View SR-MPLS and SRv6 Policies on the Topology Map

To get to the Traffic Engineering topology map, choose **Traffic Engineering** > **Traffic Engineering**.

From the Traffic Engineering table, click the checkbox of each SR-MPLS or SRv6 policy you want to view on the map. You can select up to 10 policies that will appear as separate colored links.

Figure 1: Traffic Engineering UI : SR-MPLS and SRv6 Policies

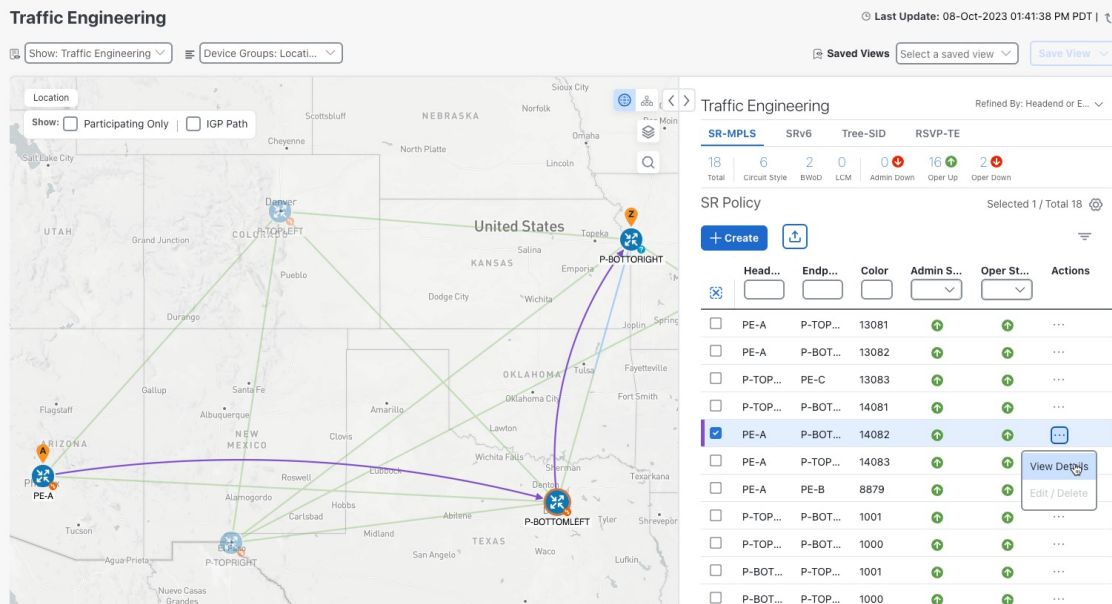

Callout No.	Description
1	A device with an orange (🔴) outline indicates there is a node SID associated with that device or a device in the cluster.
2	Click the appropriate check box to enable the following options: <ul style="list-style-type: none"> • Show IGP Path—Displays the IGP path for the selected SR-TE policy. • Show Participating Only—Displays only links that belong to selected SR-TE policy. All other links and devices disappear.
3	When SR-TE policies are selected in the SR-MPLS or SRv6 tables, they show as colored directional lines on the map indicating source and destination. An adjacency segment ID (SID) is shown as an orange circle on a link along the path (🔴).
4	SR-MPLS and SRv6 Policy Origin and Destination: If both A and Z are displayed in a device cluster, at least one node in the cluster is a source and another is a destination. The A+ denotes that there is more than one SR-TE policy that originates from a node. The Z+ denotes that the node is a destination for more than one SR policy.
5	The content of this window depends on what has been selected or filtered. In this example, the SR-MPLS tab is selected and the SR Policy table is displayed.
6	Click on either the SR-MPLS or SRv6 tabs to view the respective list of SR-TE policies.
7	The Mini Dashboard provides a summary of the operational SR-MPLS or SRv6 policy status. If filters are applied, the Mini Dashboard is updated to reflect what is displayed in the SR Policy and SRv6 Policy tables. In addition to the policy status, the SR-MPLS Mini Dashboard table displays the number of PCC and PCE initiated tunnels that are <i>currently</i> listed in the SR Policy table.

Callout No.	Description
8	<p>This option allows you to choose how the group filter (when in use) should be applied on the table data. For example, if Headend only was selected, then it would only display policies where the headend device of the policy is in the selected group. This filter allows you to see specific configurations and is useful when you have a large network.</p> <p>Filter options:</p> <ul style="list-style-type: none"> • Headend or Endpoint—Show policies with either the headend or endpoint device in the selected group. • Headend and Endpoint—Show policies if both the headend and endpoint are in the group. • Headend only—Show policies if the headend device of the policy is in the selected group. • Endpoint only—Show policies if endpoint device of the policy is in the selected group.
9	Exports <i>all</i> data into a CSV file. You cannot export selected or filtered data.

View SR-MPLS and SRv6 Policy Details

View SR-MPLS or SRv6 TE policy level details as well segment lists and any path computation constraints configured on a per-candidate path basis.

Step 1 From the **Actions** column, click  > **View Details** for one of the SR-MPLS or SRv6 policies.

The screenshot displays the Traffic Engineering interface. On the left, a map of the United States shows network paths between various cities. On the right, a table lists SR Policies. The table has columns for Headend, Endpoint, Color, Admin Status, and Oper Status. The policy with ID 14082 is selected, and a 'View Details' button is visible next to it.

SR-MPLS	SRv6	Tree-SID	RSVP-TE
18	6	2	0
Total	Circuit Style	BWob	LCM
		Admin Down	Oper Up
		Oper Down	

Head...	Endp...	Color	Admin S...	Oper St...	Actions
<input type="checkbox"/>	PE-A	P-TOP...	13081	●	● ...
<input type="checkbox"/>	PE-A	P-BOT...	13082	●	● ...
<input type="checkbox"/>	P-TOP...	PE-C	13083	●	● ...
<input type="checkbox"/>	P-TOP...	P-BOT...	14081	●	● ...
<input checked="" type="checkbox"/>	PE-A	P-BOT...	14082	●	●  View Details
<input type="checkbox"/>	PE-A	P-TOP...	14083	●	● Edit / Delete
<input type="checkbox"/>	PE-A	PE-B	8879	●	● ...
<input type="checkbox"/>	P-TOP...	P-BOT...	1001	●	● ...
<input type="checkbox"/>	P-TOP...	P-BOT...	1000	●	● ...
<input type="checkbox"/>	P-BOT...	P-TOP...	1001	●	● ...
<input type="checkbox"/>	P-BOT...	P-TOP...	1000	●	● ...

Step 2 View SR-MPLS or SRv6 policy details. From the browser, you can copy the URL and share with others.

Note The Delay value is calculated for all policies every 10 minutes. Hover your mouse over the "i" icon (next to the Delay value) to view the last time the value was updated.

Figure 3: SR Policy Details - Candidate Path

The screenshot displays the 'Candidate Path' configuration interface. At the top, there is a 'Collapse All' button. Below it is a table with columns: Path Name, Preference, Path Type, and State. The selected path is 'bwod_name_101236' with a preference of 100 and path type 'Explicit'. Below the table, there is a detailed view of the path configuration:

S...	Seg...	L...	Algo	IP	N...	Inte...	S...
0	No...	1...	0	192.1...	xr...		Reg

Below the table, the detailed configuration for the selected path is shown:

- Path Name:** bwod_name_101236
- Oper State:** Up | Active
- Metric Type:** UNKNOWN
- Bandwidth:** Requested: 0 Mbps, Reserved: 0 Mbps
- Disjoint Group:** ID: -, Association Source: -, Type: -
- PCE Initiated:** true
- Affinity:** Exclude-Any: -, Include-Any: -, Include-All: -
- Segment Type:** Protected
- SID Algorithm:** -

Visualize IGP Path and Metrics

View the physical path and metrics between the endpoints of the selected SR-MPLS policies.

- Step 1** From the **SR Policy** table, check the check box next to the SR-TE (SR-MPLS and SRv6) policies you are interested in.
- Step 2** Check the **Show IGP Path** check box. The IGP paths for the selected SR-MPLS policies are displayed, with straight lines, instead of the segment hops. In a dual stack topology, the **Participating Only** checkbox must also be checked to view metrics on participating links.
- Step 3** Click > **Metrics** tab.
- Step 4** Toggle applicable metrics to **ON**.

Note You must check the **Show IGP Path** check box in order to view metrics.

Find Multiple Candidate Paths (MCPs)

Find Multiple Candidate Paths (MCPs)

Visualizing MCPs gives you insight into which paths might be a better alternative to the currently active one. If you determine to do so, you can then manually configure the device and change which path becomes active.

Important Notes

- Only PCC-initialized SR-TE policies with MCPs are supported.
- Crosswork Optimization Engine does not distinguish dynamic paths versus explicit paths. The Policy Type field value displays as 'Unknown'.
- You can view active explicit paths, but not inactive candidate explicit paths in the UI.

Before you begin

A policy must be configured with MCPs on devices before visualizing them on the Traffic Engineering topology map. This configuration can be done manually or within Crosswork Network Controller.

Step 1 From the main menu, choose **Traffic Engineering > Traffic Engineering > SR-MPLS or SRv6** tab.

Step 2 Navigate to the active SR-TE policy that has MCPs configured and view it on the topology map.

- Check the check box next to the SR-TE policy that has MCPs configured.
- View the SR-TE policy that is highlighted on the topology map.

In this example, you see that the active path is going from **xrv9k-12 > xrv9k-14 > xrv9k-16**.

Step 3 View the list of candidate paths.

- From the SR-TE Policy table **Actions** column, click > **View Details**. A list of candidate paths appear along with policy details in the **SR Policy Details** window. The green A in the state column indicates the active path.

Include-Any: -
Include-All: -

Segment Type Unprotected

SID Algorithm -

Step 4 You can expand individual paths or click **Expand All** to view details of each path.

Step 5 Visualize the candidate path on the topology map.

- a) Check the check box next to any candidate path.

Note You will not be able to select or view explicit candidate paths.

- b) From the **Candidate Path** area, hover your mouse over the candidate path name. The candidate path is highlighted on the topology map.

In this example, you see that the alternate path goes directly from **xrv9k-12** > **xrv-16**.

Visualize Underlying Paths Associated with a Defined Binding-Segment ID (B-SID) Label

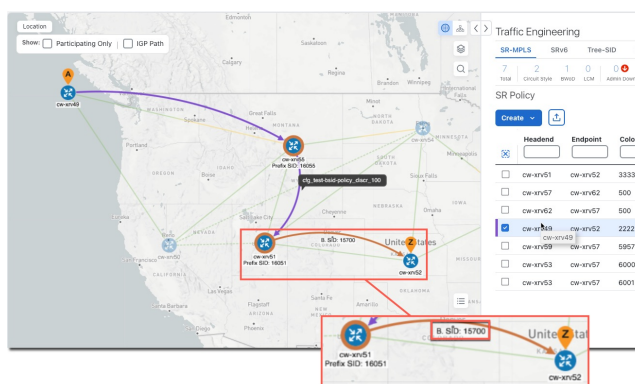

Cisco Crosswork allows you to visualize the underlying path of a B-SID hop that you have manually configured on a device or configured using Crosswork Network Controller. In this example, we have assigned **15700** as a B-SID label on an SR-MPLS policy hop.

To view the B-SID underlying path for an SR-MPLS or SRv6 policy, do the following:

Step 1 From the main menu, choose **Traffic Engineering > Traffic Engineering > SR-MPLS**.

Step 2 From the SR Policy table, check the check box next to the policy that has a hop assigned with a B-SID label. Hover your mouse over any part of the SR-MPLS row to see the B-SID name. The B-SID path is highlighted in **orange** on the topology map.

In this example, you see that the B-SID path is going from **cw-xrv51** to **cw-xrv52**.

Step 3 From the **Actions** column, click **...** > **View Details**.

Step 4 From the **SR Policy Details** window, expand the active path name to view more information. In this example, the underlying path actually goes from **cw-xrv51 > cw-xrv54 > cw-xrv53 > cw-xrv52**.

Visualize Native SR Paths

Visualizing the native path will help you in OAM (Operations, Administration and Maintenance) activities to monitor label-switched paths (LSPs) and quickly isolate forwarding problems to assist with fault detection and troubleshooting in the network. Since this feature uses multipaths, all ECMP paths are shown between the source and destination. You can visualize only native SR IGP paths.

Before you begin

Confirm that device requirements are met. See [Visualize Native Path Device Prerequisites, on page 12](#).

To create a path query, do the following:

- Step 1** From the main menu, choose **Traffic Engineering > Path Query**. The Path Query dashboard appears.
- Step 2** On the Path Query dashboard, click **New Query**.
- Step 3** Enter the device information in the required fields to find available Native SR IGP Paths.
- Step 4** Click **Get Paths**. The Running Query ID pop-up appears.

Note Path queries may take a moment to complete. When the Running Query ID pop-up appears, you can also select **View Past Queries** to return to the Path Query Dashboard. If you already had path queries in the list, you can view existing details as the new query continues to run in the background, which is indicated by the blue Running icon in the Query State column. When the new query state turn green, completed, it can be viewed.

Step 5 Click **View Result** when it becomes available on the Running Query ID pop-up. The Path Details panel appears with corresponding available paths details while the defined topology map appears with the available Native SR IGP Paths on the left.

Example:

In the below example, you can view the available paths : **Path 0**

Figure 4: Path Details

The screenshot displays the 'New Path Query' interface. On the left, a map of the United States shows a network topology with nodes labeled 'TOP-LEFT', 'TOP-RIGHT', 'BOTTOM-LEFT', and 'BOTTOM-RIGHT', connected by green lines. On the right, a form titled 'New Path Query' is visible, containing fields for 'Select Service', 'Select Instance', 'Headend', and 'Endpoint'. The 'Headend' and 'Endpoint' fields have a warning icon and the text 'Enter host name, or select node on the map..'. Below the form are 'Get Paths' and 'Cancel' buttons. The top right corner of the interface shows the last update time: '© Last Update: 09-Nov-2023 06:02:31 PM IST'.

Step 6 From the main menu, choose **Traffic Engineering > Path Query**. to return to the Path Query dashboard.

Step 7 From the **Actions** column, click **View Details**.

If you have not provided the longitude and latitude information for your devices, the path is visualized in the logical view.

Step 8 From the available paths, click **Path 0** to expand and view the active path.

Example:

Figure 5: Path Details

The screenshot shows a 'Path Details' window with the following configuration:

- Select Service:** L3vpn-Service (NSS-L3-Shared-540-internal)
- Headend:** PE-C (100.100.10.7)
- Endpoint:** PE-B (100.100.10.8)

Available Paths:

- Path 0:** Status Found, Output GigabitEthernet0/0/0/0, Nexthop 20.20.20.30, Source 100.100.10.7, Destination 127.0.0.0

Hop Details:

- Hop Index:0 | Hop Origin IP:100.100.10.7 | Hop Destination IP:20.20.20.30 | MRU:1500 | Labels:[16006] | ret code:0 | multipaths:0
- Hop Index:1 | Hop Origin IP:20.20.20.30 | Hop Destination IP:20.20.20.21 | MRU:1500 | Labels:[16006] | ret code:8 | return char:L | multipaths:1
- Hop Index:2 | Hop Origin IP:20.20.20.21 | Hop Destination IP:20.20.20.26 | MRU:1500 | Labels:[implicit-null] | ret code:8 | return char:L | multipaths:1
- Hop Index:3 | Hop Origin IP:20.20.20.26 | MRU:0 | ret code:3 | return char:I | multipaths:0

Visualize Native Path Device Prerequisites

Confirm the following device software and configurations are met prior to visualizing native paths.

1. Devices should be running Cisco IOS XR 7.3.2 or higher. Run `show version` command to verify it.
2. Devices should have GRPC enabled.
 - a. Run `show grpc` to confirm GRPC configuration. You should see something similar to this:

```

tpa
vrf default
address-family ipv4
default-route mgmt
!
address-family ipv6
default-route mgmt
!
!
!
or

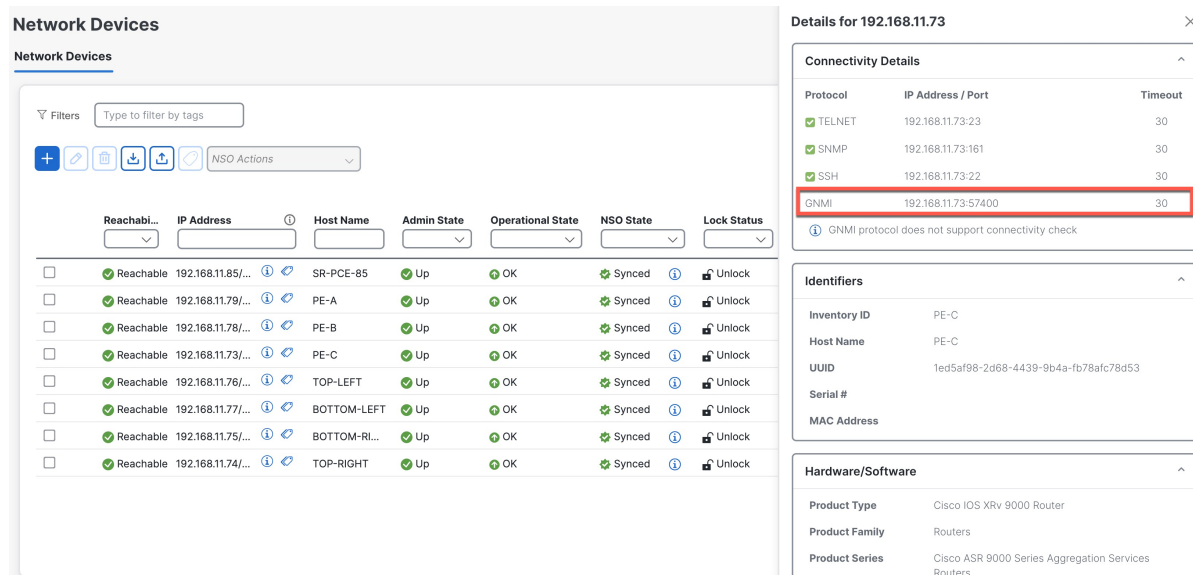

linux networking
vrf default
address-family ipv4
default-route software-forwarding
!
address-family ipv6
default-route software-forwarding
!
!
!
```

**Note**

- `address-family` is only required in an IPv4 topology.
- To enable GRPC with a secure connection, you must upload security certificates to connect to the device.

3. Devices should have GNMI capability enabled and configured.

- From Device Management > Network Devices, click  icon for the device you are interested.
- Confirm that GNMI is listed under Connectivity Details.

The screenshot shows the 'Network Devices' management interface. On the left, a table lists several devices with columns for Reachability, IP Address, Host Name, Admin State, Operational State, NSO State, and Lock Status. The device '192.168.11.73' is highlighted. On the right, a 'Details for 192.168.11.73' panel is open, showing 'Connectivity Details' with a table of protocols and their configurations. The 'GNMI' entry is highlighted with a red box.

Protocol	IP Address / Port	Timeout
TELNET	192.168.11.73-23	30
SNMP	192.168.11.73-161	30
SSH	192.168.11.73-22	30
GNMI	192.168.11.73-57400	30

Below the connectivity table, it notes: *GNMI protocol does not support connectivity check*

The 'Identifiers' section shows:

- Inventory ID: PE-C
- Host Name: PE-C
- UUID: 1ed5af98-2d68-4439-9b4a-fb78afc78d53
- Serial #:
- MAC Address:

The 'Hardware/Software' section shows:

- Product Type: Cisco IOS XRv 9000 Router
- Product Family: Routers
- Product Series: Cisco ASR 9000 Series Aggregation Services Routers

**Note**

Based on the type of devices, the following device encoding type are available:

- JSON
- BYTES
- PROTO
- ASCII
- JSON IETF

4. Devices should have the CDG router static address. Static route should be added from the device to the southbound CDG IP address. For example:

```
RP/0/RP0/CPU0:xrvr-7.3.2#config
```

```
RP/0/RP0/CPU0:xrvr-7.3.2(config)#router static
```

```
RP/0/RP0/CPU0:xrvr-7.3.2(config-static)#address-family ipv4 unicast <CDG Southbound interface IP: eg. 172.24.97.110> <Device Gateway eg: 172.29.105.1>
```

```
RP/0/RP0/CPU0:xrivr-7.3.2(config-static)#commit
```

Configure TE Link Affinities

If you have any affinities you wish to account for when provisioning an SR policy, Tree-SID, or RSVP-TE tunnel, then you can optionally define affinity mapping on the Cisco Crosswork UI for consistency with affinity names in device configurations. Cisco Crosswork will only send bit information to SR-PCE during provisioning. If an affinity mapping is not defined in the UI, then the affinity name is displayed as "UNKNOWN". If you want to configure affinity mappings in Cisco Crosswork for visualization purposes, you should collect affinities on the device, then define affinity mapping in the Cisco Crosswork UI with the same name and bits that are used on the device.

The affinity configuration on interfaces simply turns on some bits. It is a 32-bit value, with each bit position (0–31) representing a link attribute. Affinity mappings can be colors representing a certain type of service profile (for example: low delay, high bandwidth, and so on). This makes it easier to refer to link attributes.

See SR, Tree-SID, or RSVP-TE configuration documentation for your specific device to view descriptions and supported configuration commands (for example: [Segment Routing Configuration Guide for Cisco ASR 9000 Series Router](#))

The following example shows the affinity configuration (`affinity-map`) on a device:

```
RP/0/RP0/CPU0:c12#sh running-config segment-routing traffic-eng affinity-map
Wed Jul 27 12:14:50.027 PDT
segment-routing
 traffic-eng
  affinity-map
   name red bit-position 1
   name blue bit-position 5
   name green bit-position 4
  !
 !
 !
```

Step 1 From the main menu, choose **Administration > Settings > System Settings tab > Traffic Engineering > Affinity > TE Link Affinities**. You can also define affinities while creating an SR-TE policy, Tree-SID, or RSVP-TE tunnel by clicking **Manage Mapping**.

Step 2 To add a new affinity mapping, click **+ Create**.

Step 3 Enter the name and the bit it will be assigned. For example (using the above configuration):

Example:

TE Link Affinities		Flex-Algo Affinities	
+ Create			
Name ⓘ	Bit Position (0-31) ⓘ	Actions	
<input type="text"/>	<input type="text"/>		
green	4	<button>Edit</button>	<button>Delete</button>
blue	5	<button>Edit</button>	<button>Delete</button>
red	1	<button>Edit</button>	<button>Delete</button>

Step 4 Click **Save** to save the mapping.

Note You should remove the TE tunnel before removing the affinity to avoid orphan TE tunnels. If you have removed an affinity associated to a TE tunnel, the affinity is shown as "UNKNOWN" in the **SR Policy / RSVP-TE Tunnel Details** window.

Create Explicit SR-MPLS Policies

This task creates SR-MPLS policies using an explicit (fixed) path consisting of a list of prefix or adjacency Segment IDs (SID list), each representing a node or link along on the path.

Tip If you plan to use affinities, collect affinity information from your devices, and then map them in Cisco Crosswork before creating an explicit SR-MPLS policy. For more information, see [Configure TE Link Affinities, on page 14](#).

Step 1 From the main menu, choose **Traffic Engineering > Traffic Engineering > SR-MPLS** tab.

Step 2 From the **SR Policies** table, click + **Create**.

Step 3 Enter or select the required SR-MPLS policy values. Hover the mouse pointer over the ⓘ to view a description of the field.

Tip If you have set up device groups, you can select the device group from the **Device Groups** drop-down list. Then navigate and zoom in on the topology map to click the device for headend or endpoint selection.

Step 4 Under Policy Path, click **Explicit Path** and enter a path name.

Step 5 Add segments that will be part of the SR-MPLS policy path.

Step 6 Click **Preview** and confirm that the policy you created matched your intent.

Step 7 If you want to commit the policy path, click **Provision** to activate the policy on the network or exit to abort the configuration process.

Step 8 Validate the SR-MPLS policy creation:

a. Confirm that the new SR-MPLS policy appears in the SR Policy table. You can also click the check box next to the policy to see it highlighted in the map.

Note The newly provisioned SR-TE policy may take some time, depending on the network size and performance, to appear in the **SR Policy** table. The **SR Policy** table is refreshed every 30 seconds.

b. View and confirm the new SR-MPLS policy details. From the **SR Policy** table, click the and select **View**.

Note On a setup with high node, policy, or interface counts, a timeout may occur during policy deployment. To configure timeout options, see [Configure TE Timeout Settings](#).

Create Dynamic SR-MPLS Policies Based on Optimization Intent

This task creates an SR-MPLS policy with a dynamic path. SR-PCE computes a path for the policy based on metrics and path constraints (affinities or disjointness) defined by the user. A user can select from three available metrics to minimize in path computation: IGP, TE, or latency. The SR-PCE will automatically re-optimize the path as necessary based on topology changes. In the event of a link or interface failing, the network will find an alternate path that meets all the criteria specified in the policy and raise an alarm. The alarm is also raised in case no path is found, the packets are then dropped.

Tip For visualization purposes, you can optionally collect affinity information from your devices and then map them in Cisco Crosswork before creating a dynamic SR-MPLS policy. For more information, see [Configure TE Link Affinities, on page 14](#) or [Configure Flexible Algorithm Affinities](#).

Step 1 From the main menu, choose **Traffic Engineering > Traffic Engineering > SR-MPLS** tab.

Step 2 From the **SR Policy** table, click + **Create**.

Step 3 Under **Policy Details**, enter or select the required SR-MPLS policy values. Hover the mouse pointer over  to view a description of each field.

Tip If you have set up device groups, you can select the device group from the **Device Groups** drop-down menu. Then navigate and zoom in on the topology map to click the device for headend or endpoint selection.

Step 4 Under **Policy Path**, click **Dynamic Path** and enter a path name.

Step 5 Under **Optimization Objective**, select the metric you want to minimize.

Step 6 Define any applicable constraints and disjointness.

Note

- Affinity constraints and disjointness cannot be configured on the same SR-MPLS policy. Also, there cannot be more than two SR-MPLS policies in the same disjoint group or subgroup. The configuration will not be allowed during Preview.
- If there are existing SR-MPLS policies belonging to a disjoint group that you define here, all SR-MPLS policies that belong to that same disjoint group are shown during Preview.

Step 7 Under **Segments**, select whether or not protected segments should be used when available.

Step 8 If applicable, enter a SID constraint in the **SID Algorithm** field. Cisco Crosswork will try to find a path with this SID. If a path with the SID constraint cannot be found, the provisioned policy will remain operationally down until the conditions are met.

Note

- Flexible Algorithm: The values correspond to the Flexible Algorithm that are defined on the device and the 128-255 range is enforced by Cisco IOS XR.
- Algorithm 0: This is a Shortest Path First (SPF) algorithm based on link metric. This shortest path algorithm is computed by the Interior gateway protocol (IGP).
- Algorithm 1: This is a Strict Shortest Path First (SSPF) algorithm based on link metric. The algorithm 1 is identical to algorithm 0 but requires that all nodes along the path honor the SPF routing decision. Local policy does not alter the forwarding decision. For example, a packet is not forwarded through locally engineered path.

Step 9 Click **Preview**. The path is highlighted on the map.

Step 10 If you want to commit the policy path, click **Provision**.

Step 11 Validate the SR-MPLS policy creation:

- a. Confirm that the new SR-MPLS policy appears in the SR Policy table. You can also click the check box next to the policy to see it highlighted in the map.

Note The newly provisioned SR-MPLS policy may take some time, depending on the network size and performance, to appear in the **SR Policy** table. The **SR Policy** table is refreshed every 30 seconds.

- b. View and confirm the new SR-MPLS policy details. From the **SR Policy** table, click and select **View**.

Note On a scaled setup with high node, policy, or interface counts, a timeout may occur during policy deployment. To configure timeout options, see [Configure TE Timeout Settings](#).

Modify SR-MPLS Policies

To view, modify, or delete an SR-MPLS policy, do the following:

Step 1 From the main menu, choose **Traffic Engineering > Traffic Engineering > SR-MPLS** tab.

Step 2 From the SR Policy table, locate the SR-MPLS policy you are interested in and click .

Step 3 Choose **View** or **Edit/Delete**.

- Note**
- You can only modify or delete SR-MPLS policies that have been created with the UI.
 - After updating the SR-MPLS policy details, you can preview the changes on the map before saving it.
