirteen times specifying FRU ID everytime. Instead use **show platform software patch info**, which will display the detailed patch information for all the FRUs.

Examples

The following example shows a typical display for the **show platform software patch slot info** command for all cable interfaces:

```
Router# show platform software patch 3 info
cbrsup-clciosdb: 3.15 (0.0)
cbrsup-clc-firmware: 3.15 (0.0)
cbrsup-clcvideo: 3.15 (0.0)
cbrsup-clcios: 3.15 (0.0)
cbrsup-clccontrol: 3.15 (0.0)
cbrsup-clcdocsis: 3.15 (0.0)
cbrsup-clcmipsbase: 3.15 (0.0)
```

The following example shows a typical display for the **show platform software patch info** command for all cable interfaces:

```
Router# show platform software patch info
Base Version: 3.18.0
```

Table 259: show platform software punt-policer Field Descriptions

Field	Description
Punt Cause	Punt cause number.

Field	Description
Description	Description of the punt cause.
Configured (pps) Normal	Configured punt policing rate limit for normal-priority punts, in packets per second. Corresponds to the platform punt-policer punt-cause punt-rate command.
Configured (pps) High	Configured punt policing rate limit for high-priority punts, in packets per second. Corresponds to the platform punt-policer punt-cause punt-rate high command.
Conform Packets Normal	Number of packets that conform to the configured rate limit for normal-priority punts.
Conform Packets High	Number of packets that conform to the configure rate limit for high-priority punts.
Dropped Packets Normal	Number of dropped packets for normal-priority punts.
Dropped Packets High	Number of dropped packets for high-priority punts.

Related Commands

Command	Description
platform punt-policer	This command configures punt policing.

show platform software restart info

To view the stage in which the process restart is in, us the **show platform software restart info** command.

show platform software {**ios** | **us-scheduler**} *slot-number* **restart info**

Syntax Description	
ios	Displays information for Cable Line Card Control Plane Restart feature.
us-scheduler	Displays information for Cable Line Card Upstream Scheduler Process Restart feature.
<i>slot-number</i>	Specifies the cable line card slot number for which the information is required to be displayed.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.16.0S	This command was introduced.
	IOS-XE 3.17.0S	This command was modified. The us-scheduler keyword was added.

Usage Guidelines

This command is used for the following features:

- Cable Line Card Control Plane Restart feature.
- Cable Line Card Upstream Scheduler Process Restart feature.

Restart states displayed, by the **ios** keyword in the command output:

- NOT_RESTARTED — No restart happened after system boot
- GLB_CONFIG_PENDING — Configuration is synchronizing from database process.
- SYNC_PENDING — Modem data is synchronizing from database process.
- RECOVERY_PENDING — Modem data is being reconstructed inside the IOSd.
- RECONCILE_PENDING — Modem data is being reconciled between SUP IOSd, CDMAN and LCHAMAN is occurring.
- DB_RESET_PENDING — Stale modem data in database process is being flushed (This results in restart of database process IOSDB).
- BULK_SYNC_PENDING — Synchronizing the clean data to database process.
- DB_ACTIVE_PENDING — Waiting for confirmation from database process of the bulk synchronization.
- ACTIVE — IOSd active (ready for next restart).

Restart states displayed, by the **us-scheduler** keyword in the command output:

- BOOT — Process is booting up.
- INIT — Process initialization state.
- INFRA_READY — Basic infra is ready.
- IPC_INFRA_READY — Process can talk to other processes.
- OPERATIONAL — Process is ready for new sessions.
- RESTART_INIT — Process has restarted.
- RESTART_INFRA_READY — Basic infra after restart is ready.
- RESTART_IPC_INFRA_READY — Process can talk to other processes after restart.
- RESTART_CFG_RECOVER_DONE — Data has been read from Elcaro database and feature recovery is done.
- RESTART_RECON_PEND — Reconciliation has started.
- RESTART_OPERATIONAL — Process is ready after restart.

Example

This example shows the output for the **show platform software restart info** command with the **ios** keyword:

```
Router#show platform software ios 6 restart info
IOSD process restart info:
  Process restartable: Yes
  IOSD restart state : ACTIVE
  Total Modem Count  : 31
  Active Modem Count : 31
```

This example shows the output for the **show platform software restart info** command with the **us-scheduler** keyword:

```
Router#show platform software us-scheduler 6 restart info
us-scheduler process restart info:
  Process restartable           : Yes
  us-scheduler state            : RESTART_OPERATIONAL
  Features bit map              : 0x001e
  us-scheduler restart count    : 1
```

show platform software trace message lc-veman LC slot number/0

You can use the **show platform software trace message lc-veman <LC slot number>/0** to view the brace logs that provide for better debugging of VOD failures.

show platform software trace message lc-veman <LC slot number> /0

Syntax Description	<i>LC slot-number</i> Specifies the cable Line Card slot number for which the log is required to be displayed.				
Command Default	None				
Command Modes	Privileged EXEC (#)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>IOS-XE 16.12.1y</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	IOS-XE 16.12.1y	This command was introduced.
Release	Modification				
IOS-XE 16.12.1y	This command was introduced.				

This example shows the output for the **show platform software trace message lc-veman <LC slot number>/0** command:

```
Router# show platform software trace message lc-veman 8/0
```

```
This command is being deprecated. Please use 'show logging process' command.

show ptp clock

To display the PTP clock information synchronized with the PTP primary clock, use the **show ptp clock** command in privileged EXEC mode.

Cisco cBR Series Converged Broadband Router

show ptp clock { dataset [{ current | default | parent | time-properties }] | running domain | running domain id }

Syntax Description		
datasetcurrent		Specifies the current dataset for the PTP clock synchronized with the PTP primary clock.
datasetdefault		Specifies default dataset for the PTP clock synchronized with the PTP primary clock.
datasetparent		Specifies parent dataset for the PTP clock synchronized with the PTP primary clock.
datasettime-properties		Specifies time-properties dataset for the PTP clock synchronized with the PTP primary clock.
running domain-number		The domain number of the PTP clock synchronized with the RPD synchronized with the PTP primary clock.
running domain <id>		Checks the PTP primary clock state.

Command Default None

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced.

Usage Guidelines Use this command to monitor PTP clock status. Use this command to verify the IEEE 1588 PTP configuration and monitor its status.

The following example shows the sample output for the **show ptp clock datasetdefault** command:

```
Router#show ptp clock dataset default

CLOCK [Boundary Clock, domain 10]

Two Step Flag: No
Clock Identity: 0x2A:0:0:0:58:67:F3:4
Number Of Ports: 1
Priority1: 89
Priority2: 90
Domain Number: 10
Slave Only: No
Clock Quality:
```

```
Class: 224
Accuracy: Unknown
Offset (log variance): 4252
```

The following example shows the sample output for the **show ptp clock datasetdefault** command:

```
Router#show ptp clock dataset current

CLOCK [Boundary Clock, domain 10]

Steps Removed: 18522
Offset From Master: 4661806827187470336
Mean Path Delay: 314023819427708928
```

The following example shows the sample output for the **show ptp clock datasetparent** command:

```
Router#show ptp clock dataset parent

CLOCK [Boundary Clock, domain 10]

Parent Stats: No
Observed Parent Offset (log variance): 0
Observed Parent Clock Phase Change Rate: 58087144

Grandmaster Clock:
Identity: 0x3E:D3:D0:0:0:0:0:0
Priority1: 42
Priority2: 0
Clock Quality:
Class: 176
Accuracy: Unknown
Offset (log variance): 4252
```

The following example shows the sample output for the **show ptp clock datasettime-properties** command:

```
Router#show ptp clock dataset time-properties

CLOCK [Boundary Clock, domain 10]

Current UTC Offset Valid: TRUE
Current UTC Offset: 10752
Leap 59: FALSE
Leap 61: TRUE
Time Traceable: TRUE
Frequency Traceable: TRUE
PTP Timescale: TRUE
Time Source: Unknown
```

The following example shows the sample output for the **show ptp clock running domain** command:

```
Router#show ptp clock running domain 0
```

show ptp clock

show pxf cable

To display information about the multicast echo, packet intercept, or source-verify features for one or all cable interfaces, use the **show pxf cable** command in user EXEC or privileged EXEC mode.

show pxf cable {**feature-table** [cx/y/z] | **maptable** cx/y/z [sid] | **multicast-echo ds-group** | **multicast-echo mcast-addr** | **source-verify** [ip address]}

Syntax Description		
feature-table [cx/y/z]		Displays the multicast echo and packet intercept status on the PXF processor. If given without any options, displays the status for all cable interfaces and subinterfaces. If given with an optional cable interface, displays the status for that particular interface.
maptable cx/y/z [sid]		Displays memory and service ID (SID) information for a particular cable interface. If the optional <i>sid</i> parameter is specified, displays information for that particular SID.
multicast-echo ds-group		Displays the cable interfaces that are associated with each downstream group, where each downstream group is a unique DOCSIS MAC domain. (Interfaces that are bundled together are considered one MAC domain.)
multicast-echo mcast-addr		Displays the service flow ID (SFID) information for all multicast addresses that hash to the same index as the specified multicast IP address.
source-verify [ip-address]		Displays the interface and SFID mapping tables that are maintained by the source-verify feature. If the optional <i>ip-address</i> parameter is specified, displays information only for that particular IP address.

Command Default None

Command Modes User EXEC (>)

Privileged EXEC (#)

Command History	Release	Modification
	12.2(11)CY, 12.2(11)BC2	This command was introduced as show hardware pxf cable for the Cisco uBR10012 router.
	12.2(15)BC2	This command was renamed from show hardware pxf cable to show pxf cable .
	12.3BC	This command was integrated into Cisco IOS release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS release 12.2(33)SCA.
	12.2(33)SCB	The command was modified and verbose option was removed.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **show pxf cable** command displays information about whether multicast echo and packet intercept are enabled on the cable interfaces. It can also be used to display the service flow ID (SFID) used for each multicast address that is being processed by the router.

Note The **source-verify** option is not supported on the PRE-2 module. Instead, use the **show pxf cpu cef verbose** command to display the primary SID information on the PRE-2 module.

Examples

The following example shows a typical display for the **show pxf cable feature-table** command for all cable interfaces:

```
Router# show pxf cable feature-table
```

Interface	SWInterface	VCCI	McastEcho	Intercept	DSGroup	InterceptGroup
Cable5/0/0	Cable5/0/0	3	On	On	0	0
Cable5/0/0.1	Cable5/0/0	9	On	On	0	0
Cable5/0/1	Cable5/0/1	4	On	Off	255	-
Cable6/0/0	Cable6/0/0	5	On	Off	255	-
Cable6/0/1	Cable6/0/1	6	On	Off	255	-
Cable7/0/0	Cable7/0/0	7	On	Off	1	-
Cable7/0/1	Cable7/0/1	8	On	Off	2	-

The following example shows a typical display for the **show pxf cable feature-table** option for a particular cable interface:

```
Router# show pxf cable feature-table c5/0/0
```

Interface	SWInterface	VCCI	McastEcho	Intercept	DSGroup	InterceptGroup
Cable5/0/0	Cable5/0/0	3	On	On	0	0
Cable5/0/0.1	Cable5/0/0	9	On	On	0	0

The following example shows a typical display for the **show pxf cable feature-table** option when a cable interface has a bundle interface configured without a corresponding primary interface:

```
Router# show pxf cable feature-table
```

Interface	SWInterface	VCCI	McastEcho	Intercept	DSGrp	InterceptGrp
Cable5/0/0	<No Cable Bundle Master Configured>					
Cable5/0/1	Cable5/0/1	4	On	Off	11	-
Cable5/1/0	<No Cable Bundle Master Configured>					
Cable5/1/1	Cable5/1/1	6	On	Off	15	-
Cable6/0/0	Cable6/0/0	7	On	Off	0	-
Cable6/0/1	Cable6/0/1	8	On	Off	1	-
Cable6/1/0	Cable6/1/0	9	On	Off	6	-
Cable6/1/1	Cable6/1/1	10	On	Off	7	-
Cable7/0/0	Cable7/0/0	11	On	Off	8	-
Cable7/0/1	Cable7/0/1	12	On	Off	9	-
Cable7/1/0	Cable7/1/0	13	On	Off	4	-
Cable7/1/1	Cable7/1/1	14	On	Off	5	-
Cable8/0/0	Cable8/0/0	15	On	Off	255	-
Cable8/0/1	Cable8/0/1	16	On	Off	3	-
Cable8/1/0	Cable8/1/0	17	On	Off	12	-
Cable8/1/1	Cable8/1/1	18	On	Off	13	-

Table below describes the fields shown by both forms of the **show pxf cable feature-table** command:

Table 260: show pxf cable feature-table Field Descriptions

Field	Description
Interface	Identifies the cable interface or subinterface.
SWInterface	Identifies the primary cable interface for bundled interfaces.
McastEcho	Displays whether multicast echo is enabled (On) or disabled (Off).
VCCI	Displays the Virtually Cool Common Index (VCCI) for this cable interface or subinterface. The VCCI is an index that uniquely identifies every interface or subinterface on the PXF processor, and that quickly maps that interface to the appropriate set of services and features.
Intercept	Displays whether packet intercept, as per the Communications Assistance of Law Enforcement Act (CALEA), is enabled (On) or disabled (Off).
DSGroup	Displays the downstream group (unique MAC domain) that is associated with this interface or subinterface. Interfaces that are bundled together are considered one MAC domain. Note A downstream group number of 255 indicates that the CMTS has not assigned the interface to a MAC domain, typically because the interface is shutdown.
InterceptGroup	Displays the intercept packet group assigned to this cable interface.

The following example shows a typical display for the **show pxf cable mactable** command for a particular cable interface:

```
Router# show pxf cable mactable c5/1/0
SID   VCCI   FIB Index   SrcVfy   Pri SID   CM IP Address
1     3       0           On       1         10.10.11.31
2     3       0           On       2         10.10.11.129
```

Table below describes the fields shown by the **show pxf cable mactable** command:

Table 261: show pxf cable mactable Field Descriptions

Field	Description
SID	Identifies the service ID (SID).
VCCI	Displays the Virtually Cool Common Index (VCCI) for this cable interface or subinterface. The VCCI is an index that uniquely identifies every interface or subinterface on the PXF processor, and that quickly maps that interface to the appropriate set of services and features.
FIB Index	Identifies the forwarding information base (FIB) being used.
SrcVfy	Identifies whether the source-verify feature (enabled with the cable source-verify command) is On or Off for this SID and interface.
Pri SID	Identifies the primary SID associated with this SID, in case this SID is a secondary or dynamic SID.
CM IP Address	Displays the IP address for the CM that is associated with this SID.

The following example shows a typical display for the **show pxf cable multicast-echo ds-group** command, listing each downstream multicast group and its associated cable interface:

```
Router# show pxf cable multicast-echo ds-group
```

```
DS Group      Interface
0             Cable5/0/0
1             Cable7/0/0
2             Cable7/0/1
```

The following example shows a typical display for the **show pxf cable multicast-echo** command for a particular multicast address:

```
Router# show pxf cable multicast-echo 230.1.1.1
```

```
Src          I/f          SFID   DS Jib Header          Packets   Bytes
230.1.1.1   Cable7/0/1   16385  0x0000 0000 1000 0001 1000          321      2160
```

Table below describes the fields shown by the **show pxf cable multicast-echo** command:

Table 262: show pxf cable multicast-echo Field Descriptions

Field	Description
Src	Multicast address being displayed.
I/F	Cable interface being used for this multicast address.
SFID	Displays the service flow ID (SFID) for this particular multicast address.

Field	Description
DS Jib Header	<p>Shows the bitmask used for this multicast address on the PRE's MAC-layer processor. The bitmask consists of ten hexadecimal bytes in the following format (reading left to right, from most significant to least significant bit):</p> <ul style="list-style-type: none"> • Bytes 9:8 = Specifies the key index for the downstream. • Bytes 7:6 = Identifies the rule number used for packet header suppression (if enabled) • Byte 5 = Bitmask that defines the type of packet transmitted: <ul style="list-style-type: none"> • Bit 4 = 1 if padding CRC for data packets, 0 if not padding the CRC • Bit 3 = 1 if inserting an extended header (EH) for PHS processing • Bit 2 = 1 if inserting an extended header (EH) for BPI+ processing • Bits 1:0 = Specifies the packet type: 00 = Data packet 01 = MAC management message for transmitted packets 10 = Internal MAP message on upstream 11 = Special packet • Byte 4 = Bitmask that identifies the type of map control and key sequence for the packet: <ul style="list-style-type: none"> • Bits 6:4 = Destination upstream for the MAP message • Bits 3:0 = BPI Key Sequence number • Bytes 3:2 = Index to obtain the downstream modem statistics. • Byte 1 = Specifies the assumed minimum size of a packet data unit. Multiply this byte by 4 to get the actual minimum size in bytes. • Byte 0 = Specifies the DOCSIS header size, with a maximum value of 0xE0 (248 decimal).
Packets	Number of packets sent to this address.
Bytes	Number of bytes sent to this address.

The following example shows a typical display for the **show pxf cable source-verify** command:

```
Router# show pxf cable source-verify
IP Address      Interface      Fib Index    Mac-Domain    SID
50.1.1.3       Cable5/0/0    0            0             1
50.1.1.29      Cable5/0/0    0            0             2
50.1.1.32      Cable5/0/0    0            0             2
50.1.2.6       Cable8/0/0    0            6             1
50.1.2.19      Cable8/0/0    0            6             1
```

Table below describes the fields shown by the **show pxf cable source-verify** command:

Table 263: show pxf cable source-verify Field Descriptions

Field	Description
IP Address	Identifies the IP addresses that have been verified by the source-verify feature.

Field	Description
Interface	Identifies the cable interface or subinterface used for this IP address.
FIB Index	Identifies the forwarding information base (FIB) being used.
Mac-Domain	Identifies the MAC DOCSIS downstream domain for this IP address.
SID	Identifies the service ID (SID).

Related Commands

Command	Description
cable source-verify	Enables verification of IP addresses for CMs and CPE devices on the upstream.
clear pxf	Clears the direct memory access (DMA) and error checking and correcting (ECC) error counters on the PXF processor.
debug pxf	Enables debugging of the PXF subsystems on the active PRE1 module on the Cisco uBR10012 router.
show pxf cable interface	Displays display DOCSIS-related information about a particular service ID (SID) on a particular cable interface.
show pxf cpu	Displays the display different statistics about the operation of the CPU processor during PXF processing.
show pxf microcode	Displays identifying information for the microcode being used on the processor.
show pxf xcm	Displays the current state of error checking and correcting (ECC) for the External Column Memory (XCM) on the PXF processor.

show pxf cable controller

To display information about radio frequency (RF) channel Versatile Traffic Management System (VTMS) links and link queues, use the **show pxf cable controller** command in privileged EXEC mode.

show pxf cable controller modular-cable slot /subslot /unit rf-channel channel link queues

Syntax Description	modular-cable	Specifies the modular cable interface.
	slot/subslot/unit	Identifies a cable interface on the Cisco uBR10012 router. The following are valid values: <ul style="list-style-type: none"> • slot = 1 or 3 • subslot = 0 or 1 • unit = 0
	rf-channel	Specifies the RF channel physical port on the Wideband SPA field-programmable gate array (FPGA).
	channel	Specifies the number of the RF channel. The range is 0 to 23.
	link queues	(Optional) Displays the link queue information for the specified RF channel.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(23)BC1	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The **show pxf cable controller** command displays information about VTMS link queues only on the Cisco uBR10012 universal broadband router.

Examples

The following example using the **show pxf cable controller** command, omitting the **link queues** option, displays only VTMS-related output:

```
Router# show pxf cable controller modular-cable 1/0/0 rf-channel 3
Link ID is 32259
      link next_send:    0x00000000    channel number:    0
      temporary bgbw:   0x00000000    reserved bgbw:    0x00000000
col.6 link bandwidth mult: 55778                shift:    18
col.7 link bandwidth mult: 55778                shift:    18
      link aggregate cir: 0x00000000    aggregate eir:    0x00000000
      bw reclaimed/trunc eir: 0/0                link cir_max:    0xFFFF
      link cir_sum:      70                link eir_sum:    2
      link bw_sum:      0                act. link q num: 0
```

The following example using the **show pxf cable controller** command including the **link queues** option, displays VTMS-related output as well as link queue-related output:

show pxf cable controller

```

Router# show pxf cable controller modular-cable 1/0/0 rf-channel 3 link-queues
Link ID is 32259
      link next_send:    0x00000000    channel number:    0
      temporary bgbw:   0x00000000    reserved bgbw:    0x00000000
col.6 link bandwidth mult: 55778                shift:    18
col.7 link bandwidth mult: 55778                shift:    18
      link aggregate cir: 0x00000000    aggregate eir:    0x00000000
      bw reclaimed/trunc eir: 0/0                link cir_max:    0xFFFF
      link cir_sum:      70                link eir_sum:    2
      link bw_sum:      0                act. link q num: 0

Link Queues :
  QID  CIR(act/conf)      EIR          MIR          WB Chan.  Status
  420  13107/13107         1/1          65535/65535  0         Inactive
  423  32768/32768         1/1          65535/65535  2         Inactive

```

See Table below for descriptions of link queue fields.

Table 264: show pxf cable controller Link Queue Field Descriptions

Field	Description
QID	Displays the identification number of the link queue.
CIR (act/conf)	Displays the information for the committed information rate (CIR) of link queues on this RF channel. <ul style="list-style-type: none"> The first number, <i>act</i>, indicates the parameter that a link queue is actually using. The second number, <i>conf</i>, indicates the parameter that is configured for a link queue.
EIR	Displays the information for the excess information rate (EIR) of link queues on this RF channel. <ul style="list-style-type: none"> The first number in the output indicates the parameter that a link queue is actually using. The second number in the output indicates the parameter that is configured for a link queue.
MIR	Displays the information for the maximum information rate (MIR) of link queues on this RF channel. <ul style="list-style-type: none"> The first number in the output indicates the parameter that a link queue is actually using. The second number in the output indicates the parameter that is configured for a link queue.
WB Chan	The number of the wideband cable channel.
Status	Displays the state of the link queue.

Related Commands

Command	Description
debug cr10k-rp dbs-queue	Displays debug information for dynamic bandwidth sharing (DBS) on the Cisco uBR10012 universal broadband router.
show pxf cpu queue	Displays parallel express forwarding (PXF) queueing and link queue statistics.

show pxf cable feature

To display multicast echo, packet intercept, or source-verify features for one or all cable interfaces, to include information for virtual interface bundles, use the **show pxf cable feature** command in privileged EXEC mode.

show pxf cable feature

Syntax Description

This command has no additional arguments or keywords.

Command Default

Display output without page breaks and remove passwords and other security information.

Command Modes

User EXEC, Privileged EXEC

Command History

Release	Modification
12.3(21)BC	This command was introduced to support Multicast with Virtual Interface Bundling on the Cisco CMTS.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Refer to the following document on Cisco.com for additional information about cable interface bundling and virtual interface bundling on the Cisco CMTS:

- *Cable Interface Bundling and Virtual Interface Bundling on the Cisco CMTS*

Examples

The following example illustrates Multicast Echo and virtual interface bundling information on the Cisco uBR10012 router.

```
Router# show pxf cable feature
Interface SWInterface VCCI McastEcho Intercept SrcVfy DHCP DSGrp InterceptGrp
Cable5/0/0 Bundle1 36 On Off On On 0
Cable5/0/1 Cable5/0/1 15 On Off Off Off 11
Cable5/1/0 Bundle1 36 On Off On On 0
Cable5/1/1 Cable5/1/1 17 On Off Off Off 9
Cable6/0/0 Bundle1 36 On Off On On 0
Cable6/0/1 Cable6/0/1 19 On Off Off Off 12
Cable6/1/0 Cable6/1/0 20 On Off Off Off 7
Cable6/1/1 Cable6/1/1 21 On Off Off Off 8
Cable7/0/0 Cable7/0/0 22 On Off Off Off 255
Cable7/0/0 Cable7/0/0.1 42 On Off Off Off 255
Cable7/0/1 Bundle200 38 On Off Off Off 3
```

Related Commands

Command	Description
cable bundle	Configures a cable interface to belong to an interface bundle or virtual interface bundle.
show arp	Displays the entries in the router's ARP table.

Command	Description
show cable bundle forwarding-table	Displays the MAC forwarding table for the specified bundle, showing the MAC addresses of each cable modem in a bundle and the physical cable interface that it is currently using.
show cable modem	Displays the cable modems that are online both before and after cable interface bundling has been configured.
show running-config interface cable	Displays the configuration for the specified cable interface.

show pxf cable interface

To display information about a particular service ID (SID) on a particular cable interface, use the **show pxf cable** command in user EXEC or privileged EXEC mode.

show pxf cable interface cable *x/y/z* **sid**
classifiers | **mac-rewrite** | **queue** | **service-flow ds** | **service-flow us**

Syntax Description	Parameter	Description
	cable <i>x/y/z</i>	Identifies the cable interface for which information should be displayed.
	<i>sid</i>	Identifies the service ID (SID) for which information should be displayed. The valid range is 1 to 8191.
	classifiers	Displays the packet classifiers used for this SID.
	mac-rewrite	Displays the CPE MAC information for this SID.
	queue	Displays the status of the queues being used by this SID.
	service-flow ds	Displays the service flow IDs (SFID) associated with the given SID on the downstream for the given cable interface.
	service-flow us	Displays the SFIDs associated with the given SID on the upstream for the given cable interface.

Command Default None

Command Modes User EXEC, Privileged EXEC

Command History	Release	Modification
	12.2(11)BC2	This command was introduced as show hardware pxf cable for the Cisco uBR10012 router.
	12.2(15)BC2	This command was renamed from show hardware pxf cable interface to show pxf cable interface .
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **show pxf cable interface** command displays the DOCSIS-related information for a particular service ID (SID) on a particular cable interface.

Examples

The following example shows a typical display for SID 1 on cable interface c8/0/0 for the **show pxf cable interface classifiers** command:

```
Router# show pxf cable interface c8/0/0 1 classifiers
CM Classifiers:
Mac Rw Index: 18          CCB Index: 47
```

show pxf cable interface

Related Commands

Command	Description
clear pxf	Clears the direct memory access (DMA) and error checking and correcting (ECC) error counters on the PXF processor.
debug pxf	Enables debugging of the PXF subsystems on the active PRE1 module on the Cisco uBR10012 router.
show pxf cable	Displays information about the multicast echo and packet intercept features for one or all cable interfaces.
show pxf cpu	Displays the display different statistics about the operation of the CPU processor during PXF processing.
show pxf microcode	Displays identifying information for the microcode being used on the processor.
show pxf xcm	Displays the current state of error checking and correcting (ECC) for the External Column Memory (XCM) on the PXF processor.

show pxf cable multicast

To display information about multicast routes (mroute) in the PXF processor for a specified group, use the **show pxf cable multicast** command in privileged EXEC mode.

show pxf cable multicast [*multicast-group*]

Syntax Description	<i>multicast-group</i> (Optional) Displays the name of the multicast group.
---------------------------	---

Command Default None

Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(33)SCB	The command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **show pxf cable multicast** command displays information about whether routes are enabled on the cable interfaces.

Examples The following example shows a typical display for the **show pxf cable multicast** command for all cable interfaces:

```
Router# show pxf cable multicast multicast-group

MDB Flags: L - Local, F - Register flag, T - SPT-bit set, J - Join SPT
Z - Multicast Tunnel, N- No FastSwitching
OIF Flags: P - Prune Flag, A - Assert Flag
PXF multicast switching for vrf default is enabled.
Mdb at index= 3 hash= 0xE9F7:
next_mdb_idx: 0, fib_root: 0x0001, source_addr: 0.0.0.0, group_addr: 230.1.1.1
uses: 0, bytes: 0, vcci_in: 0, oif: 0x000002
rpf_failed: 0, drop_others: 0
rp_bit_mask:0x00, flags: [0xA0]
Ref Count=0, MDB Flags=0x0082, MDB FastFlags=0x10
```

Related Commands	Command	Description
	show pxf cable interface	Displays display DOCSIS-related information about a particular service ID (SID) on a particular cable interface.
	show pxf cpu	Displays the display different statistics about the operation of the CPU processor during PXF processing.

show pxf cpu

To display the different statistics about the operation of the CPU on the Performance Routing Engine (PRE1) module during Parallel eXpress Forwarding (PXF) processing, use the **show pxf cpu** command in user EXEC or privileged EXEC mode.

```
show pxf cpu {access-lists {qos | security} | buffers | cef [{mem | verbose | vrf ip-address mask}] |
context | mroute [ipaddress1] [ipaddress2] | queue [interface] | schedule [{interface | summary}] |
statistics [{diversion | drop [interface] | ip | mlp}] | subblocks [interface]}
```

Syntax Description

access-lists {qos security}	Displays information for either quality of service (QoS) access lists (ACLs) or security access lists. Note The PRE module automatically compiles all access lists into the turbo ACL format, so that they can be efficiently processed by the PXF processors. The only exception are very simple access lists that would require more processing time to be compiled than to be executed.
buffers	Displays information about buffer usage on the processor.
cef [mem verbose vrf ip-address mask]	Displays information about the memory usage and routing tables in the PXF processors for Cisco Express Forwarding (CEF) operation. Optionally displays detailed information about memory usage and about a particular entry in the virtual private network (VPN) routing/forwarding (VRF) tables.
context	Displays performance statistics on the processing of contexts on the processors. (A context is a unit of packet processing time on the PXF processor.) Note The show pxf cpu context command displays more useful information on the PXF processor's performance than the show processor cpu command that is used on other platforms.
mroute [ipaddress1] [ipaddress2]	Displays multicast static route (mroute) information for all groups, for one particular group, or for a range of groups. Displays information about IP multicast routes in the PXF processor for a specified IP prefix. For a more user-friendly display of the same information, use the show ip mroute command.
queue [interface]	Displays queue drop counters for all interfaces, or optionally for one selected interface. This can be useful in determining if traffic is being properly distributed among the correct interfaces.
schedule [interface / summary]	Displays the timing wheel dequeue schedule counters for all interfaces, or optionally for one interface, or optionally a summary of all interfaces.

statistics [diversion drop [<i>interface</i>] ip mlp]	<p>Displays statistics for the packets that the PXF has processed. The default is to display all packet statistics, or you can optionally specify one of the following keywords to display a particular type of statistics:</p> <ul style="list-style-type: none"> • diversion—(Optional) Displays packets that the PXF diverted to the main route processor for special handling. • drop [<i>interface</i>]—(Optional) Displays dropped packets and bytes. You can also optionally display the dropped packets for a particular interface. • ip—(Optional) Displays statistics for the processing of IP and ICMP packets. • mlp—(Optional) Displays statistics for multilink point-to-point protocol (MLPPP) packets.
subblocks [<i>interface</i>]	Displays subblocks information for all interfaces, or optionally for one interface.

Command Default No default behavior or values

Command Modes User EXEC, Privileged EXEC

Command History

Release	Modification
12.2(1)XF1	This command was introduced as show hardware pxf cpu for the Cisco uBR10012 router.
12.2(11)BC2	The MAC domain was added to the display of the show pxf cpu subblocks command for a particular cable interface.
12.2(15)BC2	This command was renamed from show hardware pxf cpu to show pxf cpu . In addition, the cef option was enhanced to display CEF tag adjacency information. The verbose option was also added to the cef option to display more detailed information about the Forwarding Information Base (FIB) tables being maintained by the CEF subsystem.
12.2(15)BC2	The detail option and additional counters were added to the show pxf cpu statistics diversion command.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

See the following sections for typical displays for the different forms of the **show pxf cpu** command.

Access-Lists

The following example shows a typical display for the **access-list qos** option, which displays information about the processing of quality-of-service (QoS) access-lists:

```
Router# show pxf cpu access qos
```

```
PXF QoS ACL statistics:
ACL          State    Tables  Entries  Config  Fragment  Redundant  Memory
101          Operational  1        9        1        0          0         1Kb
First level lookup tables:
Block      Use           Rows      Columns  Memory used
0          TOS/Protocol  1/128     0/32     16384
```

```

Table below describes the fields shown in the **show pxf cpu access-list** command:

Table 265: Field Descriptions for the show pxf cpu access-list Command

Field	Description
ACL	Identifies the access list (ACL) in use, by either name or number.

Field	Description
State	Displays the current state of the access list: <ul style="list-style-type: none"> • Copying—The ACL is in the process of being created or compiled. • Operational—ACL is active and filtering packets. • Out of acl private mem—ACL has run out of the private memory that was allocated exclusively to it. • Out of shared mem—ACL has run out of the memory that it shares with other ACLs. • Unknown Failure—ACL has failed because of an uncategorized reason. • Unneeded—ACL was allocated but is not currently in use.
Tables	Displays the number of tables that the ACL is currently using.
Entries	Displays the number of table entry slots for the fields or values that the ACL is currently using to match packets.
Config	Displays the number of simple or extended entries for this ACL.
Fragment	Displays the number of entries that were configured with the fragments keyword.
Redundant	Displays the number of duplicate entries for this ACL.
Memory	Displays the total amount of memory, rounded up to the nearest kilobyte, that the ACL is currently using.
First level lookup tables	Describes the blocks of memory that store the IP fields that are used to match packets for access list processing.
Block	Identifies the block of memory used for this particular lookup table.
Use	Describes the IP packet field that is being matched.
Rows	Describes the number of table rows currently in use and the total number of rows.
Columns	Describes the number of table columns currently in use and the total number of columns.
Memory used	Describes the total amount of memory, in bytes, currently being used by the memory block.
Banknum	Identifies the block of memory used for this particular lookup table.
Heapsize	Identifies the total amount of memory, in bytes, allocated for this block of memory.
Free size	Identifies the amount of memory, in bytes, that is currently available for use by this block of memory.
%Free	Identifies the percentage of memory that is free and available for use for this block of memory.

Buffers

The following example shows a typical display for the **buffers** option:

```
Router# show pxf cpu buffers

FP buffers
  pool   size   # buffer   available   allocate failures
-----
  0      9216   3203      3203        0
  1      1536   6406      6406        0
  2       640   89432     89432       0
  3       256   76872     76872       0
  4        64  128120    128120      0
Router#
```

Table below describes the fields shown in the **show pxf cpu buffers** command:

Table 266: Field Descriptions for the show pxf cpu buffers Command

Field	Description
pool	Identifies the buffer pool.
size	Displays the size, in bytes, of each buffer in this particular pool.
# buffer	Displays the total number of buffers in this particular pool.
available	Displays the number of buffers that are currently available.
allocate failures	Displays the number of attempts to allocate a buffer that have failed since the last reset.

CEF

The following example shows a typical display for the **cef** option:

```
Router# show pxf cpu cef

Shadow 10-9-5-8 Toaster Mtrie:
  97 leaves, 3104 leaf bytes, 40 nodes, 41056 node bytes

FP CEF state: 2

Note If the value in the Alloc column is equal to the number in the Total column, then the PXF has run out of its allocated memory for that level and the CEF entries for that particular level have been exhausted.

Table below describes the fields shown in the **show pxf cpu cef** command:

Table 267: Field Descriptions for the show pxf cpu cef Command

Field	Description
Shadow 10-9-5-8 Toaster Mtrie	Header for the memory used by the CEF switching tables, which use the optimized multiway tree (Mtrie) data structure format.
leaves	Number of leaves in the CEF Mtrie table.
leaf bytes	Number of bytes used by the leaves in the Mtrie table.
nodes	Number of nodes in the Mtrie table.
node bytes	Number of bytes used by the nodes in the Mtrie table.
invalidations	Number of times an existing entry in the adjacency table was invalidated because of updated information.
prefix updates	Number of updates made to the adjacency table.

Field	Description
refcounts	Number of references (leaves and nodes) to an adjacency that are currently stored in the adjacency table. There is one reference for each corresponding entry in the CEF table, plus a few others for maintenance and system purposes.
Prefix/Length	IP prefix and length (IP network or host number, with subnet) that is in the CEF adjacency table.
RefCount	Number of times this prefix is referenced in the adjacency table.
Parent	Parent of this prefix's leaf or node entry in the adjacency table.
FP CEF/MFIB/TFIB XCM Type usage—The following fields display the memory usage of the shadow forwarding information base (FIB).	
Type	Level number of this particular memory block.
Name	Identifier for this particular memory block.
Total	Total number of nodes available on each level and changes to other data structures.
Alloc	Number of nodes currently allocated.
Start, End	Starting and ending addresses for the memory block.
Error	Number of errors discovered in the memory block.

Context

The following example shows a typical display for the **context** option, which displays performance statistics for the PXF processors over the past 1-minute, 5-minute, and 60-minute periods:

```
Router# show pxf cpu context
```

```

FP context statistics  count          rate
-----
  feed_back           2002946946  645161
  new_work            3992307360  1293715
  null                2261726736  708206
-----
                          2647082

FP average context/sec 1min          5min          60min
-----
  feed_back           679377       707217       191844      cps
  new_work            1358758     1414842     391367      cps
  null                587560      520274      2171829     cps

Maximum          84 %      84 %      88 %
Router#

```

Note The **show pxf cpu context** command displays more useful information on the processor's performance than the **show processor cpu command** that is used on other platforms.

This display shows statistics that are based on three counters on the PXF processors:

- **feed_back**—Incremented each time the processor requires another processor cycle to process a packet. Each PXF processor contains 8 columns that perform different packet header processing tasks, such as ACL processing or QoS processing. A typical IP packet passes through all 8 columns only once, but some types of packets can require more than one pass through these columns, and each additional pass through the PXF processor is referred to as feedback. This counter represents the amount of traffic that cannot be processed in an optimal manner.
- **new_work**—Incremented for new packets that come into the PXF pipeline. This counter represents a snapshot of the amount of incoming traffic being processed by the processor.
- **null**—Incremented for every context during which the PXF pipe is not processing traffic. This counter represents the processor's potential to handle additional traffic. As the processor becomes more busy, the value for null decreases until it becomes 0, at which point the processor has reached its maximum usage.

Table below describes the fields shown in the **show pxf cpu context** command:

Table 268: Field Descriptions for the show pxf cpu context Command

Field	Description
FP context statistics	
feed_back	Displays the current value for the feed_back counter and the rate that the counter is increasing per second (the difference between the current value and the previous value divided by the time period between the two).
new_work	Displays the current value for the new_work counter and the rate that the counter is increasing per second (the difference between the current value and the previous value divided by the time period between the two).
null	Displays the current value for the null counter and the rate that the counter is increasing per second (the difference between the current value and the previous value divided by the time period between the two).
FP average context/sec	
feed_back	Displays the rate, in terms of the number of contexts per second (cps) for the feed_back counter for the last 1-minute, 5-minute, and 60-minute time periods.
new_work	Displays the rate, in terms of the number of contexts per second (cps) for the new_work counter for the last 1-minute, 5-minute, and 60-minute time periods.
null	Displays the rate, in terms of the number of contexts per second (cps) for the null counter for the last 1-minute, 5-minute, and 60-minute time periods.

Field	Description
FP context utilization	
Actual	Displays the actual percentage of processor usage per second, compared to the theoretical maximum, for the last 1-minute, 5-minute, and 60-minute time periods. The value for Actual = $(\text{new_work} + \text{feed_back}) * 100 / (\text{new_work} + \text{feed_back} + \text{null})$.
Theoretical	Displays the percentage of processor usage compared to the ideal theoretical capacities for the last 1-minute, 5-minute, and 60-minute time periods. The value for Theoretical = $(\text{new_work} + \text{feed_back}) * 100 / 3125000$. (The theoretical maximum for the PXF processors is 3,125,000 contexts per second.)
Maximum	Displays the actual maximum percentage of processor usage that has occurred for the last 1-minute, 5-minute, and 60-minute time periods. The value for Actual = $(\text{new_work} + \text{feed_back} + \text{null}) * 100 / 3125000$.

Mroute

The following example shows a typical display for the **mroute** option:

```
Router# show pxf cpu mroute

Shadow G/SG[5624]: s: 0.0.0.0 g: 224.0.1.40 uses: 0 bytes 0 flags: [D ] LNJ

Router#
```

Table below describes the fields shown in the **show pxf cpu mroute** command:

Table 269: Field Descriptions for the show pxf cpu mroute Command

Field	Description
Interface	Cable interface or subinterface.
vcci	Virtually Cool Common Index (VCCI) for this cable interface or subinterface. The VCCI is an index that uniquely identifies every interface or subinterface on the PXF processor, and that quickly maps that interface to the appropriate set of services and features.
rw index	Index used to read and write into the multicast table for this entry.

Field	Description
mac_header	MAC header that is used when rewriting the packet for output.

Queue

The following example shows a typical display for the **queue** option, which displays the chassis-wide counters for the PXF pipeline counters that show drops on the output side of the processor:

```
Router# show pxf cpu queue

FP queue statistics for RP
Queue number 0   Shared
  wq_avg_qlen           0           wq_flags_pd_offset    1B48001
  wq_drop_factor        74
  wq_buffer_drop        0           wq_limit_drop         0
  wq_invalid_enq_wqb_drop 0           wq_invalid_deq_wqb_drop 0
  wq_rnd_pkt_drop       0           wq_rnd_byte_drop      0
  wq_static_qlen_drop   0
  wq_len                0
  Packet xmit           804833      Byte xmit              487438911
Queue number 15   Shared High priority
  wq_avg_qlen           0           wq_flags_pd_offset    1BC8001
  wq_drop_factor        174
  wq_buffer_drop        0           wq_limit_drop         0
  wq_invalid_enq_wqb_drop 0           wq_invalid_deq_wqb_drop 0
  wq_rnd_pkt_drop       0           wq_rnd_byte_drop      0
  wq_static_qlen_drop   0
  wq_len                0
  Packet xmit           69647      Byte xmit              41230926

Router#
```

The following example shows a typical display for the **queue** option for a particular cable interface:

```
Router# show pxf cpu queue c6/0/0

FP queue statistics for Cable5/0/0
FP queue statistics for Cable6/0/0
Queue algorithm 0x0
Queue number 0   Shared
  wq_avg_qlen           0           wq_flags_pd_offset    18A0001
  wq_drop_factor        40

Router#
```

Schedule

The following example shows a typical display for the **schedule summary** option:

```
Router# show pxf cpu schedule summary

FP average dequeue schedule rate in pps
Interface          Level 1    Level 2    maximum    1min      5min      60min
-----
Total              32 / 32   1 / 1     3125000    0 %       0 %       0 %
Router#
```

The following example shows a typical display for the **schedule** option for a particular interface:

```
Router# show pxf cpu schedule c5/0/0

FP average dequeue schedule rate in pps
Interface          Level 1    Level 2    maximum    1min      5min      60min
-----
Cable5/0/0        1 / 32    1 / 1     97656      0 %       0 %       0 %
Router#
```

Table below describes the fields shown in the **show pxf cpu schedule** command:

Table 270: Field Descriptions for the show pxf cpu schedule Command

Field	Description
Interface	Identifies the cable interface or subinterface.
Level 1	Displays the number of occupied level 1 (port) wheel slots and the total number of wheel slots for this interface or subinterface.
Level 2	Displays the number of occupied level 2 (channel) wheel slots and the total number of wheel slots for this interface or subinterface.
maximum	Displays the maximum number of packet dequeues per second.
1 min	Displays the dequeue rate for the last 1-minute period.
5 min	Displays the dequeue rate for the last 5-minute period.
60 min	Displays the dequeue rate for the last 60-minute period.

Statistics

The following example shows a typical display for the **statistics diversion** option, which shows chassis-wide statistics for PXF diversions, which occur whenever the PXF processor sends a packet to the main route processor for special processing (such as errored packets, address resolution protocol (ARP) packets, point-to-point protocol (PPP) control packets, an unsupported Layer 2 packet header, and so forth).

```
Router# show pxf cpu statistics diversion
```

```

Diversion Cause Stats:
  local      = 263171
  dest       = 0
  option     = 0
  protocol   = 0
  encap      = 541943
  oam f5 seg= 0
  oam f5 ete= 0
  oam f4 seg= 0

Router#

```

Note As shown in this display, the majority of dropped packets should typically be either local (sent to the router for routing), encap (encapsulated for another protocol), or multicast (IP multicast traffic).

The following example shows a typical display for the **statistics drop** option, which shows chassis-wide PXF drop statistics:

```

Router# show pxf cpu statistics drop

FP drop statistics

```

	packets	bytes
icmp_on_icmp	0	0
ipc_cmd_invalid	0	0

```

  Data Received  0          0
Router#

```

The following example shows a typical display for the **statistics ip** option, which displays chassis-wide PXF forwarding statistics for IP, multicast, fragmented, and ICMP packets:

```

Router# show pxf cpu statistics ip

FP ip statistics
  dropped      0
  forwarded   1291
  punted      11393
  input_packets 14049
  icmps_created 1365
  noadjacency  0

```

```

        noroute          300
        unicast_rpf      0
        unresolved       0
FP ip multicast statistics
        mcast total      69665
        mcast drops      0
        mcast rpf        0
        mcast inputacl   0
        mcast outptacl   0
        mcast punts      69665
        mcast switched   0
        mcast failed     0
FP ip frag statistics
        packets          0
        fragments        0
        fragfail         0
        dontfrag         0
        mcdontfrag       0
FP icmp statistics
        unreachsent     0
        ttlsent          0
        echorepsent     0
        echorcvcv        0
        checksumerr     0
Router#

```

Note The `noroute` counter increases whenever the router drops a packet because its destination IP address is 0.0.0.0. This counter also increases whenever the Cisco Express Forwarding (CEF) adjacency tables drop a packet because it has a null, discard, or drop adjacency.

Subblocks

The following example shows a typical display for the `subblocks` option for all interfaces:

```

Router# show pxf cpu subblocks

Interface          Status  ICB   WQB_ID Fwding  Encap  VCCI map  VCCI

Router#

```

Table below describes the fields shown in the display for the **show pxf cpu subblocks** command.

Table 271: show pxf cpu subblocks Field Descriptions

Field	Description
Interface	Identifies the interface or subinterface.
Status	Displays the status of the interface: <ul style="list-style-type: none"> • Administ—The interface has been shut down and is in the administrative down state. • Deleted—The subinterface has been removed from the router's configuration. • Down—The interface is down because of a cable or other connectivity problem. • Initiali—The interface is in the process of initializing. • Reset—The interface is currently being reset. • Up—The interface is up and passing traffic.
ICB	Displays the Interface Control Block (ICB) that is mapped to this interface.
MAC Domain	Displays the DOCSIS-layer domain for this interface or subinterface.
WQB_ID	Displays the Work Queue Block (WQB) identifier for this interface.
Fwding	Displays whether traffic is being forwarded (PXF) or not (disable).
Encap	Identifies the type of encapsulation being used on the interface. The most common types of encapsulation are: 0 = None 1 = Ethernet ARPA 2 = Ethernet SAP 3 = 802.2 SNAP 5 = Serial, raw HDLC 8 = Serial, LAPB 9 = Serial, X.25 20 = Frame Relay 21 = SMDs 22 = MAC level packets 27 = LLC 28 = Serial, SDLC (primary) 30 = Async SLIP encapsulation 33 = ATM interface 35 = Frame Relay with IETF encapsulation 42 = Dialer encapsulation 46 = Loopback interface 51 = ISDN Q.921 59 = DOCSIS (previously known as MCNS) 61 = Transparent Mode 62 = TDM clear channel 64 = PPP over Frame Relay 65 = IEEE 802.1Q 67 = LAPB terminal adapter 68 = DOCSIS Cable Modem

Field	Description
VCCI map	Displays the memory address for the Virtually Cool Common Index (VCCI) map table for this particular VCCI. The VCCI is an index that uniquely identifies every interface or subinterface on the PXF processor and that quickly maps that interface to the appropriate set of services and features.
VCCI	Identifies the VCCI (in hexadecimal) that is assigned to the interface or subinterface.

Related Commands

Command	Description
clear pxf	Clears the direct memory access (DMA) and error checking and correcting (ECC) error counters on the PXF processor.
debug pxf	Enables debugging of the PXF subsystems on the active PRE1 module on the Cisco uBR10012 router.
show pxf cable	Displays information about the multicast echo and packet intercept features for one or all cable interfaces.
show pxf cable interface	Displays information about a particular service ID (SID) on a particular cable interface.
show pxf dma	Displays information for the current state of the PXF DMA buffers, error counters, and registers.
show pxf microcode	Displays identifying information for the microcode being used on the processor.
show pxf xcm	Displays the current state of ECC for the External Column Memory (XCM) on the PXF processor.
show ip mroute	Displays the contents of the IP multicast routing table.

show pxf cpu drl-trusted-sites

To display the configured Divert-Rate-Limit (DRL) trusted sites, use the **show pxf cpu drl-trusted-sites** command in privileged EXEC mode.

show pxf cpu drl-trusted-sites

Syntax Description

This command has no keywords or arguments.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to display the configured DRL trusted sites.

Examples

The following example shows sample output for the **show pxf cpu drl-trusted-sites** command:

```
Router# show pxf cpu drl-trusted-sites
Divert-Rate-Limit Trusted-Site list
IP-addr      IP-addr mask  ToS   ToS mask  VRF
50.0.0.0     255.255.255.0 0x18  0xF8     global internet
50.0.1.0     255.255.0.0  0x01  0xFF     all
60.0.1.0     255.255.255.0 0x18  0xF8     blue
```

Table below describes the significant fields shown in the display.

Table 272: show pxf cpu drl-trusted-sites Field Descriptions

Field	Description
IP-addr	The IP address of the host or CM.
IP-addr mask	The IP address mask of the host or CM.
ToS	Type of Service value to be matched by the filter.
ToS Mask	Type of Service mask to be matched by the filter.
VRF	Name of the virtual interface that has been configured for DRL trusted sites.

Related Commands

Command	Description
show pxf cpu statistics dnl cable-wan-ip	This command displays the PXF DNL cable/wan-ip statistics table.
show pxf cpu statistics dnl wan-non-ip	This command displays the PXF DNL wan-non-ip statistics.

show pxf cpu queue wb-spa

To send queue and service flow information to and from the uBR10-MC 5x20 line cards, use the **show pxf cpu queue wb-spa** command in privileged EXEC mode.

show pxf cpu queue wb-spa

Syntax Description This command has no arguments or keywords.

Command Default None

Command Modes Privileged EXEC

Command History	Release	Modification
	12.3(23)BC	This command was introduced for the uBR10012 router.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines A virtual time management system (VTMS) link and two queues are set up for each Wideband SPA allowing MAC Management Messages (MMM) to be sent from the uBR10-MC 5x20 line card to the Wideband SPA, which in turn sends the messages to the appropriate RF channels.

In addition to this, another VTMS link and two queues are set up for each uBR10-MC 5x20 line card so that the SIP can send statistics IPC messages and cable monitor packets to the uBR10-MC 5x20 line card. The queue and service flow information for these data paths can be displayed by using the **show pxf cpu queue wb-spa** command.

The output of this command shows the two RP service flows for each SPA, including the RP service flow index and the associated queue ID. Refer to the **show pxf cpu queue qid** command for more information.

Examples

The following is a sample output of the **show pxf cpu queue wb-spa** command for the Cisco Wideband SPA port 1, slot 1, and bay 0:

```
Router# show pxf cpu queue wb-spa
SPA 1/0/0
MAP/UCD Service Flow Index: 32926
  Ironbus Channel: 0x8000 Queue ID: 266 Queue Flags: 0x2
LP-MMM Service Flow Index: 32768
  Ironbus Channel: 0x8000 Queue ID: 264 Queue Flags: 0x0
CableInternal5/1
Statistics Service Flow Index: 32887
  Ironbus Channel: 0x500 Queue ID: 504 Queue Flags: 0x0
Cable Monitor Service Flow Index: 129
  Ironbus Channel: 0x500 Queue ID: 505 Queue Flags: 0x0
CableInternal6/0
Statistics Service Flow Index: 32893
  Ironbus Channel: 0x500 Queue ID: 516 Queue Flags: 0x0
Cable Monitor Service Flow Index: 135
  Ironbus Channel: 0x500 Queue ID: 517 Queue Flags: 0x0
```

The following is a sample output of the **show pxf cpu queue wb-spa** command for the Cisco Wideband SPA sharing downstreams with the Cisco uBR-MC3GX60V line card, in Cisco IOS Release 12.2(33)SCG:

```

Router# show pxf cpu queue wb-spa

Table below describes the fields shown in the **show pxf cpu queue wb-spa** command display.

Table 273: show pxf cpu queue WB-SPA Field Descriptions

Field	Description
QID	CPU Queue ID.
Len/Max	Current CPU queue length/ CPU maximum queue length.
TailDrops	Number of CPU queue packet drops.
ShapeRt (Kbps)	Queue packet rate shaping.
FlowId	Service flow ID.

Related Commands

Command	Description
show pxf cpu queue <i>qid</i>	Displays parallel express forwarding queue statistics.

show pxf cpu statistics drl ipv4

To verify drop counters for WAN-IPv4 packets, use the **show pxf cpu statistics drl ipv4** command in the privileged EXEC mode.

```
show pxf cpu statistics drl ipv4 [{thresholdoutput modifiers}]
```

Syntax Description	threshold	The packet threshold value. The valid range is 0 to 4294967295.
	output modifiers	<p>The following output modifiers are used.</p> <ul style="list-style-type: none"> • append—Appends the redirected output to URL (URLs supporting append operation only) • begin—Begins with the line that matches. • exclude—Excludes the lines that match. • include—Includes the lines that match. • redirect—Redirects the output to the URL. • section—Filters a specific section of the output. • tee—Copies the output to the URL.

Command History

Release	Modification
12.2(33)SCE	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following examples indicate the drop counters for WAN-IPv4 packets.

```
Router# show pxf cpu statistics drl ipv4
Divert-Rate-Limit WAN-IPv4 statistics
  dropped  identifier
    460    11.12.13.10  VRF: global  divert_code: fib_rp_dest
    150    11.12.13.10  VRF: global  divert_code: fib_limited_broadcast
Router#
Router# show pxf cpu statistics drl ipv4 threshold 400
Divert-Rate-Limit WAN-IPv4 statistics :: threshold = 400
  dropped  identifier
    460    11.12.13.10  VRF: global  divert_code: fib_rp_dest
```

Related Commands

Command	Description
clear pxf statistics drl ipv4	Clears all the entries in the WAN IPv4 statistics table.
service divert-rate-limit trusted-site-ipv6	Adds IPv6-specific entries to the trusted site list.

Command	Description
show pxf cpu statistics drl us-cable	Displays the number of upstream cable packets that are dropped from the CMTS.
show pxf cpu statistics drlipv6	Verifies the drop counters for WAN-IPv4 packets.

show pxf cpu statistics drl ipv6

To verify drop counters for WAN-IPv6 packets, use the **show pxf cpu statistics drl ipv6** command in the privileged EXEC mode.

```
show pxf cpu statistics drl ipv6 [{thresholdoutput modifiers}]
```

Syntax Description	threshold	The packet threshold value. The valid range is 0 to 4294967295.
	output modifiers	The following output modifiers are used. <ul style="list-style-type: none"> • append—Appends the redirected output to URL (URLs supporting append operation only) • begin—Begins with the line that matches. • exclude—Excludes the lines that match. • include—Includes the lines that match. • redirect—Redirects the output to the URL. • section—Filters a specific section of the output. • tee—Copies the output to the URL.

show redundancy

To display the current redundancy status, use the **show redundancy** command in user EXEC or privileged EXEC mode.

Cisco uBR10012 Router

```
show redundancy [{clients | counters | history | states}]
```

Cisco cBR Series Converged Broadband Router

```
show redundancy [{application | clients | config-sync | counters | domain | history | idb-sync-history | lincecard | rii | states | switchover history | trace history}]
```

Syntax Description

application	(Optional on Cisco cBR router) Displays box to box application information
clients	(Optional) Displays the Redundancy Facility (RF) client list.
counters	(Optional) Displays RF operational counters.
domain	(Optional on Cisco cBR router) Specifies the RF domain.
history	(Optional) Summarizes RF history.
idb-sync-history	(Optional on Cisco cBR router) Displays the Redundancy Facility (RF) IDB sync history
states	(Optional) Displays RF states for active and standby modules.
switchover history	(Optional on Cisco cBR router) Displays the redundancy Facility (RF) switchover history.

Command Default

None

Command Modes

User EXEC (>)

Privileged EXEC (#)

Command History

Release	Modification
12.2(4)XF1	This command was introduced for the Cisco uBR10012 router.
12.2(11)BC3	The clients , counters , history , and states option were added, and the default display was enhanced to show the version of Cisco IOS software that is running on the standby PRE module.
12.2(15)BC2	The default display includes additional information about the history of switchovers, as well as a stack trace from the secondary PRE module's ROMMON for when it last crashed, if ever.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.

Release	Modification
12.2(44)SQ	This command was integrated into Cisco IOS Release 12.2(44)SQ. Support for the Cisco RF Gateway 10 was added.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router. The application , domain , idb-sync-history , and switchover keywords were added.

Usage Guidelines

The **show redundancy** command shows whether the PRE A slot or PRE B slot contains the active (primary) Performance Routing Engine (PRE1) module, the status of the standby (secondary) PRE1 module, and the values for the standby PRE1 module's boot variables and configuration register. In Cisco IOS Release 12.2(13)BC1 and later releases, it also shows the version of Cisco IOS software that is running on the standby PRE module.

Note The **show redundancy** command always shows the correct location of the active PRE1 module. The other PRE slot will always be marked as **Secondary**, even if a standby PRE1 module is not installed.

Cisco RF Gateway 10

The **show redundancy** command shows whether the Supervisor A slot or Supervisor B slot contains the active (primary) Supervisor card, the status of the standby (secondary) Supervisor card, and the values for the standby Supervisor card's boot variables and configuration register.

Note The **show redundancy** command always shows the correct location of the active Supervisor card. The other Supervisor slot will always be marked as **secondary**, even if a standby Supervisor card is not installed.

Cisco cBR Series Converged Broadband Router

The Cisco cBR Series Converged Broadband Router supports redundancy of Supervisor card and line cards. The **show redundancy** command shows whether the Supervisor A slot or Supervisor B slot contains the active (primary) Supervisor card, the status of the standby (secondary) Supervisor card, and the values for the standby Supervisor card's parameters

Examples

This section contains examples of typical displays for each of the options that are available for the **show redundancy** command.

Default Displays

The following example shows a typical display from the **show redundancy** command in Cisco IOS Release 12.2(15)BC2 and later releases:

```
PRE A           : Secondary
PRE B (This PRE) : Primary
Uptime since this PRE switched to active : 5 minutes
Total system uptime from reload       : 37 minutes
Switchovers this system has experienced : 5
Secondary failures since this PRE active : 0
```

```

The secondary PRE has been up for      : 1 minute
The reason for last switchover:  ACTIVE RP CRASHED
Secondary PRE information....
Secondary is up.
Secondary has 524288K bytes of memory.
Secondary BOOT variable = slot0:ubr10k-k8p6-mz.122-11.CY,12;
Secondary CONFIG_FILE variable = bootflash:030227.config
Secondary BOOTLDR variable =
Secondary Configuration register is 0x0

Router#

```

The following example shows the same display but after a switchover has occurred. The **show redundancy** command now shows that the active (primary) PRE has changed slots (in this case, moving from slot A to slot B):

```

Router# show redundancy

PRE A                : Secondary
PRE B (This PRE)    : Primary

Redundancy state is REDUNDANCY_PEERSECONDARY_INITED

Secondary PRE information....
Secondary is up.
Secondary BOOT variable = bootflash:ubr10k-k8p6-mz
Secondary CONFIG_FILE variable =
Secondary BOOTLDR variable = bootflash:c10k-eboot-mz
Secondary Configuration register is 0x2
Secondary version:

Router#

```

The following example shows a typical display when the standby PRE1 module is not installed or is not operational. The standby (secondary) PRE1 module is shown as not up, and its boot variables and configuration register are not shown.

```

Router# show redundancy

PRE A (This PRE)    : Primary
PRE B               : Secondary
Redundancy state is REDUNDANCY_PEERSECONDARY_NONOPERATIONAL
Secondary PRE information....
Secondary PRE is not up
Router#

```

This example shows the output of the **show redundancy** command on the Cisco cBR router:

```

Router#show redundancy
Redundant System Information :
-----
      Available system uptime = 1 day, 17 hours, 50 minutes
Switchovers system experienced = 0

States Display

The following example shows a typical display for the **show redundancy states** command:

```

Router# show redundancy states
  my state = 13 -ACTIVE
  peer state = 8  -STANDBY HOT
    Mode = Duplex
    Unit = Primary
    Unit ID = 0
  Redundancy Mode = Hot Standby Redundancy
  Maintenance Mode = Disabled
  Manual Swact = Enabled
  Communications = Up
  client count = 5

```

```
client_notification_TMR = 30000 milliseconds
RF debug mask = 0x0
```

This example shows the output on the Cisco cBR router:

```
Router#show redundancy states
  my state = 13 -ACTIVE
  peer state = 1 -DISABLED
    Mode = Simplex
    Unit = Primary
    Unit ID = 48

Redundancy Mode (Operational) = Non-redundant
Redundancy Mode (Configured) = sso
Redundancy State = Non Redundant
  Maintenance Mode = Disabled
  Manual Swact = disabled (system is simplex (no peer unit))
  Communications = Down      Reason: Simplex mode

  client count = 120
  client_notification_TMR = 30000 milliseconds
  RF debug mask = 0x0

Router#
```

Cisco RF Gateway 10

The following example shows sample output for the show redundancy command on the Cisco RF Gateway 10:

```
Router#show redundancy
Redundant System Information :
-----
  Available system uptime = 3 minutes
Switchovers system experienced = 0
  Standby failures = 0
  Last switchover reason = none
    Hardware Mode = Simplex
  Configured Redundancy Mode = Stateful Switchover
  Operating Redundancy Mode = Stateful Switchover
  Maintenance Mode = Disabled
  Communications = Down      Reason: Simplex mode

Current Processor Information :
-----
  Active Location = slot 1
  Current Software state = ACTIVE
  Uptime in current state = 2 minutes
    Image Version = Cisco IOS Software, Catalyst 4500 L3 Switch So
tware (rfgw-ENTSERVICES-M), Version 12.2(FLO_RFGW_NIGHT_MON.2008-08-11) UBUILD1

```

Clients Display

The following example shows a typical display for the **show redundancy clients** command:

```
Router# show redundancy clients
clientID = 0      clientSeq = 0      RF_INTERNAL_MSG
clientID = 25     clientSeq = 130     CHKPT RF
clientID = 5      clientSeq = 170     RFS client
clientID = 50     clientSeq = 530     Slot RF
clientID = 65000  clientSeq = 65000  RF_LAST_CLIENT
```

Table below describes the significant fields shown in the display.

Table 274: show redundancy clients Field Descriptions

Field	Description
clientID	Displays the client ID number.
clientSeq	Displays the client notification sequence number.

Counters Display

The following example shows a typical display for the **show redundancy counters** command:

```
Router# show redundancy counters
Redundancy Facility OMs
      comm link up = 1
      comm link down down = 0
      invalid client tx = 0
      null tx by client = 0
      tx failures = 0
      tx msg length invalid = 0
      client not rxing msgs = 0
rx peer msg routing errors = 0
      null peer msg rx = 0
      errored peer msg rx = 0
      buffers tx = 1009
tx buffers unavailable = 0
      buffers rx = 1006
      buffer release errors = 0
duplicate client registers = 0
failed to register client = 0
Invalid client syncs = 0
```

History Display

The following example shows a typical display for the **show redundancy history** command:

```
Router# show redundancy history
00:00:00 client added: RF_INTERNAL_MSG(0) seq=0
00:00:00 client added: RF_LAST_CLIENT(65000) seq=65000

```

States Display

The following example shows a typical display for the **show redundancy state** command:

```

Router# show redundancy states
    my state = 13 -ACTIVE
    peer state = 8  -STANDBY HOT
    Mode = Duplex
    Unit = Primary
    Unit ID = 0
    Redundancy Mode = Hot Standby Redundancy
    Maintenance Mode = Disabled
    Manual Swact = Enabled
    Communications = Up
    client count = 5
    client_notification_TMR = 30000 milliseconds
    RF debug mask = 0x0

```

Related Commands

Command	Description
associate	Associates two line cards for Automatic Protection Switching (APS) redundancy protection.
clear redundancy	Clears the counters and history information that are used by the Redundancy Facility (RF) subsystem.
mode (redundancy)	Configures the redundancy mode of operation.
redundancy	Enters redundancy configuration mode.
redundancy force-failover main-cpu	Forces a manual switchover between the active and standby PRE1 modules or Supervisor cards.

Command	Description
redundancy force-switchover	Forces the standby PRE or Supervisor card to assume the role of the active PRE or Supervisor card.
show redundancy config-sync	Displays failure information generated during a bulk synchronization from the active PRE to the standby PRE.
show redundancy platform	Displays active and standby PRE and software information.

show redundancy config-sync

To display failure information generated during a bulk synchronization from the active Performance Routing Engine (PRE) to the standby PRE, use the **show redundancy config-sync** command in user EXEC or privileged EXEC modes.

```
show redundancy config-sync {failures {bem | mcl | prc} | ignored failures mcl}
```

Syntax Description	failures	Displays failures related to bulk synchronisation of the standby PRE.
	bem	Displays Best Effort Method (BEM) failure list.
	mcl	Displays Mismatched Command List (MCL) failure list.
	prc	Displays Parser Return Code (PRC) failure list.
	ignored failures mcl	Displays mismatched commands in the MCL that are ignored.

Command Default None

Command Modes
User EXEC (>)
Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCA	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines This command is used on the active PRE only.

If there are mismatched commands between the active and standby PRE, remove the configuration lines that are not supported on the standby image. If it is not possible to remove the mismatched lines, or it has been determined that the mismatched lines are not critical to the operation of the system, use the command **redundancy config-sync ignore mismatched-commands** to temporarily ignore them.

Examples

The examples in this section are supported on the Cisco cBR Series Converged Broadband Router.

The following example displays a mismatched command list:

```
Router# show redundancy config-sync failures mcl
Mismatched Command List
-----
- tacacs-server host 209.165.200.225 timeout 5
```

The following example shows that no mismatched commands are ignored:

```
router# show redundancy config-sync ignored failures mcl
Ignored Mismatched Command List
```

```
-----
The list is Empty
```

The following example displays a Parser Return Code failure list:

```
router# show redundancy config-sync failures prc
PRC Failed Command List
-----
router bgp 999
address-family ipv4 vrf TEST2
- bgp dampening 44 66 66 44
! </submode> "address-family"
address-family ipv4 vrf TEST1
- bgp dampening 44 66 66 44
! </submode> "address-family"
```

The following example displays a Best Effort Method failure list:

```
router# show redundancy config-sync failures bem
BEM Failed Command List
-----
interface Tunnel0
- tunnel mpls traffic-eng priority 7 7
! </submode> "interface"
- next-address loose 10.165.202.158
- next-address loose 10.165.202.129
```

Related Commands

Command	Description
redundancy force-switchover	Forces the standby PRE to assume the role of the active PRE.
show redundancy	Displays current active and standby PRE redundancy status.
show redundancy platform	Displays active and standby PRE and software information.

show redundancy linecard

To display information about the line card redundancy, use the **show redundancy linecard** command in privileged EXEC mode.

```
show redundancy linecard { all | group {group-id | all } | history | slot slot | {sub-block all } }
```

Syntax Description	all	Displays role and state information for all line cards.
	group <i>group-id</i>	Displays the line card redundancy information for the line card groups. The valid value is 0.
	group all	Displays all the line card groups.
	history	Displays the state change history log for all the line cards.
	slot <i>slot</i>	Displays the redundancy information for the line card slot number.
	sub-block	Displays the sub-block information.

Command Default None.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE Release 3.16.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to display the redundancy group information:

```
Router# show redundancy linecard group all
Group Identifier: 0
Revertive, Revert Timer: OFF (60000 sec)
Reserved Cardtype: 0xFFFFFFFF 4294967295
Group Redundancy Type: INTERNAL SWITCH
Group Redundancy Class: 1:N
Group Redundancy Configuration Type: LINECARD GROUP
Primary: Slot 6
Primary: Slot 7
Secondary: Slot 0
```

The following example shows how to display the role and state information for all line cards:

```
Router# show redundancy linecard all
LC My Peer Peer Peer
Slot Subslot Group State State Slot Subslot Role Mode
-----
9 - 0 Active Stdb Cold 0 - Active Primary
8 - 0 Active Stdb Warm 0 - Active Primary
7 - 0 Active Stdb Warm 0 - Active Primary
6 - 0 Active Stdb Cold 0 - Active Primary
3 - 0 Active Stdb Cold 0 - Active Primary
```

show redundancy linecard

```

2 - 0 Active Stdbby Cold 0 - Active Primary
1 - 0 Active Stdbby Cold 0 - Active Primary
0 - 0 - - Multiple None Standby Secondary

```

The following is a sample output of the command when secondary card becomes active for a primary card, and the N+1 redundancy is changed to 1+1 redundancy:

```

Router# show redundancy linecard all
LC My Peer Peer Peer
Slot Subslot Group State State Slot Subslot Role Mode
-----
9 - 0 Stdbby Hot Active 0 - Standby Primary
8 - 0 Active Unavail 0 - Active Primary
7 - 0 Active Unavail 0 - Active Primary
6 - 0 Active Unavail 0 - Active Primary
3 - 0 Active Unavail 0 - Active Primary
2 - 0 Active Unavail 0 - Active Primary
1 - 0 Active Unavail 0 - Active Primary
0 - 0 Active Stdbby Hot 9 - Active Secondary

```

The following example displays the redundancy information for the line card:

```

Router# show redundancy linecard slot 9
LC Redundancy Is Configured:
LC Group Number: 0
LC Slot: 9 (idx=9)
LC Peer Slot: 0
LC Card Type: 0x4076 , 16502
LC Name: 9
LC Mode: Primary
LC Role: Active
LC My State: Active
LC Peer State: Stdbby Warm

```

The following example displays the state change history for all line cards:

```

Router# show redundancy linecard history
Jan 05 2012 12:24:27 20559 - st_mem(9): MY State Change, (Active Wait) -> (Active)
Jan 05 2012 12:24:27 20559 - st_mem(9): MY FSM execution, Active Wait:Init:State Ntfy
Jan 05 2012 12:24:27 20559 - st_mem(9): MY State Change, (Active LC Cfg Dnld) -> (Active Wait)
Jan 05 2012 12:24:27 20559 - st_mem(9): MY FSM execution, Active LC Cfg Dnld:Init:Cfg Dnld Done
Jan 05 2012 12:24:27 20559 - st_mem(9): MY State Change, (Active Cold) -> (Active LC Cfg Dnld)
Jan 05 2012 12:23:09 12763 - st_mem(9): MY FSM execution, Active Cold:Init:Cfg Dnld
Jan 05 2012 12:23:09 12760 - st_mem(9): MY State Change, (Init) -> (Active Cold)
Jan 05 2012 12:23:09 12760 - st_mem(9): MY FSM execution, Init:Init:Up
Jan 05 2012 12:21:39 3746 - st_mem(9): PEER FSM Execution , Init:Init:Reset

```

Related Commands

Command	Description
class	Configures redundancy class on the line card.
description	Adds a description to the line card group.
member slot	Adds a slot to the line card redundancy group.
redundancy slot	Enters redundancy configuration mode.

show redundancy platform

To display active and standby Performance Routing Engine (PRE) and software information, use the **show redundancy platform** command in user EXEC or privileged EXEC modes.

show redundancy platform

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes
User EXEC (>)
Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SCA	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Router.

Examples

The following example displays active and standby PRE information such as PRE states, reason for last failover, total system uptime, Cisco IOS release version, and so on:

```
Router# show redundancy platform

PRE A (This PRE)      : Active
PRE B                 : Standby

                        Operating mode : SSO
Uptime since this PRE became active from reload : 13 minutes
  Standby failures since this PRE active : 0
  The standby PRE has been up for : 3 minutes
Previous rp_cre_redun_reg bits - 1057h
Current  rp_cre_redun_reg bits - 1041h
Previous peer_ready_reg - 01
Current  peer_ready_reg - 11
Standby PRE information...
Standby is up
Standby has 1044480K bytes of memory
Standby BOOT variable = disk1:ubr10k2-k9p6u2-mz.Prednld-prototype-2,12;
Standby CONFIG_FILE variable =
Standby BOOTLDR variable =
Standby Configuration register is 0x0
Standby version:
Cisco IOS Software, 10000 Software (UBR10K2-K9P6U2-M), Version 12.2(122_33_SCA.2008-02-15)

Related Commands

Command	Description
debug ehpa	Enables debug information on the EHSA module.
redundancy force-switchover	Forces the standby PRE to assume the role of the active PRE.
show redundancy (ubr10012)	Displays the current redundancy status.
show redundancy config-sync	Displays failure information generated during a bulk synchronization from the active PRE to the standby PRE.

show running-config interface cable

To display the bundles that are configured on a Cisco CMTS router and display the running configuration for each of the cable interfaces, use the **show running-config interface cable** command in privileged EXEC mode.

Cisco IOS Release 12.2(33)SCE and later

show running-config interface cable *{slot/cable-interface-index | slot/subslot/cable-interface-index }*

showrunning-configinterfacecable

slot / | subslot / | port /

Cisco IOS Release 12.2(33)SCE and later

show running-config interface cable

slot / cable-interface-index | slot / subslot / cable-interface-index

Cisco cBR Series Converged Broadband Router

show running-config interface cable

slot / subslot / cable-interface-index

Syntax Description	
<i>slot</i>	<p>Slot where the line card resides.</p> <ul style="list-style-type: none"> • Cisco uBR7225VXR router—The valid value is 1 or 2. • Cisco uBR7246VXR router—The valid range is from 3 to 6. • Cisco uBR10012 router—The valid range is from 5 to 8. • Cisco cBR router—The valid range is 0 to 3, and 6 to 9.
<i>subslot</i>	<p>(Cisco uBR10012 only) Secondary slot number of the cable interface line card. The valid subslots are 0 or 1.</p> <p>On the Cisco cBR router, the subslot is always 0.</p>
<i>port</i>	<p>Downstream port number.</p> <ul style="list-style-type: none"> • Cisco uBR7225VXR router and Cisco uBR7246VXR router—The valid value is 0 or 1. • Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).
<i>cable-interface-index</i>	<p>Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V line cards.</p> <p>Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</p> <p>Cisco uBR10012 router—The valid range for the Cisco uBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</p> <p>Cisco cBR router—The valid range is 0 to 7.</p>

Command Default Displays screen output without page breaks, removes passwords and other security information.

User EXEC (>)

Privileged EXEC (#)

Command History

Release	Modification
10.0	This command was introduced.
12.3(21)BC	This command was enhanced to support cable interface bundling and virtual interface bundling.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCC	The command output was modified to display profile description for the specified profile.
12.2(33)SCE	This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Router.

Examples

The following example displays typical output for the show running-config command for a specified cable interface:

```
Router# show running-config interface cable 8/1/0
```

```
Building configuration...
Current configuration : 1563 bytes
!
interface Cable8/1/0
  downstream Modular-Cable 1/3/0 rf-channel 0 upstream 0-4
  no cable packet-cache
  cable bundle 1
  cable downstream channel-id 203
  cable downstream annex B
  cable downstream modulation 64qam
  cable downstream interleave-depth 32
  cable downstream frequency 525000000
  cable downstream rf-shutdown
  cable upstream max-ports 4
  cable upstream 0 connector 0
  cable upstream 0 frequency 5800000
  cable upstream 0 channel-width 1600000 1600000
  cable upstream 0 docsis-mode tdma
  cable upstream 0 minislot-size 4
  cable upstream 0 range-backoff 3 6
  cable upstream 0 modulation-profile 21
  cable upstream 0 attribute-mask 20000000
  no cable upstream 0 shutdown
  cable upstream 1 connector 1
  cable upstream 1 channel-width 1600000 1600000
  cable upstream 1 docsis-mode tdma
  cable upstream 1 minislot-size 4
```

```

cable upstream 1 range-backoff 3 6
cable upstream 1 modulation-profile 21
cable upstream 1 attribute-mask 20000000
no cable upstream 1 shutdown
cable upstream 2 connector 2
cable upstream 2 channel-width 1600000 1600000
cable upstream 2 docsis-mode tdma
cable upstream 2 minislots-size 4
cable upstream 2 range-backoff 3 6
cable upstream 2 modulation-profile 21
cable upstream 2 attribute-mask 20000000
cable upstream 2 shutdown
cable upstream 3 connector 3
cable upstream 3 channel-width 1600000 1600000
cable upstream 3 docsis-mode tdma
cable upstream 3 minislots-size 4
cable upstream 3 range-backoff 3 6
cable upstream 3 modulation-profile 21
cable upstream 3 attribute-mask 20000000
cable upstream 3 shutdown
end

```

The following example displays the virtual bundle information for the specified bundle:

```

Router# show running-config interface Bundle 1
Building configuration...
Current configuration : 158 bytes
!
interface Bundle1
 ip address 1.60.0.1 255.255.255.0
 cable arp filter request-send 3 2
 cable arp filter reply-accept 3 2
 no cable ip-multicast-echo
end

```

The following examples displays subinterface information for the specified bundle on a Cisco uBR10012 router:

```

Router# show ip interface brief | include Bundle
Wideband-Cable8/0/0:0 Bundle2 YES unset up up
In8/0/0:0 Bundle2 YES unset up up
Bundle1 1.60.0.1 YES NVRAM up up
Bundle2 1.80.0.1 YES NVRAM up up
Bundle5 unassigned YES NVRAM up up
Router# show running-config interface Bundle150.1
Building configuration...
Current configuration : 93 bytes
!
interface Bundle150.1
 ip address 30.0.0.1 255.0.0.0
 cable helper-address 1.8.35.200
end

```

The following example displays the profile description specified for an interface on a Cisco uBR10012 router:

```

Router#show running-config | include gold
cable multicast auth profile gold
 profile-description gold profile for higher bandwidth

```

show running-config interface cable

```

bootfile gold11_bpi.cm
tftp-server disk0:gold2.cm alias gold2.cm
tftp-server disk0:gold11_bpi.cm alias gold11_bpi.cm
tftp-server disk0:gold11_bpi.cm

```

Related Commands

Command	Description
cable bundle	Configures a cable interface to belong to an interface bundle or virtual interface bundle.
profile description	Configures profile descriptions for each profile in the selected cable multicast authorization profile.
show arp	Displays the entries in the router's ARP table.
show cable bundle <i>number</i> forwarding-table	Displays the MAC forwarding table for the specified bundle, showing the MAC addresses of each cable modem in a bundle and the physical cable interface that it is currently using.
show cable modem	Displays the cable modems that are online both before and after cable interface bundling has been configured.

show run interface VirtualPortGroup

To verify the VirtualPortGroup interface configuration, use the **show run interface VirtualPortGroup** command in privileged EXEC mode.

show run interface VirtualPortGroup *number*

Syntax Description

number Displays the information of the VirtualPortGroup with this number.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command is used to verify the VirtualPortGroup interface configuration.

The following sample output shows the VirtualPortGroup interface configuration:

```
router#show run interface VirtualPortGroup 5
Building configuration...

Current configuration : 145 bytes
!
interface VirtualPortGroup5
 ip address 1.2.2.2 255.255.255.0 secondary
 ip address 1.2.2.1 255.255.255.0
 no mop enabled
 no mop sysid
end
```

Related Commands

Command	Description
mgmt-intf	Defines a cable video management interface.
interface	Defines a VirtualPortGroup interface.
show run include mgmt-intf	Displays the cable video management interface configuration.
show interfaces VirtualPortGroup	Displays the VirtualPortGroup interface state.

show run | se ptp

You can use the **show run | se ptp** command to check the PTP configuration on both cBR and RPD.

show run | se ptp

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.7.1y	Support for checking PTP configuration was introduced.

Usage Guidelines

Use the **show run | se ptp** command to view the PTP configuration status.

The following example shows the sample output for the **show run | se ptp** command:

```
Router# show run | se ptp

ptp clock boundary domain 55
servo tracking-type R-DTI
clock-port 22 master profile g8275.2
sync interval -5
sync one-step
transport ipv6 unicast interface Lo1588 negotiation
clock-port 33 master profile g8275.2
sync interval -5
sync one-step
transport ipv6 unicast interface Lo1589 negotiation
ptp r-dti 1
profile G.8275.2
ptp-domain 55
clock-port 22
ethernet 0
transport ipv6
clock source ipv6 2001:158:158:158::158 gateway ipv6 2001:120:101:16::1
clock source ipv6 2001:158:158:158::159 gateway ipv6 2001:120:101:16::2 alternate
```

show snmp | i queue

You can use the **show snmp | i queue** command to display the SNMP queue size. You can also view if the queue size has dropped and can also view the maximum queue size.

show snmp | i queue

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Cupertino 17.9.1x	This command is introduced.

Usage Guidelines

Use the **show snmp | i queue** command to view the SNMP queue size.

The following example shows the sample output for the **show snmp | i queue** command:

```
Router# show snmp | i queue
0 Input queue packet drops (Maximum queue size 1000)
0 Dispatcher queue packet drops (Maximum queue size 75)
Packets currently in SNMP process input queue: 0, max 1000
Packets currently in SNMP PDU dispatcher queue: 0, max 75
Router#
```

The table below describes the significant fields shown in the display:

Table 275: show snmp | i queue Field Descriptions

Field	Description
Input queue	The process input queue holds SNMP packets from the dispatcher queue, waiting to be processed.
Dispatcher queue	The dispatcher queue holds SNMP packets from socket.

Related Commands

Command	Description
snmp snmp-server dispatcher-queue-size	Specify the dispatcher queue size.
snmp snmp-server local-queue-size	Specify the local queue size.

show tech-support

To automatically run **show** commands that display system information, use the **show tech-support** command in the EXEC mode.

show tech-support *keywords*

Syntax Description

Firewall	Displays firewall related information.
aaa	Displays aaa related information.
alg	Displays ALG related information.
appnav	Displays AppNav related information.
bgp	Displays BGP information.
called-number	Displays Called Number commands.
called-number-pool	Displays Called Number Pool commands.
cef	Displays CEF related information.
cft	Displays CFT related information.
cmts	Displays CMTS related information.
cmts rpd	Displays downstream cable and RPHY related information.
cmts queuestuck	Useful for debugging and working around queue stuck issues.
cube	Displays cube related information.
dhcpv4	Displays DHCPv4 related information.
dhcpv6	Displays DHCPv6 related information.
diagnostic	Displays diagnostic related information.
dial-peer	Displays dial-peer group.
dmvpn	Displays DMVPN related information.
dpg	Displays dial-peer groups.
e164-pattern-map	Displays e164 pattern maps.
e164-translation	Displays voice class e164-translation.
eigrp	Displays EIGRP related information.
ethernet	Displays ethernet protocols related information.
evc	Displays EVC related information.

fnf	Displays Flexible Netflow information
ipc	Displays IPC related information.
ipmulticast	Displays IP multicast related information.
ipsec	Displays IPSEC related information.
isis	Displays CLNS and ISIS related information.
issu	Displays ISSU related information.
iwan	Displays IWAN related information.
l2vpn	Displays L2VPN related information.
lisp	Displays Locator/ID Separation Protocol.
mdns-sd	Displays mdns-sd related information.
memory	Displays memory related information.
mfib	Displays MFIB related information.
mpls	Displays MPLS forwarding and application related information.
mvpn	Displays multicast VPN related information.
nat	Displays NAT related information.
nbar	Displays NBAR related information.
onep	Displays ONEP related information.
ospf	Displays OSPF related information.
ospfv3	Displays OSPFv3 related information.
otv-isis	Displays OTV and ISIS related information.
page	Displays page through output.
password	Includes passwords.
perf_measure	Displays PERF_MEASURE related information.
performance-monitor	Displays performance monitor related information.
pfrv3	Displays Pfrv3 related information.
pki	Displays PKI related information.
route-string	Displays route-string commands.
rsvp	Displays IP RSVP related information.
sbc	Displays SBC related information.

segment-routing	Displays segment-routing related information.
server-group	Displays server groups.
sip-options-keepalive	Displays voice class sip-options-keepalive.
sip-predefined-profiles	Displays predefined voice class sip profiles.
sisf	Displays SISF information.
subscriber	Displays subscriber related information.
video	Displays video related information.

Command Modes

User EXEC (>)

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Fuji 16.8.2	This command was introduced.
Cisco IOS XE Bengaluru 17.6.1x	This command was updated to include the cmts rpd keywords.

Usage Guidelines

This command generates technical support information that is useful for Cisco Technical Support representatives when troubleshooting a router. If you want to share the command output with Cisco Technical Support, use **redirect show tech | redirect harddisk:<filename>.txt** to export the command output to a plain text file and share.

Examples

The commands that run automatically when you run the **show tech-support** command include but not limited to the following:

```
show clock
show version
show running-config
show redundancy history
show redundancy states
show redundancy switchover history
show stacks
show interfaces
show interfaces history
show controllers
show user
show data-corruption
```

```

show memory statistics
show process memory sorted
show process memory platform sorted
show process cpu sorted
show process cpu platform sorted
show process cpu extended history
show process cpu history
show file systems
show file descriptors
show bootflash: all
show harddisk: all
show webui: all
show stby-bootflash: all
show stby-harddisk: all
show controllers t1
show controllers e1
show ipc nodes
show ipc ports
show ipc queue
show ipc status
show derived-config interface
show cable card 0/0 ds-phy trigger
show alignment
show process cpu sorted
show facility-alarm status
show facility-alarm status critical
show redundancy
show redundancy counters
show redundancy linecard all
show lcha rfs
show redundancy linecard history
show lcha logging level info
show platform hardware network-clocks
show platform diag
show diag all eeprom detail
show environment all
show environment power
show platform software ios RP active ipcc1 statistics port
show platform software ios RP active ipcc1 statistics client
show platform software ios RP active ipcc1 statistics service 1
show platform hardware qfp active infrastructure chipset 0 ver
show platform software object f0 pending-ack-update sorted 600
show platform software object f1 pending-ack-update sorted 600
show platform hardware qfp active system fault stats

```

Examples

The commands that run automatically when you run the **show tech-support cmts rpd** command include but not limited to the following:

```

show cable rpd
show cable rpd ipv6
show cable rpd version
show cable rpd sw-version
show cable rpd lcha
show cable rpd depi
show cable rpd log rev
show cable rpd info
show cable rpd md-association
show cable rpd sum
show ip spd
show ipv6 spd
show ptp clock running

```

```
show platform software us-scheduler infra cpu utilization
show platform software process slot x monitor
show cable card cdman chunk
show cable card ds-mac all
show cable card scheduler info
show cable card us-mac counts all
show cable card us-triggered-spectrum uts-common
show controllers Downstream-Cable all
show controllers Downstream-Cable association
show controllers Downstream-Cable bandwidth rf-channel

show platform software rphyman rp active gcp statistics in
show platform software rphyman rp active gcp statistics me
show platform software rphyman rp active gcp statistics ms
show logging process rphyman internal reverse
```

show usb-devices summary

To view a summary of all the system USB devices (eUSB Flash), use **show usb-devices summary** command in Privileged Exec mode.

show usb-devices summary

Syntax Description This command has no arguments or keywords.

Command Default None

Command Modes Privileged Exec (#)

Command History	Release	Modification
	Cisco IOS XE Dublin 17.12.1	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to display a summary of the system USB devices:

```
Router# show usb-devices summary
Load for five secs: 3%/0%; one minute: 4%; five minutes: 4%
Time source is NTP, 21:37:37.209 EDT Mon Jun 26 2023
```

```
USB Device: EHCI Host Controller
Bus: 01 Port: 00 Cnt: 00 Speed: 480
Vendor: 1d6b ProdID: 0002 Rev: 5.15
Manufacturer: Linux 5.15.12 ehci_hcd
Serial Number: 0000:00:1d.0
```

```
USB Device:
Bus: 01 Port: 00 Cnt: 01 Speed: 480
Vendor: 8087 ProdID: 0020 Rev: 0.00
Manufacturer:
Serial Number:
```

```
USB Device: DataTraveler 3.0
Bus: 01 Port: 00 Cnt: 01 Speed: 480
Vendor: 0951 ProdID: 1666 Rev: 1.00
Manufacturer: Kingston
Serial Number: 60A44C3FACCEB221996A0158
```

```
USB Device: EUSB
Bus: 01 Port: 03 Cnt: 02 Speed: 480
Vendor: 0e39 ProdID: 2f00 Rev: 3.49
Manufacturer: SMART
Serial Number: STP22370JF8
```

In this example USB Device: DataTraveler 3.0 indicates a front panel usb drive and USB Device: EUSB indicates a eUSB flash drive.

Related Commands	Command	Description
	show hdd-devices summary	Displays a summary of all the system HDD devices(SSD).

snmp manager

To create a DOCSIS configuration file that specifies the IP address for the Simple Network Management Protocol (SNMP) manager, use the **snmp manager** command in cable config-file configuration mode. To disable this function, use the **no** form of this command.

snmp manager *ip-address*
no snmp manager

Syntax Description	<i>ip-address</i> Specifies an IP address for the SNMP manager.
---------------------------	---

Command Default No SNMP manager is defined.

Command Modes Cable config-file configuration

Command History	Release	Modification
	12.1(2)EC1	This command was introduced.
	12.2(4)BC1	Support was added to the Release 12.2 BC train.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines For SNMP commands that affect the operation of the CMTS, see the [Cisco IOS Configuration Fundamentals Command Reference Guide](#).

Examples The following example shows how to specify the IP address of the SNMP manager in a DOCSIS configuration file:

```
router(config)# cable config-file snmp.cm
router(config-file)# snmp manager 10.10.1.1
router(config-file)# exit

router(config)#
```

Related Commands	Command	Description
	cable config-file	Creates a DOCSIS configuration file and enters configuration file mode.
	access-denied	Disables access to the network.
	channel-id	Specifies upstream channel ID.
	cpe max	Specifies CPE information.
	download	Specifies download information for the configuration file.
	frequency	Specifies downstream frequency.

Command	Description
option	Provides config-file options.
privacy	Specifies privacy options for baseline privacy images.
service-class	Specifies service class definitions for the configuration file.
timestamp	Enables time-stamp generation.

snmp server dispatcher-queue-size

Use the **snmp-server dispatcher-queue-size** command in global configuration mode, to configure dispatcher queue size for SNMP global configuration. To disable this function, use the **no** form of this command.

snmp-server dispatcher-queue-size *dispatcher-queue-size*
no snmp-server dispatcher-queue-size

Syntax Description

<i>dispatcher-queue-size</i>	Specify the the maximum value for SNMP dispatcher queue size. The dispatcher queue holds SNMP packets from socket. The range is 75-100000 and the default value is 75.
------------------------------	--

Command Default

None

Command Modes

Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Cupertino 17.9.1x	This command is introduced.

Examples

The following example shows how to configure **snmp snmp-server dispatcher-queue-size**:

```
router(config)# snmp-server dispatcher-queue-size 150
router(config)#
```

Related Commands

Command	Description
snmp snmp-server local-queue-size	Specify the local queue size.

snmp-server enable traps cable

To enable the sending of Simple Network Management Protocol (SNMP) traps for cable related events, use the **snmp-server enable traps cable** command in global configuration mode. To disable the sending of traps, use the **no** form of this command.

Cisco uBR10012 Universal Broadband Router and Cisco cBR-8 Converged Broadband Router

```
snmp-server enable traps cable [admission_control] [cm-chover] [cm-onoff] [cm-remote-query]
[dmic-lock] [enfrule-violation] [hccp-failover] [hopping] [metering] [rfswitch-polling] [sfp-link]
no snmp-server enable traps cable [admission_control] [cm-chover] [cm-onoff] [cm-remote-query]
[dmic-lock] [enfrule-violation] [hccp-failover] [hopping] [metering] [rfswitch-polling] [sfp-link]
```

Cisco uBR7225VXR and Cisco uBR7246VXR Universal Broadband Routers

```
snmp-server enable traps cable [admission_control] [cm-chover] [cm-onoff] [cm-remote-query]
[dmic-lock] [enfrule-violation] [hccp-failover] [hopping] [metering]
no snmp-server enable traps cable [admission_control] [cm-chover] [cm-onoff] [cm-remote-query]
[dmic-lock] [enfrule-violation] [hccp-failover] [hopping] [metering]
```

Syntax Description

admission_control	Enables traps for Service Flow Admission Control (SFAC), as defined in CISCO-CABLE-ADMISSION-CTRL-MIB.
cm-chover	Enables traps that are sent upon completion of CMTS channel override operations, as defined in CISCO-DOCS-EXT-MIB.
cm-onoff	Enables traps for CM online/offline status changes, as defined in CISCO-DOCS-EXT-MIB.
cm-remote-query	Enables traps that are sent when the remote polling of CMs has been completed, as defined in CISCO-DOCS-REMOTE-QUERY-MIB.
dmic-lock	Enables traps that are sent when a cable modem fails the dynamic shared-secret security checks, as defined in CISCO-DOCS-EXT-MIB.
enfrule-violation	Enables traps that are sent when a user violates their quality of service (QoS) profile, as defined in the CISCO-CABLE-QOS-MONITOR-MIB.
hccp-failover	Enables traps for Hot Standby Connection-to-Connection Protocol (HCCP) redundancy switchover events, as defined in CISCO-CABLE-AVAILABILITY-MIB.
hopping	Enables traps for spectrum hopping events, as defined in CISCO-CABLE-SPECTRUM-MIB.
metering	Enables traps that are sent to indicate success or failure in creating the metering record file or streaming it to the collection server, as defined in CISCO-CABLE-METERING-MIB.
rfswitch-polling	Enables traps that are sent when the connectivity between the Cisco CMTS and the Cisco RF Switch is lost, as defined in CISCO-CABLE-AVAILABILITY-MIB.

sfp-link	Enables the traps that are sent when the SFP port link status changes on the Cisco Wideband SPA, and on the Cisco uBR-MC3GX60V line card, as defined in CISCO-CABLE-WIDEBAND-MIB.
-----------------	---

Command Default

No SNMP traps for cable-related events are enabled. You can specify one type of trap or any combination of traps. When the **snmp-server enable traps cable** command is given without any options, all cable-related traps are enabled.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.0(5)T	This command, with the cm-chover and cm-onoff options, was added.
12.0(7)XR2, 12.1(1)T	The cm-remote-query option, along with the CISCO-DOCS-REMOTE-QUERY-MIB MIB, was introduced.
12.1(2)EC1	This command was supported on the 12.1 EC train.
12.1(7)CX1	The hopping and cmts-event options were introduced.
12.2(4)BC1	This command was supported on the Cisco uBR10012 universal broadband router. The cmts-event option was also removed as redundant.
12.2(8)BC1	The hccp-failover option was supported on the Cisco uBR10012 router.
12.2(11)BC1	The hccp-failover option was supported on the Cisco uBR7200 series router.
12.2(15)BC1	The enforce-rule option was added to generate traps for subscribers who violate their enforce-rule QoS profile.
12.2(15)BC21	The dmic-lock and usage options were added.
12.3BC	The admission_control , metering , and rfswitch-polling options were added.
12.2(33)SCG	The sfp-link option was added to generate traps when the SFP port link status changed on the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

For other SNMP commands that affect the operation of the CMTS, see the [Cisco CMTS Universal Broadband Router Series MIB Specifications Guide](#).

Examples

The following example shows how to enable all traps for cable-related events except HCCP switchover on the CMTS:

```
Router# configure terminal
Router(config)# snmp-server enable traps cable cm-chover cm-onoff cm-remote-query hopping
Router(config)#
```

The following example shows how to enable traps for any HCCP switchovers that occur on the CMTS:

```
Router# configure terminal
Router(config)# snmp-server enable traps cable hccp-failover
Router(config)#
```

The following example shows how to enable traps for when a user violates the maximum bandwidth for the quality of service (QoS) profile specified by their enforce-rule.

```
Router# configure terminal
Router(config)# snmp-server enable traps cable enforce-rule
Router(config)#
```

The following example shows how to enable traps for to see the SFP port link status on the Cisco uBR10012 router and Cisco cBR-8 router.

```
Router# configure terminal
Router(config)# snmp-server enable traps cable sfp-link
Router(config)#
```

Related Commands

Command	Description
cable modem remote-query	Enables and configures the remote-query feature to gather CM performance statistics on the CMTS.
debug cable remote-query	Turns on debugging to gather information from remote CMs.
show cable modem remote-query	Displays the statistics accumulated by the remote-query feature.

snmp-server enable traps rpd-event

To enable RPD event traps to send RPD events using SNMP traps, use the **snmp-server enable traps rpd-event** command in global configuration mode. To disable RPD event traps, use the **no** form of this command.

snmp-server enable traps rpd-event *priority*

no snmp-server enable traps rpd-event *priority*

Syntax Description

priority	Priority can be 1-8, where: 1—Enable RPD event trap for emergency priority 2— Enable RPD event trap for alert priority 3—Enable RPD event trap for critical priority 4— Enable RPD event trap for error priority 5— Enable RPD event trap for warning priority 6— Enable RPD event trap for notice priority 7— Enable RPD event trap for informational priority 8— Enable RPD event trap for debug priority
-----------------	---

Command Modes

Global configuration (config)

Command History

Release	Modification
IOS-XE 16.8.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to enable enable RPD event traps:

```
Router# configure terminal
Router(config)# snmp-server enable traps rpd-event 1
Router(config)#
```

snmp-server enable traps docsis-cm

To enable one or more Simple Network Management Protocol (SNMP) traps for DOCSIS 1.1 events, use the **snmp-server enable traps docsis-cm** command in global configuration mode. To disable the SNMP traps, use the **no** form of this command.

Cisco uBR905 and Cisco uBR925 cable access routers, and Cisco CVA122 Cable Voice Adapter
snmp-server enable traps docsis-cm [{bpi | bpkm | dccack | dccreq | dccrsp | dhcp | dsack | dsreq | dsrsp | dynsa | swupevc | swupfail | swupinit | swupsucc | tlv}]
no snmp-server enable traps docsis-cm [{bpi | bpkm | dccack | dccreq | dccrsp | dhcp | dsack | dsreq | dsrsp | dynsa | swupevc | swupfail | swupinit | swupsucc | tlv}]

Syntax Description

bpi	(Optional) Enables Baseline Privacy Interface (BPI) initialization failure traps.
bpkm	(Optional) Enables Baseline Privacy Key Management (BPKM) initialization failure traps.
dccack	(Optional) Enables dynamic channel change acknowledgement failure traps.
dccreq	(Optional) Enables dynamic channel change request failure traps.
ccrsp	(Optional) Enables dynamic channel change response failure traps.
dhcp	(Optional) Enables DHCP failure traps.
dsack	(Optional) Enables dynamic service acknowledgement failure traps.
dsreq	(Optional) Enables dynamic service request failure traps.
dsrsp	(Optional) Enables dynamic service response failure traps.
dynsa	(Optional) Enables dynamic SA failure traps.
swupevc	(Optional) Enables secure software upgrade code verification certificate (CVC) failure traps.
swupfail	(Optional) Enables secure software upgrade failure traps.
swupinit	(Optional) Enables secure software upgrade initialization failure traps.
swupsucc	(Optional) Enables secure software upgrade success traps.
tlv	(Optional) Enables unknown Type/Length/Value (TLV) traps.

Command Default

No traps are enabled. If no options are specified, all DOCSIS-related traps are enabled.

Command Modes

Global configuration

Command History

Release	Modification
12.2(15)CZ	This command was introduced on the Cisco uBR905 and Cisco uBR925 cable access routers, and the Cisco CVA122 Cable Voice Adapter.

Usage Guidelines

This command enables the sending of SNMP traps when DOCSIS-related events occur. Multiple traps can be enabled at the same time.

Note The traps are described in the [DOCS-CABLE-DEVICE-TRAP-MIB](#) MIB, which is an extension of the CABLE DEVICE MIB that is defined in RFC 2669.

Examples

The following example shows the BPI+ and secure software download traps being enabled:

```
Router# config terminal

Router(config)# snmp-server enable traps docsis-cm bpi bpkm swupcvc swupfail swupinit
swupsucc

Router(config)#
```

Related Commands

Command	Description
show snmp	Checks the status of SNMP communications.
snmp-server manager	Starts the SNMP manager process.

snmp-server enable traps docsis-cmts

To enable the sending of Simple Network Management Protocol (SNMP) traps for DOCSIS-related events, use the **snmp-server enable traps docsis-cmts** command in global configuration mode. To disable the sending of traps, use the **no** form of this command.

snmp-server enable traps docsis-cmts [*docsis-events*]

no snmp-server enable traps docsis-cmts [*docsis-events*]

Syntax Description	
<i>docsis-events</i>	<p>Specifies one or more of the following DOCSIS event types:</p> <ul style="list-style-type: none"> • bpi—Enables traps for BPI initialization failure events. • bpkm—Enables traps for BPKM failure events. • dcack—Enables traps for the failure of Dynamic Channel Change Acknowledgement (DCC-ACK) requests. • dcreq—Enables traps for the failure of Dynamic Channel Change Request (DCC-REQ) requests. • dcrsp—Enables traps for the failure of Dynamic Channel Change Response (DCC-RSP) requests. • dsac—Enables traps for the failure of Dynamic Service Acknowledgement (DSx-ACK) requests. • dsreq—Enables traps for the failure of Dynamic Service Request (DSx-REQ) requests. • dsrsp—Enables traps for the failure of Dynamic Service Response (DSx-RSP) requests. • dynsa—Enables traps for the failure of Dynamic Service Addition (DSA-ACK) requests. • regack—Enables traps for the failure of Registration Acknowledgement (REG-ACK) requests. • regreq—Enables traps for the failure of Registration Request (REG-REQ) requests. • regrsp—Enables traps for the failure of Registration Response (REG-RSP) requests.

Command Default No SNMP traps for DOCSIS-related events are enabled. When the **snmp-server enable traps docsis-cmts** command is given without any options, all DOCSIS-related traps are enabled.

Command Modes Global configuration

Command History	Release	Modification
	12.1(7)CX1, 12.2(4)BC1	This command, along with the DOCS-CABLE-DEVICE-TRAP-MIB MIB, was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command enables traps that are defined in the [DOCS-CABLE-DEVICE-TRAP-MIB](#) MIB.

For other SNMP commands that affect the operation of the CMTS, see the [Cisco IOS Configuration Fundamentals Command Reference Guide](#).

Examples

The following example shows how to enable traps for the failure of DOCSIS registration-related events on the CMTS:

```
router(config)# snmp-server enable traps docsis-cmts reqack reqreq regrsp
router(config)#
```

Related Commands

Command	Description
snmp-server enable traps cable	Enables traps for cable-related events.

snmp-server enable traps docsis-resil

To enable Simple Network Management Protocol (SNMP) traps for Wideband Resiliency specific events on the Cisco CMTS, use the **snmp-server enable traps docsis-resil** command in global configuration mode. To disable SNMP traps, use the **no** form of this command.

snmp-server enable traps docsis-resil [*resil-events*]

no snmp-server enable traps docsis-resil [*resil-events*]

Syntax Description	<i>resil</i> <i>-events</i>	Specifies one or more of the following wideband resiliency specific event types: <ul style="list-style-type: none"> • cm-pmode—Enables the wideband resiliency cable modem partial service trap. • cm-recover—Enables the wideband resiliency cable modem full service trap. • event—Enables the wideband resiliency event trap. • rf-down—Enables the wideband resiliency RF channel down status trap. • rf-up—Enables the wideband resiliency RF channel up status trap.
---------------------------	--------------------------------	--

Command Default No SNMP traps for wideband resiliency specific events are enabled. When the **snmp-server enable traps docsis-resil** command is given without any options, all wideband resiliency specific traps are enabled.

Command Modes Global configuration (config)

Command History	Release	Modification
	12.2(33)SCG2	This command was introduced.
	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command enables traps that are defined in the [CISCO-DOCS-EXT-MIB.my](#) MIB.

For other SNMP commands that affect the operation of the Cisco CMTS, see the [Cisco IOS Configuration Fundamentals Command Reference Guide](#).

Examples The following example shows how to enable traps when the RF channel logical status changes to DOWN on the Cisco CMTS:

```
router(config)# snmp-server enable traps docsis-resil rf-down
router(config)#
```

Associated Features

The **snmp-server enable traps docsis-resil** command is associated with the [Wideband Modem Resiliency](#) feature.

Related Commands

Command	Description
cableresiliencytraps-interval	Sets the interval at which traps must be sent for Wideband Resiliency related events for each cable modem on the Cisco CMTS.
show cable modem resiliency	Displays resiliency status of the cable modem in resiliency mode on the Cisco CMTS router.
snmp-server enable traps cable	Enables traps for cable-related events on the Cisco CMTS.

snmp-server enable traps video-cable

To enable alarm event traps for cable related events, use the **snmp-server enable traps video-cable** command in global configuration mode. To disable the alarm event traps, use the **no** form of this command.

```
snmp-server enable traps video-cable backup-source-active[ {cemconn | d6conn | ecmgconn | eisconn
| gqiconn} ] input-stream-failure [ {pidcflct | pmeecm} ] pmt-missing[ {progcflct | qamovr} ]
no snmp-server enable traps video-cable backup-source-active[ {cemconn | d6conn | ecmgconn |
eisconn | gqiconn} ] input-stream-failure [ {pidcflct | pmeecm} ] pmt-missing[ {progcflct | qamovr} ]
```

Syntax Description

backup-source-active	Enable backup source active trap.
cemconn	Enable CEM connection error trap.
d6conn	Enable D6 connection error trap.
ecmgconn	Enable ECMG connection error trap.
eisconn	Enable EIS connection error trap.
gqiconn	Enable GQI connection error trap.
input-stream-failure	Enable input stream failure error trap.
pidcflct	Enable PID Conflict trap.
pmeecm	Enable PME ECM missing trap.
pmt-missing	Enable PMT missing error trap.
progcflct	Enable Program Conflict trap.
qamovr	Enable QAM Over-subscription trap.

Command Default

None

Command Modes

Global configuration (config)

Command History

Release	Modification
IOS-XE Fuji 16.7.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
IOS-XE Fuji 16.8.1d	The backup-source-active , input-stream-failure , and pmt-missing keywords were added.

Examples

The following example shows how to enable alarm event traps :

```
Router# configure terminal
Router(config)# snmp-server enable traps video cable backup-source-active cemconn d6conn
```

Related Commands

Command	Description
showcable video snmp-alarms	Display the active alarms in the system.
show cable video snmp-alarm-config	Display the alarm configuration in the system.
report-stream-error input-stream-failure report-interval syslog	Configure a timeout value and syslog message for input stream failure trap for multicast sources.
snmp-trap input-stream-failure multicast	Disable input stream failure trap for EAS stream.

snmp-server host traps docsis-resil

To enable Wideband Resiliency trap notifications to a specific Simple Network Management Protocol (SNMP) host on the Cisco CMTS, use the **snmp-server host traps docsis-resil** command in global configuration mode. To disable Wideband Resiliency trap notifications to a specific SNMP host, use the **no** form of this command.

snmp-server host ipaddr traps string docsis-resil
no snmp-server host ipaddr traps string

Syntax Description

<i>ipaddr</i>	IPv4 or IPv6 address of the SNMP notification host.
<i>string</i>	SNMPv1 community string, SNMPv2c community string, or SNMPv3 username.

Command Default

Wideband Resiliency trap notifications are not sent to an SNMP host.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(33)SCG2	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to start or stop sending Wideband Resiliency traps to a specific SNMP host.

Examples

The following example shows how to enable Wideband Resiliency trap notifications to an SNMP host:

```
Router# configure terminal
Router(config)# snmp-server host 172.17.2.0 traps snmphost01 docsis-resil
```

Associated Features

The **snmp-server host traps docsis-resil** command is associated with the [Wideband Modem Resiliency](#) feature.

Related Commands

cable resiliency traps-interval	Sets the interval at which traps must be sent for Wideband Resiliency related events for each cable modem on the Cisco CMTS.
show cable modem resiliency	Displays resiliency status of the cable modem in resiliency mode on the Cisco CMTS router.
snmp-server enable traps docsis-resil	Enables SNMP Wideband Resiliency traps for Wideband Resiliency specific events on the Cisco CMTS.

snmp-server host traps version 2c public udp-port

To configure SNMP trap server on the cable modem, use the **snmp-server host traps version 2c public udp-port** command in global configuration mode. To disable SNMP trap server, use the **no** form of this command.

snmp-server host *ip address* **traps version 2c public udp-port** *port number*

no snmp-server host *ip address* **traps version 2c public udp-port** *port number*

Syntax Description

<i>ip address</i>	IP address of the server.
<i>port number</i>	The UDP port number assigned to receive the SNMP traps. Configure the same port number on the SNMP server.

Command Modes

Global configuration (config)

Command History

Release	Modification
IOS-XE 16.8.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how configure SNMP trap server on the cable modem:

```
router(config)# snmp-server host 209.165.201.1 traps version 2c public udp-port 443
router(config)#
```

snmp server local-queue-size

Use the **snmp-server local-queue-size** command in global configuration mode, to configure local queue size for SNMP global configuration. To disable this function, use the **no** form of this command.

snmp-server local-queue-size *local-queue-size*
no snmp-server local-queue-size

Syntax Description	<p><i>local-queue-size</i> Specify the maximum value for SNMP local queue size.</p> <p>The process input queue holds SNMP packets from the dispatcher queue, waiting to be processed.</p> <p>The range is 1000-100000 and the default value is 1000.</p>
---------------------------	--

Command Default None

Command Modes Global configuration (config)

Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Cupertino 17.9.1x</td> <td>This command is introduced.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS XE Cupertino 17.9.1x	This command is introduced.
Release	Modification				
Cisco IOS XE Cupertino 17.9.1x	This command is introduced.				

Examples The following example shows how to configure **snmp snmp-server local-queue-size**:

```
router(config)# snmp-server local-queue-size 2000
router(config)#
```

Related Commands	<table border="1"> <thead> <tr> <th>Command</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>snmp snmp-server dispatcher-queue-size</td> <td>Specify the dispatcher queue size.</td> </tr> </tbody> </table>	Command	Description	snmp snmp-server dispatcher-queue-size	Specify the dispatcher queue size.
Command	Description				
snmp snmp-server dispatcher-queue-size	Specify the dispatcher queue size.				

snmp-trap input-stream-failure multicast

To disable input stream failure trap for EAS stream, use the **snmp-trap input-stream-failure multicast** command in video configuration mode.

snmp-trap input-stream-failure multicast *multicast ip* **disable**

Command Default

None

Command Modes

Video configuration (config-video)

Command History

Release	Modification
IOS-XE Fuji 16.8.1d	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to enable alarm event traps :

```
Router# configure terminal
Router(config)#cable video
Router(config-video)# snmp-trap input-stream-failure multicast 230.1.1.1 disable
```

Related Commands

Command	Description
showcable video snmp-alarms	Display the active alarms in the system.
show cable video snmp-alarm-config	Display the alarm configuration in the system.
report-stream-error input-stream-failure report-interval syslog	Configure a timeout value and syslog message for input stream failure trap for multicast sources.
snmp-server enable traps video-cable	Enable alarm event traps for cable related events.

source-id

To configure the source ID for virtual ARPD, use the **source-id** command in OOB virtual ARPD configuration mode. To void the source ID configuration, use the **no** form of this command.

source-id *id*

no source-id *id*

Syntax Description	<i>id</i> Specifies the source ID value.
---------------------------	--

Command Default	None
------------------------	------

Command Modes	OOB Virtual ARPD configuration (config-oob-varpd)
----------------------	---

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Use this command to configure the source ID for virtual ARPD.

Examples The following example shows how to configure the source ID for virtual ARPD:

```
Router# configure terminal
Router(config)# cable oob
Router(config-oob)# virtual-arpd 1
Router(config-oob-varpd)# source-id 12
```

Related Commands	Command	Description
	virtual-arpd	Defines a virtual ARPD configuration.
	ip	Configures the virtual ARPD source IP address.
	nc	Configures the network controller for virtual ARPD.

spectrum-inversion

To enable or disable the spectrum-inversion for a specific QAM profile, use the **spectrum-inversion** command in QAM profile configuration mode.

spectrum-inversion { **off** | **on** } [**interop**]

Syntax Description	off	Disables the spectrum inversion.
	on	Enables the spectrum inversion.
	interop	Enables the spectrum inversion explicit setting.

Command Default None

Command Modes QAM profile configuration (config-qam-prof)

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
	IOS XE 17.6.1w	This command was updated on the Cisco cBR Series Converged Broadband Routers. Interop keyword was added.

Usage Guidelines Use this command to enable or disable the spectrum-inversion for a specific QAM profile.

When using the inversion flag in combination with different Annex types, the following table shows the spectrum inversion output on a Cisco RPD:

Table 276: Spectrum Inversion Output on a Cisco RPD

spectrum-inversion command option	annex A	annex B	annex B
on	normal	inverted	normal
off	inverted	normal	inverted
on interop	inverted	inverted	inverted
off interop	normal	normal	normal

Examples

The following example shows how to enable the spectrum-inversion for a specific QAM profile:

```
Router# configure terminal
Router(config)# cable downstream qam-profile 4
Router(config-qam-prof)# spectrum-inversion on
```

Related Commands

Command	Description
cable downstream qam-profile	Set the QAM profile for the cable interface line card.
interleaver-depth	Set the interleaver-depth.
modulation	Set the QAM modulation format.
annex	Set the MPEG framing format.
symbol-rate	Set the symbol rate.

start-delay

To configure the time between start of crypto period and start of ECM broadcast, use the **start-delay** command in the DVB scrambling ECMG overrule configuration mode. To void the start delay configuration, use the **no** form of this command.

start-delay *time*
no start-delay

start-delay <i>time</i>	Specifies the time between start of crypto period and start of ECM broadcast in milliseconds.
--------------------------------	---

Command Default None

Command Modes DVB scrambling ECMG overrule configuration mode (config-video-encrypt-dvb-ecmg-overrule)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command specifies the time between start of crypto period and start of ECM broadcast in milliseconds. The valid range is from -30000 to 0.

The following is an example of how to configure the time between start of crypto period and start of ECM broadcast in milliseconds:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dwb
Router(config-video-encrypt-dwb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dwb-ecmg)#overrule
Router(config-video-encrypt-dwb-ecmg-overrule)#start-delay 10000
```

Related Commands

Command	Description
overrule	Enters DVB scrambling configuration mode.
ac-start-delay	Specifies the time between start of first CP after a change in AC and start of ECM broadcast.
ac-stop-delay	Specifies the time between end of last CP preceding a change in AC and end of ECM broadcast.
max-comp-time	Specifies the maximum time needed by ECMG to compute an ECM.

Command	Description
max-streams	Specifies the maximum number of simultaneous open streams supported by the ECMG on a channel.
min-cp-duration	Specifies the minimum crypto period.
rep-period	Specifies the time between two ECM packets at the output.
stop-delay	Specifies the delay between the end of CP and ECM broadcast.
trans-start-delay	Specifies the transition start delay.
trans-stop-delay	Specifies the transition stop delay.

start-frequency

To specify the starting frequency associated with the first configurable subcarrier in the profile determined by the width, use the **start-frequency** command in OFDM modulation profile configuration mode. To undo the start frequency assignment, use **no** form of this command.

start-frequency *frequency*

no start-frequency

Syntax Description

<i>frequency</i>	OFDM channel start frequency in Hz.
------------------	-------------------------------------

Command Default

None

Command Modes

OFDM modulation profile configuration (config-ofdm-mod-prof)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to specify the starting frequency associated with the first configurable subcarrier in the profile determined by the width.

Modulation profiles configured with a start frequency can only be applied to channels with the same start frequency. If no start frequency is configured, the profile can be applied to any channel.

Examples

The following example shows how to specify the starting frequency:

```
Router# configure terminal
Router(config)# cable downstream ofdm-modulation-profile 21
Router(config-ofdm-mod-prof)# start-frequency 10800000
```

Related Commands

Command	Description
cable downstream ofdm-modulation-profile	Define the OFDM modulation profile on the OFDM channel.
description (OFDM modulation profile)	Specify a user defined description for the profile up to 64 characters.
assign	Assign modulations to subcarriers.
subcarrier-spacing	Specify the spacing for specific subcarriers configured in this profile.
width	Specify width of profile in Hz.

stop-delay

To configure the time between end of crypto period and end of ECM broadcast, use the **stop-delay** command in the DVB scrambling ECMG overrule configuration mode. To void the stop delay configuration, use the **no** form of this command.

stop-delay *time*
no stop-delay

stop-delay <i>time</i>	Specifies the time between end of crypto period and end of ECM broadcast in milliseconds.
-------------------------------	---

Command Default

None

Command Modes

DVB scrambling ECMG overrule configuration mode (config-video-encrypt-dvb-ecmg-overrule)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command specifies the time between end of crypto period and end of ECM broadcast in milliseconds. The valid range is from 0 to 30000.

The following is an example of how to configure the time between end of crypto period and end of ECM broadcast in milliseconds:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dvb-ecmg)#overrule
Router(config-video-encrypt-dvb-ecmg-overrule)#stop-delay 10000
```

Related Commands

Command	Description
overrule	Enters DVB scrambling configuration mode.
ac-start-delay	Specifies the time between start of first CP after a change in AC and start of ECM broadcast.
ac-stop-delay	Specifies the time between end of last CP preceding a change in AC and end of ECM broadcast.
max-comp-time	Specifies the maximum time needed by ECMG to compute an ECM.

Command	Description
max-streams	Specifies the maximum number of simultaneous open streams supported by the ECMG on a channel.
min-cp-duration	Specifies the minimum crypto period.
rep-period	Specifies the time between two ECM packets at the output.
start-delay	Specifies the delay between the start of CP and ECM broadcast.
trans-start-delay	Specifies the transition start delay.
trans-stop-delay	Specifies the transition stop delay.

strong-pairing-enforce

To switch on the NDS strong pairing enforcement, use the **strong-pairing-enforce** command in the DVB scrambling configuration mode. To switch off the NDS strong pairing enforcement, use the **no** form of this command.

strong-pairing-enforce
no strong-pairing-enforce

Command Default None

Command Modes DVB scrambling configuration mode (config-video-encrypt-dvb)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines Strong pairing enforcement is used in the NDS CA setup. When strong pairing enforcement is enabled, the strong pairing enforcement bit is always reset in the control word.

The following is an example of how to switches on the NDS strong pairing enforcement:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#strong-pairing-enforce
```

Related Commands

Command	Description
dvb	Enters DVB scrambling configuration mode.
scramble-video-audio	Scrambles only video and audio pids.
check-scg-at-prov	Enables Check SCG at provision time.
route-ecmg	Configures the route to the ECMG server.
mgmt-ip	Configures the management IP for EIS/Broadcast ECMG.
ca-interface	Configures the conditional access interface.
tier-based	Enters the tier-based scrambling configuration mode.
ecmg	Enters the ECM Generator configuration mode.
eis	Enters the Event Information Scheduler configuration mode.

subcarrier-spacing

To specify the spacing for specific subcarriers configured in this profile, use the **subcarrier-spacing** command in OFDMA modulation profile, OFDM modulation profile, or OFDM channel profile configuration mode. To undo the spacing assignment, use **no** form of this command.

subcarrier-spacing [{25KHz | 50KHz}]

no subcarrier-spacing

Command Default

50 KHz

Command Modes

OFDM modulation profile configuration (config-ofdm-mod-prof)

OFDM channel profile configuration (config-ofdm-chan-prof)

OFDMA modulation profile configuration (config-ofdma-mod-profile)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
Cisco IOS XE Everest 16.6.1	This command can be used in the OFDMA modulation profile configuration (config-ofdma-mod-profile) command mode.

Usage Guidelines

Use this command to specify the spacing for specific subcarriers configured in this profile.

When a modulation profile is configured in a channel profile, the modulation profile subcarrier spacing must match the channel profile subcarrier spacing.

Examples

The following example shows how to specify the subcarrier spacing:

```
Router# configure terminal
Router(config)# cable downstream ofdm-modulation-profile 21
Router(config-ofdm-mod-prof)# subcarrier-spacing 25KHz
```

The following example shows how to specify the subcarrier spacing for OFDMA channel:

```
outer# configure terminal
Router(config)# cable mod-profile-ofdma 466
Router(config-ofdma-mod-profile)# subcarrier-spacing 50KHz
```

Related Commands

Command	Description
cable downstream ofdm-modulation-profile	Define the OFDM modulation profile on the OFDM channel.
description (OFDM modulation profile)	Specify a user defined description for the profile up to 64 characters.
assign	Assign modulations to subcarriers.

Command	Description
start-frequency	(Optional) Specify the starting frequency associated with the first configurable subcarrier in the profile determined by the width.
width	Specify width of profile in Hz.

switchover pxf restart

To configure the maximum number of PXF crashes that are allowed within a specified time period, use the **switchover pxf restart** command in redundancy configuration (main-cpu) mode. To reset the router to its default values, use the **no** form of this command.

switchover pxf restart *number-of-crashes* *time-period*
no switchover pxf restart

Syntax Description

<i>number-of-crashes</i>	Maximum number of PXF crashes that are allowed within the specified time period. If the PXF processors crash this many times within the given time period, the router switches over to the redundant PRE1 module. The valid range is 1 to 25, with a default of 2.
<i>time-period</i>	Time period, in hours, that PXF crashes are monitored. The valid range is 0 to 120 hours, with a default of 5.

Command Default

2 PXF crashes within 5 hours are allowed (**switchover pxf restart 2 5**)

Command Modes

Redundancy configuration, main-cpu mode

Command History

Release	Modification
12.2(15)BC2	This command was introduced for the Cisco uBR10012 router.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The PXF processors that are onboard the PRE1 module automatically restart themselves if a crash occurs. Occasional crashes could be expected, but repeated crashes could indicate a hardware problem.

The **switchover pxf restart** command specifies the maximum number of times that a PXF processor can crash during a specified time period before the router switches over to the redundant PRE1 module. If the PXF processors crash this number of times, the router assumes a hardware problem and initiates a switchover to the redundant PRE1 module.

Note When a switchover occurs because of repeated PXF crashes, the router displays the following system message: C10KEVENTMGR-3-PXF_FAIL_SWITCHOVER: Multiple PXF failures, switchover to redundant PRE initiated.

Examples

The following example shows how to configure the router so that if five PXF crashes occur within a one-hour period, the router should initiate a switchover to the redundant PRE1 module.

```
Router# config t
Router(config)# redundancy
```

```

Router(config-r) # main-cpu

Router(config-r-mc) # switchover pxf restart 5 1
Router(config-r-mc) # exit

Router(config-f) # exit

Router(config) #

```

Related Commands

Command	Description
main-cpu	Enters main-CPU redundancy configuration mode, so that you can configure the synchronization of the active and standby Performance Routing Engine (PRE1) modules.
redundancy	Configures the synchronization of system files between the active and standby PRE1 modules.
redundancy force-failover main-cpu	Forces a manual switchover between the active and standby PRE1 modules.

switchover timeout

To configure the switchover timeout period of the PRE1 module, use the **switchover timeout** command in redundancy configuration (main-cpu) mode. To reset the timeout period to its default value, use the **no** form of this command.

switchover timeout *timeout-period*
no switchover timeout

Syntax Description	<i>timeout-period</i>	Specifies the timeout, in milliseconds. The range is 0 to 25000 milliseconds (25 seconds), where 0 specifies no timeout period.
---------------------------	-----------------------	---

Command Default 0

Command Modes Redundancy configuration, main-cpu mode

Command History	Release	Modification
	12.2(11)BC3	This command was introduced for the Cisco uBR10012 router.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **switchover timeout** command specifies how long the standby PRE module should wait when it does not detect a heartbeat from the active PRE module before initiating a switchover and assuming responsibility as the active PRE module. If set to 0, the standby PRE module initiates a switchover immediately when the active PRE module misses a scheduled heartbeat.

Examples The following example shows how to set the timeout period to 60 milliseconds:

```
Router# config t
Router(config)# redundancy
Router(config-r)# main-cpu
Router(config-r-mc)# switchover timeout 60
Router(config-r-mc)# exit
Router(config-f)# exit
Router(config)#
```

Related Commands	Command	Description
	main-cpu	Enters main-CPU redundancy configuration mode, so that you can configure the synchronization of the active and standby Performance Routing Engine (PRE1) modules.

Command	Description
redundancy	Configures the synchronization of system files between the active and standby PRE1 modules.
redundancy force-failover main-cpu	Forces a manual switchover between the active and standby PRE1 modules.

symbol-rate

To set the symbol rate for a specific QAM profile, use the **symbol-rate** command in QAM profile configuration mode.

symbol-rate *symbol-rate*

Syntax Description

<i>symbol-rate</i>	Specifies the symbol rate value in kilo-symbol/sec.
--------------------	---

Command Default

None

Command Modes

QAM profile configuration (config-qam-prof)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to set the symbol rate for a specific QAM profile.

Examples

The following example shows how to set the symbol rate for a specific QAM profile:

```
Router# configure terminal
Router(config)# cable downstream qam-profile 4
Router(config-qam-prof)# symbol-rate 5361
```

Related Commands

Command	Description
cable downstream qam-profile	Set the QAM profile for the cable interface line card.
interleaver-depth	Set the interleaver-depth.
modulation	Set the QAM modulation format.
spectrum-inversion	Set the spectrum-inversion on or off.
annex	Set the MPEG framing format.

table-based

To define a table based video session, use the **table-based** command in video configuration mode. To delete all table based sessions, use the **no** form of this command.

table-based
no table-based

Command Default None

Command Modes Video configuration (config-video)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command defines the video session as table based.

Examples The following example shows how to define a table based video session:

```
Router# configure terminal
Router(config)#cable video
Router(config-video)#table-based
```

Related Commands	Command	Description
	session	Specifies and configures the table based video session.
	vei-bundle	Bundles the virtual edge inputs for a particular LED.
	show cable video vei-bundle	Displays the virtual edge input bundle information.
	show controllers integrated-cable	Displays the integrated cable configuration information.
	show cable video integrated-cable	Displays the integrated cable controller information.

tag

To add a tag to a restricted load balancing group (RLBG), use the **tag** command in the config-lb-group configuration mode. To remove the tag, use the **no** form of this command.

```
tag tag-name
no tag tag-name
```

Syntax Description

<i>tag-name</i>	The name of the tag that has been created and configured for the load balancing group.
-----------------	--

Command Default

No default behavior or values.

Command Modes

DOCSIS load balancing group mode (config-lb-group)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

You can use the **tag** command to add a tag to a RLBG, only if the tag is already created using the **cable tag** command for the DOCSIS load balancing group on the CMTS.

Examples

The following example shows how to add a tag to a RLBG using the **tag** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# restricted
Router(config-lb-group)# tag CSCO
Router(config-lb-group)#
```

Related Commands

Command	Description
cable load-balance docsis-group	Configures a DOCSIS load balancing group on the CMTS.
show cable load-balance docsis-group	Displays real-time configuration, statistical, and operational information for load balancing operations on the router.
cable tag	Configures a tag for a DOCSIS load balancing group on the CMTS.

test cable dcc (Supporting Dynamic Channel Change)

To move a specified cable modem or a group of cable modems to another channel, or to test Dynamic Channel Change (DCC) for load balancing on the Cisco CMTS, use the following command in privileged EXEC mode.

```
test cable dcc {source-interface [cable slot/subslot/cable-interface-index | integrated-cable
slot/subslot/cable-interface-index | modular-cable slot/subslot/cable-interface-index] | sid | ip-addr | mac-addr
| frequency frequency} {destination-interface [cable slot/subslot/cable-interface-index | integrated-cable
slot/subslot/cable-interface-index | modular-cable slot/subslot/cable-interface-index] upstream-port}
{init-tech | force | tlv}
```

Cisco cBR Series Converged Broadband Routers

```
test cable dcc { source-interface [ integrated-cable slot/subslot/cable-interface-index | ip-addr |
mac-addr ] {destination-interface [ integrated-cable slot/subslot/cable-interface-index ]
upstream-port} {init-tech}
```

Syntax Description

<i>source-interface</i>	Source interface of the cable modem. Use any one of the following options: <ul style="list-style-type: none"> (Not applicable for Cisco cBR Series Converged Broadband Routers) cable—Specifies the name of the source downstream interface for the DCC transaction. (For Cisco cBR Series Converged Broadband Routers) integrated-cable—Specifies the name of the integrated-cable interface to which the cable modem belongs. (Not applicable for Cisco cBR Series Converged Broadband Routers) modular-cable—Specifies the name of the modular-cable interface to which the cable modem belongs. <i>slot/subslot/cable-interface-index</i>—Slot, subslot, and downstream controller number assigned to the cable modem.
sid	(Optional) Specifies the primary Service ID (sid) value of the cable modem for that interface.
ip-addr	Specifies the IP address of the cable modem to be moved for DCC test.
mac-addr	Specifies the MAC address of the cable modem to be moved for DCC test.
frequency <i>frequency</i>	Specifies the DCC downstream frequency parameter. (Not applicable for Cisco cBR Series Converged Broadband Routers) <i>frequency</i> —New downstream frequency in Hz. The valid range is between 55000000 to 1050000000 Hz.

<i>destination-interface</i>	Destination interface of the cable modem. Use any one of the following options: <ul style="list-style-type: none"> • cable—Specifies the name of the target or destination downstream interface to which the cable modem should be moved. • integrated-cable—Specifies the name of the integrated-cable interface to which the cable modem should be moved. • modular-cable—Specifies the name of the modular-cable interface to which the cable modem should be moved. • <i>slot/subslot/cable-interface-index</i>—Slot, subslot, and downstream controller number assigned to the cable modem.
upstream-port	Specifies the upstream port of the destination interface.
<i>init-tech</i>	(Optional) DOCSIS 3.0 GLBG DCC initialization techniques. The valid range is from 1 to 4. For Cisco cBR Series Converged Broadband Routers, the valid range is from 0 to 4. Note If <i>init-tech</i> is not specified, its value is taken as 0.
<i>force</i>	(Optional) (Not for Cisco cBR Series Routers) Target modem or group of modems that are forced to move to the specified downstream interface or upstream channel. Note This option is available only when <i>init-tech</i> is set to 0 and is used to move cable modems with Internet Group Management Protocol (IGMP) or Resource-reservation protocol (RSVP) configuration. Note This option cannot be used with the <i>tlv</i> option.
<i>tlv</i>	(Optional) (Not for Cisco cBR Series Routers) Specifies the type-length-value (TLV) in a DCC request message. This is represented as HEX data. Note <i>force</i> option is not available if the <i>tlv</i> option is used.

Command Default

Test functions are disabled by default.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(17a)BC	This command was introduced on the Cisco uBR10012 router and the Cisco uBR7246VXR router, with supporting broadband processing engines (BPEs) or cable interface line cards on the respective routers.
12.2(33)SCF2	The <i>force</i> argument was introduced.
IOS-XE 3.15.OS	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following examples illustrate DCC verification, using the **test cable dcc** command.

The following example shows how to move a target cable modem, specified by MAC address, IP address, or the primary SID value on the source interface to a target downstream with the specified frequency using DCC initialization technique 0:

```
Router# test cable dcc [<mac-addr>|<ip-addr>|< cable-if-src><sid>] frequency <freq-value>
Frequency-value: <55000000-858000000> New Downstream Frequency in HZ.
```

The following example shows how to move a target cable modem, specified by MAC address, IP address, or the primary SID value on the source interface to a upstream channel on a target downstream with the DCC-REQ TLV given in the specified HEX data.

```
Router# test cable dcc [<mac-addr>|<ip-addr>|< cable-if-src><sid>] TLV<Hex-data>
```

The following example shows how to move all cable modems on a source interface to a target downstream with the specified frequency using DCC initialization technique 0.

```
Router# test cable dcc < cable-if-src> frequency<frequency-value>
Frequency-value: <55000000-858000000> New Downstream Frequency in HZ.
```

The following example shows how to force a cable modem to move to a modular-cable interface 7/0/0:2 with init-tech set to 0:

```
Router# test cable dcc 0023.4ed0.db25 modular-Cable 7/0/0:0 0 0 force
```

```
Router# show cable modem 0023.4ed0.db25
```

```
Load for five secs: 1%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *10:00:48.167 SGT Wed Nov 16 2011
```

```

```
test dcc integrated-Cable 3/0/0:0 1 integrated-Cable 3/0/0:0 0 1
```

```
Router# show cable modem 0025.2e2d.77c8
```

```
MAC Address IP Address I/F MAC Prim RxPwr Timing Num I
```

```
State Sid (dBmv) Offset CPE P
```

```
0025.2e2d.77c8 100.1.0.2 C3/0/0/U0 online 1 -1.00 1796 0 N
```

Usage Guidelines

This command is subject to the restrictions and prerequisites described in [Load Balancing, Dynamic Channel Change, and Dynamic Bonding Change on the Cisco CMTS Routers](#).

The Cisco CMTS does not support the *force* option for **test cable dcc tlv** command where *tlv* is a HEXDATA node.

Related Commands

Command	Description
cable load-balance group (Supporting Dynamic Channel Change)	Sets multiple parameters for load balancing with DCC.
cable load-balance group dcc-init-technique (Supporting Dynamic Channel Change)	Sets the initialization technique for Dynamic Channel Change (DCC) for load balancing.
cable load-balance group policy (Supporting Dynamic Channel Change)	Sets the type of service flow policy (PacketCable MultiMedia (PCMM) or Unsolicited Grant Service (UGS)) for use with load balancing and DCC.
cable load-balance group threshold (Supporting Dynamic Channel Change)	Sets the threshold levels for corresponding service flow types for the specified load balancing group, supporting Dynamic Channel Change (DCC).
show controllers cable	Displays statistics for Dynamic Channel Change (DCC) for load balancing.
show cable modem	Displays the information about registered and unregistered cable modems.

test cable pnm rxmer ifIndex get all

To display the count of all the Proactive Network Management RxMER jobs by ifIndex, use the **test cable pnm rxmer <ifIndex> get all** command.

```
test cable pnm rxmer <ifIndex> get all
```

Syntax Description

<i>ifIndex</i>	The value of the ifIndex.
----------------	---------------------------

Command Default

No default behavior or values.

Command Modes

Command History

Release	Modification
IOS-XE 16.12.1y	This command was introduced.

Usage Guidelines

You can use the **test cable pnm rxmer <ifIndex> get all** command to display the count of all the Proactive Network Management RxMER jobs by ifIndex.

Examples

The following example shows you a command usage:

```
Router# test cable pnm rxmer 389838 get all
PNM RxMER MIB for ifIndex 389838
Status: INACTIVE
CM-mac: 0000.0000.0000
Enable: False
Pre-Eq: OFF
Num-Avgs: 1
TFTP filename: <default>
```

test cable pnm rxmer show

To display the status of PNM RxMER jobs by ifIndex, use the **test cable pnm rxmer show** command.

test cable pnm rxmer show

Command Default

No default behavior or values.

Command Modes

Command History

Release	Modification
IOS-XE 16.12.1y	This command was introduced.

Usage Guidelines

You can use the **test cable pnm rxmer show** command to display the status of PNM RxMER jobs by ifIndex.

Examples

The following example shows you a command usage:

```
Router# test cable pnm rxmer show
```

```

Job  Client  ifIndex  CM-Mac          Status          Enable  Pre-Eq  Num-Avgs  Retry

test cable voice

To manually set voice tag of a cable modem, use the test cable voice command in privileged EXEC mode.

test cable voice {*mac-addr*|*ip-addr*}

Syntax Description

<i>mac-addr</i>	Specifies the MAC address of an individual CM, or of any CPE devices or hosts behind that CM.
<i>ip-addr</i>	Specifies the IP address of an individual CM, or of any CPE devices or hosts behind that CM.

Command Default

No voice tags are enabled

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.3(23)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines

The **test cable voice** command is intended for use by Cisco Systems technical support personnel.

Examples

The following example shows how to enable the voice tag of a cable modem:

```
Router# test cable voice 209.165.200.225
```

Related Commands

Commands	Description
show cable modem voice	Displays the detected voice-enabled modems.
clear cable modem voice	Clears the voice tag that is set for a cable modem.

threshold

To specify the load limit beyond which load balancing occurs, use the **threshold** command in the config-lb-group configuration mode. To remove the specified load limit, use the **no** form of this command.

threshold {load | {minimum *I-100* | **1-100**} | **pcmm** *I-100* | **stability** *0-100* | **ugs** *I-100*}
nothreshold {load | {minimum *I-100* | **1-100**} | **pcmm** *I-100* | **stability** *0-100* | **ugs** *I-100*}

Syntax Description

load { minimum }	Specifies interface load threshold settings as a percentage value. You can also set minimum number of modems/flows difference ranging from 1 to 100 before load balancing starts.
pcmm	Specifies PCMM service flow threshold as a percentage value.
stability	Specifies stability condition detection threshold as a percentage value.
ugs	Specifies stability detection threshold as a percentage value.
<i>I-100</i>	Interface utilization threshold in percentage of the interface capacity. Note When utilization method is used, the <i>I-100</i> utilization threshold is a percentage of the interface capacity. When modem method is used, the <i>I-100</i> utilization threshold is a percentage difference of number of modems between the two interfaces.

Command Default

None

Command Modes

DOCSIS load balancing group mode (config-lb-group)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to configure the threshold of the DOCSIS LBG using the **threshold** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# threshold load minimum 10
Router(config-lb-group)#
```

Related Commands

Command	Description
cable load-balance docsis-group	Configures a DOCSIS load balancing group on the CMTS.

Command	Description
show cable load-balance docsis-group	Displays real-time configuration, statistical, and operational information for load balancing operations on the router.

tier-based

To enter the tier-based scrambling configuration mode, use the **tier-based** command in the DVB scrambling configuration mode. To void the tier-based scrambling configuration, use the **no** form of this command.

tier-based
no tier-based

Command Default None

Command Modes DVB scrambling configuration mode (config-video-encrypt-dvb)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to enter the tier-based scrambling configuration mode:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#tier-based
Router(config-video-encrypt-dvb-tier)#
```

Related Commands

Command	Description
ecmg	Configures the tier-based scrambling.
enable	Enables the tier-based scrambling.

timeout init-session

To set the default video session initial ranging timeout, use the **timeout init-session** command in the video configuration mode.

timeout init-session *number*

Syntax Description	<i>number</i> The initial ranging timeout value . The default video session init timeout is 1000 msec. The permissible range is 100 to 60000 msec.				
Command Default	None.				
Command Modes	Video configuration mode (config-video)				
Command History	<table><thead><tr><th>Release</th><th>Modification</th></tr></thead><tbody><tr><td>Cisco IOS-XE Release 3.18.0S</td><td>This command was introduced on the Cisco cBR Series Converged Broadband Routers.</td></tr></tbody></table>	Release	Modification	Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
Release	Modification				
Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.				
Usage Guidelines	<p>This command is used to change the default video session initial ranging timeout.</p> <p>The following example shows how to change the default video session initial ranging timeout:</p> <pre>configure terminal cable video timeout init-session 5000</pre>				

timeout idle-session

To set the default video timeout idle-session, use the **timeout idle-session** command in the video configuration mode.

timeout idle-session *number*

Syntax Description

number The idle session timeout value. The default video idle session timeout is 250 msec. The permissible range is 100 to 5000 msec.

Command Default

None.

Command Modes

Video configuration mode (config-video)

Command History

Release	Modification
Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command is used to change the default video timeout idle-session.

The following example shows how to change the default video timeout idle-session:

```
configure terminal
cable video
timeout idle-session 1500
```

timeout off-session

To set the default off-session timeout, use the **timeout off-session** command in the video configuration mode.

timeout off-session *number*

Syntax Description	<i>number</i> Off session timeout value. The default value is 60 seconds. The permissible range is 1 to 1800.				
Command Default	None.				
Command Modes	Video configuration mode (config-video)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS-XE Release 3.18.0S</td> <td>This command was introduced on the Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
Release	Modification				
Cisco IOS-XE Release 3.18.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.				
Usage Guidelines	<p>This command is used to change the default off session timeout value.</p> <p>The following example shows how to change the default off session timeout value:</p> <pre>configure terminal cable video timeout off-session 100</pre>				

timestamp

To create a DOCSIS configuration file that enables timestamp generation, use the **timestamp** command in cable config-file configuration mode. To disable this function, use the **no** form of this command.

timestamp
no timestamp

Syntax Description This command has no arguments or keywords.

Command Default None

Command Modes Cable config-file configuration

Command History

Release	Modification
12.1(2)EC1	This command was introduced.
12.2(4)BC1	Support was added to the Release 12.2 BC train.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The DOCSIS specification supports the optional time-stamping of DOCSIS configuration files by adding a field to the file that shows the time that the file was sent to the CM. This prevents someone from trying to subvert DOCSIS security by replaying a valid DOCSIS configuration file to another CM. The timestamp is expressed as the number of seconds since midnight on January 1, 1900.

Examples

The following example shows how to enable timestamp generation for the DOCSIS configuration file.

```
router(config)# cable config-file upgrade.cm
router(config-file)# timestamp
router(config-file)# exit

router(config)#
```

Related Commands

Command	Description
cable config-file	Creates a DOCSIS configuration file and enters configuration file mode.
access-denied	Disables access to the network.
channel-id	Specifies upstream channel ID.
cpe max	Specifies CPE information.
download	Specifies download information for the configuration file.
frequency	Specifies downstream frequency.

Command	Description
option	Provides config-file options.
privacy	Specifies privacy options for baseline privacy images.
service-class	Specifies service class definitions for the configuration file.
snmp manager	Specifies Simple Network Management Protocol (SNMP) options.

tlv

To configure a TLV type tag matching rule, use the **tlv** command in CMTS-tag configuration mode.

tlv *type value*

Syntax Description

<i>type</i>	Specifies the type identifier. It can be one of the following: <ul style="list-style-type: none"> • mrcs - Multiple Receive Channel Support. • mtcs - Multiple Transmit Channel Support. • ufrs - Upstream Frequency Range Support.
<i>value</i>	Specifies a decimal number value for the type tag. The range is 0 to 255.

Command Default

None

Command Modes

CMTS tag configuration mode (config-cmts-tag).

Command History

Release	Modification
12.2(33)SCH	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to configure the **tlv** command:

```
Router# configure terminal
Router(config)# cable tag 1
Router(config-cmts-tag)# tlv mrcs 3
```

Related Commands

Command	Description
cable tag	To configure a tag for a DOCSIS load balancing group on the CMTS.

tos

To configure the Type of Service (ToS) byte in the header of Layer 2 tunneled packets, use the **tos** command in DEPI tunnel configuration mode. To disable a configured ToS value, use the **no** form of this command.

tos value
no tos value

Syntax Description	value	Value of the ToS byte for IP packets in a Layer 2 Tunnel Protocol version 3 (L2TPv3) data session. The valid values range from 0 to 255. The default value is 0.
---------------------------	--------------	--

Command Default None

Command Modes DEPI tunnel configuration

Command History	Release	Modification
	12.2(33)SCC	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines The **tos** command allows you to manually configure the value of the ToS byte used in the headers of Layer 2 tunneled packets.

Examples The following example shows how to assign a ToS value of 100:

```
Router# configure terminal
Router(config)# depi-tunnel rf6
Router(config-depi-tunnel)# tos 100
```

Related Commands	Command	Description
	depi-tunnel	Specifies the name of the depi-tunnel and enters the DEPI tunnel configuration mode.

tos (multicast qos)

To set type of service (ToS) low byte, high byte, and mask values within a multicast QoS group, use the **tos** command in multicast QoS configuration mode. To disable the type of service, use the **no** form of this command.

tos *low-byte high-byte mask*
no tos *low-byte high-byte mask*

Syntax Description

<i>low-byte</i>	Specifies the minimum ToS data bytes for a multicast QoS group. The valid range is 0–255.
<i>high-byte</i>	Specifies the maximum ToS data bytes for a multicast QoS group. The valid range is 0–255.
<i>mask</i>	Specifies the ToS mask for a multicast QoS group. The valid range is 0–255.

Command Default

ToS parameters are not defined for a specific multicast QoS group.

Command Modes

Multicast QoS configuration (config-mqos)

Command History

Release	Modification
12.2(33)SCA	This command was introduced.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The three precedence bits in the ToS byte in the IP header specifies a class of service assignment for each packet. Those packets with the precedence bit set in the ToS field are given higher priority.

Examples

The following example defines the low and high ToS rates and the mask value using the **tos** command:

```
Router(config)# cable multicast qos group 20 priority 55 global
Router(config-mqos)# tos 1 6 15
```

Related Commands

Command	Description
cable multicast qos group	Specifies and configures a cable multicast QoS group.
show interface bundle multicast-sessions	Displays multicast session information for a specific virtual cable bundle.
show interface cable multicast-sessions	Displays multicast session information for a specific cable interface.

trans-start-delay

To configure the transition start delay, use the **trans-start-delay** command in the DVB scrambling ECMG overrule configuration mode. To void the transition start delay configuration, use the **no** form of this command.

trans-start-delay *time*
no trans-start-delay

trans-start-delay <i>time</i>	Specifies the transition start delay in milliseconds.
--------------------------------------	---

Command Default

None

Command Modes

DVB scrambling ECMG overrule configuration mode (config-video-encrypt-dvb-ecmg-overrule)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command specifies the transition start delay in milliseconds. The valid range is from -30000 to 0.

The following is an example of how to configure the transition start delay in milliseconds:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dvb-ecmg)#overrule
Router(config-video-encrypt-dvb-ecmg-overrule)#trans-start-delay -10000
```

Related Commands

Command	Description
overrule	Enters DVB scrambling configuration mode.
ac-start-delay	Specifies the time between start of first CP after a change in AC and start of ECM broadcast.
ac-stop-delay	Specifies the time between end of last CP preceding a change in AC and end of ECM broadcast.
max-comp-time	Specifies the maximum time needed by ECMG to compute an ECM.
max-streams	Specifies the maximum number of simultaneous open streams supported by the ECMG on a channel.
min-cp-duration	Specifies the minimum crypto period.

Command	Description
rep-period	Specifies the time between two ECM packets at the output.
start-delay	Specifies the delay between the start of CP and ECM broadcast.
stop-delay	Specifies the delay between the end of CP and ECM broadcast.
trans-stop-delay	Specifies the transition stop delay.

trans-stop-delay

To configure the transition stop delay, use the **trans-stop-delay** command in the DVB scrambling ECMG overrule configuration mode. To void the transition stop delay configuration, use the **no** form of this command.

trans-stop-delay *time*
no trans-stop-delay

trans-stop-delay <i>time</i>	Specifies the transition stop delay in milliseconds.
-------------------------------------	--

Command Default

None

Command Modes

DVB scrambling ECMG overrule configuration mode (config-video-encrypt-dvb-ecmg-overrule)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command specifies the transition stop delay in milliseconds. The valid range is from 0 to 30000.

The following is an example of how to configure the transition stop delay in milliseconds:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dwb
Router(config-video-encrypt-dwb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dwb-ecmg)#overrule
Router(config-video-encrypt-dwb-ecmg-overrule)#trans-stop-delay 10000
```

Related Commands

Command	Description
overrule	Enters DVB scrambling configuration mode.
ac-start-delay	Specifies the time between start of first CP after a change in AC and start of ECM broadcast.
ac-stop-delay	Specifies the time between end of last CP preceding a change in AC and end of ECM broadcast.
max-comp-time	Specifies the maximum time needed by ECMG to compute an ECM.
max-streams	Specifies the maximum number of simultaneous open streams supported by the ECMG on a channel.
min-cp-duration	Specifies the minimum crypto period.

Command	Description
rep-period	Specifies the time between two ECM packets at the output.
start-delay	Specifies the delay between the start of CP and ECM broadcast.
stop-delay	Specifies the delay between the end of CP and ECM broadcast.
trans-start-delay	Specifies the transition start delay.

type

To define the QAM data type, use the **type** command in the RF channel sub configuration mode.

type {docsis | video}

Syntax Description	docsis Defines the QAM data type as DOCSIS.
	video Defines the QAM data type as video.

Command Default None.

Command Modes RF channel sub configuration mode (config-rf-chan)

Usage Guidelines This command is used to define the QAM data type.

The following example shows how to change the output mode:

```

router#configure terminal
router(config)#controller integrated-cable 3/0/0
router(config-controller)#rf-chan 5 10
router(config-controller)#shutdown
router(config-rf-chan)#type video
router(config-rf-chan)#frequency 723000000
router(config-rf-chan)#rf-output alt
router(config-rf-chan)#exit
router(config-controller)#exit
router(config)#exit
router#show controller integrated-Cable 3/0/0 rf-channel 5 10
Chan State Admin Frequency Type Annex Mod srate Interleaver dcid power output
 5 TEST UP 723000000 VIDEO B 256 5361 I32-J4 164 34 ALT
10 TEST UP 753000000 VIDEO B 256 5361 I32-J4 169 34 ALT

```

Related Commands

Command	Description
controller integrated-cable	Enters the controller configuration mode.
frequency	Defines the RF channel frequency.
qam-profile	Defines the QAM profile number.
rf-chan	Enters the RF channel sub configuration mode.
rf-output	Defines the QAM output mode.
power-adjust	Defines the channel power level.

type (ECMG)

To configure the ECMG type, use the **type** command in the DVB scrambling ECMG configuration mode.

type {hitachi | irdeto | nagra | pkey | standard}

Command Default

None

Command Modes

DVB scrambling ECMG configuration mode (config-video-encrypt-dvb-ecmg)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

The following is an example of how to configure the ECMG type:

```
Router>enable
Router#configure terminal
Router (config)#cable video
Router (config-video)#encryption
Router (config-video-encrypt)#dwb
Router (config-video-encrypt-dwb)#ecmg ECMG-7 id 7
Router (config-video-encrypt-dwb-ecmg)#type standard
```

Related Commands

Command	Description
ecmg	Enters the ECM Generator configuration mode.
auto-channel-id	Enables automatic channel ID selection.
connection	Configures the ECMG connection.
ecm-pid-source	Configures the source of ECM PID.
ca-system-id	Configures the CA system ID.
mode	Configures the application mode of ECMG.
desc-rule	Configures the descriptor rule.
overrule	Overrules the default settings.

upgrade fpd auto

To enable automatic upgrade of the Field Programmable Device (FPD) image on the Cisco cBR-8 router, use the **upgrade fpd auto** command in privileged EXEC mode.

upgrade fpd auto

no upgrade fpd auto

Command Default

FPD auto upgrade is enabled by default.

Command Modes

Global configuration (config)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the upgrade fpga auto-upgrade command.

Usage Guidelines

The FPD auto upgrade feature enables automatic upgrade of the FPD image on the Cisco cBR-8 router. To disable auto upgrade of the FPD, use the **no upgrade fpd auto** command.

Examples

The following example shows how to enable automatic upgrade of the FPD firmware on the Cisco cBR-8 router:

```
Router# upgrade fpd auto
```

The following example shows how to disable automatic upgrade of the FPD firmware on the Cisco cBR-8 router:

```
Router# no upgrade fpd auto
```

The following example shows how to display the FPD version:

```
Router# show upgrade fpd table
Field Programmable Devices (FPD) Bundle Information Table:
=====
For IOS version 15.5(20150412:160914)

Entry #1: RF Switch PIC (0xB86), Minimal H/W Version: 0.0
FPD ID FPD Name Min. Req. Version
-----
34 CBR RFSW PIC 7.35

Entry #2: RF Switch PIC (0xB87), Minimal H/W Version: 0.0
FPD ID FPD Name Min. Req. Version
-----
35 CBR STEALTHSTAR 7.13

Entry #3: 8x10GE Supervisor PIC (0xB82), Minimal H/W Version: 0.0
FPD ID FPD Name Min. Req. Version
```

36 CBR SUP PIC 0.130

Related Commands

Command	Description
upgrade fpd file	Upgrades the FPD on the PRE4 module on the Cisco uBR10012 router.

upgrade fpd file

To upgrade the Field-Programmable Device (FPD) image on the Cisco cBR-8 router, use the **upgrade fpd file** command in privileged EXEC mode.

upgrade hw-module subslot *slot/subslot* fpd bundled

Syntax Description	slot	The slot where a SIP resides. On the Cisco cBR-8 router, slots 0 to 9 can be used for a SIP.
	subslot	The subslot where the Wideband SIP resides. On the Cisco cBR-8 router, subslot 1 is always specified.

Command Default FPD is disabled by default.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the upgrade fpga file command.

Usage Guidelines Use this command to upgrade the FPD image on the Cisco cBR-8 router.

Examples The following example shows how to upgrade the FPD on the Cisco cBR-8 router:

```
Router# upgrade hw-module subslot 4/1 fpd bundled
```

Related Commands	Command	Description
	show upgrade fpd progress	Display in progress FPD image upgrade.

upgrade fpga auto-upgrade

To perform a firmware Field-Programmable Gate Array (FPGA) automatic upgrade on the PRE4 module on the Cisco uBR10012 router, use the **upgrade fpga auto-upgrade** command in privileged EXEC mode.

upgrade fpga auto-upgrade {**debug-off** | **debug-on** | **disable** | **enable** | **show**}

Syntax Description

debug-off	Turns off debugging of the firmware FPGA auto upgrade of the PRE4 module.
debug-on	Turns on debugging of the firmware FPGA auto upgrade of the PRE4 module.
disable	Disables auto upgrade of the FPGA.
enable	Enables auto upgrade of the FPGA.
show	Displays information on the FPGA upgrade on the Cisco uBR10012 router.

Command Default

FPGA auto upgrade is enabled by default.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCG	This command was introduced.
IOS-XE 3.15.0S	This command was replaced by the upgrade fpd auto command on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

The FPGA auto upgrade feature enables automatic upgrade of the FPGA image on the PRE4 module on the Cisco uBR10012 router. To disable auto upgrade of the FPGA, use the **upgrade fpga auto-upgrade disable** command.

Examples

The following example shows how to activate the FPGA debugging on the Cisco uBR10012 router:

```
Router# upgrade fpga auto-upgrade debug-on
Router#
```

The following example shows how to disable automatic upgrade of the FPGA firmware on the Cisco uBR10012 router:

```
Router# upgrade fpga auto-upgrade disable
```

The following example shows how to display the FPGA version, which is the FPGA in the flash on the PRE4 module:

```
Router# upgrade fpga auto-upgrade show
Alternative IOFPGA Running, version - 0x05111800
Default IOFPGA version - 0x00000000
Alternative IOFPGA version - 0x00000000
```

```

Bundle IOFPGA version - 0x0A0A0D01
IOFPGA auto-upgrade enabled - No
IOFPGA auto-upgrade debug - No
IOFPGA auto-upgrade test mode - (Default IOFPGA:flash image verify error)

```

Table below describes the significant fields shown in the display.

Table 277: upgrade fpga auto-upgrade show Field Descriptions

Field	Description
Alternative IOFPGA Running, version	Alternative IOFPGA image that is running, and its version.
Default IOFPGA version	Default IOFPGA version.
Alternative IOFPGA version	Alternative IOFPGA version.
Bundled IOFPGA version	Bundled IOFPGA version.
IOFPGA auto-upgrade enabled	IOFPGA auto-upgrade is enabled.
IOFPGA auto-upgrade debug	IOFPGA debug is turned on.
IOFPGA auto-upgrade test mode	IOFPGA test mode is turned on.

Associated Features

The **upgrade fpga auto-upgrade** command is used to automatically upgrade of the FPGA on the PRE4 module on the Cisco uBR10012 router.

- [Cisco uBR10012 Universal Broadband Router Performance Routing Engine Module](#)

Related Commands

Command	Description
upgrade fpga file	Upgrades the FPGA on the PRE4 module on the Cisco uBR10012 router.

upgrade fpga file

To upgrade the Field-Programmable Gate Array (FPGA) image on the Performance Routing Engine 4 (PRE4) module on the Cisco uBR10012 router, use the **upgrade fpga file** command in privileged EXEC mode.

upgrade fpga {**alt** | **def**} **file** {*url**version* }

Syntax Description

alt	Specifies the alternative IOFPGA version.
def	Specifies the default IOFPGA version.
<i>url</i>	URL of the IOFPGA file.
<i>version</i>	Version of the IOFPGA file.

Command Default

FPGA is disabled by default.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
12.2(33)SCB	This command was introduced.
12.2(33)SCG	This command is modified. The argument <i>version</i> is added to the command.
IOS-XE 3.15.0S	This command was replaced by the upgrade fpd file command on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to upgrade the FPGA image on the PRE4 module on the Cisco uBR10012 router.

In Cisco IOS Releases 12.2(33)SCG, you must specify the version of the IOFPGA file to manually upgrade the PRE4 module.

If you are using a PRE4 VE board and running Cisco IOS Release 12.2(33)SCG, use the **upgrade fpga** {**alt** | **def**} **file** {*url* } command upgrade the PRE4 module.

Examples

The following example shows how to upgrade the FPGA on the Cisco uBR10012 router:

```
Router# upgrade fpga alt file disk0:pre4_iofpga.bin 0x0A0A0D01
```

Associated Features

The **upgrade fpga file** command is used to manually upgrade the FPGA on the PRE4 module on the Cisco uBR10012 router. For more information, see

- [Cisco uBR10012 Universal Broadband Router Performance Routing Engine Module](#)

Related Commands

Command	Description
upgrade fpga auto-upgrade	Performs automatic upgrade of the IOFPGA on the PRE4 module on the Cisco uBR10012 router.

upgrade hw-programmable cable

To perform a downstream PHY firmware upgrade on the Cisco cBR-8 router, use the **upgrade hw-programmable cable** command in privileged EXEC mode.

Note This command can be performed on the standby line card if the line card is not actively protecting the active line card.

upgrade hw-programmable cable *slot number* **dsphy** {**cpld** | **psoc**} **pkg-name** *package name*

Syntax Description

<i>slot number</i>	Specifies the slot number. These commands are applicable to cable line cards only. The valid values are 0, 1, 2, 3, 6, 7, 8, 9.
dsphy	Specifies the downstream PHY firmware.
cpld	Perform a Complex Programmable Logic Device (CPLD) upgrade on the Cisco cBR-8 router.
psoc	Perform a Programmable System-on-Chip (PSOC) upgrade on the Cisco cBR-8 router.
pkg-name <i>package name</i>	Specifies the hardware programmable upgrade cable package file and its file location. For example: <i>/harddisk/rp-prog.pkg</i>

Command Default

CPLD or PSOC is not upgraded.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
IOS-XE 3.18.0S	This command was introduced on the Cisco cBR-8 Converged Broadband Router.

Examples

The following example shows how to upgrade downstream PHY CPLD firmware on the Cisco cBR-8 router:

```
Router# upgrade hw-programmable cable 3 dsphy cpld pkg-name /harddisk/rp-prog.pkg
Please wait for firmware download to complete.
Router#
*Jan 1 09:08:22.830 EDT: %IOSXE-5-PLATFORM: CLC3: cdman: DSPHY manual downloading gemini

```

Related Commands

Command	Description
upgrade rom-monitor	For performing SUP ROMMON upgrade.

upstream

To add upstream channels to an upstream bonding group, use the **upstream** command in upstream bonding configuration submode. To disable this configuration, use the **no** form of this command.

upstream *number*
no upstream *number*

Syntax Description

<i>number</i>	Upstream channel number. The valid range is from 0 to 7.
---------------	--

Command Default

None

Command Modes

Upstream bonding configuration submode (config-upstream-bonding)

Command History

Release	Modification
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

DOCSIS 3.0-certified cable modems can support only four upstream channels on an upstream bonding group. These cable modems cannot accept additional upstream channels that you have added to an upstream bonding group.

Examples

The following example shows how to add upstream channels to an upstream bonding group on a cable interface line card on a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface cable7/1/0
Router(config-if)# cable upstream bonding-group 20
Router(config-upstream-bonding)# upstream 0
Router(config-upstream-bonding)# upstream 1
Router(config-upstream-bonding)# upstream 2
Router(config-upstream-bonding)# upstream 3
```

Related Commands

Command	Description
cable upstream bonding-group	Creates an upstream bonding group on a cable interface.
cable fiber-node	Creates a fiber node and enters cable fiber-node configuration mode.

upstream (config-lb-group)

To set upstream channels in a DOCSIS load balancing group, use the **upstream** command in the config-lb-group configuration mode. To disable the upstream channel configuration, use the **no** form of this command.

Cisco cBR Series Router

```
upstream Upstream-Cable slot / card / port us-channel grouplist
no upstream Upstream-Cable slot / card / port us-channel grouplist
```

Cisco uBR10012 Router

```
upstream cable slot / subslot / port upstream-list
no upstream cable slot / subslot / port upstream-list
upstream
```

Cisco uBR7225VXR and Cisco uBR7246VXR Routers

```
upstream cable slot / port upstream-list
no upstream cable slot / port upstream-list
```

Syntax Description	
cable <i>slot/card/port</i>	Specifies the CMTS interface slot, subslot, and port number parameters on the Cisco cBR series router. <ul style="list-style-type: none"> <i>slot</i>—Slot where the line card resides. The permitted range is from 0 to 9. <i>card</i>—Subslot where the line card resides. The available slots is 0. <i>port</i>—The downstream controller number on the line card. The permitted range is from 0 to 7.
cable <i>slot/subslot/port</i>	Specifies the CMTS interface slot, subslot, and port number parameters on the Cisco uBR10002 router. <ul style="list-style-type: none"> <i>slot</i>—Slot where the line card resides. The permitted range is from 5 to 8. <i>subslot</i>—Subslot where the line card resides. The available slots are 0 or 1. <i>port</i>—The downstream controller number on the line card. The permitted <i>port</i> range is from 0 to 4.
cable <i>slot/port</i>	Specifies the CMTS interface slot and port number parameters on the Cisco uBR7246VXR or Cisco uBR7225VXR router. <ul style="list-style-type: none"> <i>slot</i>—Slot where the line card resides. <ul style="list-style-type: none"> Cisco uBR7225VXR router—The range is from 1 to 2. Cisco uBR7246VXR router—The range is from 3 to 6. <i>port</i>—Downstream controller number on the line card. The permitted <i>port</i> values are 0 or 1.
<i>upstream-list</i>	Upstream channel list ranging from 0 to 7.
<i>grouplist</i>	Upstream channel number ranging from .

Command Default None

Command Modes

DOCSIS load balancing group mode (config-lb-group)

Command History

Release	Modification
12.2(33)SCC	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. The value ranges for the <i>slot/card/port</i> variables were changed.

Examples

The following example shows how to set upstream channels in a DOCSIS LBG using the upstream command on the Cisco uBR series router.

```
Router# configure terminal
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# upstream cable 1/0/1 2
```

The following example shows how to set upstream channels in a DOCSIS LBG using the upstream command on the Cisco cBR series router.

```
Router# configure terminal
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# upstream Upstream-Cable 3/0/1 us-channel 1
```

Related Commands

Command	Description
cable load-balance docsis-group	Configures a DOCSIS load balancing group on the CMTS.
show cable load-balance docsis-group	Displays real-time configurational, statistical, and operational information of load balancing operations on the router.

upstream cable channel

To configure upstream channels, use the **upstream cable channel** command in channel group or fiber node configuration modes. To disable the configuration, use the **no** form of the command.

upstream cable *slot/subslot/port* **channel** *group***list**

no upstream cable *slot/subslot/port* **channel** *group***list**

Syntax Description	cable <i>slot/subslot/port</i>	Specifies the cable interface. <ul style="list-style-type: none"> • <i>slot</i>—Chassis slot number of the cable interface line card. The valid range is from 5 to 8. • <i>subslot</i>—Secondary slot number of the cable interface line card. The valid range is from 0 to 1. • <i>port</i>—Port number on the line card. The valid range is from 0 to 14.
	channel <i>group</i> list	Specifies the list of upstream channels. <ul style="list-style-type: none"> • <i>group</i>list—List or range of upstream channel numbers. The value can be one or more upstream channel numbers, a range of channel numbers separated by a hyphen, or a combination of both. The valid range is from 0 to 7 for the channel group configuration and 0 to 3 for the fiber node configuration.

Command Default Upstream channel is not configured.

Command Modes Channel group configuration (config-ch-group)
Fiber node configuration (config-fiber-node)

Command History	Release	Modification
	Cisco IOS Release 12.2(33)CX	This command was introduced.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines All the upstream channels in a channel group must be associated with the same connector.

The following example shows how to configure upstream channels for a channel group:

```
Router# configure terminal
Router(config)# cable channel-group 1
Router(config-ch-group)# upstream Cable 7/1/0 channel 0-3
```

Related Commands	Command	Description
	cable channel-group	Configures channel group.

Command	Description
show cable channel-group	Displays the channel group information.
show cable fiber-node	Displays the fiber node information.

upstream cable connector

To configure an upstream cable connector for a fiber node, use the **upstream cable connector** command in cable fiber node configuration mode. To disable the configuration, use the **no** form of this command.

Cisco uBR10012 Router

upstream cable *slot / subslot* **connector** *port-number*

no upstream cable *slot / subslot* **connector** *port-number*

Cisco uBR7225VXR and Cisco uBR7246VXR Routers

upstream cable *slot* **connector** *port-number*

no upstream cable *slot* **connector** *port-number*

Syntax Description

cable <i>slot/ subslot</i>	Identifies the cable interface on the Cisco uBR10012 router. <ul style="list-style-type: none"> <i>slot</i> —Chassis slot number of the cable interface line card. The valid range is from 5 to 8. <i>subslot</i> —Secondary slot number of the cable interface line card. The valid range is from 0 or 1.
cable <i>slot</i>	Identifies the cable interface on the Cisco uBR7246VXR or Cisco uBR7225VXR router. <ul style="list-style-type: none"> <i>slot</i> —Slot where the line card resides. <ul style="list-style-type: none"> Cisco uBR7246VXR router: The valid range is from 3 to 6. Cisco uBR7225VXR router: The valid range is from 1 to 2.
connector	Specifies the physical upstream port connector on the cable interface line card.
<i>port-number</i>	A range of physical port numbers on the cable interface line card. The <i>port-number</i> can be one or more port numbers or a range of port numbers separated by a hyphen or combinations of both. <ul style="list-style-type: none"> Cisco uBR10012 router—The range for port numbers is from 0 to 19. Cisco uBR7246VXR or Cisco uBR7225VXR router—The range for port numbers is from 0 to 7.

Command Default

None

Command Modes

Cable fiber node configuration (config-fiber-node)

Command History

Release	Modification
12.3(21)BC	This command was introduced for the Cisco uBR10012 router.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA.
12.2(33)SCC	This command was introduced in Cisco IOS Release 12.2(33)SCC.

Release	Modification
12.2(33)SCD	This command was modified. Added support for Cisco uBR7246VXR and Cisco uBR7225VXR routers.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to configure upstream channels for fiber node 1. Notice that the list of port numbers (connectors) can be a single port number, a range of port numbers, or some combination of the two.

```
Router(config)# cable fiber-node 1

Router(config-fiber-node)# upstream cable 5/0 connector 0
Router(config-fiber-node)# upstream cable 5/0 connector 1-2
Router(config-fiber-node)# upstream cable 6/0 connector 0 1-2 3
```

Related Commands

Command	Description
cable fiber-node	Enters cable fiber-node configuration mode to configure a fiber node.
cable upstream bonding-group	Creates an upstream bonding group on a cable interface line card.
description (cable fiber-node)	Specifies a description for a fiber node.
downstream cable	Assigns a primary downstream channel for a fiber node.
downstream modular-cable rf-channel	Specifies the RF channels that are available for wideband channels on a fiber node.

upstream freq-range

To configure the Cisco CMTS router for the range of frequencies that are acceptable on upstreams, use the **upstream freq-range** command in global configuration mode. To restore the default value of North American ranges, use the **no** form of this command.

```
upstream freq-range [{european | japanese | north american}]
no upstream freq-range
```

Syntax Description		
	european	Configures the Cisco CMTS router to accept upstream frequency ranges that conform with the EuroDOCSIS specifications (5 MHz to 65 MHz).
	japanese	Configures the Cisco CMTS router to accept upstream frequency ranges that conform to the expanded range used in Japan (5 MHz to 55 MHz).
	north american	Configures the Cisco CMTS router to accept upstream frequency ranges that conform to the DOCSIS specifications (5 MHz to 42 MHz).

Command Default North American (DOCSIS, 5 MHz to 42 MHz)

Command Modes Global configuration

Command History	Release	Modification
	12.2(15)BC2	This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers.
	IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines In Cisco IOS Release 12.2(15)BC2 and later, the Cisco CMTS router supports three different modes of operation, depending on the cable interface line cards being used. The range of frequencies that are allowed in each mode are as follows:

- North American DOCSIS (Annex B)—Upstreams use frequencies between 5 MHz and 42 MHz.
- European EuroDOCSIS (Annex A)—Upstreams use frequencies between 5 MHz and 65 MHz.
- Japanese Expanded Range (Annex B)—Upstreams use frequencies between 5 MHz and 55 MHz.

To configure the router so that it supports the proper range of upstream frequencies, use the **upstream freq-range** command. After you have configured the router with the **upstream freq-range** command, the **cable upstream frequency** command then accepts only frequencies that are in the configured range.

Note This command configures only the range of frequencies that can be configured on an upstream. It does not configure the upstreams for the DOCSIS (Annex B) or EuroDOCSIS (Annex A) modes of operation, which is done using the **cable downstream annex** interface command. (Annex C mode is not supported.)

The allowable range for the upstream channel frequency depends on the cable interface line card and Cisco IOS software release being used. See Table 2-12 for the currently supported values.

Examples

The following example shows how to configure the Cisco CMTS router to support the EuroDOCSIS upstream frequency range of 5 MHz to 65 MHz:

```
Router# configure terminal
Router(config)# upstream freq-range european
Router(config)#
```

The following example shows how to configure the Cisco CMTS router to support the expanded Japanese upstream frequency range of 5 MHz to 55 MHz:

```
Router# configure terminal
Router(config)# upstream freq-range japanese
Router(config)#
```

The following example shows how to configure the Cisco CMTS router for its default configuration (DOCSIS upstream frequency range of 5 MHz to 42 MHz):

```
Router# configure terminal
Router(config)# upstream freq-range north american
Router(config)#
```

The following example shows all of the commands that are needed to configure the cable interface and upstream on a Cisco uBR-MC28U/X cable interface line card to support a frequency in the EuroDOCSIS upstream frequency range of 5 MHz to 65 MHz:

```
Router# configure terminal
Router(config)# upstream freq-range european
Router(config)# interface 3/0
Router(config-if)# cable downstream annex a
Router(config-if)# cable upstream 0 frequency 62500000
Router(config-if)#
```

Related Commands

Command	Description
cable spectrum-group (global configuration)	Creates spectrum groups, which contain one or more upstream frequencies.
cable upstream frequency	Configures a fixed frequency of the upstream radio frequency (RF) carrier for an upstream port.
show controllers cable	Displays information about the cable interface, including the upstream center frequency.

upstream upstream-cable

To configure upstream port, use the **upstream upstream-cable** command in fiber node configuration modes. To disable the configuration, use the **no** form of the command.

upstream upstream-cable *slot/subslot/port*

no upstream upstream-cable *slot/subslot/port*

Syntax Description	<p><i>slot/subslot/port</i> Specifies the cable interface.</p> <ul style="list-style-type: none"> • <i>slot</i>—Chassis slot number of the cable interface line card. The valid range is from 0 to 3 and 6 to 9. • <i>subslot</i>—Subslot number of the cable interface line card. The valid range is 0. • <i>port</i>—Port number on the line card. The valid range is from 0 to 15. 				
Command Default	Upstream port is not configured.				
Command Modes	Fiber node configuration (config-fiber-node)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>IOS-XE 3.15.0S</td> <td>This command was introduced on the Cisco cBR Series Converged Broadband Routers.</td> </tr> </tbody> </table>	Release	Modification	IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.
Release	Modification				
IOS-XE 3.15.0S	This command was introduced on the Cisco cBR Series Converged Broadband Routers.				

Usage Guidelines All the upstream channels in a port must be associated with the same fiber node.

The following example shows how to configure upstream port for a fiber node:

```
Router# configure terminal
Router(config)# cable fiber-node 1
Router(config-fiber-node)# upstream Upstream-Cable 6/0/0
```

Related Commands	Command	Description
	cable fiber-node	Configures fiber node.
	show cable fiber-node	Displays the fiber node information.

us-channel

To configure the OOB upstream channel, use the **us-channel** command in the profile configuration mode. To void the OOB upstream channel configuration, use the **no** form of this command.

us-channel *id* {**frequency** *f-value* | **shutdown** | **varpd-portid** *va-id* **varpd-demodid** *vd-id*}

us-channel *id* [**docsis-mode** **ofdma**] [**subcarrier-spacing** *value*] [**frequency-range** *start value end value*] [**modulation-profile** *id*] [**cyclic-prefix** *value* **roll-off-period** *value*] [**symbols-per-frame** *value*] [**data-iuc** *id* **band** *start-value end-value* **modulation** *value* **pilot-pattern** *value*]

no **ds-channel** *id* {**frequency** | **shutdown** | **varpd-portid**}

Syntax Description		
	<i>f-value</i>	Specifies the OOB upstream channel frequency value.
	<i>va-id</i>	Specifies the OOB upstream channel virtual ARPD portid.
	<i>vd-id</i>	Specifies the OOB upstream channel virtual ARPD demodid.
	docsis-mode ofdma	Configures the upstream for DOCSIS 3.1 Orthogonal frequency-division multiple access (OFDMA) modulation profiles.
	subcarrier-spacing	Specify the spacing for specific subcarriers configured in modulation profile.
	frequency-range	Configure the frequency range of OFDMA channel.
	modulation-profile	Modulation profile number.
	[cyclic-prefix <i>value</i> roll-off-period <i>value</i>]	Set cyclic prefix for OFDMA only.
	symbols-per-frame	Configure number of symbols per frame for OFDMA channel
	[data-iuc <i>id</i> band <i>start value end value</i> modulation <i>value</i> pilot-pattern <i>value</i>]	Configure the data iuc profile for the channel.
	shutdown	Shutdown the upstream channel.

Command Default None

Command Modes Profile configuration (config-profile)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Release	Modification
Cisco IOS XE Everest 16.6.1	The docsis-mode ofdma , subcarrier-spacing , frequency-range , modulation-profile , cyclic-prefix , roll-off-period , symbols-per-frame , data-iuc , band , modulation , shutdown and pilot-pattern keywords were added.

Examples

The following example shows how to configure the OFDMA channel:

```
Router# enable
Router# configure terminal
Router(config)# controller Upstream-Cable 1/0/4
Router(config-controller)# us-channel 12 docsis-mode ofdma
Router(config-controller)# us-channel 12 subcarrier-spacing 25KHz
Router(config-controller)# us-channel 12 frequency-range 40000000 85000000
Router(config-controller)# us-channel 12 modulation-profile 423
Router(config-controller)# us-channel 12 cyclic-prefix 640 roll-off-period 224
Router(config-controller)# us-channel 12 symbols-per-frame 9
Router(config-controller)# us-channel 12 data-iuc 9 band 50000000 60000000 modulation 512-QAM
pilot-pattern 8
Router(config-controller)# no us-channel 12 shutdown
```

The following example shows how to configure the Exclusion / Unused Bands:

```
Router# enable
Router# configure terminal
Router(config)# controller Upstream-Cable 1/0/2
Router(config-controller)# cable ofdma-frequency-exclusion-band 48000000 54200000
Router(config-controller)# cable ofdma-frequency-unused-band 50000000 52000000
Router(config-controller)# us-channel 12 docsis-mode ofdma
Router(config-controller)# us-channel 12 subcarrier-spacing 25KHz
Router(config-controller)# us-channel 12 modulation-profile 423
Router(config-controller)# us-channel 12 frequency-range 45000000 70000000
Router(config-controller)# us-channel 12 cyclic-prefix 96 roll-off-period 64
Router(config-controller)# us-channel 12 symbols-per-frame 18
```

The following example shows how to override the modulation and pilot pattern used by a particular IUC on a given OFDMA channel:

```
Router# enable
Router# configure terminal
Router(config)# controller Upstream-Cable 1/0/2
Router(config-controller)# us-channel 12 docsis-mode ofdma
Router(config-controller)# us-channel 12 subcarrier-spacing 25KHz
Router(config-controller)# us-channel 12 modulation-profile 423
Router(config-controller)# us-channel 12 frequency-range 28000000 70000000
Router(config-controller)# us-channel 12 cyclic-prefix 96 roll-off-period 64
Router(config-controller)# us-channel 12 symbols-per-frame 18
Router(config-controller)# us-channel 12 data-iuc 6 band 60000000 65000000 modulation 128-QAM
pilot-pattern 9
Router(config-controller)# no us-channel 12 shutdown
```

The following example shows how to configure the OOB upstream channel:

```
Router# configure terminal
Router(config)# controller upstream-oob 55d1-profile 1
```

```
Router(config-profile)# us-channel 1 frequency 600000  
Router(config-profile)# us-channel 1 varpd-portid 3 varpd-demodid 4
```

Related Commands

Command	Description
controller upstream-oob 55d1-profile	Configures the OOB upstream controller profile.

us-channel chan-class-id

To configure a channel class ID for a logical upstream channel, use the **us-channel chan-class-id** command in controller configuration mode. To disable the channel class ID configuration, use the **no** form of this command.

```
us-channel n chan-class-id id
no us-channel n chan-class-id id
```

Syntax Description	
<i>n</i>	Specifies the upstream port number. The valid range is from 0 to 11.
<i>id</i>	Channel class ID for the logical upstream channel in the hexadecimal format. The valid range is from 0 to ffffffff. The default value is 0.

Command Default None

Command Modes Controller configuration (config-controller)

Command History	Release	Modification
	IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream chan-class-id command.

Usage Guidelines The **us-channel chan-class-id** command is associated with the https://www.cisco.com/c/en/us/td/docs/cable/cbr/configuration/guide/b_cbr_full_book_docsis/cable_mode_steering.html feature.

An upstream channel descriptor (UCD) message includes type, length, value (TLV) 18 and 19 for an upstream logical channel based on the channel class ID and ranging hold-off priority configuration. If a channel class ID is not configured, the UCD does not include TLV18 and 19 irrespective of the ranging hold-off priority configuration.

Examples

The following example shows how to configure a channel class ID for a logical upstream channel on a cable interface line card on the cisco cBR router:

```
Router# configure terminal
Router(config)# controller Upstream-Cable 3/0/0
Router(config-controller)# us-channel 3 chan-class-id ff
```

Related Commands	Command	Description
	us-channel rng-holdoff	Configures an upstream ranging hold-off priority value for an upstream logical channel on the router.
	show cable modem verbose	Displays information about the registered and unregistered cable modems connected to the CMTS router.

us-channel channel-width

To set the channel-width in upstream channel configuration, use the **us-channel channel-width** command in controller configuration mode. To restore the default value, use the **no** form of this command.

us-channel *n* **channel-width** {*first-choice-width* [*last-choice-width*] }
no us-channel *n* **channel-width**

Syntax Description

<i>n</i>	Specifies the upstream port number. The valid range is from 0 to 11.
<i>first-choice-width</i>	Specifies the upstream channel width in hertz. The valid values are 1600000, 3200000 and 6400000.
<i>last-choice-width</i>	(Optional) Specifies the upstream channel width in hertz. The valid values are 1600000, 3200000 and 6400000.

Command Default

The default channel width is 1600000 Hz.

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
IOS-XE 3.15.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream channel-width command.

Usage Guidelines

When you specify both channel width values, the smaller value is taken as the last-choice-width parameter and the larger value is taken as the first-choice-width parameter. In the event of noise in the channel, the symbol rate automatically steps down to a value that is lower than the first-choice-width and greater or equal to the last-choice-width to maintain a stable channel.

Refer to the **cable upstream channel-width** command for more information.

Examples

The following example shows how to set the channel-width using **us-channel channel-width** command:

```
Router# configure terminal
Router(config)# controller Upstream-Cable 3/0/0
Router(config-controller)# us-channel 1 channel-width 1600000
Router(config-controller)#
```

Related Commands

Command	Description
cable upstream hopping blind	Disables optimum frequency hopping on the Cisco uBR-MC16S and Cisco uBR-MC5X20S cable interface line cards.
cable upstream minislot-size	Specifies the minislot size for a specific upstream interface.

Command	Description
cable upstream modulation-profile	Overrides modulation types specified in the modulation profile for the specified upstream channel.
cable upstream docsis-mode	Configures an upstream to use either DOCSIS 1.x or DOCSIS 2.0 modulation profiles.

us-channel cyclic-prefix

To specify the upstream channel cyclic-prefix, use the **us-channel cyclic-prefix** command in OFDM channel profile configuration mode. To undo the cyclic-prefix assignment, use **no** form of this command.

us-channel cyclic-prefix [{192 | 256 | 512 | 768 | 1024}] **roll-off-period** [{64 | 128 | 192 | 256}]

no us-channel cyclic-prefix

Syntax Description **roll-off-period** *value* Specifies the channel roll-off value. Valid values are 64, 128, 192, and 256.

Command Default 192

Command Modes Controller configuration (config-controller)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco Series Converged Broadband Routers.

Usage Guidelines Use this command to specify the upstream channel cyclic-prefix.

Examples The following example shows how to specify the channel cyclic-prefix:

```
Router# enable
Router# configure terminal
Router(config)# controller Upstream-Cable 1/0/4
Router(config-controller)# us-channel 12 cyclic-prefix 640 roll-off-period 224
```

Related Commands	Command	Description
	us-channel subcarrier-spacing	
	us-channel frequency-range	
	us-channel symbols-per-frame	
	us-channel data-iuc	

us-channel description

To assign a label to an upstream, use the **us-channel description** command in controller configuration mode. To remove the label from the upstream, use the **no** form of this command.

us-channel *n* **description** *label*

Syntax Description	<i>n</i> Upstream channel number. The range is from 0 to 11 on the Cisco cBR-8 router.				
	<i>label</i> An arbitrary string, up to 80 characters long, that describes this upstream for management and tracking purposes. If the string contains any spaces, enclose the string within quotes.				
Command Default	No description is assigned to upstreams.				
Command Modes	Controller configuration—upstream-cable only (config-controller)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>IOS-XE 3.15.0S</td> <td>This command was implemented on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream description command.</td> </tr> </tbody> </table>	Release	Modification	IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream description command.
Release	Modification				
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream description command.				
Usage Guidelines	Use the us-channel description command to assign arbitrary labels to the upstreams. These labels can contain any information that identifies the upstream and that could aid in network management or troubleshooting.				

Example

The following example shows how to assign descriptions to the first two upstreams for upstream-cable 3/0/1 on the Cisco cBR-8 router:

```
Router# configure terminal
Router(config)# controller upstream-cable 3/0/1
Router(config-controller)# us-channel 0 description "SJ-Node1-Upstream channel 0"
Router(config-controller)# us-channel 1 description "SJ-Node1-Upstream channel 1 (Unused)"
Router(config-controller)#
```

Related Commands	Command	Description
	show interfaces cable	Displays the current configuration and status of the cable interface.

us-channel docsis-mode

To configure an upstream to use DOCSIS modulation profiles, use the **us-channel docsis-mode** command in controller configuration mode. To restore the default value, use the **no** form of this command.

```
us-channel n docsis-mode {atdma | tdma | tdma-atdma | ofdma}
no us-channel n docsis-mode {atdma | tdma | tdma-atdma | ofdma}
```

Syntax Description

<i>n</i>	The upstream channel number. The valid range is from 0 to 11. OFDMA use upstream channel range from 12 to 15.
atdma	Configures the upstream only for DOCSIS 2.0 Advanced Time Division Multiple Access (A-TDMA) modulation profiles.
tdma	Configures the upstream only for DOCSIS 1.0/DOCSIS 1.1 Time Division Multiple Access (TDMA) modulation profiles.
tdma-atdma	Configures the upstream for both A-TDMA and TDMA operations (mixed mode).
ofdma	Configures the upstream for DOCSIS 3.1 Orthogonal frequency-division multiple access (OFDMA) modulation profiles.

Command Default

All upstreams are configured ATDMA-only mode

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
IOS-XE 3.15.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream docsis-mode command.
Cisco IOS XE Everest 16.6.1	The ofdma keyword was added to this command.

Usage Guidelines

The DOCSIS 2.0 specification builds on the existing TDMA to support advanced modulation profiles that increase potential upstream bandwidth. The A-TDMA profiles support higher QAM rates of up to 64-QAM and wider channel widths of up to 6.4 MHz (5.12 Msymbols).

Starting from Cisco IOS XE Everest 16.6.1 release, DOCSIS 3.1 Upstream OFDMA channel can be bonded with DOCSIS 3.0 ATDMA channel. If the user wants to utilize the non-best effort flows, it is recommended to bond the OFDMA channel with one or more ATDMA channel. But be aware that in Cisco IOS XE Everest 16.6.1 release, a maximum of one OFDMA channel and four ATDMA channels can be bonded together.

Refer to the **cable upstream docsis-mode** command for more information .

Examples

The following example shows how configure an upstream to use DOCSIS TDMA mode using **us-channel docsis-mode** command:

```
Router# configure terminal
Router(config)# controller Upstream-Cable 3/0/0
Router(config-controller)# us-channel 1 docsis-mode tdma
```

The following example shows how configure an upstream to use DOCSIS OFDMA mode using **us-channel docsis-mode ofdma** command:

```
Router# configure terminal
Router(config)# controller Upstream-Cable 1/0/4
Router(config-controller)# us-channel 12 docsis-mode ofdma
```

Related Commands

Command	Description
cable modulation-profile	Defines a modulation profile for use on the router.
cable modulation-profile global-scheme	Defines a global modulation profile for use on the router.
cable upstream channel-width	Specifies an upstream channel width for an upstream port.
cable upstream equalization-coefficient	Enables the use of a DOCSIS 1.1 pre-equalization coefficient on an upstream.
cable upstream maintain-psd	Requires DOCSIS 2.0 CMs on an A-TDMA-only upstream to maintain a constant power spectral density after a modulation rate change.
cable upstream modulation-profile	Assigns one or two modulation profiles to an upstream port.
show cable modulation-profile	Displays the modulation profile information for a Cisco CMTS.
show interface cable mac-scheduler	Displays the current time-slot scheduling state and statistics.

us-channel equalization-coefficient

To enable equalization-coefficient in upstream channel configuration, use the **us-channel equalization-coefficient** command in controller configuration mode. To restore the default value, use the **no** form of this command.

us-channel *n* **equalization-coefficient**
no us-channel *n* **equalization-coefficient**

Syntax Description	<i>n</i> Specifies the upstream port number. The valid range is from 0 to 11.
---------------------------	---

Command Default None.

Command Modes Controller configuration (config-controller)

Command History	Release	Modification
	IOS-XE 3.15.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream equalization-coefficient command.

Usage Guidelines The DOCSIS 1.1 and 2.0 specifications allow a CMTS to specify a pre-equalization coefficient in the DOCSIS ranging response (RNG-RSP) MAC management messages it forwards to the cable modems (CM)s. When this is enabled, a CM can engage in transmit-side equalization (pre-equalization) to mitigate the effects of certain impairments in the cable plant, such as in-channel tilt, and group delay.

Refer to the **cable upstream equalization-coefficient** command for more information.

Examples The following example shows how to enable equalization-coefficient in controller configuration mode using **us-channel equalization-coefficient** command:

```
Router# configure terminal
Router(config)# controller Upstream-Cable 3/0/0
Router(config-controller)# us-channel 1 equalization-coefficient
Router(config-controller)#
```

Related Commands	Command	Description
	show cable modem phy	Displays the physical layer RF parameters of the cable modem, including USSNR estimate (MER).
	show cable modem docsis version	Displays the DOCSIS version of a cable modem, and the upstream DOCSIS mode— TDMA or ATDMA.
	show cable modem [verbose]	Displays detailed information about the cable modem. Lines with the string Equalizer describe modem specific equalizer data.

Command	Description
debug cable range	Debugging commands to display the equalizer coefficients being sent by the CMTS to the cable modem in the DOCSIS RNG-RSP MAC management messages.
debug cable interface <i>{interface}</i> <i>{cm-mac-address}</i> [verbose]	Debugging commands to display the equalizer coefficients being sent by the CMTS to the cable modem in the DOCSIS RNG-RSP MAC management messages. Caution Certain debug settings can produce a very large amount of data on a production router, and should be used with caution. Specifying the CM mac-address will dramatically reduce the amount of data produced.

us-channel frequency

To enter a fixed frequency of the upstream radio frequency (RF) carrier for an upstream port, use the **us-channel frequency** command in controller configuration mode. To restore the default value, use the **no** form of this command.

```
us-channel n frequency {up-freq-hz }
no us-channel n frequency {up-freq-hz }
```

Syntax Description

<i>n</i>	The upstream channel number. The valid range is from 0 to 11.
<i>up-freq-hz</i>	The upstream center frequency configured to a fixed Hertz (Hz) value. The valid range is from 5000000 Hz to 85000000 Hz

Command Default

The default upstream channel number is 0. The default frequency is 0 Hz.

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
IOS-XE 3.15.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream frequency command.

Usage Guidelines

The upstream channel frequency of your RF output must be set to comply with the expected input frequency of your cable interface line card. To configure an upstream channel frequency, you may:

- Configure a fixed frequency between the allowable ranges and enable the upstream port, or
- Create a global spectrum group, assign the interface to it, and enable the upstream port.

Refer to the **cable upstream frequency** command for more information.

Examples

The following example shows how to configure the upstream center frequency using **us-channel frequency** command:

```
Router# configure terminal
Router(config)# controller Upstream-Cable 3/0/0
Router(config-controller)# us-channel 1 frequency 5700000
```

Related Commands

Command	Description
cable spectrum-group (global configuration)	Creates spectrum groups, which contain one or more upstream frequencies.
show controllers cable	Displays information about the cable interface, including the upstream center frequency.

Command	Description
upstream freq-range	Configures the Cisco CMTS router for the range of frequencies that are acceptable on upstreams.

us-channel hop-priority

To configure the priority of the corrective actions to be taken when a frequency hop is necessary due to ingress noise on the upstream, use the **us-channel hop** command in controller configuration mode. To restore the default value, use the **no** form of this command.

us-channel *n* **hop-priority** **frequency modulation channel-width**
us-channel *n* **hop-priority modulation frequency channel-width**
us-channel *n* **hop-priority frequency channel-width modulation**

Syntax Description

<i>n</i>	The upstream channel number. The valid range is from 0 to 11.
frequency, modulation, channel-width	Specifies the priority of corrective actions to be taken when ingress noise occurs on a downstream.

Command Default

The default priority is **frequency, modulation**, and **channel-width**.

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
IOS-XE 3.15.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream hop-priority command.

Usage Guidelines

This command specifies the priority of the corrective actions that should be taken when a frequency hop is necessary to correct excessive ingress noise on an upstream.

Refer to the **cable upstream hop-priority** command for more information.

Examples

The following example shows the usage of **us-channel hop-priority** command when ingress noise on the upstream exceeds the threshold allowed for the primary modulation profile:

```
Router# configure terminal
Router(config)# controller Upstream-Cable 3/0/0
Router(config-controller)# us-channel 1 hop-priority modulation frequency channel-width
```

Related Commands

Command	Description
cable modulation-profile	Creates a cable modulation profile.
cable upstream channel-width	Configures an upstream for a range of allowable channel widths.
cable upstream modulation-profile	Configures an upstream for one modulation profile (static profile) or two modulation profiles (Dynamic Upstream Modulation).
show cable hop	Displays the current hop period and threshold for an upstream, along with other statistics.

Command	Description
show cable modulation-profile	Displays the cable modulation profiles that have been created.

us-channel ingress-noise-cancellation

To configure how often a cable interface line card should train its noise-cancellation circuitry so as to adjust to noise levels on the upstream, use the **us-channel ingress-noise-cancellation** command in controller configuration mode. To restore the default value, use the **no** form of this command.

us-channel *n* **ingress-noise-cancellation** [*interval*]

no us-channel *n* **ingress-noise-cancellation** [*interval*]

Syntax Description

<i>n</i>	The upstream channel number. The valid range is from 0 to 11.
<i>interval</i>	(Optional) Triggering interval in milliseconds. The valid range is from 40 to 300.

Command Default

Enabled.

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
IOS-XE 3.15.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream hop-prioingress-noise-cancellation command.

Usage Guidelines

The **us-channel ingress-noise-cancellation** command is used to configure how often these line cards should train their noise cancellation circuitry so as adapt to changes in the noise types and levels.

Examples

The following example shows how to perform ingress noise cancellation every 200 milliseconds using **us-channel ingress-noise-cancellation** command:

```
Router# configure terminal
Router(config)# controller Upstream-Cable 3/0/0
Router(config-controller)# us-channel 1 ingress-noise-cancellation 200
```

Related Commands

Command	Description
cable modulation-profile	Defines a modulation profile for use on the router.
cable upstream channel-width	Specifies an upstream channel width for an upstream port.

us-channel maintain-psd

To maintain a constant power spectral density (PSD) after a modulation rate change, use the **us-channel maintain-psd** command in controller configuration mode. To restore the default value, use the **no** form of this command.

```
us-channel n maintain-psd
no us-channel n maintain-psd
```

Syntax Description	<i>n</i> The upstream channel number. The valid range is from 0 to 11.
---------------------------	--

Command Default	Enabled.
------------------------	----------

Command Modes	Controller configuration (config-controller)
----------------------	--

Command History	Release	Modification
	IOS-XE 3.15.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream maintain-psd command.

Usage Guidelines Use this command to specify whether DOCSIS 2.0 CMs should maintain their power spectral density when the Cisco CMTS changes their upstream modulation rate in an upstream channel descriptor (UCD) message. Refer to **cable upstream maintain-psd** command for more information.

Examples The following example shows how to maintain a constant power spectral density after a modulation rate change using **us-channel maintain-psd** command:

```
Router# configure terminal
Router(config)# controller Upstream-Cable 3/0/0
Router(config-controller)# us-channel 1 maintain-psd
```

Related Commands	Command	Description
	cable upstream docsis-mode	Configures an upstream to use either DOCSIS 1.x or DOCSIS 2.0 modulation profiles.

us-channel minislot-size

To specify the minislot size (in ticks) for a specific upstream interface, use the **us-channel minislot-size** command in controller configuration mode. To restore the default value, use the **no** form of this command.

us-channel *n* **minislot-size** *size*

no us-channel *n* **minislot-size**

Syntax Description

<i>n</i>	The upstream channel number. The valid range is from 0 to 11.
<i>size</i>	Specifies the minislot size in time ticks. valid minislot sizes are: <ul style="list-style-type: none"> • 1 • 2 • 4 • 8 • 16 • 32 • 64

Command Default

The default minislot size is 4.

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
IOS-XE 3.15.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream minislot-size command.

Usage Guidelines

The minislot size determines the minimum amount of information that can be transmitted on the upstream. How much a particular minislot size can contain depends on the modulation profile and channel width being used, with higher-bandwidth settings allowing larger amounts of data.

Refer to **cable upstream minislot-size** command for more information.

Examples

The following example shows how to set the minislot size using **us-channel minislot-size** command:

```
Router# configure terminal
Router(config)# controller Upstream-Cable 3/0/0
Router(config-controller)# us-channel 1 minislot-size 64
```

Related Commands

Command	Description
cable upstream modulation-profile	Assigns one or two modulation profiles to an upstream port.
show cable hop	Displays CM configuration settings.

Command	Description
show cable modulation-profile	Displays the modulation profile information for a Cisco CMTS.
show interface cable mac-schedule	Displays the current time-slot scheduling state and statistics.
show interface cable sid	Displays cable interface information.

us-channel modulation-profile

To assign modulation profiles to an upstream port, use the **us-channel modulation-profile** command in controller configuration mode. To restore the default value, use the **no** form of this command.

us-channel *n* **modulation-profile** *primary-profile number* [*secondary-profile-number*]
[*tertiary-profile-number*]

no us-channel *n* **modulation-profile** *primary-profile number* [*secondary-profile-number*]
[*tertiary-profile-number*]

Syntax Description

<i>n</i>	The upstream channel number. The valid range is from 0 to 11.
<i>primary-profile number</i>	Specifies the primary modulation profile. The valid range is from 1 to 400.
<i>secondary-profile-number</i>	(Optional) Specifies the secondary modulation profile. The valid range is from 1 to 400.
<i>tertiary-profile-number</i>	(Optional) Specifies the tertiary modulation profile. The valid range is from 1 to 400.

Command Default

The default value is 221.

Command Modes

Controller configuration (config-controller)

Command History

Release	Modification
IOS-XE 3.15.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream modulation-profile command.

Usage Guidelines

The **us-channel modulation-profile** command assigns up to three modulation profiles to an upstream port, depending on the type of cable interface and Cisco IOS software release being used.

Refer to the **cable upstream modulation-profile** command for more information.

Examples

The following example shows how assign modulation profiles using **us-channel modulation-profile** command:

```
Router# configure terminal
Router(config)# controller Upstream-Cable 3/0/0
Router(config-controller)# us-channel 1 modulation-profile 2 1
```

Related Commands

Command	Description
cable modulation-profile	Creates a cable modulation profile.
cable modulation-profile global-scheme	Defines a global modulation profile for use on the router.

Command	Description
cable upstream hop-priority	Determines the order of the corrective actions to be taken when ingress noise exceeds the allowable value for an upstream. This command is related to the cable upstream modulation-profile command only when using advanced dynamic modulation configuration, that is, when spectrum group is defined for the upstream channel.
show cable modulation-profile	Displays the cable modulation profiles that have been created.

us-channel power-level

To set the input power level for the upstream radio frequency (RF) carrier in decibels per millivolt (dBmV), use the **us-channel power-level** command in controller configuration mode. To restore the input power level to its default value, use the **no** form of this command.

us-channel *n* **power-level** *dbmv*

Syntax Description

<i>n</i>	Upstream channel number. The range is from 0 to 11 on the Cisco cBR-8 router.
<i>dbmv</i>	Decibels per millivolt designating the upstream signal input power level. The range is from –13 to 23 on the Cisco cBR-8 router depending on the upstream symbol rate (channel width).

Command Default

0 dBmV

Command Modes

Controller configuration—upstream-cable only (config-controller)

Command History

Release	Modification
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream power-level command.

Usage Guidelines

The Cisco CMTS controls the output power levels of the CMs to meet the desired upstream input power level. The nominal input power level for the upstream RF carrier is specified in decibels per millivolt (dBmV). The default setting of 0 dBmV is the optimal setting for the upstream power level.

The valid range for the input power level depends on the data rate, as expressed as the symbol rate and channel width. The table below shows the valid power levels for each allowable rate, as given in the DOCSIS specification. Higher (more positive) values cause the CMs to increase their transmit power, achieving a greater carrier-to-noise ratio (CNR).

Table 278: Allowable DOCSIS Power Levels

Symbol Rate (Symbols per second)	Channel Width (Hz)	Allowable Power Range (dBmV)
160,000	200,000	–16 to +14 (minimum valid value for DOCSIS is –13)
320,000	400,000	–13 to +17
640,000	800,000	–10 to +20
1,280,000	1,600,000	–7 to +23
2,560,000	3,200,000	–4 to +26 (maximum valid value for DOCSIS is +23)
5,120,000 ²⁴	6,400,000	–1 to +29 (maximum valid value for DOCSIS is +23)

- ²⁴ The 5.12 MSymbols/sec symbol rate and 6.4 MHz channel width are supported only on upstreams that are configured for DOCSIS 2.0 A-TDMA-only operation.

Tip You can use inline attenuators to force CMs to transmit at higher power levels and to achieve a higher CNR value on the network.

Caution If you increase the input power level or add inline attenuators before the Cisco CMTS, the CMs on your HFC network increase their transmit power level. Be careful if you adjust this parameter. You might violate the upstream return laser design parameters or exceed the CM's maximum transmit power level.

Note Do not adjust your input power level by more than 5 dB in a 30-second interval. If you increase the power level by more than 5 dB within 30 seconds, you will disrupt CM service on your network. If you decrease the power level by more than 5 dB within 30 seconds, the CMs on your network will be forced to re-range.

Tip When setting upstream power levels, we recommend that the adjacent channels of equal bandwidth do not have a large variation. The recommended maximum input power variance is 5 to 6 dB.

Example

The following example shows how to input power level for upstream channel 10 on the Cisco cBR-8 router:

```
Router# configure terminal
Router(config)# controller upstream-Cable 3/0/1
Router(config-controller)# us-channel 10 power-level 22
Router(config-controller)#
```

Related Commands

Command	Description
show interfaces cable	Displays the current configuration and status of the cable interface.

us-channel rng-holdoff

To hold off a cable modem from initial ranging (init rl) on a logical upstream channel, use the **us-channel rng-holdoff** command in controller configuration mode. To disable the ranging hold-off, use the **no** form of this command.

us-channel *n* **rng-holdoff** *priority*
no us-channel *n* **rng-holdoff** *priority*

Syntax Description		
	<i>n</i>	Specifies the upstream port number. The valid range is from 0 to 11.
	rng-holdoff <i>priority</i>	Specifies the ranging hold-off priority value in the hexadecimal format. The valid range is from 0 to ffffffff. The default value is 0.

Command Default None

Command Modes Controller configuration (config-controller)

Command History	Release	Modification
	IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream rng-holdoff command.

Usage Guidelines The **us-channel rng-holdoff** command is associated with the https://www.cisco.com/c/en/us/td/docs/cable/cbr/configuration/guide/b_cbr_full_book_docsis/cable_mode_steering.html feature.

An upstream channel descriptor (UCD) message includes type, length, value (TLV) 18 and 19 for an upstream logical channel based on the channel class ID and ranging hold-off priority configuration. If a ranging hold-off priority value is not configured, the value of TLV 18 becomes zero. If an upstream channel class ID is configured and a ranging hold-off priority value is not configured, the UCD message includes TLV 18 and 19, and the value of TLV 18 becomes zero.

Examples

The following example shows how to specify a ranging hold-off priority value for a logical upstream channel on a cable interface line card on the cisco cBR router:

```
Router# config terminal
Router(config)# controller upstream-cable 3/0/0
Router(config-controller)# us-channel 3 rng-holdoff ff
```

Related Commands	Command	Description
	us-channel chan-class-id	Configures a channel class ID for a logical upstream channel on the CMTS router.
	show cable modem verbose	Displays information about the registered and unregistered cable modems connected to the CMTS router.

us-channel spectrum-group

To set up spectrum group in upstream channel configuration, use the **us-channel spectrum-group** command in controller configuration mode. To restore the default value, use the **no** form of this command.

us-channel *upstream channel number* **spectrum-group** { *spectrum group number* }
no us-channel *upstream channel number* **spectrum-group**

Syntax Description		
	<i>upstream channel number</i>	The upstream channel number. The valid range is from 0 to 11.
	spectrum-group	Specifies spectrum group set up.
	<i>spectrum group number</i>	The spectrum group number. The valid range is from 1 to 40.

Command Default None.

Command Modes Controller configuration (config-controller)

Command History	Release	Modification
	IOS-XE 3.15.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream spectrum-group command.

Usage Guidelines This command assigns a spectrum group to a single us-channel in the upstream-controller. To configure the spectrum groups, use the set of **cable spectrum-group** commands in global configuration mode. In addition, you can also spectrum groups to all of the us-channels for one specific upstream-controller, use the **cable spectrum-group** (upstream-cable controller configuration) command.

Examples

The following example shows how to assign spectrum group 12 to the first us-channel of the upstream-cable controller 0 in slot 9/0:

```
Router(config)# controller upstream-cable 9/0/0
Router(config-controller)# us-channel 0 spectrum-group 12
Router(config-controller)# exit
Router(config)#
```

Related Commands	Command	Description
	cable modulation-profile	Defines a modulation profile for using on the router.
	cable spectrum-group(global configuration)	Create and configure a spectrum-group.
	cable spectrum-group hop period	Changes the minimum time between frequency hops.
	cable spectrum-group hop threshold	Specifies a frequency hop threshold for a spectrum group.

us-channel subcarrier-spacing

To specify the spacing for specific subcarriers configured in modulation profile, use the **us-channel subcarrier-spacing** command in OFDM modulation profile or OFDM channel profile configuration mode. To undo the spacing assignment, use no form of this command.

us-channel *n* **subcarrier-spacing** [{25KHz | 50KHz}]

no us-channel subcarrier-spacing

Syntax Description *n* Upstream channel number. The valid range is from 12 to 15.

Command Default No description is assigned to upstreams.

Command Modes Controller configuration—upstream-cable only (config-controller)

Command History	Release	Modification
	Cisco IOS XE Everest 16.6.1	This command was introduced on the Cisco cBR Series Converged Broadband Router.

Usage Guidelines When a modulation profile is configured in a channel profile, the modulation profile subcarrier spacing must match the channel profile subcarrier spacing.

Example

The following example shows how to specify the subcarriers spacing:

```
Router# enable
Router# configure terminal
Router(config)# controller Upstream-Cable 1/0/4
Router(config-controller)# us-channel 12 subcarrier-spacing 25KHz
```

Related Commands

Command	Description
us-channel docsis-mode	
us-channel subcarrier-spacing	
us-channel frequency-range	
us-channel cyclic-prefix	
us-channel symbols-per-frame	
us-channel data-iuc	

us-channel threshold

To set spectrum management thresholds in upstream channel configuration, use the **us-channel threshold** command in controller configuration mode. To restore the default value, use the **no** form of this command.

```
us-channel upstream channel number threshold { { cnr-profile1 cnr-profile2 { bypass CNR threshold | CNR threshold in DB } } | { corr-fec { corrected FEC threshold in percentage } } | { snr-profile1 snr-profile2 { bypass SNR threshold | SNR threshold in DB } } | { uncorr-fec { uncorrected FEC threshold in percentage } } }
```

```
us-channel upstream channel number threshold { { cnr-profile1 cnr-profile2 } | { corr-fec } | { snr-profile1 snr-profile2 } | { uncorr-fec } }
```

Syntax Description

<i>upstream channel number</i>	The upstream channel number. The valid range is from 0 to 11.
cnr-profiles	Specifies CNR thresholds.
<i>bypass CNR threshold</i>	Bypasses CNR threshold for modulation profile1 and profile2. The valid value is 0.
<i>CNR threshold in DB</i>	The CNR threshold in Decibel for the modulation profile1 and profile2. The valid range is from 5 to 35.
corr-fec	Specifies corrected FEC threshold.
<i>corrected FEC threshold in percentage</i>	The corrected FEC threshold in percentage. The valid range is from 0 to 30 where 0 denotes the bypass threshold.
snr-profiles	Specifies SNR thresholds .
<i>bypass SNR threshold</i>	Bypasses SNR threshold for modulation profile1 and profile2. The valid value is 0.
<i>SNR threshold in DB</i>	The SNR threshold in Decibel for the modulation profile1 and profile2. The valid range is from 5 to 35.
uncorr-fec	Specifies uncorrected FEC threshold.
<i>uncorrected FEC threshold in percentage</i>	The uncorrected FEC threshold in percentage. The valid range is from 0 to 30 where 0 denotes the bypass threshold.

Command Default

The default value for:

- **cnr-profile1** is 25.
- **cnr-profile2** is 13.
- **corr-fec** is 3
- **uncorr-fec** is 1.
- **snr-profile1** is 25.
- **snr-profile2** is 13.

Command Modes

Controller configuration (config-controller)

Command History	Release	Modification
	IOS-XE 3.15.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream threshold command.

Usage Guidelines The **us-channel threshold** command allows setting the of spectrum management thresholds in upstream channel configuration.

Examples The following example shows how to set spectrum management thresholds in upstream channel configuration using **us-channel threshold** command:

```
Router# configure terminal
Router(config)# controller Upstream-Cable 3/0/0
Router(config-controller)# us-channel 1 threshold ?
Router(config-controller)# cnr-profiles CNR thresholds in dB
  corr-fec      Corrected FEC threshold
  hysteresis    CNR/SNR upgrade threshold hysteresis value
  snr-profiles  SNR thresholds in dB
  uncorr-fec    Uncorrected FEC threshold
```

Related Commands	Command	Description
	show cable hop thresholds	Displays all the thresholds of the active line card.

us-channel threshold hysteresis

To upgrade CNR/SNR threshold hysteresis value, use the **us-channel threshold hysteresis** command in controller configuration mode. To restore the default value, use the **no** form of this command.

us-channel *upstream channel number* **threshold hysteresis** *CNR/SNR upgrade threshold hysteresis in DB*
us-channel *upstream channel number* **threshold hysteresis**

Syntax Description		
	<i>upstream channel number</i>	The upstream channel number. The valid range is from 0 to 11.
	<i>CNR/SNR upgrade threshold hysteresis in DB</i>	The CNR/SNR upgrade threshold hysteresis in Decibel. The valid range is from 0 to 10.

Command Default The default value for **threshold hysteresis** is 3.

Command Modes Controller configuration (config-controller)

Command History	Release	Modification
	IOS-XE 3.15.OS	This command was introduced on the Cisco cBR Series Converged Broadband Routers. This command replaces the cable upstream threshold hysteresis command.

Usage Guidelines The **us-channel threshold hysteresis** command allows upgrading the CNR/SNR threshold hysteresis value in the controller configuration mode.

Examples The following example shows how to upgrade CNR/SNR threshold hysteresis value using **us-channel threshold hysteresis** command:

```
Router# configure terminal
Router(config)# controller Upstream-Cable 3/0/0
Router(config-controller)# us-channel 1 threshold hysteresis 1
Router(config-controller)#
```

vcg

To specify the virtual carrier group assigned to this logical edge device, use the **vcg** command in logical edge device protocol configuration mode. To undo the virtual carrier group assignment, use the **no** form of this command.

vcg *name*
no vcg *name*

Syntax Description

vcg <i>name</i>	Specifies the virtual carrier group.
------------------------	--------------------------------------

Command Default

None.

Command Modes

Logical edge device protocol configuration (config-video-led-protocol)

Command History

Release	Modification
IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

This command specifies the virtual carrier group assigned to this logical edge device.

Examples

The following example shows how to specify the virtual carrier group assigned to this logical edge device:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# logical-edge-device vod id 1
Router(config-video-led)# protocol table-based
Router(config-video-led-protocol)# vcg vod
```

Related Commands

Command	Description
logical-edge-device	Define a logical edge device.
protocol	Specifies the protocol used in the logical edge device.
virtual-edge-input-ip	Specifies and configures a cable multicast QoS group.
active	Activates the logical edge device.
show cable video logical-edge-device	Displays the logical edge device information.

vcg (config-video-bd)

To configure the virtual carrier group and service distribution group for replication, use the **vcg name sdg name** command in virtual carrier group binding configuration mode. To undo the virtual carrier group assignment, use the **no** form of this command.

vcg name sdg name
no vcg name sdg name

Syntax Description	Parameter	Description
	vcg name	Specifies the virtual carrier group.
	sdg name	Specifies the service distribution group.

Command Default None.

Command Modes Virtual carrier group binding configuration (config-video-bd)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command configures the virtual carrier group and service distribution group for replication.

Examples The following example shows how to configure the virtual carrier group and service distribution group for replication:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# service-distribution-group sdg-replication id 1
Router(config-video-sdg)# rf-port integrated-cable 7/0/0
Router(config-video-sdg)# rf-port integrated-cable 7/0/1
Router(config-video-sdg)# rf-port integrated-cable 7/0/2
Router(config-video-sdg)# rf-port integrated-cable 7/0/3
Router(config-video-sdg)# virtual-carrier-group vcg-replication
Router(config-video-vcg)# virtual-edge-input-ip 172.31.1.1 input-port-number 1
Router(config-video-vcg)# rf-channel 21-31 tsid 21-31 output-port-number 21-31
Router(config-video-vcg)# bind-vcg
Router(config-video-bd)# vcg vcg-replication sdg sdg-replication
```

Related Commands	Command	Description
	service-distribution-group	Defines a service distribution group.
	virtual-carrier-group	Defines a virtual carrier group.
	virtual-edge-input-ip	Specifies and configures a cable multicast QoS group.
	rf-port integrated-cable	Specifies the RF ports in a service distribution group.

Command	Description
rf-channel	Specifies the virtual RF channels in a virtual carrier group.
bind-vcg	Binds a set of virtual RF-channels defined in the virtual carrier group to the physical port in the service distribution group.
show cable video virtual-carrier-group	Displays the virtual carrier group information.

vcg (table-based)

To specify the virtual carrier group associated with the table-based session, use the **vcg** command in cable video configuration mode. To delete the configuration, use the **no** form of this command.

vcg *name*
no **vcg** *name*

Command Default

None.

Command Modes

Table-based session configuration (config-video-tb)

Release	Modification
IOS-XE 16.4.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Examples

The following example shows how to set session jitter:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# table-based
Router(config-video-tb)# vcg vcg1
```

Related Commands

Command	Description
table-based	Defines a table based video session.

vei-bundle

To bundle the virtual edge inputs, use the **vei-bundle** *id* **input-port-number** *numbers* command in logical edge device protocol configuration mode. To delete a virtual edge input bundle, use the **no** form of this command.

vei-bundle *id* **input-port-number** *numbers*
no **vei-bundle** *id* **input-port-number** *numbers*

Syntax Description	Command	Description
	vei-bundle <i>id</i>	Specifies the virtual edge input bundle ID. The valid range is from 1 to 65535.
	input-port-number <i>numbers</i>	Specifies the virtual edge input port number. You can specify maximum of five input port numbers separated by commas.

Command Default None.

Command Modes Logical edge device protocol configuration (config-video-led-protocol)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command bundles the virtual edge inputs.

Examples The following example shows how to bundle the virtual edge inputs:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# service-distribution-group sdg-vei id 1
Router(config-video-sdg)# rf-port integrated-cable 7/0/3
Router(config-video-sdg)# virtual-carrier-group vcg-vei id 1
Router(config-video-vcg)# virtual-edge-input-ip 111.111.111.111 input-port-number 111
Router(config-video-vcg)# virtual-edge-input-ip 222.222.222.222 input-port-number 222
Router(config-video-vcg)# virtual-edge-input-ip 33.33.33.33 input-port-number 33
Router(config-video-vcg)# virtual-edge-input-ip 44.44.44.44 input-port-number 44
Router(config-video-vcg)# rf-channel 0-4 tsid 0-4 output-port-number 1-5
Router(config-video-vcg)# virtual-carrier-group vcg-veil id 2
Router(config-video-vcg)# virtual-edge-input-ip 111.111.111.111 input-port-number 111
Router(config-video-vcg)# virtual-edge-input-ip 222.222.222.222 input-port-number 222
Router(config-video-vcg)# virtual-edge-input-ip 33.33.33.33 input-port-number 33
Router(config-video-vcg)# virtual-edge-input-ip 44.44.44.44 input-port-number 44
Router(config-video-vcg)# rf-channel 5-10 tsid 5-10 output-port-number 5-10
Router(config-video-vcg)# bind-vcg
Router(config-video-bd)# vcg vcg-vei sdg sdg-vei
Router(config-video-bd)# vcg vcg-veilsdg sdg-vei
Router(config-video-bd)# logical-edge-device led-vei id 1
Router(config-video-led)# protocol table-based
Router(config-video-led-protocol)# virtual-edge-input-ip 11.11.11.11 input-port-number 11
Router(config-video-led-protocol)# virtual-edge-input-ip 22.22.22.22 input-port-number 22
Router(config-video-led-protocol)# virtual-edge-input-ip 66.66.66.66 input-port-number 66
Router(config-video-led-protocol)# virtual-edge-input-ip 77.77.77.77 input-port-number 77
```

```

Router(config-video-led-protocol) # virtual-edge-input-ip 222.222.222.222 input-port-number 222
Router(config-video-led-protocol) # vcg vcg-vei
Router(config-video-led-protocol) # vei-bundle 40000 input-port-number 33,44,66,77,222
Router(config-video-led-protocol) # active

```

Related Commands

Command	Description
logical-edge-device	Defines a logical edge device.
virtual-carrier-group	Defines a virtual carrier group.
protocol	Specifies the protocol used in the logical edge device.
virtual-edge-input-ip	Specifies and configures a cable multicast QoS group.
rf-port integrated-cable	Specifies the RF ports in a service distribution group.
rf-channel	Specifies the virtual RF channels in a virtual carrier group.
bind-vcg	Binds a set of virtual RF-channels defined in the virtual carrier group to the physical port in the service distribution group.
active	Activates the logical edge device.
show cable video virtual-carrier-group	Displays the virtual carrier group information.

video

The following commands are intended only for troubleshooting. For details, contact Cisco Support.

video set default

video show default

Syntax Description

cas-system-id	Set default CAS System ID.
config	Set config context.
cr-mode	Set default clock recovery mode.
encrypt	Set default session encryption flag.
jitter	Set default network jitter.
owner-id	Set default owner ID.
session-qos	Set default session QoS.
timer	Set default timer parameters.

Command Default

None.

Command Modes

NA

Command History

Release	Modification
Cisco IOS XE Amsterdam 17.2.x	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use these commands only for troubleshooting. For details, contact Cisco Support.

Example: Set Default Clock Recovery Mode

To set the default clock recovery mode, use the following command:

```
ng_cli> video set default cr-mode

cbr                Unified CBR clock recovery mode
primary-subordinate Primary-subordinate clock recovery mode (CBR)
vbr                Unified VBR clock recovery mode
```

To view the default video configuration, run the following command:

```
ng_cli> video show default e
Config: 3
Clock recovery mode: primary-subordinate
Jitter 300, delay 150
Timer: init 2000, idle 500, off 30
Session QoS: 0
Encrypt flag: 0
```

```
Owner ID: 0  
CAS System ID: 57344  
ng_cli>
```

virtual-arpd

To configure the virtual advanced return path demodulator (ARPD), use the **virtual-arpd** command in OOB configuration mode. To void the virtual ARPD configuration, use the **no** form of this command.

virtual-ARPD *id*

no virtual-ARPD *id*

Command Default

None

Command Modes

OOB configuration (config-oob)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to configure the virtual ARPD.

Examples

The following example shows how to configure the virtual ARPD:

```
Router# configure terminal
Router(config)# cable oob
Router(config-oob)# virtual-ARPD 1
Router(config-oob-varpd)#
```

Related Commands

Command	Description
virtual-om	Defines a virtual OOB modulator configuration.
cable oob	Enters the OOB configuration mode.

virtual-carrier-group

To define a virtual carrier group, use the **virtual-carrier-group** command in video configuration mode. To delete a virtual carrier group, use the **no** form of this command.

```
virtual-carrier-group name [id id]
no virtual-carrier-group name [id id]
```

Syntax Description	virtual-carrier-group name	Specifies the virtual carrier group name.
	id id	Specifies the virtual carrier group identifier.

Command Default None.

Command Modes Video configuration (config-video)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines This command defines a virtual carrier group.

Examples The following example shows how to define a virtual carrier group:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# virtual-carrier-group vod id 1
```

Related Commands	Command	Description
	virtual-edge-input-ip	Defines a virtual edge input.
	encrypt	Encrypts the virtual carrier group.
	service-type	Specifies the service type of the virtual carrier group.
	rf-channel	Specifies the virtual RF channels in a virtual carrier group.
	show cable video virtual-carrier-group	Displays the virtual carrier group information.

virtual-edge-input-ip

To define a virtual edge input, use the **virtual-edge-input-ip** *ip* [**vrf** *vrf name*] **input-port-number** *port* command in virtual carrier group configuration mode or logical edge device protocol configuration mode. To delete a virtual edge input, use the **no** form of this command.

virtual-edge-input-ip *ip* [**vrf** *vrf name*] **input-port-number** *port*
no virtual-edge-input-ip *ip* [**vrf** *vrf name*] **input-port-number** *port*

Syntax Description		
	virtual-edge-input-ip <i>ip</i>	Specifies the virtual edge input IP address.
	vrf <i>vrf name</i>	Specifies the virtual edge input VRF name.
	input-port-number <i>port</i>	Specifies the virtual edge input port number.

Command Default None.

Command Modes

Virtual carrier group configuration (config-video-vcg)

Logical edge device protocol configuration (config-video-led-protocol)

Command History	Release	Modification
	IOS-XE 3.18.0S	This command is introduced on the Cisco cBR Series Converged Broadband Routers.
	IOS-XE 3.18.0Sa	This command was modified. An optional parameter vrf <i>vrf name</i> was added.

Usage Guidelines

This command defines a virtual edge input.

Examples

The following example shows how to define a virtual edge input in virtual carrier group configuration:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# virtual-carrier-group vod id 1
Router(config-video-vcg)# virtual-edge-input-ip 174.1.1.1 input-port-number 1
```

The following example shows how to define a virtual edge input in logical edge device protocol configuration:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# logical-edge-device vod id 1
Router(config-video-led)# protocol table-based
Router(config-video-led-protocol)# virtual-edge-input-ip 174.1.1.1 input-port-number 1
```

Related Commands

Command	Description
logical-edge-device	Defines a logical edge device.
virtual-carrier-group	Defines a virtual carrier group.
show cable video logical-edge-device	Displays the logical edge device information.
show cable video virtual-carrier-group	Displays the virtual carrier group information.

virtual-om

To configure the virtual OOB modulator (OM), use the **virtual-om** command in OOB configuration mode. To void the virtual OM configuration, use the **no** form of this command.

virtual-om *id*

no virtual-om *id*

Syntax Description	<i>id</i> Specifies the virtual OM ID.
---------------------------	--

Command Default	None
------------------------	------

Command Modes	OOB configuration (config-oob)
----------------------	--------------------------------

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines	Use this command to configure the virtual OM.
-------------------------	---

Examples	The following example shows how to configure the virtual OM:
-----------------	--

```
Router# configure terminal
Router(config)# cable oob
Router(config-oob)# virtual-om 1
Router(config-oob-vom)#
```

Related Commands	Command	Description
	virtual-arpd	Defines a virtual advanced return path demodulator configuration.
	cable oob	Enters the OOB configuration mode.

vrf (multicast qos)

To specify the name for a virtual routing and forwarding (VRF) instance, use the **vrf** command in multicast QoS configuration mode. To disable the VRF instance, use the **no** form of this command.

vrf *name*
no vrf *name*

Syntax Description

<i>name</i>	Specifies the routing and forwarding instance that is populated with multicast Virtual Private Network (MVPN) routes.
-------------	---

Command Default

A VRF name is not defined for the multicast QoS group.

Command Modes

Multicast QoS configuration (config-mqos)

Command History

Release	Modification
12.2(33)SCA	This command was introduced.
IOS-XE 3.15.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

If a multicast QoS (MQoS) group is not defined for the named VRF instance, you will see an error message. You must either define a specific MQoS group for each VRF instance, or define a default MQoS that can be assigned in those situations where no matching MQoS group is found.

Examples

The following example identifies a multicast QoS group VRF name using the **vrf** command:

```
Router(config)# cable multicast qos group 20 priority 55 global
Router(config-mqos)# vrf name1
```

Related Commands

Command	Description
cable multicast qos group	Specifies and configures a cable multicast QoS group.
show interface bundle multicast-sessions	Displays multicast session information for a specific virtual cable bundle.
show interface cable multicast-sessions	Displays multicast session information for a specific cable interface.

weekend duration

To configure different subscriber monitoring options over weekends on a Cisco CMTS router, use the **weekend duration** command in enforce-rule configuration mode. To remove the weekend monitoring configuration and to return to the same monitoring conditions for all days of the week, use the **no weekend** form of this command.

```
weekend duration minutes avg-rate rate sample-interval interval [penalty-period duration]
{downstream | upstream} [enforce]
no weekend duration minutes avg-rate rate sample-interval interval [penalty-period duration]
{downstream | upstream} [enforce]
no weekend
```

Syntax Description

<i>minutes</i>	Specifies the size of the sliding window (in minutes) during which subscriber usage is monitored. The range is 10 to 44640 with a default of 360 minutes (6 hours).
avg-rate <i>rate</i>	Specifies the average sampling rate in kilobits per second for the specified duration. The range is 1 to 400000 kilobits with no default.
sample-interval <i>interval</i>	Specifies how often (in minutes) the CMTS router should sample a service flow to get an estimate of subscriber usage. The range is 1 to 30, with a default value of 15.
(Optional) Specifies the period (in minutes) during which a cable modem (CM) can be under penalty. The range is 1 to 10080. penalty-period <i>minutes</i>	(Optional) Specifies the period (in minutes) during which a cable modem (CM) can be under penalty. The range is 1 to 10080. (Optional) Specifies the period during which an enforced quality of service (QoS) profile should be in force for subscribers who violate their registered QoS profile. The range is 1 to 10080.
downstream	Specifies monitoring of traffic in the downstream direction.
upstream	Specifies monitoring of traffic in the upstream direction.
enforce	(Optional) Specifies that the enforce-rule QoS profile should be applied automatically if a user violates their registered QoS profile.

Command Default

Weekend monitoring is disabled.

Command Modes

Enforce-rule configuration (enforce-rule)

Command History

Release	Modification
12.3(23)BC2	This command was introduced.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCD2	The penalty keyword option was added.

Release	Modification
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Note This command is applicable only after the **monitoring-basics** command is configured with the keyword **legacy**.

The **weekend duration** command works similarly to the **duration** command for subscriber traffic monitoring. Use the **weekend duration** command when you want to configure different monitoring parameters for subscribers on weekends.

This command can only be used when you have already configured the **duration** or **peak-time1** commands as weekday monitoring conditions for an enforce-rule.

If you still want to monitor traffic over the weekend, but want to return to the same monitoring conditions for every day of the week, use the **no weekend** command. This command removes the weekend monitoring conditions, but still performs monitoring over the weekends according to the other monitoring options that you have configured in the enforce-rule.

If you want to disable monitoring entirely over the weekend, use the **weekend off** command.

The **penalty** duration, which is configured using the **weekend duration** command, is unique to weekends, and takes precedence over the global penalty duration configured using the **penalty-period** command.

Examples

The following example specifies automatic monitoring of upstream traffic over the weekend if a subscriber is identified as violating their QoS profile. The monitoring will take place every 10 minutes and last for 5 minutes, with traffic sampled at an average rate of 2 kb/s:

```
Router(enforce-rule)# weekend duration 5 avg-rate 2 sample-interval 10 penalty 11 upstream
enforce
```

Related Commands

Command	Description
duration	Specifies the time period and sample rate to be used for monitoring subscribers.
peak-time1	Specifies peak and offpeak monitoring times on a Cisco CMTS router.
penalty-period	Specifies the period during which an enforced quality of service (QoS) profile should be in force for subscribers who violate their registered QoS profile.
weekend off	Disables peak and offpeak monitoring on weekends on a Cisco CMTS router.
weekend peak-time1	Configures peak and offpeak subscriber monitoring over weekends on a Cisco CMTS router.

weekend off

To disable peak and offpeak monitoring on weekends on a Cisco CMTS router, use the **weekend off** command in enforce-rule configuration mode. To re-enable the configuration for weekend monitoring, use the **no** form of this command.

weekend off
no weekend off

Syntax Description This command has no arguments or keywords.

Command Default Weekend monitoring is enabled once you configure the **weekend duration** or **weekend peak-time1** commands.

Command Modes Enforce-rule configuration (enforce-rule)

Command History

Release	Modification
12.3(23)BC2	This command was introduced.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. Support for the Cisco uBR7225VXR router was added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use the **weekend off** command to disable previously configured weekend monitoring and stop the CMTS router from monitoring cable modems (CMs) with that enforce-rule over the weekend. This command allows you to retain or modify your weekend monitoring configuration without enabling it for actual monitoring use on the CMTS router.

To perform weekend monitoring according to the same parameters used for weekday monitoring, use the **no weekend** command.

Examples

The following example shows how to disable weekend monitoring when weekend peak-time monitoring has previously been configured on a Cisco CMTS router:

```
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# weekend peak-time1 8 duration 60 avg-rate 100 peak-time2 20 duration
60 avg-rate 10000 duration 90 avg-rate 20000 sample-interval 20 downstream enforce
Router(enforce-rule)# weekend off
```

Related Commands

Command	Description
weekend duration	Configures different subscriber monitoring options over weekends on a Cisco CMTS router.
weekend peak-time1	Configures peak and offpeak subscriber monitoring over weekends on a Cisco CMTS router.

weekend peak-time1

To configure peak and offpeak subscriber monitoring over weekends on a Cisco CMTS router, use the **weekend peak-time1** command in enforce-rule configuration mode. To remove the peak and offpeak weekend monitoring configuration, use the **no** form of this command.

```

weekend peak-time1 {hourhh:mm}
duration minutes avg-raterate
peak-time2 {hourhh:mm} duration minutes avg-rate rate
duration offpeak-minutes avg-rate offpeak-rate
sample-interval minutes
penalty-period minutes
downstream | upstream
enforce
weekend peak-time1 {hourhh:mm}
duration minutes avg-raterate
peak-time2 {hourhh:mm} duration minutes avg-rate rate
duration offpeak-minutes avg-rate offpeak-rate
sample-interval minutes
penalty-period minutes
downstream | upstream
enforce

```

```

weekend peak-time1 {hourhh:mm} duration minutes avg-raterate [ peak-time2 {hourhh:mm} duration
minutes avg-rate rate ] duration minutes avg-rate rate sample-interval minutes [ penalty-period minutes
] { downstream | upstream } [ enforce ]
no weekend peak-time1 {hourhh:mm} duration minutes avg-raterate [ peak-time2 {hourhh:mm} duration
minutes avg-rate rate ] duration minutes avg-rate rate sample-interval minutes [ penalty-period minutes
] { downstream | upstream } [ enforce ]
no weekend

```

Syntax Description	
<i>hour</i> <i>hour:minutes</i>	Specifies the time of day, in either hh or hh:mm format, during which monitoring occurs for the peak time. If the time is specified in hour (hh), the valid range is 1 to 23 using a 24-hour clock. If the time is specified in hour:minutes (hh:mm), the valid range for hour is 1 to 23 using a 24-hour clock, and the valid range for minutes is 0 to 59.
duration <i>minutes</i>	Specifies the size of the sliding window (in minutes) during which the subscriber usage is monitored for the first peak time, and optionally for a second peak time when used with the peak-time2 keyword. The valid range is 60 to 1440. For Cisco cBR Series Converged Broadband Routers, the valid range is 6 to 1440.
avg-rate <i>rate</i>	Specifies the average sampling rate in kilobits per second for the specified duration. The valid range is 1 to 400000 kilobits with no default.

duration <i>offpeak-minutes</i>	(Optional) Specifies the size of the sliding window during which the subscriber usage is monitored for the remaining offpeak time (time not specified for peak monitoring). Valid range is 60 to 1440 minutes.
avg-rate <i>offpeak-rate</i>	Specifies the average sampling rate in kilobits per second for the specified offpeak duration. The valid range is 1 to 400000 kilobits with no default.
peak-time2	(Optional) Specifies the time of day during which monitoring occurs for a second peak time. The time can be specified either in hours or hour:minutes format.
sample-interval <i>minutes</i>	Specifies how often (in minutes) the CMTS router should sample a service flow to get an estimate of subscriber usage. The valid range is 1 to 30, with a default value of 15 For Cisco cBR Series Converged Broadband Routers, the valid range is 1 to 30.
penalty <i>minutes</i> penalty-period <i>minutes</i>	(Optional) Specifies the period (in minutes) during which a cable modem can be under penalty. The range is 1 to 10080. Specifies the period for which an enforced quality of service (QoS) profile should be in force for subscribers who violate their registered QoS profile. The range is from 1 to 10080.
downstream	Specifies monitoring of traffic in the downstream direction.
upstream	Specifies monitoring of traffic in the upstream direction.
enforce	(Optional) Specifies that the enforce-rule QoS profile should be applied automatically if a user violates their registered QoS profile.

Command Default

Weekend monitoring is disabled. The only default value for the **weekend peak-time1** command is the 15-minute sample interval.

Command Modes

Enforce-rule configuration (enforce-rule)

Command History

Release	Modification
12.3(23)BC2	This command was introduced.
12.2(33)SCB	This command was integrated into Cisco IOS Release 12.2(33)SCB. Support for the Cisco uBR7225VXR router was added.
12.2(33)SCD2	The minute-level granularity (hh:mm) for weekend peak-time1 and peak-time2 duration, and the penalty keyword option were added.
IOS-XE 3.15.0S	This command is not supported on the Cisco cBR Series Converged Broadband Routers.
IOS-XE 3.17.0S	This command was implemented on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Note This command is applicable only after the monitoring-basics command is configured with the keyword **peak-offpeak**.

The **weekend peak-time1** command is similar to the **peak-time1** command for subscriber traffic monitoring. Use the **weekend peak-time1** command when you want to configure different peak and offpeak monitoring parameters for subscribers on weekends.

This command can only be used when you have already configured the **duration** or **peak-time1** commands as weekday monitoring conditions for an enforce-rule.

The **penalty** duration, which is configured using the **weekend peak-time1** command, is unique to weekends, and takes precedence over the global penalty duration configured using the penalty-period command.

Examples

The following example shows configuration of two peak monitoring windows on the weekend, with the first monitoring period beginning at 8:00 A.M. for one hour and the second monitoring period beginning at 8:00 P.M. for one hour, and monitoring at all other times of the weekend for 1-1/2 hours (90 minutes) for downstream traffic. The unique penalty period for both **weekend peakttime1** and **peakttime2** is configured as 60 minutes:

```
Router(enforce-rule)# weekend peak-time1 8 duration 60 avg-rate 10000 peak-time2 20 duration
60 avg-rate 100 duration 90 avg-rate 20000 sample-interval 20 penalty 60 downstream enforce
```

Related Commands

Command	Description
peak-time1	Specifies peak and offpeak monitoring times on a Cisco CMTS router.
weekend duration	Configures different subscriber monitoring options over weekends on a Cisco CMTS router.
penalty-period	Specifies the period for which an enforced quality of service (QoS) profile should be in force for subscribers who violate their registered QoS profile.
weekend off	Disables peak and offpeak monitoring on weekends on a Cisco CMTS router.

width

To specify width of profile in Hz, use the **width** command in OFDM modulation profile configuration mode. To undo the width assignment, use **no** form of this command.

width *width*

no width

Syntax Description

<i>width</i>	Profile width in Hz.
--------------	----------------------

Command Default

192000000

Command Modes

OFDM modulation profile configuration (config-ofdm-mod-prof)

Command History

Release	Modification
IOS-XE 3.18.0SP	This command was introduced on the Cisco cBR Series Converged Broadband Routers.

Usage Guidelines

Use this command to specify width of profile in Hz.

The width determines the range of subcarriers that can be assigned specific modulations in lists or ranges using the **assign** command. Regardless of the specified width, each modulation profile has a default modulation range that covers the entire FFT spectrum (204.8 MHz) from subcarrier 0 to 4095 or 8192 depending on spacing. The default modulation is configured using the **assign** command.

Examples

The following example shows how to specify the width:

```
Router# configure terminal
Router(config)# cable downstream ofdm-modulation-profile 21
Router(config-ofdm-mod-prof)# width 24000000
```

Related Commands

Command	Description
cable downstream ofdm-modulation-profile	Define the OFDM modulation profile on the OFDM channel.
description (OFDM modulation profile)	Specify a user defined description for the profile up to 64 characters.
assign	Assign modulations to subcarriers.
subcarrier-spacing	Specify the spacing for specific subcarriers configured in this profile.
start-frequency	(Optional) Specify the starting frequency associated with the first configurable subcarrier in the profile determined by the width.

alias

To define an alias to be used at the ROM monitor prompt, use the **alias** command in ROM monitor mode.

alias [*name=value*]

Syntax Description

[<i>name=value</i>]	(Optional) Specifies the name of the alias to be defined and its corresponding command string. If the <i>value</i> parameter includes spaces, you must include the string within double quotes.
-----------------------	---

Command Default

If no arguments are given, displays the aliases that are currently defined.

Command Modes

ROM monitor (>)

Command History

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines

Aliasing allows you to abbreviate commands or to set up a command so that it is automatically run with certain options. The ROM monitor's [*name=value*]**alias** function is based on the syntax used in the Korn shell on Unix systems.

Normally, only the first word at the ROM monitor prompt is checked for an alias. However, when you define an alias that contains a space as its last character, the ROM monitor also checks the next word at the ROM monitor prompt for an alias.

Note If an alias contains any spaces, the entire command must be enclosed within quotes when you define it with the **alias** command. To create an alias for multiple commands, separate the commands with a semicolon (;) delimiter.

Tip Use the **unalias** command to delete an alias.

Examples

The following example shows how to display the currently defined aliases:

```
rommon 13 > alias

r=repeat
h=history
?=help
b=boot
ls=dir
i=reset
k=stack
rommon 14 >
```

The following example defines an alias named “cpuinfo” that executes three separate CPU-related commands:

```
rommon 31 > alias cpuinfo="cpu_card_type;meminfo;context"

rommon 32 >
```

The following example shows how to define an alias **dird** that lists the file contents of the Flash Disk in the disk0 slot:

```
rommon 18 > alias dird="dir disk0:"

rommon 19 > alias

r=repeat
h=history
?=help
b=boot
ls=dir
i=reset
k=stack
dird=dir disk0:
rommon 20 >
```

Related Commands

Command	Description
sync	Writes the current values of aliases and monitor environment variables to Flash memory.
unalias	Deletes a currently-defined alias.

boot

To boot a router manually, use the **boot** command in ROM monitor mode.

```
boot [-xv]
boot [-xv] [device:] [imagename]
boot [-xv] filename [tftp-ip-address]
boot [-xv] tftp://server/path/filename
```

Syntax Description		
x	(Optional) Loads the specified image into the router's memory but does not execute it.	
v	(Optional) Enables verbose mode to display debugging information as the image is loaded and executed.	
<i>device:</i>	(Optional) Specifies that the router should boot an image on the specified device. If not specified, the router boots from the default memory device.	
<i>imagename</i>	(Optional) Specifies the filename for the image to be booted and loaded. If not specified, the router boots the first file on the specified device. Note When specifying both a <i>device:</i> and <i>imagename</i> , do not put any spaces between the two arguments.	
<i>filename</i>	Specifies the path and filename for the image that the router should download from a Trivial File Transfer Protocol (TFTP) server. Note You must specify the full path for the desired file, as it exists on the TFTP server.	
<i>tftp-ip-address</i>	(Optional) Specifies the IP address for the TFTP server from which the router should download and boot the specified <i>filename</i> . If not specified, the router sends a TFTP request to the IP broadcast address of 255.255.255.255 and uses the first TFTP server that responds.	
<i>tftp://server/path/filename</i>	Specifies the complete TFTP URL for the filename to be downloaded and run. This URL should specify the fully-qualified <i>server</i> name (or IP address), full <i>path</i> on the TFTP server, and <i>filename</i> to be downloaded.	

Command Default

If specified without any options, the **boot** command loads and executes the first file on the default memory device. If a *device* is specified without a *filename* , the **boot** command loads and executes the first file on that device. If a *filename* is specified without a TFTP server IP address, the boot command advertises for a TFTP server using the IP broadcast address of 255.255.255.255 and uses the first TFTP server that responds.

Command Modes

ROM monitor (>)

Command History

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.

Release	Modification
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines

The **boot** command allows a network administrator to boot the router from the ROM monitor (ROMMON) prompt. The router can enter ROMMON for the following reasons:

- The administrator interrupted the boot sequence or Cisco IOS software by pressing the BREAK signal.
- The router's configuration register is set to boot into ROMMON (0x00).
- The router entered ROMMON because of a software exception or error.

The **boot** command allows the administrator to continue the boot process or to load a new software image.

Note To upgrade the router to a new Cisco IOS software image, you can use either the **boot** command in ROMMON mode or the **boot system** commands in global configuration mode.

Boot Changes in Cisco IOS Release 12.2

Cisco IOS Release 12.2 changed the behavior of the ROM monitor (ROMMON) during the bootup sequence. Previously, users could issue the break signal during the bootup sequence to break into ROMMON, and then immediately boot a new Cisco IOS image using the **boot** command.

This behavior is no longer allowed when the router is using a boot image that is based on Cisco IOS Release 12.2, because interrupting the boot process could leave the hardware and software registers in an unknown state. Instead, use the following procedure when using a router with a Cisco IOS Release 12.2 boot image:

1. At the router's console prompt, send a BREAK signal to interrupt the boot process and enter ROMMON.
2. Set the configure register to boot into ROMMON by giving the **confreg 0x0** command.
3. Use the **reset** command to reset the NPE and to boot into ROMMON. This ensures a clean boot into ROMMON, with all registers set to a known state.
4. Set the configure register to boot an IOS image by giving the **confreg 0x2102** command.
5. Use the **boot** command to boot the desired Cisco IOS image.

Examples

The following example shows how to boot the router using the first file in the default device:

```
rommon 1 > boot

Self decompressing the image :
#####
[OK]
(Software image boots...)
Router>
```

The following example shows how to specify that the router should download and boot the file named “newimage.bin” in the subdirectory named “ubrimages” on the TFTP server with the IP address of 10.10.10.31:

```
rommon 45> boot tftp://10.10.10.31/ubrimages/newimage.bin

Self decompressing the image :
#####
[OK]
(Software image boots...)
Router>
```

The following example shows how to use the alternate syntax to specify that the router should download and boot the file named newimage.bin on the TFTP server with the IP address of 10.10.10.31:

```
rommon 45> boot newimage.bin 10.10.10.31

Self decompressing the image :
#####
[OK]
(Software image boots...)
Router>
```

The following example shows the new ROMMON boot procedure that is required when using a Cisco IOS Release 12.2 (or later) boot image:

```
Router-NPE#
telnet> send brk

*** System received an abort due to Break Key ***
signal= 0x3, code= 0x0, context= 0x6208b290
PC = 0x606b5ab0, SP = 0x80007e00, RA = 0x606d2370
Cause Reg = 0xffffffff, Status Reg = 0x3400ff03
rommon 2 > boot flash:newiosimage.bin

Please reset before booting
rommon 3 > confreg 0x0

You must reset or power cycle for new config to take effect
rommon 4 > reset

System Bootstrap, Version 12.2(11)BC3a, RELEASE SOFTWARE (fc1)
Copyright (c) 2002 by cisco Systems, Inc.
UBR7200 platform with 524288 Kbytes of main memory
rommon 1 > boot flash:newiosimage.bin

Self decompressing the image :
#####
[OK]
(Software image boots...)
Router>
```

Related Commands

Command	Description
break	Sets or clears the debugger breakpoint.

Command	Description
cont	Continues the execution of the Cisco IOS software image that has been interrupted by a BREAK or debugger command.
reset	Reinitializes the ROM monitor and return it to a known state.
sync	Writes the current values of aliases and monitor environment variables to Flash memory.
sysreset	Displays the return information from the system image that was last booted.
tftpdnld	Downloads a file from a Trivial File Transfer Protocol (TFTP) server.

break

To set or clear the debugger breakpoint, use the **break** command in ROM monitor mode.

break [{-s *address* | -c}]

Syntax Description

-s <i>address</i>	(Optional) Sets the breakpoint to the specified <i>address</i> in memory. The <i>address</i> must be specified in hexadecimal.
-c	(Optional) Clears the currently-defined breakpoint.

Command Default

If no arguments are given, the command displays the currently-defined breakpoint.

Command Modes

ROM monitor

Command History

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines

The ROM monitor supports one breakpoint. If set, the processor runs normally, but when its program counter reaches the breakpoint address, the system breaks into ROM monitor mode. You can examine memory locations or register contents, and then continue normal program execution by using the **cont** command.

Examples

The following example shows how to set a breakpoint so that when the processor breaks into ROM monitor mode when its program counter reaches 0xbfc02708:

```
rommon 37 > break -s 0xbfc02708
breakpoint set to 0xbfc02708
rommon 38 >
```

The following example shows how to display the currently-defined breakpoint:

```
rommon 38 > break
breakpoint set to 0xbfc02708
rommon 39 >
```

The following example shows how to clear the currently-defined breakpoint:

```
rommon 39 > break -c
```

```
breakpoint is cleared  
rommon 40 >
```

Related Commands

Command	Description
boot	Boots the router manually.
cont	Continues the execution of the Cisco IOS software image that has been interrupted by a BREAK or debugger breakpoint.

confreg

To change the value of the router's configuration register, use the **confreg** command in ROM monitor mode.

confreg [*value*]

Syntax Description

<i>value</i>	(Optional) New value for the configuration register, expressed as a 16-bit hexadecimal value. The valid range for <i>value</i> is 0x0 to 0xFFFF. If <i>value</i> is not specified, the command interactively prompts you for the individual register settings.
--------------	--

Command Default

0x2102 (boots the Cisco IOS software image and allows the use of the BREAK signal to enter ROMMON)

Command Modes

ROM monitor (>)

Command History

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines

The configuration register determines the router's behavior when it boots. Typically, an administrator changes the configuration register so that it boots either into ROMMON mode or boots a Cisco IOS software image, but other options are also available.

If given without an argument, the **confreg** command interactively prompts you for the new values of the individual register settings, using English descriptions. You can either keep the current settings unchanged or change them as desired. The new value of the configuration register is written into the router's nonvolatile Flash memory (NVRAM) immediately, but does not take effect until you reset the router.

If you specify an argument with the **confreg** command, it must be a 16-bit hexadecimal value in the following format:

Table 279: Configuration Register Bit Field Descriptions

Bit	Description
15	If set, enables the router's diagnostic mode (for example, 0x8000).
14	If set, uses the network number in IP broadcasts (for example, 0x4000).
13	If set, allows the router to fall back into ROMMON mode if the boot procedure fails. If not set, the router attempts each valid boot command (as specified by bits 3–0) for a total of 5 times each, until one of the commands is successful (for example, 0x2000).

Bit	Description
12–11	Defines the speed, in bps, for the console port: 00 = 0x0000 = 9600 01 = 0x0800 = 4800 10 = 0x1000 = 1200 11 = 0x1800 = 2400 Note On the Cisco CMTS routers, the console port speed is fixed at 9600 bps and cannot be changed.
10	If set, uses an IP broadcast address that consists of all ones (for example, 0x0400).
9	If set, disables the secondary bootstrap (for example, 0x0200).
8	If set, the router enables the BREAK key, allowing users to break into ROMMON during the boot process (for example, 0x0100).
7	Unused on the Cisco CMTS routers.
6	If set, the router ignores the configuration file in its Flash memory. This is typically done when the user has forgotten the router's enable password (for example, 0x0040).
5–4	Unused on the Cisco CMTS routers.
3–0	Defines the router's boot behavior: 0x0000 = Boots to the ROMMON prompt 0x0001 = Boots the ROMMON boot helper software (first file in bootflash:) 0x0002 to 0x000F = Boots a Cisco IOS software image, based on the values of the router's boot variables. Each boot system command in the configuration file is tried until a valid image is booted.

For example, for normal operations the configuration register is set to 0x2102, which sets bit 13 (allows the router to fall into ROMMON mode if the boot fails), bit 8 (allows the user to break into ROMMON), and bit 1 (boots a Cisco IOS software image). Bits 11 and 12 are cleared, which sets the console port to 9600 bps.

The following are the most commonly-used configuration register values:

- 0x0 = Boot into ROMMON.
- 0x2002 = Normal boot for standard operations, but the BREAK signal cannot be used to break into ROM monitor mode.
- 0x2102 = Normal boot for standard operations, enabling the BREAK signal.
- 0x2142 = Normal boot but the router ignores the configuration file in Flash memory.

Tip The **confreg** command is identical in function to the **config-register** command that is available in global configuration mode.

Examples

The following example shows how to change the configuration register by using the English prompts. In this example, the only change is to have the router boot the Cisco IOS software image instead of entering ROMMON mode:

```
rommon 1 > confreg
Configuration Summary
enabled are:
```

```

break/abort has effect
console baud: 9600
boot: the ROM Monitor
do you wish to change the configuration? y/n [n]: y

enable "diagnostic mode"? y/n [n]:
enable "use net in IP bcast address"? y/n [n]:
enable "load rom after netboot fails"? y/n [n]:
enable "use all zero broadcast"? y/n [n]:
disable "break/abort has effect"? y/n [n]:
enable "ignore system config info"? y/n [n]:
change console baud rate? y/n [n]:
change the boot characteristics? y/n [n]: y

enter to boot:
 0 = ROM Monitor
 1 = the boot helper image
 2-15 = boot system
 [0]: 2

Configuration Summary
enabled are:
break/abort has effect
console baud: 9600
boot: image specified by the boot system commands
      or default to: cisco2-C10000
do you wish to change the configuration? y/n [n]: n

You must reset or power cycle for new config to take effect.
rommon 2 >

```

Note After changing the configuration register in interactive mode, the system displays the new values and prompts you again as to whether you want to change them. If the values are correct, answer **no** and the system returns you to the ROMMON prompt. If you made any changes, the system reminds you that you must reset or power cycle the router before the new configuration register takes effect.

The following example shows how to set the configuration register to the typical value of 0x2102, so that it boots a Cisco IOS software image:

```

rommon 7 > confreg 0x2102

You must reset or power cycle for new config to take effect.
rommon 8 >

```

Related Commands

Command	Description
boot	Boots the router manually.

cont

To continue the execution of the Cisco IOS software image that has been interrupted by a BREAK signal or debugger breakpoint, use the **cont** command in ROM monitor mode.

cont [*address*]

Syntax Description

<i>address</i>	(Optional) Specifies the address in memory at which the router should continue execution. If <i>address</i> is not specified, the command continues execution at the address currently stored in the program counter (PC) register.
Caution	Do not use the <i>address</i> option unless instructed to do so by Cisco TAC engineers.

Command Default

If given without any arguments, the command continues execution at the address currently stored in the processor's program counter (PC) register.

Command Modes

ROM monitor (>)

Command History

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines

The **cont** command typically is used when a user has interrupted the operation of the Cisco IOS software by using the BREAK signal to enter ROM monitor mode, and then wants to continue with the original Cisco IOS software image. This command can also be used to continue program execution when the user uses the BREAK signal to interrupt the Cisco IOS software boot procedure, or has used the **break** command to set a debug breakpoint.

Examples

In the following example, the **cont** command continues executing the Cisco IOS software image, after the user has interrupted the software by sending a BREAK signal:

```
Router#
telnet> send brk
*** System received an abort due to Break Key ***
signal= 0x3, code= 0x0, context= 0x6208b290
PC = 0x606b5ab0, SP = 0x80007e00, RA = 0x606d2370
Cause Reg = 0xffffffff, Status Reg = 0x3400ff03
rommon 5 > cont
```

Router#

Related Commands

Command	Description
boot	Boots the router manually.
break	Sets or clears the debugger breakpoint.
reset	Reinitializes the ROM monitor and return it to a known state.
sysreset	Displays the return information from the system image that was last booted.

context

To display the processor context at the time of the most recent fault or exception, use the **context** command in ROM monitor mode.

context

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes ROM monitor (>)

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines When the processor fault or exception occurs, the ROM monitor preserves the processor context at the time of the fault. The **context** command displays this processor context, which includes information about the kernel registers and the process mode of the booted image (if available).

Examples The following example shows how to display the CPU context at the time of the most recent fault or exception:

```
rommon 21 > context
```

```
Kernel Level Context:
```

Related Commands

Command	Description
boot	Boots the router manually.
sysreset	Displays the return information from the system image that was last booted.

cpu_card_type

To display the type of processor card that is installed in the router, use the **cpu_card_type** command in ROM monitor mode.

cpu_card_type

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes ROM monitor (>)

Command History	Release	Modification
	11.3 NA	This command was introduced on Cisco uBR7200 series routers.
	12.1(5)EC	Support was added for Cisco uBR7100 series routers.
	12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Examples

The following example shows that the router is using an NPE-225 processor card:

```
rommon 92 > cpu_card_type
CPU card type is NPE-225
rommon 93 >
```

Related Commands	Command	Description
	boot	Boots the router manually.
	sysreset	Displays the return information from the system image that was last booted.

dev

To list the known storage and memory devices for the router, use the **dev** command in ROM monitor mode.

dev

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes ROM monitor (>)

Command History

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.

rommon 42 >
```

Related Commands	Command	Description
	dev	Lists the known storage and memory devices for the router.

dis

To disassemble a segment of main memory, use the **dis** command in ROM monitor mode.

dis [*address*] [*num-of-bytes*]

Syntax Description

<i>address</i>	(Optional) Address in main memory at which the disassembly should begin.
<i>num-of-bytes</i>	(Optional) Number of bytes to disassemble.

Command Default

If no arguments are given, the command prompts for the *address* and *num-of-bytes* parameters.

Command Modes

ROM monitor (>)

Command History

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Examples

The following example shows a typical disassembly:

```
rommon 23 > dis 0x60696358 0x20
0x60696358: 1040012b          beq v0, zero, #0x60696808
0x6069635c: 00008821          addu s1, zero, zero
0x60696360: 8e0285d0          lw v0, -31280(s0)
0x60696364: 14400006          bne v0, zero, #0x60696380
0x60696368: 00002021          addu a0, zero, zero
0x6069636c: 0c1a2d93          jal 0x6068b64c
0x60696370: 00002021          addu a0, zero, zero
0x60696374: 8e0285d0          lw v0, -31280(s0)
rommon 24 >
```

The following example shows the command's interactive mode being used to perform the same disassembly:

```
rommon 25 > dis
```

```
Enter in hex the start address [0x0]: 0x60696358
```

```
Enter in hex the test size or length in bytes [0x0]: 0x20
```

```
0x60696358: 1040012b          beq v0, zero, #0x60696808
0x6069635c: 00008821          addu s1, zero, zero
```

```

0x60696360: 8e0285d0          lw v0, -31280(s0)
0x60696364: 14400006          bne v0, zero, #0x60696380
0x60696368: 00002021          addu a0, zero, zero
0x6069636c: 0c1a2d93          jal 0x6068b64c
0x60696370: 00002021          addu a0, zero, zero
0x60696374: 8e0285d0          lw v0, -31280(s0)
rommon 26 >

```

The `dis` command displays an exception if you attempt to disassemble a non-existent address or if you specify an argument that the system interprets as a non-existent address. For example, the following command shows the `dis disk0:` command being given. The system interprets the `disk0:` argument as a memory address of `0xd`, and because this address does not exist, displays the exception message:

```

rommon 3 > dis disk0:

Warning : address not word aligned, 0xd
*** TLB (Load/Fetch) Exception ***
Access address = 0xc
PC = 0xbfc11074, Cause Reg = 0x8, Status Reg = 0x3040d003
monitor: command "dis" aborted due to exception
rommon 4 >

```

Related Commands

Command	Description
<code>frame</code>	Displays an individual stack frame.
<code>stack</code>	Displays a stack trace.

frame

To display an individual stack frame, use the **frame** command in ROM monitor mode.

frame [*number*]

Syntax Description

<i>number</i>	(Optional) Number of the stack frame to be displayed. The default is 0 (the most current frame).
---------------	--

Command Default

Displays stack frame 0.

Command Modes

help

To display a short list of the commands that are available at the ROM monitor prompt, use the **help** command in ROM monitor mode.

help

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes ROM monitor (>)

Command History

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines

The **help** command displays a list of available ROM monitor commands, along with a brief description of each. To display additional details for a specific command, enter the command name followed by the **-?** option.

Examples

The following example shows a typical display of the **help** screen:

```
rommon 12 > help
alias          set and display aliases command
boot          boot up an external process
break        set/show/clear the breakpoint
confreg      configuration register utility
cont         continue executing a downloaded image
context      display the context of a loaded image
cpu_card_type display CPU card type
dev          list the device table
dir          list files in file system
dis         disassemble instruction stream
frame       print out a selected stack frame
help        monitor builtin command help
history     monitor command history
meminfo     main memory information
repeat      repeat a monitor command
reset       system reset
set         show all monitor variables
show_spd    show all SPD data
```

```
stack          produce a stack trace
sync           write monitor environment to NVRAM
sysret         print out info from last system return
unalias        unset an alias
unset          unset a monitor variable
rommon 13 >
```

The following example shows how to display additional help for the **alias** command:

```
rommon 14 > alias -?
usage: alias [name=value]
rommon 15 >
```

Related Commands

Command	Description
boot	Boots the router manually.

history

To display the last 16 commands given at the ROM monitor prompt, use the **history** command in ROM monitor mode.

history

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes ROM monitor (>)

Command History

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines

The ROM monitor keeps a record of the last commands given at the ROM monitor prompt (up to 16), similar to the way this is done with the Korn shell. Use the **history** command to display these commands, and the **repeat** command to repeat them one or more times.

Tip When you use an **alias**, the **history** list includes the alias and not the actual commands that were executed.

Note The **repeat** command is not added to the history list.

Examples

The following example shows how to reset the ROM monitor and return it to a known state:

```
rommon 9 > history

1 boot sysfiles/ubr10k-k8p6-mz.12211BC3
2 dev
3 dir disk0:
4 confreg
5 confreg 0x00
```

```
6 cont
7 break -c
8 break
9 history
rommon 10 >
```

Related Commands

Command	Description
alias	Defines an alias to be used at the ROM monitor prompt.
boot	Boots the router manually.
repeat	Repeats a particular ROM monitor command.

meminfo

To display information about the available range of main memory and Flash memory, use the **meminfo** command in ROM monitor mode.

meminfo

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes ROM monitor (>)

Command History

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines

The **meminfo** command displays the size of available main memory, its starting address, the size of available packet memory, and the size of nonvolatile Flash memory.

Examples

The following example shows how to display information about the current memory usage:

```
rommon 9 > meminfo

Main memory size: 512 MB.
Available main memory starts at 0xa000e000, size 0x7ffc8 KB
NVRAM size: 0x80000
rommon 10 >
```

Related Commands

Command	Description
boot	Boots the router manually.
sysreset	Displays the return information from the system image that was last booted.

repeat

To repeat a particular ROM monitor command from the history list, use the **repeat** command in ROM monitor mode.

repeat [{*number* [*count*] | *string* [*count*]}]

Syntax Description	
<i>number</i>	(Optional) Specifies the number, as listed in the history command, of the command to be repeated.
<i>string</i>	(Optional) Specifies a string to be compared against the commands in the history list. The most recent command that matches the <i>string</i> is repeated. If the <i>string</i> includes spaces, it must be enclosed within quotes.
<i>count</i>	(Optional) Specifies the number of times the command should be executed. The default is 1.

Command Default If given without any arguments, repeats the previous command once.

Command Modes ROM monitor (>)

Command History	Release	Modification
	11.3 NA	This command was introduced on Cisco uBR7200 series routers.
	12.1(5)EC	Support was added for Cisco uBR7100 series routers.
	12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines The **repeat** command repeats one of the commands in the history list (which can contain up to 16 commands). You can specify the command to be repeated by its history number (as shown by the **history** command) or by a string that will match the command.

If you do not give any arguments with the command, it repeats the last command in the history list once.

Note The **repeat** command is not added to the history list, so you cannot repeat the **repeat** command. You also cannot include the **repeat** command on a command line that has multiple commands separated by a semicolon delimiter.

Examples

The following example shows how to use the repeat command to execute one of the commands in the history list:

```

rommon 9 > history

1  boot sysfiles/ubr10k-k8p6-mz.12211BC3
2  dev
3  dir disk0:
4  confreg
5  confreg 0x00
6  cont
7  break -c
8  break
9  history
rommon 10 > repeat 9
1  boot sysfiles/ubr10k-k8p6-mz.12211BC3
2  dev
3  dir disk0:
4  confreg
5  confreg 0x00
6  cont
7  break -c
8  break
9  history
10 history
rommon 11 >

```

Related Commands

Command	Description
boot	Boots the router manually.
history	Displays the last 16 commands given at the ROM monitor prompt.
sysreset	Displays the return information from the system image that was last booted.

reset

To reinitialize the ROM monitor and return it to a known state, use the **reset** command in ROM monitor mode.

reset [-s]

Syntax Description

s	(Optional) Saves the current environment (environment variables and aliases) to nonvolatile memory before performing the reset.
---	---

Command Default

If given without any arguments, resets all environment variables and aliases to their initialized states.

Command Modes

ROM monitor (>)

Command History

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines

The **reset** command returns the ROM monitor to its initial state, without requiring a complete system reboot by performing a warm reset. This is useful if you have been setting and unsetting registers and variables, and no longer know whether the system is in a stable state.

If you specify the **-s** option, the system saves the current environment variables and aliases to nonvolatile memory before resetting the ROM monitor, so as to preserve their current values.

Examples

The following example shows how to reset the ROM monitor and return it to a known state:

```
rommon 59 > reset

System Bootstrap, Version 12.0(9r)SL2, RELEASE SOFTWARE (fc1)
Copyright (c) 2000 by cisco Systems, Inc.
Reset Reason Register = RESET_REASON_RESET_REG (0x76)
C10000 platform with 524288 Kbytes of main memory
rommon 1 >
```

Related Commands

Command	Description
boot	Boots the router manually.

Command	Description
sysreset	Displays the return information from the system image that was last booted.

set

To display the contents of the currently-defined environment variables, use the **set** command in ROM monitor mode.

set

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes ROM monitor (>)

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines The set command displays the environment variables that are currently defined in the ROM monitor. Variables are defined at the ROM monitor prompt in a manner similar to that of the Korn shell, by specifying *variable =value* .

Tip Use the **unset** command to delete a monitor variable.

Examples

The following example shows how to display the values of the currently defined monitor variables:

```
rommon 13 > set

PS1=rommon ! >
RET_2_RTS=17:28:46 PST Tue Oct 12 1993
BSI=0
RET_2_RUTC=
?=1
rommon 14 >
```

The following example shows the PS1 variable (which defines the ROM monitor prompt) being changed, and the **set** command displaying the new value:

```
rommon 12 > PS1="Rommon-CMTS ! >"

Rommon-CMTS 13 > set

PS1=Rommon-CMTS ! >
RET_2_RTS=17:28:46 PST Tue Oct 12 1993
BSI=0
RET_2_RUTC=
?=1
Rommon-CMTS 14 >
```

Related Commands

Command	Description
sync	Writes the current values of aliases and monitor environment variables to Flash memory.
ftpdnld	Downloads a file from a Trivial File Transfer Protocol (TFTP) server.
unset	Deletes the current contents of a monitor environment variable.

show_spd

To display the contents of the processor's Serial Presence Detect (SPD) device (an electrically erasable programmable read-only memory (EEPROM) device), use the **show_spd** command in ROM monitor mode.

show_spd

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes ROM monitor (>)

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines The **show_spd** command displays the contents of the processor card's SPD/EEPROM memory device. This information is typically useful only to Cisco TAC engineers.

Note The **show_spd** command displays a large volume of data. Enable the capture buffer on your terminal program so that you can preserve this data and review it later.

Examples

The following example shows how to display the SPD data (only a portion of the command's display is shown):

```
rommon 15 > show_spd

DIMM 0 SPD specifications:
byte 0 - 0x80000000
byte 1 - 0x80000000
byte 2 - 0x40000000
...
byte 125 - 0xff000000
byte 126 - 0x64000000
byte 127 - 0xad000000
DIMM 1 SPD specifications:
```

show_spd

```

byte 0 - 0xff000000

```

Related Commands

Command	Description
sync	Writes the current values of aliases and monitor environment variables to Flash memory.
unalias	Deletes a currently-defined alias.

stack

To display a stack trace, use the **stack** command in ROM monitor mode.

stack [*number*]

Syntax Description

<i>number</i>	(Optional) Number of stack frames to display. The default is 5 frames.
---------------	--

Command Default

Displays 5 stack frames

Command Modes

ROM monitor (>)

Command History

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines

The **stack** command displays a stack trace of the most recently booted software image. This trace includes the value of the program counter and the selected number of frames from the kernel stack and process stack (if available) from that software image.

Tip To display details for an individual frame stack, use the **frame** command.

Examples

The following example shows how to display a stack trace with 6 frames:

```
rommon 5 > stack 6

Stack trace:
PC = 0x02004adc
Frame 00: FP = 0x02003938   RA = 0x02005f2a
Frame 01: FP = 0x02003948   RA = 0x02005df0
Frame 02: FP = 0x02003960   RA = 0x020050ee
Frame 03: FP = 0x02003994   RA = 0x02004034
Frame 04: FP = 0x02003b00   RA = 0x00012ca6
Frame 04: FP = 0x02003b34   RA = 0x020a703c
rommon 6 >
```

The following example shows how to display a stack trace with the default of 5 frames, when a process stack is available:

```
rommon 21 > stack

Kernel Level Stack Trace:
Initial SP = 0x61bb4d30, Initial PC = 0x606931b0, RA = 0x6067bca0
Frame 0 : FP= 0x61bb4d30, PC= 0x606931b0, 0 bytes

rommon 22 >
```

Related Commands

Command	Description
boot	Boots the router manually.
dis	Disassembles a segment of main memory.
frame	Displays an individual stack frame.
sysreset	Displays the return information from the system image that was last booted.

sync

To write the current values of aliases and monitor environment variables to Flash memory, use the **sync** command in ROM monitor mode.

sync

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes ROM monitor (>)

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines The **sync** command writes the current values of the monitor environment variables and aliases to Flash memory so that they are read on the next reset. If you do not do this, all variables and aliases are deleted upon reset and replaced with the default values.

Examples The following example shows how to synchronize the monitor variables and aliases:

```
rommon 39 > sync
rommon 40 >
```

Command	Description
alias	Defines an alias to be used at the ROM monitor prompt.
boot	Boots the router manually.
set	Displays the currently-defined monitor environment variables.
sysreset	Displays the return information from the system image that was last booted.
unalias	Deletes a currently-defined alias.

Command	Description
unset	Deletes the current contents of a monitor environment variable.

sysreset

To display information about the system image that was last booted, use the **sysreset** command in ROM monitor mode.

sysreset

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes ROM monitor (>)

Command History	Release	Modification
	11.3 NA	This command was introduced on Cisco uBR7200 series routers.
	12.1(5)EC	Support was added for Cisco uBR7100 series routers.
	12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
	12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
	12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines The **sysreset** command displays the information about the last system image that was booted and then terminated. This includes the reason for why the last image ended its execution, the values of the program counter and error address registers when the program ended execution, and a stack trace holding the last eight frames. Any exception information is also shown.

Examples The following example shows a typical display from the **sysreset** command:

```
rommon 22 > sysreset

System Return Info:
count: 19, reason: user reload
pc:0x6053059c, error address: 0x0
Stack Trace:
FP: 0x6558b0d0, PC: 0x6053059c

FP: 0x6558b0e8, PC: 0x60535b84
FP: 0x6558b170, PC: 0x60488c50
FP: 0x6558b268, PC: 0x60474aa8
FP: 0x6558b2c8, PC: 0x6014d5d0
FP: 0x6558b2e8, PC: 0x60487928
FP: 0x6558b378, PC: 0x604fe80c
rommon 23 >
```

Related Commands

Command	Description
boot	Boots the router manually.
reset	Reinitializes the ROM monitor and return it to a known state.

unalias

To delete a currently-defined alias, use the **unalias** command in ROM monitor mode.

unalias *name* [*name2 name3 . . .*]

Syntax Description

<i>name</i>	Specifies the alias to be deleted.
<i>name2 name3</i> ...	(Optional) Specifies additional aliases to be deleted.

Command Default

No default behavior or values.

Command Modes

ROM monitor (>)

Command History

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines

The **unalias** command deletes one or more aliases that you have previously defined for the ROM monitor using the **alias** command.

Examples

The following example shows how to delete one alias:

```
rommon 13 > unalias dird
rommon 14 >
```

The following example shows three aliases being deleted:

```
rommon 20 > unalias alias1 alias2 alias3
rommon 21 >
```

The following example shows the error message that is displayed when you try to delete an alias that does not exist:

```
rommon 11 > unalias gobbledegook
```

```
unalias: "gobbledegook" does not exist
rommon 12>
```

Related Commands

Command	Description
alias	Defines an alias to be used at the ROM monitor prompt.
sync	Writes the current values of aliases and monitor environment variables to Flash memory.

unset

To delete the current contents of a monitor environment variable, use the **unset** command in ROM monitor mode.

```
unset name [name2 name3 . . .]
```

Syntax Description

<i>name</i>	Specifies the variable to be cleared.
<i>name2 name3</i> ...	(Optional) Specifies additional variables to be cleared.

Command Default

No default behavior or values.

Command Modes

ROM monitor (>)

Command History

Release	Modification
11.3 NA	This command was introduced on Cisco uBR7200 series routers.
12.1(5)EC	Support was added for Cisco uBR7100 series routers.
12.2(4)BC1	Support was added for the Cisco uBR10012 router. Changes were also made to the boot procedure after breaking into ROMMON to ensure that all hardware and software registers are in a known state before loading the new image.
12.3BC	This command was integrated into Cisco IOS Release 12.3BC.
12.2(33)SCA	This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.

Usage Guidelines

The **unset** command clears the contents of one or more monitor variables that have been defined in the ROM monitor. Variables are defined at the ROM monitor prompt in a manner similar to that of the Korn shell, by specifying *variable =value* .

Examples

The following example shows how to delete a variable named “temp-var”:

```
rommon 13 > unset temp-var
```

```
rommon 14 >
```

The following example shows how to delete two variables:

```
rommon 17 > unset temp-var my-var
```

```
rommon 18 >
```

Related Commands

Command	Description
set	Displays the currently-defined monitor environment variables.
