THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCB's public domain version of the UNIX operating system. All rights reserved. Copyright © 1981, Regents of the University of California.

NOTWITHSTANDING ANY OTHER WARRANTY HEREIN, ALL DOCUMENT FILES AND SOFTWARE OF THESE SUPPLIERS ARE PROVIDED "AS IS" WITH ALL FAULTS. CISCO AND THE ABOVE-NAMED SUPPLIERS DISCLAIM ALL WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THOSE OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Any Internet Protocol (IP) addresses and phone numbers used in this document are not intended to be actual addresses and phone numbers. Any examples, command display output, network topology diagrams, and other figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses or phone numbers in illustrative content is unintentional and coincidental.

All printed copies and duplicate soft copies of this document are considered uncontrolled. See the current online version for the latest version.

Cisco has more than 200 offices worldwide. Addresses and phone numbers are listed on the Cisco website at www.cisco.com/go/offices.

The documentation set for this product strives to use bias-free language. For purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. Exceptions may be present in the documentation due to language that is hardcoded in the user interfaces of the product software, language used based on standards documentation, or language that is used by a referenced third-party product.

Cisco and the Cisco logo are trademarks or registered trademarks of Cisco and/or its affiliates in the U.S. and other countries. To view a list of Cisco trademarks, go to this URL: <https://www.cisco.com/c/en/us/about/legal/trademarks.html>. Third-party trademarks mentioned are the property of their respective owners. The use of the word partner does not imply a partnership relationship between Cisco and any other company. (1721R)

CHAPTER 1

Overview

Cisco Data Center Network Manager (DCNM) is a management system for Cisco NXOS-based storage fabrics. In addition to provisioning, monitoring, and troubleshooting the data center network infrastructure, the Cisco DCNM provides a comprehensive feature-set that meets the routing, switching, and storage administration needs of data centers. It streamlines the provisioning for the Programmable Fabric and monitors the SAN components.

Cisco DCNM provides a high level of visibility and control through a single web-based management console for Cisco Nexus Series Switches, Cisco MDS, and Cisco Unified Computing System (UCS) products. Cisco DCNM also includes Cisco DCNM-SAN client and Device Manager functionality.

This section contains the following sections:

- [Introduction, on page 1](#)
- [Installation Options, on page 2](#)
- [Deployment Options, on page 2](#)
- [root and sysadmin User Privileges, on page 3](#)
- [Upgrading to Cisco DCNM Release 11.5\(2\), on page 4](#)

Introduction

Cisco DCNM provides an alternative to the command-line interface (CLI) for switch configuration commands.

Cisco DCNM Release 11.5(2) offers a Software Maintenance Update (SMU) that can be applied only on top of the DCNM Release 11.5(1) for the OVA/ISO/Appliance form factor. The DCNM LAN Fabric 11.5(2) release is the first release version that supports Cisco Nexus Insights, Release 5.1 or higher, with Cisco Nexus Dashboard, Release 2.0.2 or higher.

Cisco DCNM includes these management applications:

Cisco DCNM Web UI

Cisco DCNM Web UI allows operators to monitor and obtain reports for Cisco MDS and Nexus events, performance, and inventory from a remote location using a web browser. Licensing and discovery are part of the Cisco DCNM Web UI.

Performance Manager

Performance Manager presents detailed traffic analysis by capturing data with SNMP. This data is compiled into various graphs and charts that can be viewed on the Cisco DCNM Web UI.

Installation Options

Cisco DCNM software images are packaged with the Cisco DCNM installer, signature certificate, and signature verification script. Unzip the desired Cisco DCNM installer image ZIP file to a directory. Verify the image signature by following the steps in the README file. The installer from this package installs the Cisco DCNM software.

DCNM Open Virtual Appliance (OVA) Installer

This installer is available as an Open Virtual Appliance file (.ova). The installer contains a pre-installed OS, DCNM, and other applications needed for programmable fabric.

DCNM ISO Virtual Appliance (ISO) Installer

This installer is available as an ISO image file (.iso). The installer is a bundle of OS, DCNM, and other applications needed for dynamic fabric automation.

Note If you are installing Cisco DCNM on SE, install the DCNM ISO Virtual Appliance (.iso) installer.

Deployment Options

You can deploy the Cisco DCNM installer in one of the following modes:

Supported Latency

The supported latency for Cisco DCNM LAN Fabric deployment is defined below:

- Between Native HA Primary and Secondary appliances, latency is 50ms.
- Between DCNM Native HA Primary appliance to Switches, latency is 50ms.
- Between DCNM Computes latency is 50ms.

Standalone Server

All types of installers are packaged along with PostgreSQL database. The default installation steps for the respective installers result in this mode of deployment.

Note We recommend that you deploy Cisco DCNM in Native HA Mode.

High Availability for Virtual Appliances

You can deploy the DCNM Virtual appliances, both OVA and ISO, in High Availability mode to have resilience in case of application or OS failures.

DCNM Computes

Compute nodes are scale out application hosting nodes that run resource-intensive services to provide services to the larger Fabric. When compute nodes are added, all services that are containers, run only on these nodes. This includes Config Compliance, Endpoint Locator, and Virtual Machine Manager.

DCNM in Clustered Mode

In a clustered mode, the Cisco DCNM Server with more compute nodes provides an architecture to expand resources, as you deploy more applications. The DCNM Servers do not run containerized applications. All applications that work in unclustered mode works in the clustered mode, also.

DCNM in Unclustered Mode

In unclustered mode, the Cisco DCNM runs some of its internal services as containers. Cisco DCNM leverages resources from the Standby node for running some containers applications. The Cisco DCNM Active and Standby nodes work together to extend resources to the overall functionality and deployment of DCNM and its applications. However, it has limited resources to run some of the advanced applications and to extend the system to deploy more applications delivered through the Cisco AppCenter.

root and sysadmin User Privileges

The following table summarizes the user privileges differences between DCNM 11.5 and previous releases.

Note This is applicable to Cisco DCNM OVA/ISO deployments only.

Description	Functionality in DCNM 11.5 Release	Functionality in DCNM 11.4(1) and 11.3(1) Releases	Remarks
su command	Requires local root password. sysadmin user can't run sudo su command	Requires sysadmin password su is an alias for sudo su	The su command requires the local password even when the remote authentication is configured.
appmgr change_pwd ssh root command	Only root user can run this command.	sysadmin can also run this command.	-
appmgr root-access {permit deny ...} command	Only root user can run this command	sysadmin user can also run this command	-
appmgr remote-auth command	Only root user can run this command	Not available	-
Other appmgr commands	root or sysadmin user can run these commands	root or sysadmin user can run these commands	-

Upgrading to Cisco DCNM Release 11.5(2)

The following table summarizes the type of upgrade that you must follow to upgrade to Release 11.5(2).

Current Release Number	Deployment Type	Upgrade type to upgrade to Release 11.5(2)
11.5(1)	LAN Fabric	Software Maintenance Upgrade (SMU) version 11.5(2) Note SMU version 11.5(2) is required to use Cisco Nexus Insights Release 5.1

CHAPTER 2

Guidelines and Limitations

- [Guidelines and Limitations, on page 5](#)
- [Checking TPM Partition before Converting DCNM-SE to Nexus Dashboard, on page 7](#)

Guidelines and Limitations

The guidelines and limitations for installing and upgrading Cisco DCNM are as follows:

General Guidelines and Limitations

- Adhere to the following password requirements. If you do not comply with the requirements, the DCNM application might not function properly:
 - It must be at least 8 characters long and contain at least one alphabet and one numeral.
 - It can contain a combination of alphabets, numerals, and special characters.
 - Do not use any of these special characters in the DCNM password: <SPACE> " & \$ % ' ^ = < > ; : ` \ | / , *`
 - From Cisco DCNM Release 11.0(1), the characters that are allowed in the Administrative password is restricted for OVA and ISO installations. Therefore while upgrading, the old password used in DCNM 11.0(1) or 11.1(1) is not valid. However, different passwords are allowed during Upgrade.

The new Administrative password that is entered is used in the following scenarios.

—accessing the DCNM appliance via its console.

—accessing the appliance via SSH

—for applications running on the appliance, e.g. Postgres DBMS

However, after the upgrade, since Postgres DBMS is restored from the backup that is taken on DCNM 10.4(2), you must logon to the Cisco DCNM Web UI using the password used on DCNM Release 10.4(2) appliance.

- Do not interrupt the boot process (such as pressing the Ctrl+ALT + DELETE keys) when installing DCNM. If you interrupt, you must restart the installation process.
- Ensure that you configure the timezone after installation or upgrade, before performing any other operations on the Cisco DCNM Appliance. Use the NTP server for configuring timezones.

- To check the status of the running Postgres database in Native HA setup, use **pg_ctl** command. Do not use the **systemctl** command.
- Do not begin the password with Hash (#) symbol. Cisco DCNM considers the password as an encrypted text if it begins with # symbol.
- We recommend that you do not upgrade any underlying third-party software separately. All the necessary software components will be updated during the inline upgrade procedure. Upgrading the components outside of DCNM upgrade will cause performance issues.

Fresh Installation

- For Virtual Appliances (OVA/ISO), the installer installs the Operating system and Cisco DCNM components.
- The DCNM OVA cannot be deployed by connecting the vSphere client directly to the ESXi server.

Upgrade

- Ensure that you do not perform inline upgrade from an SSH session. The session may timeout and result in an incomplete upgrade.
- Disable Telemetry in the earlier release before you upgrade to Cisco DCNM Release .
- Disable Telemetry before you deploy Compute Nodes. You can enable Telemetry after deploying compute nodes.

For DCNM in Native HA mode, Telemetry is supported with 3 compute nodes only.

- If you need to run Network Insights applications, you must install 3 compute nodes.
- Disable Telemetry before modifying Interface settings. You can enable Telemetry after modifying the settings.
- During a backup and restore process, the compute nodes are also included in the backup. After you deploy the new compute, you can restore the backup on the compute node.

If there was no backup, disconnect the 3 compute nodes, and erase the data on all the compute nodes. On the Cisco DCNM Web Client UI, navigate to **Application > Compute**. Select the + icon to join the compute nodes.

- To erase data on the compute node, logon to the compute node through an SSH session and erase the data using the **rm -rf /var/afw/vols/data** command.

Note You must run the above command separately on all compute nodes to erase data.

- Before starting NIR application after upgrade, on the DCNM Web UI, choose **Application > Preferences**. Modify the network settings as required. If you do not modify the network settings after upgrade before you enable the Telemetry on the Fabrics, the configuration will not complete. You must stop the NIR app, modify the network settings and start the app again, to resolve the issue.

Checking TPM Partition before Converting DCNM-SE to Nexus Dashboard

A few Cisco Application Services Engine (SE) nodes that was factory pre-installed with DCNM 11.5(2) or earlier may have a corrupted TPM partition. This causes the installation of Cisco Nexus Dashboard software to fail. You must check the TPM Partition before upgrading from Cisco DCNM-SE to Cisco Nexus Dashboard.

Note TPM is not a requirement for DCNM 11.x releases. Therefore, this issue does not affect existing DCNM 11.x functionality of the device, even if the device is affected by this issue. No further action is required until you decide to upgrade to Cisco Nexus Dashboard.

To identify if your Cisco DCNM-SE is affected by this issue, perform the following steps:

Procedure

Step 1 SSH to Cisco Application Services Engine using **sysadmin** user.

Step 2 Run the following command to view the list of models and their vendors.

lsblk-S

```
[root@dcnm-se-active sysadmin]$ lsblk -S
NAME HCTL TYPE VENDOR MODEL REV TRAN
...
sdc 0:2:2:0 disk Cisco UCSC-RAID12G-2GB 5.10
sdd 0:2:3:0 disk Cisco UCSC-RAID12G-2GB 5.10
sde 0:2:4:0 disk Cisco UCSC-RAID12G-2GB 5.10
sdf 7:0:0:0 disk UNIGEN PQT8000 1100 usb /*identifying device from
UNIGEN Vendor*/
sdg 8:0:0:0 disk UNIGEN PHF16H0CM1-ETG PMAP usb
sdl 1:0:0:0 disk ATA Micron_5100_MTFD H072 sata
...
```

Applications Services Engine from **UNIGEN** vendor is detected with device name **sdf**.

Step 3 Run the following command to view the partitions in the disk.

lsblk -s or lsblk

• Example1

The following example shows functioning TPM disk with two partitions sdf1 and sdf2. This can be installed with Cisco Nexus Dashboard software with no issues.

```
[root@dcnm-se-active sysadmin]$ lsblk
NAME MAJ:MIN RM SIZE RO TYPE MOUNTPOINT
...
sdc 8:32 0 2.2T 0 disk
sdd 8:48 0 2.2T 0 disk
sde 8:64 0 371.6G 0 disk
sdf 8:80 1 7.7G 0 disk /*functioning TPM with partition*/
|--sdf1 8:81 1 60M 0 part
|--sdf2 8:82 1 3.7G 0 part
nvme0n1 259:0 0 1.5T 0 disk
```

```

|--nvme0n1p1          259:1    0   1.5T  0 part
|--flashvg-flashvol 253:3    0   1.5T  0 lvm  /var/afw/vols/data/flash
...

```

• Example2

The following example shows defective or corrupted TPM disk with no partitions defined on device **sdf**. This unit cannot be used to install Cisco Nexus Dashboard software, and must be replaced.

```

[root@dcnm-se-active sysadmin]$ lsblk
NAME                                MAJ:MIN RM   SIZE RO TYPE MOUNTPOINT
...
sdc                                 8:32   0   2.2T  0 disk
sdd                                 8:48   0   2.2T  0 disk
sde                                 8:64   0  371.6G  0 disk
sdf                                8:80   1    16G  0 disk /*corrupted TPM without partition*/
nvme0n1                             259:0   0   1.5T  0 disk
 |--nvme0n1p1                       259:1   0   1.5T  0 part
 |--flashvg-flashvol                253:3   0   1.5T  0 lvm  /var/afw/vols/data/flash
...

```

Step 4 If your device has a TPM disk with no partitions, contact Cisco Technical Assistance Center (TAC) to initiate RMA and replace the device.

No further action is required if your TPM has partitions.

CHAPTER 3

Prerequisites

This chapter provides release-specific prerequisites information for your deployment of *Cisco Data Center Network Manager*.

- [Prerequisites for DCNM Open Virtual Appliance, on page 9](#)
- [Prerequisites for DCNM ISO Virtual Appliance, on page 10](#)
- [Prerequisites for Cisco DCNM Virtual Appliance HA, on page 10](#)

Prerequisites for DCNM Open Virtual Appliance

Before you install the Cisco DCNM Open Virtual Appliance, you will need to meet following software and database requirements:

- VMware vCenter Server that is running on a Windows server (or alternatively, running as a virtual appliance).
- VMware ESXi host imported into vCenter.
- Three port groups on the ESXi host—DCNM Management Network, Enhanced Fabric Management Network, and InBand interface for EPL and Telemetry features.
- Determine the number of switches in your Cisco Programmable Fabric that will be managed by the Cisco DCNM Open Virtual Appliance.
- Ensure that no anti-virus software (such as McAfee) is running on the host where the VMware vCenter web client is launched for the DCNM OVA installation. If the anti-virus software is running, the DCNM installation might fail.
- The DCNM Open Virtual Appliance is compatible to be deployed in ESXi host as well. For deploying in the ESXi host, VMware vSphere Client application is mandatory.

Note For more information about the CPU and memory requirements, see the *Server Resource Requirements* section of the Cisco DCNM Release Notes, Release .

Prerequisites for DCNM ISO Virtual Appliance

Ensure that you do not add an additional Active or Standby node to an existing Active-Standby Native HA DCNM Appliance. The installation fails.

You have to set up the host or the hypervisor before you install the Cisco DCNM ISO Virtual Appliance. Based on the requirement, set up the setup Host machine or Hypervisor based on CPU and Memory requirement.

Note For more information about the CPU and memory requirements, see the *Server Resource Requirements* section of the *Cisco DCNM Release Notes*.

You can set up one of the following hosts to install the DCNM ISO Virtual Appliance.

VMware ESXi

The host machine is installed with ESXi and two port groups are created—one for EFM network and the other for DCNM Management network. Enhanced Fabric In-Band network is optional.

Kernel-based Virtual Machine (KVM)

The host machine is installed with Red Hat Enterprise Linux (RHEL) 5.x or 6.x or 7.x, with KVM libraries and Graphical User Interface (GUI) access. The GUI allows you to access the Virtual Machine Manager, to deploy and manage the Cisco DCNM Virtual Appliances. Two networks are created—EFM network and DCNM Management network. Typically, the DCNM management network is bridged to gain access from other subnets. Refer the KVM documentation on how to create different types of networks.

Note KVM on other platforms like CentOS or Ubuntu will not be supported as it increases the compatibility matrix.

Prerequisites for Cisco DCNM Virtual Appliance HA

This section contains the following topics that describe the prerequisites for obtaining a high-availability (HA) environment.

Deploying Cisco DCNM Virtual Appliances in HA mode

You must deploy two standalone Virtual Appliance (OVA and ISO). When you deploy both Virtual Appliances, you must meet the following criteria:

- The eth0 of the active OVA must be in the same subnet as eth0 of the standby Virtual Appliance. The eth1 of the active Virtual Appliance must be in the same subnet as eth1 of the standby OVA. The eth2 of the active virtual appliance must be in the same subnet as the eth2 of the standby appliance.
- Both Virtual Appliances must be deployed with the same administrative password. This process ensures that both Virtual Appliances are duplicates of each other.

- If you try to add an additional Active or Standby node to an existing Active-Standby Native HA DCNM Appliance, the installation fails.

Availability of Virtual IP Addresses

Two free IP addresses are needed to set up the server eth0 and eth1 interfaces. However, eth2 IP address is optional. The first IP address will be used in the management access network; it should be in the same subnet as the management access (eth0) interface of the OVAs. The second IP address should be in the same subnet as enhanced fabric management (eth1) interfaces (switch/POAP management network).

If you choose to configure inband management (eth2) for the DCNM Server, you must reserve another IP Address. For Native HA setup, the eth2 interface on Primary and Secondary servers must be in same subnet.

Installing an NTP Server

For most of the HA functionality to work, you must synchronize the time on both OVAs by using an NTP server. The installation would typically be in the management access network (eth0) interfaces.

CHAPTER 4

Upgrading Cisco DCNM

This chapter provides information about upgrading Cisco DCNM, and contains the following section:

- [Upgrading to Cisco DCNM Release 11.5\(2\), on page 13](#)

Upgrading to Cisco DCNM Release 11.5(2)

The following table summarizes the type of upgrade that you must follow to upgrade to Release 11.5(2).

Current Release Number	Deployment Type	Upgrade type to upgrade to Release 11.5(2)
11.5(1)	LAN Fabric	Software Maintenance Upgrade (SMU) version 11.5(2) Note SMU version 11.5(2) is required to use Cisco Nexus Insights Release 5.1

CHAPTER 5

Installing Software Maintenance Update

- [Software Maintenance Update \(SMU\) version 11.5\(2\) on Cisco DCNM 11.5\(1\) to use Network Insights Applications](#), on page 15

Software Maintenance Update (SMU) version 11.5(2) on Cisco DCNM 11.5(1) to use Network Insights Applications

Cisco DCNM Release 11.5(2) offers a Software Maintenance Update (SMU) that can be applied only on top of the DCNM Release 11.5(1) for the OVA/ISO/Appliance form factor. The DCNM LAN Fabric 11.5(2) release is the first release version that supports Cisco Nexus Insights, Release 5.1 or higher, with Cisco Nexus Dashboard, Release 2.0.2 or higher.

After installing Cisco DCNM, you can download and install various applications from the Cisco App Center.

To download, add, start, stop, and delete applications from the Cisco DCNM Web UI, choose **Applications > Catalog > Browse App Center**. Refer to [Installing and Deploying Applications](#) for instructions.

Note SMU version 11.5(2) is supported with Cisco DCNM Release 11.5(1) only.

Cisco DCNM allows you to upload the NI 5.1 application without the maintenance update. However, you cannot start the application. An error appears asking you to install the SMU before using the NI 5.1 applications.

Note Only a **root** user must install the SMU version 11.5(2) on Cisco DCNM Release 11.5(1).

For information about SMU version 11.5(2), refer to [Cisco DCNM Release Notes, Release 11.5\(2\)](#).

This chapter contains the following sections:

Installing SMU version 11.5(2) on Cisco DCNM 11.5(1) Standalone Deployment

To apply the Software Maintenance Update (SMU) on Cisco DCNM LAN Fabric installation in Standalone deployment mode, perform the following steps:

Before you begin

- Ensure that Cisco DCNM 11.5(1) appliance is operational.
- Take a backup of the application data using the **appmgr backup** command.

```
dcnm# appmgr backup
```

Copy the backup file to a safe location outside the DCNM server.

- If Cisco DCNM appliance is installed in VMware environment, ensure that you take a snapshot of the virtual machine. For instructions, refer to [VMware Snapshot Support for Cisco DCNM](#).
- Ensure that you plan for a maintenance window to install SMU version 11.5(2).

Procedure**Step 1**

Download the SMU file.

- Go to the following site: <http://software.cisco.com/download/>.

A list of the latest release software for Cisco DCNM available for download is displayed.

- In the Latest Releases list, choose Release 11.5(2).
- Locate **DCNM 11.5(2) Maintenance Update for VMWare, KVM, Bare-metal, and Appliance servers** file, and click **Download** icon.
- Save the **dcnm-va-patch.11.5.2.iso.zip** file to your directory that is easy to find when you start to apply the SMU.

Step 2

Unzip the **dcnm-va-patch.11.5.2.iso.zip** file and upload the file to the **/root/** folder of the DCNM setup.

Step 3

Log on to the Cisco DCNM appliance using SSH as a **sysadmin** user.

Run the **su** command to enable **root** user.

```
dcnm# su
Enter the root password:
[root@dcnm]#
```

Step 4

Run the following command to create a screen session.

```
[root@dcnm]# screen
```

This creates a session which allows you to execute the commands. The commands continue to run even when the window is not visible or if you get disconnected.

Step 5

Create a folder named **iso** using the **mkdir -p /mnt/iso** command.

```
[root@dcnm]# mkdir -p /mnt/iso
```

Step 6

Mount the DCNM SMU version 11.5(2) file in the **/mnt/iso** folder.

```
[root@dcnm]# mount -o loop dcnm-va-patch.11.5.2.iso /mnt/iso
```

Step 7

Navigate to **/scripts/** directory.

```
[root@dcnm]# cd /mnt/iso/packaged-files/scripts/
```

Step 8

Run the **./inline-upgrade.sh** script.

```
[root@dcnm]# ./inline-upgrade.sh
```

Note After the SMU is installed successfully, the DCNM process restarts. This results in a momentary loss of access to the DCNM Web UI.

Step 9 Ensure the DCNM application is functional, by using the **appmgr status all** command.

```
[root@dcnm]# appmgr status all
```

Step 10 Terminate the **screen** session, by using the **exit** command.

```
[root@dcnm]# exit
```

Step 11 Unmount the **dcnm-va-patch.11.5.2.iso** file from the DCNM setup.

Note You must terminate the **screen** session before unmounting the SMU file.

```
[root@dcnm]# umount /mnt/iso
```

What to do next

Log on to the DCNM Web UI with appropriate credentials. The version shows 11.5(2) on the login screen.

Note If you try to install the maintenance update again, a note appears stating that the patch is already applied on the Cisco DCNM.

You can now start the NI 5.1 applications on the Cisco DCNM Web UI. Refer to [Installing and Deploying Applications](#) for instructions.

Installing SMU version 11.5(2) on Cisco DCNM 11.5(1) Native HA Deployment

To apply the Software Maintenance Update (SMU) on Cisco DCNM LAN Fabric installation in Native HA deployment mode, perform the following steps:

Before you begin

- Ensure that both the Cisco DCNM 11.5.(1) Active and Standby peers are up and running.

To apply this software maintenance update on Cisco DCNM Virtual Appliance in Native HA Mode, apply this update on the Active appliance. Wait until the role of the Active appliance is Active again. Apply the update on the Standby appliance, later.

- Check and ensure that the Active and Standby servers are operational, using the **appmgr show ha-role** command.

Example:

On the Active node:

```
dcnm1# appmgr show ha-role
Native HA enabled.
Deployed role: Active
Current role: Active
```

On the Standby node:

```
dcnm2# appmgr show ha-role
Native HA enabled.
Deployed role: Standby
Current role: Standby
```

- Take a backup of the application data using the **appmgr backup** command on both Active and Standby appliances.

```
dcnm1# appmgr backup
dcnm2# appmgr backup
```

Copy the backup file to a safe location outside the DCNM server.

- If Cisco DCNM appliance is installed in VMware environment, ensure that you take a snapshot of the virtual machine. For instructions, refer to [VMware Snapshot Support for Cisco DCNM](#).
- Ensure that you plan for a maintenance window to install SMU version 11.5(2).

Procedure

Step 1 Download the SMU file.

- Go to the following site: <http://software.cisco.com/download/>.

A list of the latest release software for Cisco DCNM available for download is displayed.

- In the Latest Releases list, choose Release 11.5(1).
- Locate **Software Maintenance Update (SMU) version 11.5(2)** file and click **Download** icon.
- Save the **dcnm-va-patch.11.5.2.iso.zip** file to your directory that is easy to find when you start to apply the SMU.

Step 2 Unzip the **dcnm-va-patch.11.5.2.iso.zip** file and upload the file to the `/root/` folder in both Active and Standby node of the DCNM setup.

Note For example, let us indicate Active and Standby appliances as **dcnm1** and **dcnm2** respectively.

Step 3 Log on to the Cisco DCNM appliance using SSH as a **sysadmin** user.

Run the **su** command to enable **root** user.

```
dcnm1# su
Enter the root password:
[root@dcnm1]#

dcnm2# su
Enter the root password:
[root@dcnm2]#
```

Step 4 Run the following command to create a screen session.

```
[root@dcnm1]# screen
[root@dcnm2]# screen
```

This creates a session which allows you to execute the commands. The commands continue to run even when the window is not visible or if you get disconnected.

Step 5 On the Active node, install the SMU version 11.5(2).

- a) Create a folder named **iso** using the **mkdir /mnt/iso** command.

```
[root@dcnm1]# mkdir -p /mnt/iso
```

- b) Mount the SMU version 11.5(2) file on the Active node in the `/mnt/iso` folder.

```
[root@dcnm1]# mount -o loop dcnm-va-patch.11.5.2.iso /mnt/iso
```

- c) Navigate to `/scripts/` directory.

```
[root@dcnm1]# cd /mnt/iso/packaged-files/scripts/
```

- d) Run the `./inline-upgrade.sh` script.

```
[root@dcnm1]# ./inline-upgrade.sh
```

Note After the SMU is installed successfully, the DCNM process restarts. This results in a momentary loss of access to the DCNM Web UI.

- e) Ensure the DCNM application is functional, by using the **appmgr status all** command.

```
[root@dcnm1]# appmgr status all
```

Note Ensure that all the services are up and running on the Cisco DCNM Active node before proceeding to apply SMU on the Standby node.

Step 6 On the Standby node, install the SMU version 11.5(2).

- a) Create a folder named **iso** using the **mkdir /mnt/iso** command.

```
[root@dcnm2]# mkdir -p /mnt/iso
```

- b) Mount the SMU version 11.5(2) file on the Standby node in the `/mnt/iso` folder.

```
[root@dcnm2]# mount -o loop dcnm-va-patch.11.5.2.iso /mnt/iso
```

- c) Navigate to `/scripts/` directory.

```
[root@dcnm2]# cd /mnt/iso/packaged-files/scripts/
```

- d) Run the `./inline-upgrade.sh` script.

```
[root@dcnm2]# ./inline-upgrade.sh --standby
```

- e) Ensure the DCNM application is functional, by using the **appmgr status all** command.

```
[root@dcnm2]# appmgr status all
```

Step 7 Terminate the **screen** session, by using the **exit** command.

```
[root@dcnm1]# exit
```

```
[root@dcnm2]# exit
```

Step 8 Unmount the `dcnm-va-patch.11.5.2.iso` file in both Active and Standby node of the DCNM setup.

Note You must terminate the **screen** session before unmounting the SMU file.

```
[root@dcnm1]# umount /mnt/iso
```

```
[root@dcnm2]# umount /mnt/iso
```

What to do next

Log on to the DCNM Web UI with appropriate credentials. The version shows 11.5(2) on the login screen.

Note If you try to install the maintenance update again, a note appears stating that the patch is already applied on the Cisco DCNM.

You can now start the NI 5.1 applications on the Cisco DCNM Web UI. Refer to [Installing and Deploying Applications](#) for instructions.

Installing SMU version 11.5(2) on Cisco DCNM 11.5(1) Compute Nodes

To apply the maintenance update to use NI 5.1 applications with Cisco DCNM LAN Fabric installation on the Compute Nodes, perform the following steps:

Before you begin

- Ensure that both the Cisco DCNM 11.5.1(1) Active and Standby peers, and all Compute nodes are operational.
- Ensure that you have installed the SMU version 11.5(2) on both Active and Standby appliances.
For instructions, refer to [Installing SMU version 11.5\(2\) on Cisco DCNM 11.5\(1\) Native HA Deployment, on page 17](#).
- Ensure that you plan for a maintenance window to install SMU version 11.5(2).

Procedure

-
- Step 1** Download the SMU file.
- Go to the following site: <http://software.cisco.com/download/>.
A list of the latest release software for Cisco DCNM available for download is displayed.
 - In the Latest Releases list, choose Release 11.5(1).
 - Locate **Software Maintenance Update (SMU) version 11.5(2)** file and click **Download** icon.
 - Save the **dcnm-va-patch.11.5.2.iso.zip** file to your directory that is easy to find when you start to apply the SMU.
- Step 2** Unzip the `dcnm-va-patch.11.5.2.iso.zip` file and upload the file to the `/root/` folder on all the Compute Nodes in the DCNM setup.
- Note** For example, let us indicate the 3 compute nodes as **dcnm-compute1**, **dcnm-compute2**, and **dcnm-compute3** respectively.
- Step 3** Log on to the Cisco DCNM Compute node using SSH as a **sysadmin** user.
- Run the **su** command to enable **root** user.
- ```
dcnm-compute1# su
Enter the root password:
[root@dcnm-compute1]#
```

```
dcnm-compute2# su
Enter the root password:
[root@dcnm-compute2]#

dcnm-compute3# su
Enter the root password:
[root@dcnm-compute3]#
```

**Step 4** Run the following command to create a screen session.

```
[root@dcnm-compute1]# screen
[root@dcnm-compute2]# screen
[root@dcnm-compute3]# screen
```

This creates a session which allows you to execute the commands. The commands continue to run even when the window is not visible or if you get disconnected.

**Step 5** On Compute Node1, apply the SMU version 11.5(2).

a) Create a folder named **iso** using the **mkdir /mnt/iso** command.

```
[root@dcnm-compute1]# mkdir -p /mnt/iso
```

b) Mount the DCNM SMU version 11.5(2) file in the **/mnt/iso** folder.

```
[root@dcnm-compute1]# mount -o loop dcnm-va-patch.11.5.2.iso /mnt/iso
```

c) Navigate to **/scripts/** directory.

```
[root@dcnm-compute1]# cd /mnt/iso/packaged-files/scripts/
```

d) Run the **./inline-upgrade.sh** script.

```
[root@dcnm-compute1]# ./inline-upgrade.sh
```

**Note** After the SMU is installed successfully, the Compute node restarts.

**Step 6** Execute the instructions in [Step 5, on page 21](#) on Compute Node2 and Compute Node3 to apply the SMU version 11.5(2).

**Step 7** Terminate the **screen** session, by using the **exit** command.

```
[root@dcnm-compute1]# exit
[root@dcnm-compute2]# exit
[root@dcnm-compute3]# exit
```

**Step 8** Unmount the **dcnm-va-patch.11.5.2.iso** file on all the Compute Nodes, by using the **umount /mnt/iso** command.

**Note** You must terminate the **screen** session before unmounting the patch file.

```
[root@dcnm-compute1]# umount /mnt/iso
[root@dcnm-compute2]# umount /mnt/iso
[root@dcnm-compute3]# umount /mnt/iso
```

**What to do next**

Log on to the DCNM Web UI with appropriate credentials.

Choose **Applications > Compute**. The Compute IP status shows **Joined**.

---

**Note** If you try to install the SMU again, a note appears stating that the SMU is already applied on the Cisco DCNM.

---

## CHAPTER 6

# Deployment Best Practices

- [Best Practices for Deploying Cisco DCNM and Computes, on page 23](#)

## Best Practices for Deploying Cisco DCNM and Computes

This chapter describes the document best practices to deploy Cisco DCNM OVA and ISO in clustered and unclustered modes. The following sections explain the recommended design for configurations of IP addresses and relevant IP pools during the Cisco DCNM installation.

The Cisco DCNM OVA or the ISO installation consists of 3 network interfaces:

- dcnm-mgmt network (eth0) interface

This network provides connectivity (SSH, SCP, HTTP, HTTPS) to the Cisco DCNM.

- enhanced-fabric-mgmt (eth1) interface

This network provides enhanced fabric management of Cisco Nexus switches through the out-of-band or mgmt0 interface.

- enhanced-fabric-inband (eth2) interface

This network provides in-band connection to the fabric through the front-panel ports. This network interface is used for applications such as Endpoint Locator (EPL) and Network Insights Resources (NIR).

The following figure shows the network diagram for the Cisco DCNM management interfaces.

## Guidelines to Use the Best Practices

The following are the guidelines to remember while you use the best practices for deploying DCNM and Computes.

- The IP addresses specified in this document are sample addresses. Ensure that your setup reflects the IP addresses used in the production network.
- Ensure that the eth2 interface subnet is different from the subnet that is associated with the eth0 interface and the eth1 interface.
- As eth0 and eth1 interfaces are both on the same subnet, the DHCP returns the same IP address, two responses but same for both queries.
- Cisco DCNM Native HA consists of two Cisco DCNM appliances, that run as Active and Standby applications. The embedded databases of both Active and Standby appliances are synchronized in real time. The eth0, eth1, and eth2 interfaces of the Cisco DCNM and Compute nodes, in a clustered mode, must be Layer-2 adjacent.
- For information about Cluster Mode in your Cisco DCNM Deployment, refer to [Applications](#) chapter in the *Cisco DCNM Configuration Guide* for your deployment type.

## Deployments for Redundancy in Cisco DCNM

This section describes the recommended deployments for redundancy of DCNM operations. As a general assumption, the DCNM and the compute nodes are installed as Virtual Machines. During Cisco DCNM ISO installation on Virtual Appliance on UCS (Bare Metal), all DCNMs and computes have their own individual servers.

### Deployment 1: Minimum Redundancy Configuration

The recommended configuration for minimum redundancy in a Cisco DCNM Cluster mode installation is as follows:

- DCNM Active Node and Compute Node 1 in Server 1
- DCNM Standby Node and Compute Node 2 in Server 2
- Compute Node 3 in Server 3
- Compute VMs deployed on an exclusive disk
- No oversubscription of memory or CPU of the physical servers

*Figure 1: Cisco DCNM Cluster Mode: Physical Server to VM Mapping*

### Deployment 2: Maximum Redundancy Configuration

The recommended configuration for maximum redundancy in a DCNM Cluster mode installation is as follows:

- DCNM Active Node(Active) in Server 1
- DCNM Standby Node in Server 2
- Compute Node 1 in Server 3
- Compute Node 2 in Server 4
- Compute Node 3 in Server 5

*Figure 2: Cisco DCNM Cluster Mode: Physical Server to VM Mapping*

## IP Address Configurations in Cisco DCNM

This section describes the best practices and recommended deployments for IP address configurations of all interfaces of the Cisco DCNM and Compute nodes.

### Scenario 1: All 3 Ethernet Interfaces are in Different Subnets

In this scenario, consider all three Ethernet interfaces of DCNM on different subnets.

For example:

- eth0 – 172.28.8.0/24
- eth1 – 10.0.8.0/24
- eth2 – 192.168.8.0/24

The possible deployments are as follows:

- [Cisco DCNM Unclustered mode, on page 26](#)
- [Cisco DCNM Clustered Mode, on page 27](#)

### Cisco DCNM Unclustered mode

*Figure 3: Cisco DCNM Standalone Deployment without Compute Cluster*

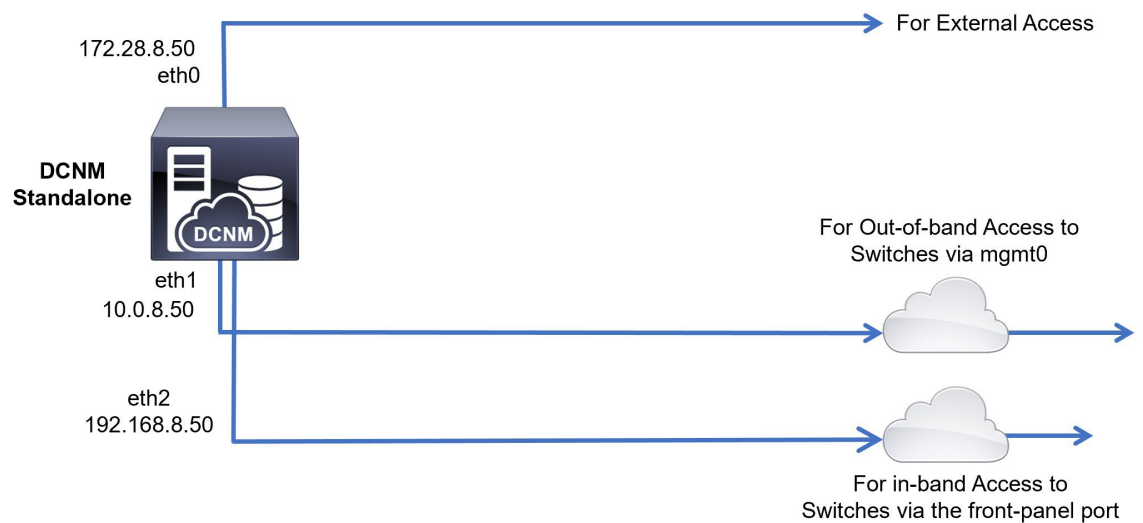

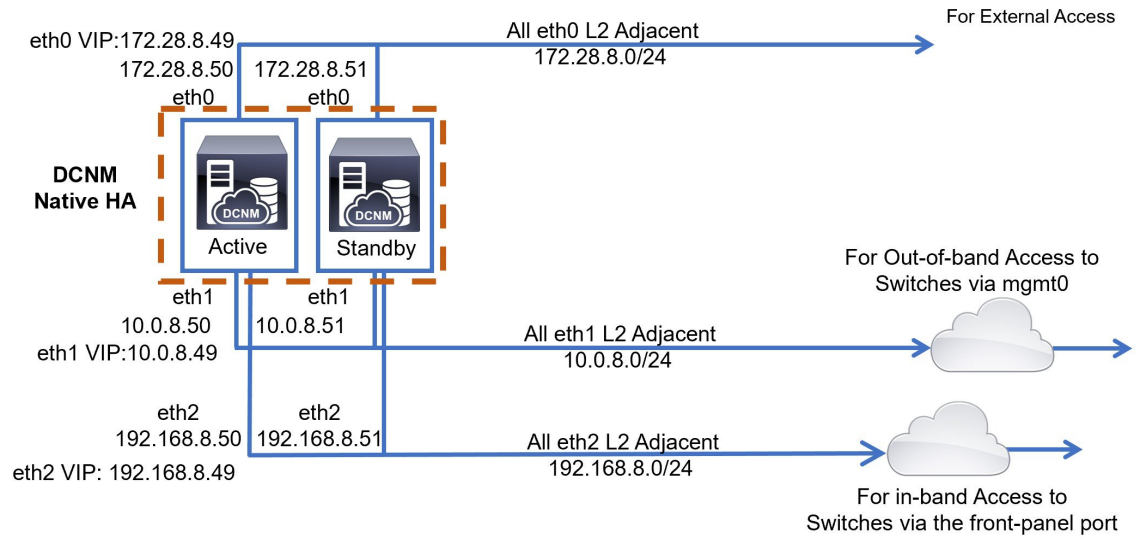

Figure 4: Cisco DCNM HA Deployment without Compute Cluster

Cisco DCNM Clustered Mode

Figure 5: Cisco DCNM Standalone Deployment with Compute Cluster

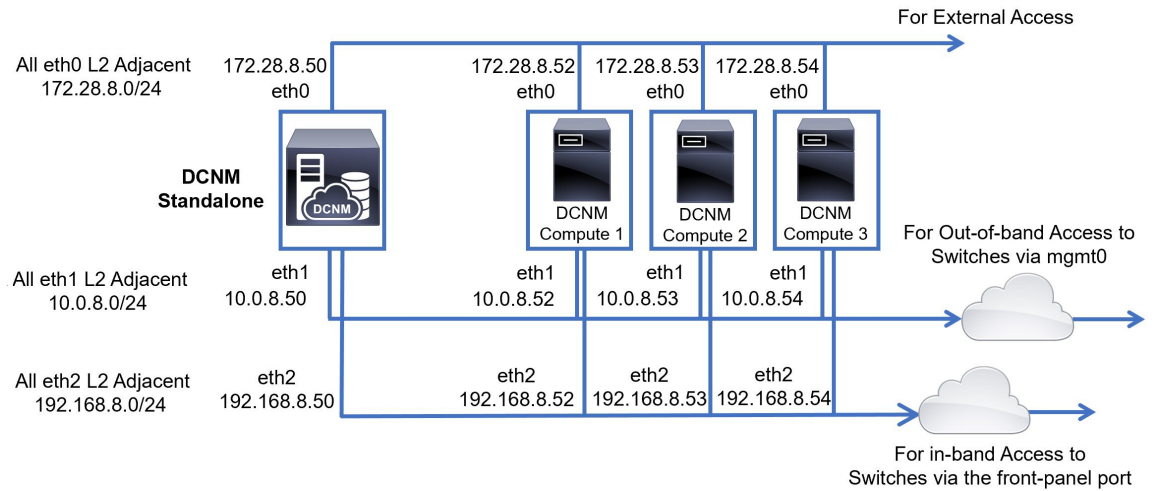

Figure 6: Cisco DCNM HA Deployment with Compute Cluster

## Scenario 2: eth2 Interface in Different Subnet

In this scenario, consider that the eth0 and eth1 interfaces are in the same subnet, and eth2 interfaces of DCNMs and Computes are in a different subnet.

For example:

- eth0 – 172.28.8.0/24
- eth1 – 172.28.8.0/24
- eth2 – 192.168.8.0/24

The possible deployments are as follows:

- [Cisco DCNM Unclustered Mode, on page 29](#)
- [Cisco DCNM Clustered Mode, on page 30](#)

### Cisco DCNM Unclustered Mode

Figure 7: Cisco DCNM Standalone deployment (No HA) without Compute Cluster

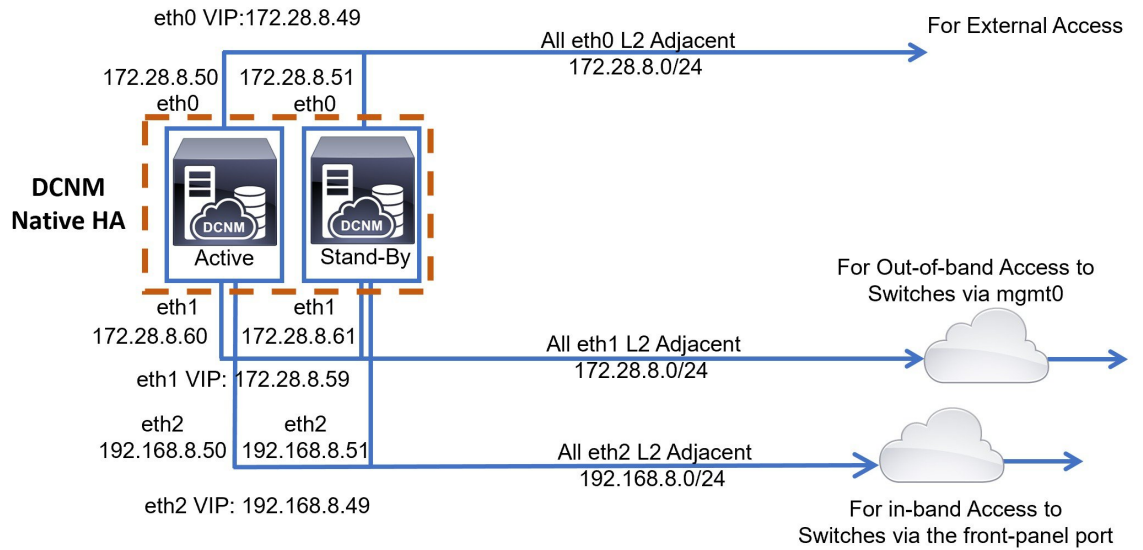

Figure 8: Cisco DCNM Native HA deployment without Compute Cluster

## Cisco DCNM Clustered Mode

Figure 9: Cisco DCNM Standalone Deployment with Compute Cluster

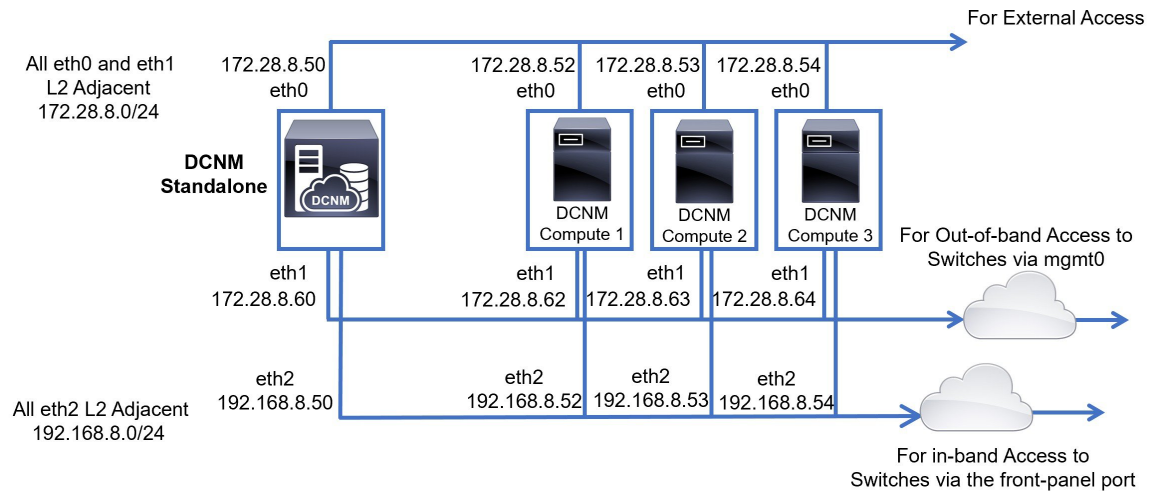

Figure 10: Cisco DCNM Native HA Deployment with Compute Cluster

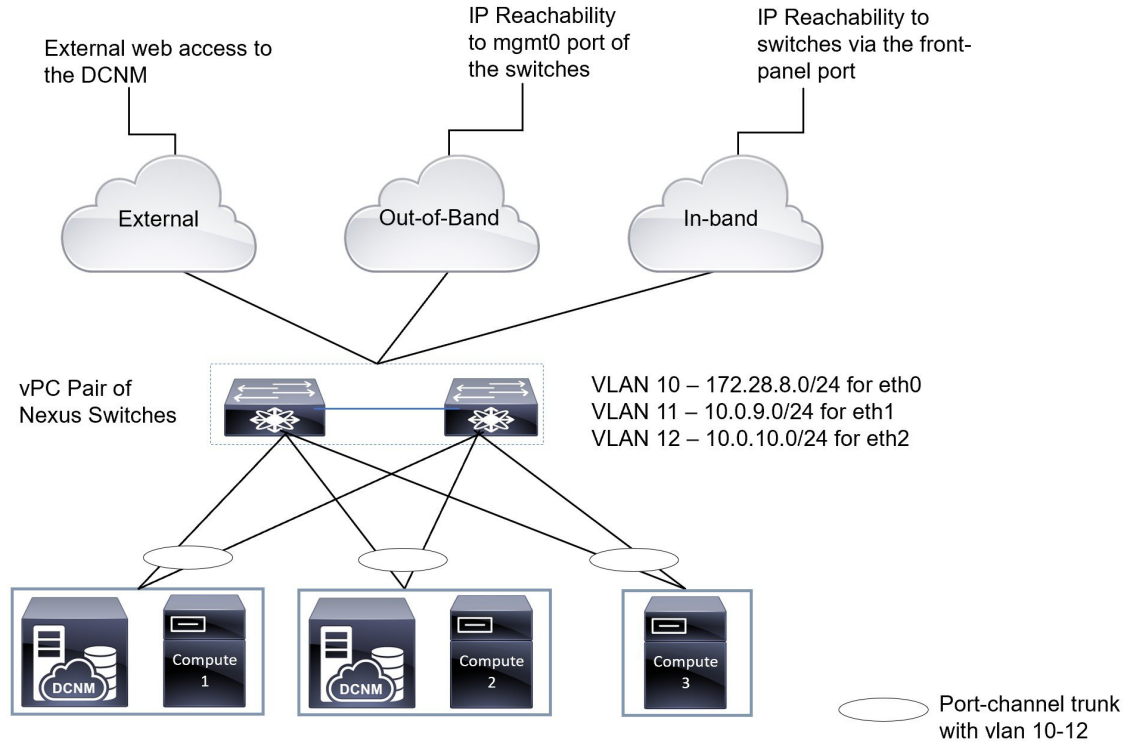

## Physical Connectivity of Cisco DCNM and Compute Nodes

This section describes the physical connectivity of the Cisco DCNM and Compute nodes in both Virtual Machines and Bare Metal installations.

### Virtual Machines

The following image shows the physical connectivity of DCNM and compute nodes supported in a 3 server redundancy configuration. The physical servers must be connected to a vPC pair of switches via port-channels. This provides adequate fault-tolerance, if a single link fails or a single switch fails. The vPC pair of switches is considered as the infra vPC pair that provides management connectivity to the physical servers.

Figure 11: Cisco DCNM VM Physical Connectivity with 3 servers

The following image shows the physical connectivity of Cisco DCNM and Compute nodes supported in an VM installation in a 5 server redundancy configuration.

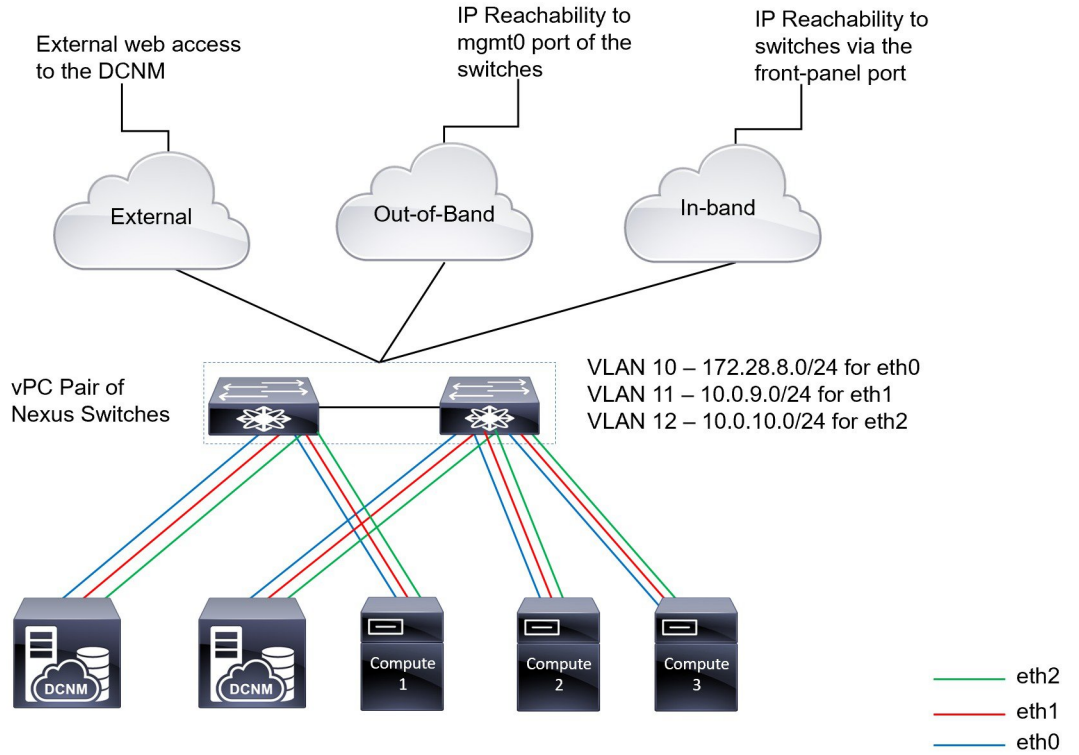

Figure 12: Cisco DCNM VM Physical Connectivity with 5 servers

### Bare Metal Installation

For installing Cisco DCNM on Bare Metal, 5 servers are required. The following image shows the physical connectivity of Cisco DCNM and Compute nodes. Note that, there are 3 physical interfaces on each server that map to the eth0, eth1, and eth2 interfaces, respectively. If the physical server consists of a managed network adapter such as the Cisco UCS VIC 1455 Virtual Interface Card, you can have a port-channel connectivity from the servers to the switches, similar to the Virtual Machines.

Figure 13: Cisco DCNM and Compute Bare Metal Physical Connectivity

## CHAPTER 7

# Disaster Recovery (Backup and Restore)

This chapter contains the following sections:

- [Backup and Restore Cisco DCNM and Application Data on Standalone DCNM setup, on page 35](#)
- [Backup and Restore Cisco DCNM and Application Data on Native HA setup, on page 36](#)
- [Recovering Cisco DCNM Single HA Node, on page 37](#)
- [Recovering admin Account, on page 39](#)
- [HA Disaster Avoidance using SRM, on page 40](#)
- [Backup and Restore Cisco DCNM on a Cluster Setup, on page 42](#)

## Backup and Restore Cisco DCNM and Application Data on Standalone DCNM setup

You can take a backup of Cisco DCNM application data for analytics and troubleshooting.

**Note** In Release 11.3(1), the sysadmin and the root user's password are not identical. When you upgrade to 11.5(2), the sysadmin and root user passwords are preserved.

However, when you perform backup and restore on Cisco DCNM after upgrade, the sysadmin user inherits the password from the root user, and therefore both the users will have the same password. You can change the password for both the users after restore is complete.

Perform the following task to take a backup of Cisco DCNM and Application data.

### Procedure

**Step 1** Logon to the Cisco DCNM appliance using SSH.

**Step 2** Take a backup of the application data using the **appmgr backup** command.

```
dcnm# appmgr backup
```

From Release 11.4(1), Cisco DCNM allows you to configure a cron job that allows saves the backup to a remote scp server. Use **appmgr backup schedule** command to configure a scheduled backup.

```
dcnm# appmgr backup schedule [day] <hh<hh>:<mm>
[destination <user>@<host>:[<dir>]]
```

Copy the backup file to a safe location and shut down the DCNM Appliance.

**Step 3** Right click on the installed VM and select **Power > Power Off**.

**Step 4** Deploy the new DCNM appliance.

**Step 5** After the VM is powered on, click on **Console** tab.

A message indicating that the DCNM appliance is configuring appears on the screen.

Copy and paste the URL to the browser to continue with restore process.

**Step 6** On the DCNM Web Installer UI, click **Get Started**.

**Step 7** On the Cisco DCNM Installer screen, select radio button.

Select the backup file that was generated in [Step 2, on page 35](#).

Continue to deploy the DCNM.

**Step 8** On the Summary tab, review the configuration details.

Click **Previous** to go to the previous tabs and modify the configuration. Click **Start Installation** complete Cisco DCNM Virtual Appliance Installation for the chosen deployment mode.

A progress bar appears showing the completed percentage, description of the operation, and the elapsed time during the installation.

After the progress bar shows 100%, click **Continue**.

**Step 9** After the data is restored, check the status using the **appmgr status all** command.

## Backup and Restore Cisco DCNM and Application Data on Native HA setup

You can take a backup of Cisco DCNM application data for analytics and troubleshooting.

**Note** In Release 11.3(1), the sysadmin and the root user's password are not identical. When you upgrade to 11.5(2), the sysadmin and root user passwords are preserved.

However, when you perform backup and restore on Cisco DCNM after upgrade, the sysadmin user inherits the password from the root user, and therefore both the users will have the same password. You can change the password for both the users after restore is complete.

Perform the following task to take perform backup and restore of data in a Native HA setup.

### Before you begin

Ensure that the Active node is operating and functional.

## Procedure

- Step 1** Check if the Active node is operational. Otherwise, trigger a failover.
- Step 2** Logon to the Cisco DCNM appliance using SSH.
- Step 3** Take a backup of the application data using the **appmgr backup** command on both Active and Standby appliances.
- ```
dcnm1# appmgr backup
dcnm2 appmgr backup
```
- From Release 11.4(1), Cisco DCNM allows you to configure a cron job that allows saves the backup to a remote scp server. Use **appmgr backup schedule** command to configure a scheduled backup.
- ```
dcnm# appmgr backup schedule [day] <hh<hh>:<mm>
[destination <user>@<host>:[<dir>]]
```
- Copy the backup file of both active and standby appliances to a safe location and shut down the DCNM Appliance.
- Step 4** Right click on the installed VM and select **Power > Power Off**.
- Step 5** Deploy the new DCNM appliance in Native HA mode.
- Step 6** For both the Active and Standby appliances, after the VM is powered on, click on **Console** tab.
- A message indicating that the DCNM appliance is configuring appears on the screen.
- Copy and paste the URL to the browser to continue with restore process.
- Step 7** On the DCNM Web Installer UI, click **Get Started**.
- Step 8** On the Cisco DCNM Installer screen, select radio button.
- Select the backup file that was generated in Step [Step 3, on page 37](#).
- The values for parameters are read from the backup file, and auto-populated. Modify the values, if required.
- Continue to deploy the DCNM.
- Step 9** On the Summary tab, review the configuration details.
- Click **Previous** to go to the previous tabs and modify the configuration. Click **Start Installation** complete Cisco DCNM Virtual Appliance Installation for the chosen deployment mode.
- A progress bar appears showing the completed percentage, description of the operation, and the elapsed time during the installation.
- After the progress bar shows 100%, click **Continue**.
- Step 10** After the data is restored, check the status using the **appmgr status all** command.

## Recovering Cisco DCNM Single HA Node

This section details the scenarios and provides instructions to recover Cisco DCNM Single HA node.

The following table details all the recovery procedures when one or both the nodes fail in a Cisco DCNM Native HA set up.

| Failure type                                                                                    | Node/Database to recover | Primary backup available | Secondary backup available | Recovery procedure                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------|--------------------------|--------------------------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary node is lost.<br>Secondary node is now Primary (due to fail over).                      | Primary Node             | —                        | —                          | <ol style="list-style-type: none"> <li>1. Convert Secondary node to Primary node.</li> <li>2. Configure new Secondary node.</li> </ol>                                                       |
| Primary and Secondary server database is lost. Secondary node is now Primary (due to fail over) | Primary database         | —                        | —                          | The Active Secondary node will restart and sync to the Standby Primary node.                                                                                                                 |
| Active Secondary node is lost. Primary node is now active due to fail over.                     | Secondary node           | —                        | No                         | Configure new Secondary node.                                                                                                                                                                |
| Active Secondary node is lost. Primary node is not active due to fail over.                     | Secondary node           | —                        | Yes                        | Configure new Secondary node, using the Web Installer. Choose <b>Fresh installation with backup file for restore</b> . Select <b>Restore secondary DCNM node only</b> in HA settings screen. |
| Secondary standby node is lost.                                                                 | Secondary node           | —                        | No                         | Configure new Secondary node.                                                                                                                                                                |
| Secondary standby node lost                                                                     | Secondary node           | —                        | Yes                        | Configure new Secondary node, using the Web Installer. Choose <b>Fresh installation with backup file for restore</b> . Select <b>Restore secondary DCNM node only</b> in HA settings screen. |
| Primary node is active. Secondary standby database lost.                                        | Secondary database       | —                        | —                          | Primary node will restart to sync with Secondary node.                                                                                                                                       |

### Converting Secondary node to Primary node

To convert the secondary node to Primary node, perform the following steps:

1. Log on to the DCNM server via SSH on the Secondary node.
2. Stop all the applications on the Secondary node by using the **appmgr stop all** command.
3. Navigate to the `/root/packaged-files/properties/ha-setup.properties` file.
4. Set the node ID to 1 to configure the secondary node as the primary node.

```
NODE_ID 1
```

After you change the node ID for the secondary node to 1, reboot the server. The old Secondary will restart as the new Primary Node. Consider the lost Primary as lost secondary node, and configure the new secondary node.

### Configuring Secondary node

To configure the secondary node, perform the following steps:

1. Install a standalone Cisco DCNM. Use the same configuration settings as the lost secondary node.

---

**Note** If the Primary node was lost, and the old secondary node was converted to primary node, configure the new standalone node with the lost primary configuration.

---

2. Log on to the new DCNM standalone server via SSH, and stop all applications, using the **appmgr stop all** command.
3. Provide access to the `/root` directory on the new node, using the **appmgr root-access permit**.
4. Log on to the primary node via SSH, and stop all applications, using the **appmgr stop all** command.
5. Provide access to the `/root` directory on the Primary node, using the **appmgr root-access permit**.
6. On the Primary node, edit the `/root/.DO_NOT_DELETE` file. Set the **NATIVE\_HA\_STATUS** parameter to **NOT\_TRIGGERED** on the primary node.
7. Configure the Primary node as Active, using the **appmgr setup native-ha active** command.
8. Configure the Secondary node as Standby, using the **appmgr setup native-ha standby** command.

## Recovering admin Account

If you have the network-admin user/password credentials, you can login and recover the password for other users from the Cisco DCNM Web UI. See [Step 5, on page 40](#).

To recover the Cisco DCNM Web UI user or password, perform the following steps:

### Before you begin

Ensure that you have privileges to change the password.

### Procedure

- 
- Step 1** Launch SSH and login to the DCNM server as a `/root` user.
 

```
[root@dcnm]#
```
  - Step 2** Navigate to `/usr/local/cisco/dcm/fm/bin` folder.
 

```
[root@dcnm]# cd /usr/local/cisco/dcm/fm/bin
[root@dcnm bin]#
```
  - Step 3** Execute **addUser.sh** script to create a new network-admin user. Provide a new username, password and the database password.
 

```
[root@dcnm bin]# ./addUser.sh <user> <password> <dbpassword>
```

The following message is generated and a new user is created.

```
----- OUTPUT -----
---insertUser-----
---username-----john123
---role-----network-admin
---insertUser-----done...
 Added user : john123 successful!
----- END -----
```

**Step 4** Login to the Cisco DCNM Web UI with new user to Cisco DCNM Web UI.

**Step 5** Choose **Administration > Management Users > Local**.

The new user is displayed in the list.

**Step 6** Select the user to recover the password, and click **Edit** icon.

**Step 7** On the Edit User window, modify the **Role** and **Password** for the user.

You can also set the password to expire in 180 days.

**Step 8** Click **Apply** to save your changes.

## HA Disaster Avoidance using SRM

Cisco DCNM Release 11.5(1) can be successfully deployed on the VM Site Recovery Manager (SRM). SRM is a disaster recovery software that provides automated orchestration of failover and fail-back to minimize downtime.

**Note** This document provides a high-level work flow. For detailed information, refer to <https://docs.vmware.com/en/Site-Recovery-Manager/index.html>.

To setup the DCNM and migrate to SRM, perform the following task:

1. Configure a management server (ESXi 6.7) running vCenter, SRM, VM replicator manager running on Site 1.
2. Similarly, configure a management server (ESXi 6.7) running vCenter, SRM, VM replicator manager running on Site 2.

VRM helps replicate VMs from one site to another.

**Note** All VMs must be deployed together in the same site. When migrating DCNM VMs (planned recovery or disaster recovery), all DCNM VMs must be migrated to the recovery site.

3. Replicate Site1 to Site2 to sync.
4. Migrate Site1 and Site2 to the Site Recovery Manager.
5. Deploy the VMs on the Recovery Site.

**Compatibility:**

- ESXi 6.7
- SRM 8.3

To configure the SRM for DCNM HA disaster recovery, perform the following task:

1. Launch the SRM.
2. Pair Site1 and Site2. After the replication is complete, both the Sites are synchronized.
3. Click View Details.  
The Summary page opens.
4. On the Summary tab,
  - a. Click Network Mappings and map the networks used by the VM on both Site1 and Site2.
  - b. Click Folder Mappings. Map all the folders used by vCenter for the VMs.
  - c. Click Resource Mappings. Map the resources on each component in Site1 to components in Site2. Choose Yes under Reverse Mapping.
  - d. Click on Placeholder Datastores. Map hosts/clusters to the correct datastores. For example, the VMs in the Host/Cluster will be replicated to the mapped Datastore.

---

**Note** Ensure that VMs are replicated to the correct datastores. Recovery plan fails, otherwise.

---

5. On the Replications tab
  - a. Replicate VMs from a source site to a target site with vSphere Replication.
  - b. Click Outgoing in the left pane. All the data synchronized with site2 are displayed.
  - c. If you're on Site1 and everything replication on Site2, this tab will be empty.
  - d. Click Incoming in the left pane. Status of all the VMs synchronizing with Site2 are displayed.
  - e. Configure a Recovery Point Objective (RPO) value during replication configuration, to determine the maximum data loss that you can tolerate.
  - f. Click New to configure Replication Latency to configure the Recovery Point Objective. Click on the arrow before the VM to view configuration data for the VM.
6. On the Protection Groups tab:  
Configure one or more protection groups in a recovery plan. A recovery plan specifies how Site Recovery Manager recovers the virtual machines in the protection groups that it contains.
7. On the Recovery Plans tab,  
After you configure Site Recovery Manager at the protected and recovery sites, you can create, test, and run a recovery plan.
  - a. When you create or modify a recovery plan, test it before you try to use it for planned migration or for disaster recovery.

- b. You can run a recovery plan under planned circumstances to migrate virtual machines from the protected site to the recovery site. If the protected site suffers an unforeseen event that might result in data loss, you can also run a recovery plan under unplanned circumstances.
- c. You can customize the actions of Site Recovery Manager during recovery by creating, testing, and running recovery plans.
- d. Running this plan in recovery mode will attempt to shut down the VMs at the protected site and recover the VMs at the recovery site.
- e. You can choose one of the recovery type:
  - **Planned migration** – replicates recent changes to the recovery site and cancel recovery if errors are encountered. Do not perform and resource intense operations during planned migration.
  - **Disaster recovery** – attempts to replicate recent changes to the recovery site, but otherwise use the most recent storage synchronization data. It continues the recovery even if errors are encountered.
- f. Click on ... after Run and click Reprotect to protect the VMs or click Cancel to stop the recovery plan.

After Site Recovery Manager performs a recovery, the virtual machines start up on the recovery site. By running reprotect when the protected site comes back online, you reverse the direction of replication to protect the recovered virtual machines on the recovery site back to the original protected site.

## Backup and Restore Cisco DCNM on a Cluster Setup

You can take a backup of Cisco DCNM application data for analytics and troubleshooting.

Perform the following task to take perform backup and restore of data in a Cisco DCNM Cluster setup.

### Before you begin

Check and ensure that the Active and Standby servers are operational, using the `appmgr show ha-role` command.

Example:

On the Active node:

```
dcnm-active# appmgr show ha-role
Native HA enabled.
Deployed role: Active
Current role: Active
```

On the Standby node:

```
dcnm2-standby# appmgr show ha-role
Native HA enabled.
Deployed role: Standby
Current role: Standby
```

### Procedure

- 
- Step 1** Log on to the Cisco DCNM appliance using SSH.

- Step 2** Take a backup of the application data using the **appmgr backup** command on both Active, Standby appliances, and on all Compute nodes.

```
dcnm-active# appmgr backup
dcnm-standby# appmgr backup
dcnm-compute1# appmgr backup
dcnm-compute2# appmgr backup
dcnm-compute3# appmgr backup
```

Copy the backup files of all nodes to a safe location and shut down the DCNM Appliance.

- Step 3** Right click on the installed VM and select **Power > Power Off**.

- Step 4** Install two Cisco DCNM Release 11.5(2) appliances.

**Note** Ensure that the Hostnames match the earlier Active and Standby appliances.

For instructions, see [Installing the Cisco DCNM](#).

- Step 5** Install three Cisco DCNM Compute nodes.

**Note** Ensure that the Hostnames match the earlier Compute nodes.

For instructions, see [Installing Cisco DCNM Compute Node](#).

- Step 6** Provide access to the `/root` directory on all nodes using the following command.

```
dcnm# appmgr root-access permit
```

- Step 7** Stop telemetry on Active and Standby nodes using the following command:

```
dcnm-active# systemctl stop pmn-telemetry
dcnm-standby# systemctl stop pmn-telemetry
```

- Step 8** Set the environment variable to allow restore process using CLI and restore the node with the same hostname as respective Active and Standby backup files, using the following command:

**Note** Ensure that you perform the restore in the same order—Active, Standby, Compute1, Compute2, and Compute3.

```
dcnm-active# APPMGR_ALLOW_RESTORE=1 appmgr restore <dcnm1-backup-file>
dcnm-standby# APPMGR_ALLOW_RESTORE=1 appmgr restore <dcnm2-backup-file>
dcnm-compute1# APPMGR_ALLOW_RESTORE=1 appmgr restore <compute1-backup-file>
dcnm-compute2# APPMGR_ALLOW_RESTORE=1 appmgr restore <compute2-backup-file>
dcnm-compute3# APPMGR_ALLOW_RESTORE=1 appmgr restore <dcnm2-backup-file>
```

- Step 9** After the data is restored, check the status using the **appmgr status all** command.

---

### What to do next

Log on to the DCNM Web UI with appropriate credentials.

The Applications tab displays all the services running on the DCNM deployment that you have installed. Click Compute tab to view the new Compute in Discovered state on the Cisco DCNM Web UI.

To add the compute nodes to a cluster, see [Adding Computes to a Cluster Node](#) in your deployment-specific *Cisco DCNM Configuration Guide* for more information.

---

**Note** If you didn't enable clustered mode while installing DCNM, use the **appmgr afw config-cluster** command to enable the compute cluster. For instructions, refer to [Enabling the Compute Cluster](#) in the Cisco DCNM LAN Fabric Configuration Guide.

---

When a compute node goes through an unscheduled powercycle and restarts, the Elasticsearch container won't start. It's possible that some filesystems are corrupted. To resolve this issue, reboot the Compute node in safe mode by using **fsck -y** command.

## CHAPTER 8

# Certificates

---

- [Certificate Management, on page 45](#)

## Certificate Management

---

**Note** This section is applicable only for DCNM OVA/ISO deployments.

---

From Release 11.2(1), Cisco DCNM allows new methods and new CLIs for installing, restoring after upgrade, and verifying certificates on the system. You can export certificates from the Active node to the Standby node, to ensure that both peers on the Native HA setup have the same certificates.

In a Cisco DCNM Native HA setup, after you install a CA certificate on the Active node and start the services, the certificates are automatically synchronized with the Standby node. If you need the same internal certificate on both Active and Standby nodes, you must export the certificate from the Active node to the Standby node. This ensures that both the peers on the Cisco Native HA setup have the same certificates.

---

**Note** From Release 11.3(1), you must use **sysadmin** role for certificate management.

---

Cisco DCNM stores two certificates:

- Self-signed certificate, for internal communication between the Cisco DCNM Server and various applications
- CA (Certificate Authority) Signed certificate, for communicating with the external world, such as Web UI.

---

**Note** Until you install a CA Signed certificate, Cisco DCNM retains a self-signed certificate for the communicating with the external network.

---

## Best practices for Certificate Management

The following are the guidelines and best practices for Certificate Management in Cisco DCNM.

- Cisco DCNM provides CLI based utilities to display, install, restore, and export or import of certificates. These CLIs are available through SSH console, and only a **sysadmin** user can accomplish these tasks.
- When you install Cisco DCNM, a self-signed certificate is installed, by default. This certificate is used to communicate with the external world. After Cisco DCNM installation, you must install a CA-Signed certificate on the system.
- On Cisco DCNM Native HA setup, we recommend that you install a CA-Signed certificate on the DCNM Active Node. The CA-Signed certificate will synchronize with the Standby node automatically. However, if you want to keep the same internal and CA-Signed certificate on both Active node and Standby node, you must export the certificates from Active node and import it to the Standby node. Both the Active node and Standby node will have the same set of certificates.

---

**Note** Compute nodes in a cluster deployment do not require any action, as the compute nodes use internally managed certificates.

---

- Generate a CSR on Cisco DCNM with a CN (common name). Provide a VIP FQDN (Virtual IP Address FQDN) as CN to install a CA Signed certificate. The FQDN is the fully qualified domain name for the management subnet VIP (VIP of eth0) interface that is used to access Cisco DCNM Web UI.
- If the CA Signed certificate was installed prior to upgrading the Cisco DCNM, then you must restore the CA Signed certificate after you upgrade the Cisco DCNM.

---

**Note** You need not take a backup of certificates when you perform inline upgrade or backup and restore.

---

## Display Installed Certificates

You can view the details of the installed certificate by using the following command:

**appmgr afw show-cert-details**

In the following sample output for the **appmgr afw show-cert-details** command, **CERTIFICATE 1** represents the certificate offered to the external network and to the Web browsers. **CERTIFICATE 2** represents the internally used certificate.

```
dcnm# appmgr afw show-cert-details

****CERTIFICATE 1****
[Certificate available to web gateway. This certificate is offered to webclients]:
-----Web gateway certificate-----
Certificate:
 Data:
 Version: 3 (0x2)
 Serial Number: 4202 (0x106a)
 Signature Algorithm: sha256WithRSAEncryption
 Issuer: C=IN, ST=KA, L=BGL, O=xyz, OU=ABC, CN=<FQDN/IP>
```

```

Validity
 Not Before: Jun 4 13:55:25 2019 GMT
 Not After : Jun 3 13:55:25 2020 GMT
Subject: C=IN, ST=KA9, L=BGL9, O=XYZ123, OU=ABC123, CN=<FQDN/IP>
Subject Public Key Info:
 Public Key Algorithm: rsaEncryption
 Public-Key: (2048 bit)
 Modulus:
 00:bb:52:1e:7f:24:d7:2e:24:62:5a:83:cc:e4:88:
-----Certificate output is truncated to first 15 lines-----

****CERTIFICATE 2****
[Certificate available in keystore(jks). CA signed certificate is installed here till DCNM
version 11.1.x]
If you have upgraded from DCNM version 11.1.x to later version please see installation guide
to restore
CA signed certificate to upgraded version.
-----Keystore certificate-----
alias = sme, storepass = <<storepass-pwd>>
Alias name: sme
Creation date: Oct 14, 2018
Entry type: PrivateKeyEntry
Certificate chain length: 2
Certificate[1]:
Owner: CN=localhost, OU=Data Center, O=Cisco Systems Inc, L=San Jose, ST=CA, C=US
Issuer: CN=dcnmca, OU=Data Center, O=Cisco Systems Inc, L=San Jose, ST=CA, C=US
Serial number: 62044620
Valid from: Sun Oct 14 20:39:39 PDT 2018 until: Fri Oct 13 20:39:39 PDT 2023
Certificate fingerprints:
 MD5: E5:F8:AD:17:4D:43:2A:C9:EE:35:5F:BE:D8:22:7D:9C

Signature algorithm name: SHA256withRSA
Subject Public Key Algorithm: 2048-bit RSA key
-----Certificate output is truncated to first 15 lines-----
dcnm#

```

**Note** <<storepass-pwd>> is the password string generated while installing DCNM Server. This string is located in the <install dir>/dcm/fm/conf/serverstore.properties directory. Fetch the **dcnm.fmserver.token** value for the **storepass-pwd**.

The Web UI refers to the **CERTIFICATE 1** after installation. If **CERTIFICATE 1** is not available, you must stop and restart all applications, using the following commands:

**Note** Ensure that you follow the same sequence of commands on the Cisco DCNM to troubleshoot this scenario.

On the Cisco DCNM Standalone appliance, run the following commands to stop and start all Cisco DCNM applications to troubleshoot **CERTIFICATE 1**:

```

dcnm# appmgr stop all /* stop all the applications running on Cisco DCNM */
dcnm# appmgr start all /* start all the applications running on Cisco DCNM */

```

On the Cisco DCNM Native HA appliance, run the following commands to stop and start all Cisco DCNM applications to troubleshoot **CERTIFICATE 1**:

For example, let us indicate the Active node as **dcnm1**, and Standby node **dcnm2**.

Stop the applications running on the both the nodes.

```
dcnm2# appmgr stop all /* stop all the applications running on Cisco DCNM Standby Node */
dcnm1# appmgr stop all /* stop all the applications running on Cisco DCNM Active Node */
```

Start the applications on both nodes.

```
dcnm1# appmgr start all /* start all the applications running on Cisco DCNM Active Node*/
dcnm2# appmgr start all /* start all the applications running on Cisco DCNM Standby Node*/
```

---

**Note** Ensure that you clear the browser cache before you launch the Cisco DCNM Web UI, using the Management IP Address.

---

The **CERTIFICATE 1** is displayed in the Security settings on the browser.

## Installing a CA Signed Certificate

We recommend that you install a CA Signed certificate as a standard security practice. The CA Signed certificates are recognized, and verified by the browser. You can also verify the CA Signed certificate manually.

---

**Note** The Certificate Authority can be an Enterprise Signing Authority, also.

---

## Installing a CA Signed Certificate on Cisco DCNM Standalone Setup

To install a CA Signed certificate on the Cisco DCNM, perform the following steps.

### Procedure

---

**Step 1** Logon to the DCNM server via SSH terminal.

**Step 2** Generate a CSR on the Cisco DCNM server using the **appmgr afw gen-csr** command:

**Note** CSR is unique to a Cisco DCNM, and only a corresponding CSR signed certificate must be installed on a given Cisco DCNM.

```
dcnm# appmgr afw gen-csr
Generating CSR....
..
...

Country Name (2 letter code) [XX]:US
State or Province Name (full name) []:CA
Locality Name (eg, city) [Default City]:San Jose
Organization Name (eg, company) [Default Company Ltd]:Cisco
Organizational Unit Name (eg, section) []:DCBG
Common Name (eg, your name or your server's hostname) []:dcnmhost.cisco.com
Email Address []:dcnm@cisco.com
```

```
Please enter the following 'extra' attributes to be sent with your certificate request
A challenge password []: /* This field is not mandatory */
An optional company name []: /* This field is not mandatory */
...
```

A CSR file `dcnmweb.csr` is created in the `/var/tmp/` directory.

```
***** CA certificate installation not completed yet. Please do followings. *****
CSR is generated and placed at /var/tmp/dcnmweb.csr.
Please download or copy the content to your certificate signing server.
```

**Step 3** Send this CSR to your Certificate signing server.

**Note** The CA Signing server is local to your organization.

**Step 4** Get the certificate signed by your Certificate Authority.

The Certificate Authority (CA) returns 3 certificates, namely, Primary, Intermediate (also known as Issuing/Subordinate), and Root certificates. Combine all the three certificates into one `.pem` file to import to DCNM.

**Step 5** Copy the new CA Signed certificate to Cisco DCNM server.

Ensure that the certificate is located at `/var/tmp` directory on the Cisco DCNM Server.

**Step 6** Install the CA Signed certificate on the Cisco DCNM by using the following commands:

**Note** We recommend that you run the following commands in the same sequence as shown below.

```
dcnm# appmgr stop all /* Stop all applications running on Cisco DCNM
dcnm# appmgr afw install-CA-signed-cert <CA-signed certificate directory>
/* CA-signed certificate with full or relative path */
Making the signed certificate available to web gateway....
```

CA signed certificate `CA-signed-cert.pem` is installed. Please start all applications as followings:

On standalone setup execute: `'appmgr start all'`

**Step 7** Restart all applications with the new certificate on Cisco DCNM using the **appmgr start all** command.

```
dcnm# appmgr start all
```

**Step 8** Verify the newly installed CA Signed certificate using the **appmgr afw show-cert-details** command.

The system is now armed with the CA Signed certificate, which is verified at the browser.

**Note** CSR is unique to a Cisco DCNM, and only a corresponding CSR signed certificate must be installed on a given Cisco DCNM.

## Installing a CA Signed Certificate on Cisco DCNM Native HA setup

To install a CA Signed certificate on the Cisco DCNM, perform the following steps.

**Note** We recommend that you run the following commands in the same sequence as shown below.

### Procedure

**Step 1** On the Active node, logon to the DCNM server via SSH terminal.

**Note** For example, let us indicate the Cisco DCNM Active and Standby appliances as **dcnm1** and **dcnm2** respectively.

**Step 2** Generate a CSR on the Cisco DCNM server using the **appmgr afw gen-csr** command:

**Note** CSR is unique to a Cisco DCNM, and only a corresponding CSR signed certificate must be installed on a given Cisco DCNM.

```
dcnm1# appmgr afw gen-csr
Generating CSR....
..
...

Country Name (2 letter code) [XX]:US
State or Province Name (full name) []:CA
Locality Name (eg, city) [Default City]:San Jose
Organization Name (eg, company) [Default Company Ltd]:Cisco
Organizational Unit Name (eg, section) []:DCBG
Common Name (eg, your name or your server's hostname) []:dcnmhost.cisco.com
/* Provide a VIP FQDN name of the eth0 interface*/
Email Address []:dcnm@cisco.com
```

```
Please enter the following 'extra' attributes to be sent with your certificate request
A challenge password []: /* This field is not mandatory */
An optional company name []: /* This field is not mandatory */
...
```

**Note** For generating CSR on the Active node, we recommend that you provide a VIP FQDN name of eth0 interface, when for prompted for Common Name.

This FQDN must be the web server address that you enter on the browser to launch the Cisco DCNM Web UI.

A CSR file `dcnmweb.csr` is created in the `/var/tmp/` directory.

```
***** CA certificate installation not completed yet. Please do followings. *****
CSR is generated and placed at /var/tmp/dcnmweb.csr.
Please download or copy the content to your certificate signing server.
```

**Step 3** Send this CSR to your Certificate signing server.

**Note** The CA Signing server is local to your organization.

The CA Signing server can be the CA certificate signing authority in your organizations, or your local CA to your organization.

**Step 4** Get the certificate signed by your Certificate Authority.

**Step 5** Copy the new CA Signed certificate to Cisco DCNM server.

Ensure that the certificate is located at `/var/tmp` directory on the Cisco DCNM Server.

**Step 6** On the Standby node, logon to the DCNM server via SSH terminal.

**Step 7** Stop all the applications on the Standby node using the **appmgr stop all** command.

```
dcnm2# appmgr stop all /* Stop all applications running on Cisco DCNM Standby Node
dcnm2#
```

**Step 8** On the Active node, stop all the applications by using the **appmgr stop all** command.

```
dcnm1# appmgr stop all /* Stop all applications running on Cisco DCNM Active Node
dcnm2#
```

- Step 9** On the Active node, install the CA Signed certificate on the Cisco DCNM by using the **appmgr afw install-CA-signed-cert** command.

```
dcnm1# appmgr afw install-CA-signed-cert <CA-signed certificate directory>
/* CA-signed certificate with full or relative path */
Making the signed certificate available to web gateway....
```

CA signed certificate CA-signed-cert.pem is installed. Please start all applications as followings:

On standalone setup execute: 'appmgr start all'

- Step 10** On the Active node, restart all applications with the new certificate on Cisco DCNM using the **appmgr start all** command.

```
dcnm1# appmgr start all /* Start all applications running on Cisco DCNM Active Node
```

Ensure that all services on Cisco DCNM Active node is operational before you proceed further.

**Note** Logon to the Cisco DCNM Web UI and check if the Certificate details are correct.

- Step 11** On the Standby node, restart all applications with the new certificate on Cisco DCNM using the **appmgr start all** command.

```
dcnm2# appmgr start all /* Start all applications running on Cisco DCNM Standby Node
```

This will ensure that the Standby node makes a fresh peer relationship with the Active Node. Therefore, the newly installed CA Signed certificate on the Active node will be synchronized on the Standby node.

- Step 12** Verify the newly installed CA Signed certificate using the **appmgr afw show-cert-details** command, on both Active and Standby nodes.

The system is now armed with the CA Signed certificate, which is verified at the browser.

**Note** If the Certificates information is not displayed, we recommend that you wait for a few minutes. The Secondary node takes a while to synchronize with the Active node.

If you want to retain the same internal and CA Signed certificate on both peers on a Native HA setup, first install the certificates on the Active node. After installing certificates on the Active node, export the certificates from Active node and import the same certificates to the Standby node.

## Exporting certificate from Active Node to Standby Node

The following procedure applies to the Cisco DCNM Native HA setup only. The CA Signed certificate installed on the Active node is always synced to the Standby node. However, the internal certificate differs on both Active and Standby nodes. If you want to keep the same set of certificates on both peers, you must perform the procedure described in this section.

**Note** You may choose not to export any certificates, because the internal certificates are internal to the system. These certificates can differ on Active and Standby nodes without having any functional impact.

To export the CA Signed certificate from Active node and import the certificate to the Standby node, perform the following procedure.

### Procedure

- 
- Step 1** On the Active node, logon to the DCNM server via SSH terminal.
- Step 2** Create a certificate bundle, by using the **appmgr afw export-import-cert-ha-peer export** command.
- ```
dcnm1# appmgr afw export-import-cert-ha-peer export
```
- Step 3** Copy the certificate bundle to the Standby node.
- Note** Ensure that you copy the certificate on the Standby node to the location as specified on the SSH terminal.
- Step 4** On the Standby node, stop all the applications by using the **appmgr stop all** command.
- ```
dcnm2# appmgr stop all /* Stop all applications running on Cisco DCNM Standby Node
dcnm2#
```
- Step 5** Import the certificates to the Standby node by using the **appmgr afw export-import-cert-ha-peer import** command.
- The certificates bundle is imported and installed on the Standby node.
- Step 6**
- Step 7** On the Standby node, restart all applications with the new certificate on Cisco DCNM using the **appmgr start all** command.
- ```
dcnm2# appmgr start all /* Start all applications running on Cisco DCNM Standby Node
```
- This ensures that the new imported certificate are effective when applications are started on the Standby node.
- Step 8** On the Standby node, verify the newly imported CA Signed certificate using the **appmgr afw show-cert-details** command.
- The system is now armed with same certificates on both Active and Standby nodes.
-

Restoring the certificates after an upgrade

This mechanism applies to Cisco DCNM Upgrade procedure using the inline upgrade process only. This procedure is not required for the backup and restore of data on the same version of the Cisco DCNM appliance.

Note that certificate restore is a disruptive mechanism; it requires you to stop and restart applications. Restore must be performed only when the upgraded system is stable, that is, you must be able to login to Cisco DCNM Web UI. On a Cisco DCNM Native HA setup, both the Active and Standby nodes must have established peer relationship.

Note A certificate needs to be restored only in following situations:

- if a CA signed certificate was installed on the system before upgrade, and,
- if you're upgrading from a version prior to 11.2(1) to version 11.2(1) or later.

After upgrading the Cisco DCNM, you must always verify the certificate before restoring to check if **CERTIFICATE 1** is the CA signed certificate. You must restore the certificates, if otherwise.

Verify the certificates using the **appmgr afw show-cert-details** as shown in the sample output below.

```

dcnm# appmgr afw show-cert-details
****CERTIFICATE 1****
[Certificate available to web gateway. This certificate is offered to webclients]:
-----Web gateway certificate-----
Certificate:
  Data:
    Version: 3 (0x2)
    Serial Number: 1575924977762797464 (0x15decf6aec378798)
    Signature Algorithm: sha256WithRSAEncryption
    Issuer: C=US, ST=CA, L=San Jose, O=Enterprise CA inc, OU=Data Center, CN=dcnml.ca.com

  Validity
    Not Before: Dec  9 20:56:17 2019 GMT
    Not After : Dec  9 20:56:17 2024 GMT

```

Restoring Certificates on Cisco DCNM Standalone setup after Upgrade

To restore the certificates after you upgrade the Cisco DCNM Standalone deployment to Release , perform the following:

Procedure

- Step 1** **Note** When you upgrade to Release , a backup of the CA Signed certificate is created.
- After you have successfully upgraded the Cisco DCNM Standalone appliance, logon to the DCNM server via SSH.
- Step 2** Stop all the applications using the following command:
appmgr stop all
- Step 3** Restore the certificate by using the following command:
appmgr afw restore-CA-signed-cert
- Step 4** Enter **yes** to confirm to restore the previously installed certificate.
- Step 5** Start all the applications using the following command:
appmgr start all
- Step 6** Verify the newly installed CA Signed certificate using the **appmgr afw show-cert-details** command.
- The system is now armed with the CA Signed certificate, which is verified at the browser.
-

Restoring Certificates on Cisco DCNM Native HA setup after Upgrade

In a Cisco DCNM Native HA setup, the certificate is installed on both the Active and Standby nodes. You must restore the certificate only on the Active node. The certificate will synchronize with the Standby node automatically.

To restore the certificates after you upgrade the Cisco DCNM Standalone deployment to Release , perform the following:

Procedure

- Step 1** Logon to the Cisco DCNM server via SSH.
- Note** For example, let us indicate Active and Standby appliances as **dcnm1** and **dcnm2** respectively.
- Step 2** On the Standby node, stop all the applications using the **appmgr stop all** command.
dcnm2# **appmgr stop all** /* Stop all applications running on Cisco DCNM Standby Node
- Step 3** On the Active node, stop all the applications using the **appmgr stop all** command.
dcnm1# **appmgr stop all** /* Stop all applications running on Cisco DCNM Active Node
- Step 4** Restore the certificate on the Active node by using the **appmgr afw restore-CA-signed-cert** command.

```
dcnm1# appmgr afw restore-CA-signed-cert
```

Step 5 Enter **yes** to confirm to restore the previously installed certificate.

Step 6 On the Active node, start all the applications using the **appmgr start all** command.

```
dcnm1# appmgr start all /* Start all applications running on Cisco DCNM Active Node
```

Ensure that all services on Cisco DCNM Active node is operational before you proceed further.

Note Logon to the Cisco DCNM Web UI and check if the Certificate details are correct.

Step 7 On the Standby node, start all the applications using the **appmgr start all** command.

```
dcnm2# appmgr start all /* Start all applications running on Cisco DCNM Standby Node
```

Wait for some time, while the Standby node synchronizes with the Active node.

Step 8 Verify the newly installed CA Signed certificate using the **appmgr afw show-cert-details** command, on both Active and Standby nodes.

The system is now armed with the CA Signed certificate, which is verified at the browser.

Recovering and Restoring Previously Installed CA Signed Certificates

Installing, restoring, managing CA signed certificate is a time-consuming process as a third-party signing server is involved. This may also lead to omissions or mistakes which can result in installing wrong certificates. In such a scenario, we recommend that you restore the certificates that were installed prior to the latest install or upgrade.

To recover and restore the previously installed CA signed certificates, perform the following steps.

Procedure

Step 1 Logon to the DCNM server via SSH terminal.

Step 2 Navigate to the `/var/lib/dcnm/afw/apigateway/` directory.

```
dcnm# cd /var/lib/dcnm/afw/apigateway/
dcnm# ls -ltr /* View the contents of the folder
total 128
-rw----- 1 root root 1844 Nov 18 13:14 dcnmweb.key.2019-11-20T132939-08:00
-rw-r--r-- 1 root root 1532 Nov 18 13:14 dcnmweb.crt.2019-11-20T132939-08:00
-rw----- 1 root root 1844 Nov 20 10:15 dcnmweb.key.2019-11-20T132950-08:00
-rw-r--r-- 1 root root 1532 Nov 20 10:15 dcnmweb.crt.2019-11-20T132950-08:00
-rw----- 1 root root 1844 Dec 22 13:59 dcnmweb.key
-rw-r--r-- 1 root root 1532 Dec 22 13:59 dcnmweb.crt
```

```
.
..
...
```

dcnmweb.key and **dcnmweb.crt** are the key and certificate files that are installed on the system, currently. Similar filenames, with timestamp suffix, help you in identifying the key and certificate pairs installed prior to the recent upgrade or restore.

Step 3 Stop all applications running on Cisco DCNM using **appmgr stop all** command.

- Step 4** Take a backup of `dcnmweb.key` and `dcnmweb.crt` files.
- Step 5** Identify the older key and certificate pair that you want to restore.
- Step 6** Copy the key and certificate pair as **dcnmweb.key** and **dcnmweb.crt** (without timestamp suffix).
- Step 7** Start all applications running on Cisco DCNM using **appmgr start all** command.
- Step 8** Verify the details of the certificate using the **appmgr afw show-cert-details** command. CERTIFICATE 1 is the CA signed certificate.

Note If the CA signed certificate is not visible to Cisco DCNM Web UI, or if the DCNM Server sends any failure message, you must reboot the system.

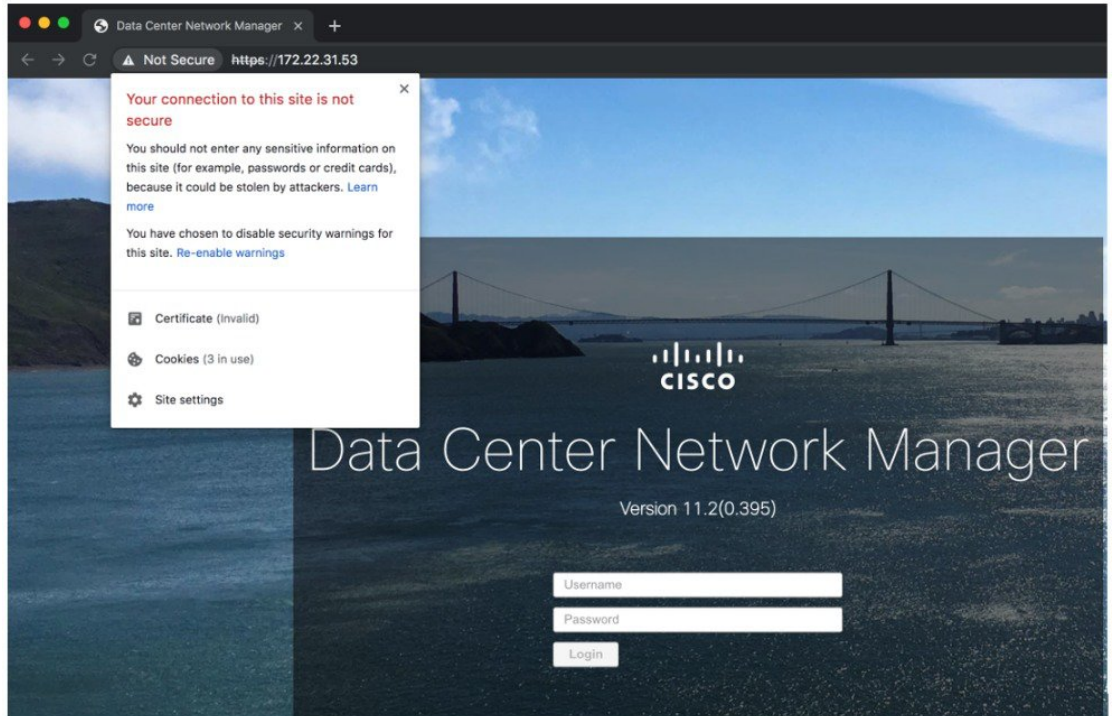

Verifying the installed certificate

While the installed certificate can be verified using the **appmgr afw show-cert-details** command, the web browser verifies if the certificate is effective or not. Cisco DCNM supports all standard browsers (Chrome, IE, Safari, Firefox). However, each browser display the certificate information differently.

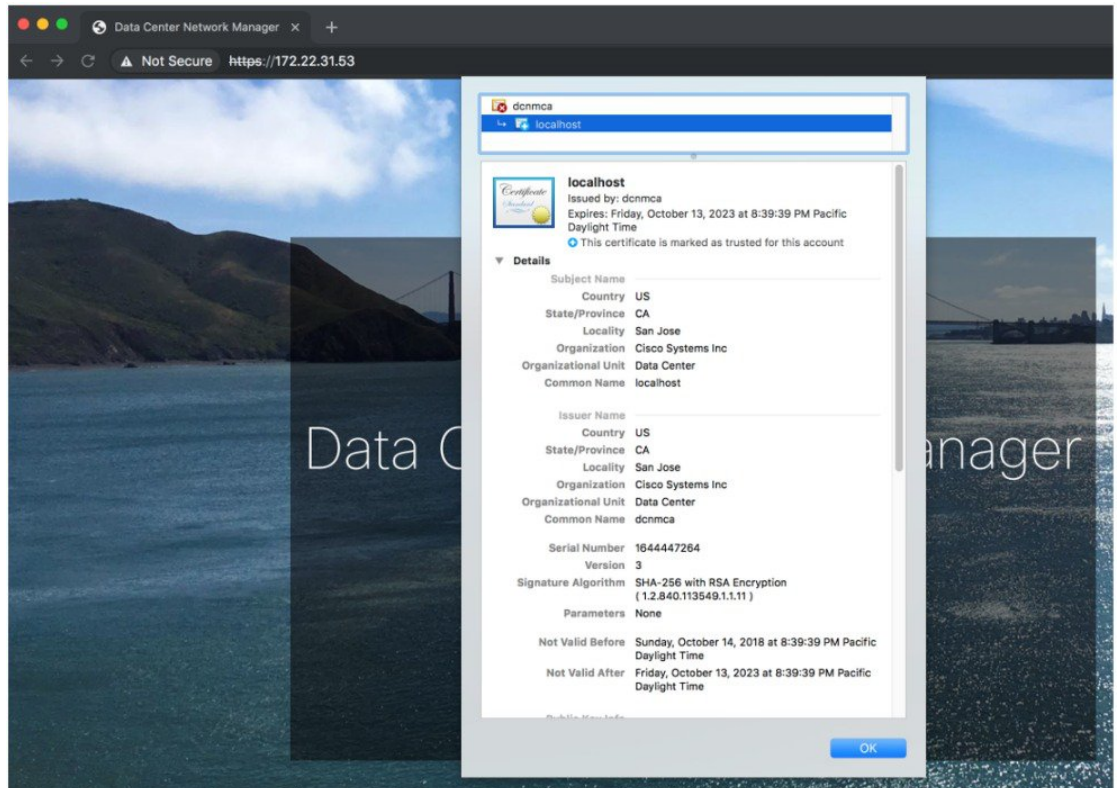

We recommend that you refer to the browser specific information on that browser provider website.

The following snippet is a sample from the Chrome Browser, Version 74.0.3729.169, to verify the certificate.

1. Enter URL **https://<dcnm-ip-address>** or **https://<FQDN>** in the address bar on the browser.
Press the **Return** key.
2. Based on the type of certificate, the icon on the left of the URL field shows a lock icon [] or an alert icon [].
Click on the icon.

- On the card, click **Certificate** field.
The information in the certificate is displayed.

The information that is displayed must match with the details as displayed on CERTIFICATE 1 when you view the certificate details using the **appmgr afw show-cert-details**.

CHAPTER 9

Running Cisco DCNM Behind a Firewall

This chapter provides information about running Cisco DCNM behind a firewall.

- [Running Cisco DCNM Behind a Firewall, on page 59](#)
- [Configuring Custom Firewalls, on page 61](#)

Running Cisco DCNM Behind a Firewall

Generally, an Enterprise (external world) and Data center is separated by a firewall, i.e., DCNM is configured behind a firewall. The Cisco DCNM Web Client and SSH connectivity must pass-through that firewall. Also, a firewall can be placed between the DCNM Server and DCNM-managed devices.

All Cisco DCNM Native HA nodes must be on the same side of the firewall. The internal DCNM Native HA ports are not listed, as it is not recommended to configure a firewall in between the Native HA nodes.

Note When you add or discover LAN devices in DCNM, java is used as a part of the discovery process. If firewall blocks the process then it uses TCP connection port 7 as a discovery process. Ensure that the **cdp.discoverPingDisable** server property is set to **true**. Choose **Web UI > Administration > DCNM Server > Server Properties** to set the server property.

Any standard port where the Ingress traffic enters from clients cannot be modified unless you disable the local firewall.

The following table lists all ports that are used for communication between Cisco DCNM Web Client, SSH Client, and Cisco DCNM Server.

Port Number	Protocol	Service Name	Direction of Communication	Remarks
22	TCP	SSH	Client to DCNM Server	SSH access to external world is optional.
443	TCP	HTTPS	Client to DCNM Server	This is needed to reach DCNM Web Server.

Port Number	Protocol	Service Name	Direction of Communication	Remarks
2443	TCP	HTTPS	Client to DCNM Server	Required during installation, to reach the server. DCNM closes this port after installation completes.

The following table lists all ports that are used for communication between Cisco DCNM Server and other services.

Note The services can be hosted on either side of the firewall.

Port Number	Protocol	Service Name	Direction of Communication	Remarks
49	TCP/UDP	TACACS+	DCNM Server to DNS Server	ACS Server can be either side of the firewall.
53	TCP/UDP	DNS	DCNM Server to DNS Server	DNS Server can be either side of the firewall.
123	UDP	NTP	DCNM Server to NTP Server	NTP Server can be either side of the firewall.
5000	TCP	Docker Registry	Incoming to DCNM Server	Docker Registry Service on DCNM Server listening to requests from DCNM compute nodes.
5432	TCP	Postgres	DCNM Server to Postgres DB Server	Default installation of DCNM does not need this port. This is needed only when Postgres is installed external to the DCNM host machine.

The following table lists all ports that are used for communication between DCNM Server and managed devices:

Port Number	Protocol	Service Name	Direction of Communication	Remarks
22	TCP	SSH	Both Direction	DCNM Server to Device – To manage devices. Device to DCNM Server – SCP (POAP).
67	UDP	DHCP	Device to DCNM Server	
69	TCP	TFTP	Device to DCNM Server	Required for POAP
161	TCP/UDP	SNMP	Server to DCNM Device	DCNM configured via <code>server.properties</code> to use TCP uses TCP port 161, instead of UDP port 161.
514	UDP	Syslog	Device to DCNM Server	
2162	UDP	SNMP_TRAP	Device to DCNM Server	
33000-33499	TCP	gRPC	Device to DCNM Server	LAN Telemetry Streaming

Configuring Custom Firewalls

Note This is applicable for DCNM OVA/ISO deployments only.

Cisco DCNM Server deploys a set of IPTables rules, known as DCNM Local Firewall. These rules open TCP/UDP ports that are required for Cisco DCNM operations. You can't manipulate the built-in Local Firewall without accessing the OS interface, through SSH, and change the rules. Don't change the Firewall rules, as it may become vulnerable to attacks, or impact the normal functioning of DCNM.

To cater to a given deployment or a network, Cisco DCNM allows you to configure your own firewall rules, from Release 11.3(1), using CLIs.

Note These rules can be broad or granular, and supersedes the built-in Local Firewall rules. Therefore, configure these rules carefully, during a maintenance period.

You don't need to stop or restart DCNM server or applications to configure custom firewalls.

Caution IPTable prioritizes the rules in the order that they are configured. Therefore, more granular rules must be installed in the beginning. To ensure that the order of the rules is as required, you can create all rules in a text editor, and then execute the CLIs in the desired order. If rules need to be adjusted, you can flush all rules and configure the rules in the desired order.

You can perform the following operations on the Custom Firewalls.

Note Run all the commands on the Cisco DCNM server using SSH.

Custom Firewall CLI

View the custom firewall CLI chain help and examples using the **appmgr user-firewall** command.

```
dcnm# appmgr user-firewall
dcnm# appmgr user-firewall - h
```

Configure Rules for Custom Firewall

Configure the custom firewall rules using the **appmgr user-firewall {add | del}** command.

```
appmgr user-firewall {add|del} proto {tcp|udp} port {<port><port range n1:n2>}
[{{in|out} <interface name>} [srcip <ip-address> [/<mask>]] [dstip <ip-address> [/<mask>]]
action {permit|deny}
```

Note The custom firewall rules supersede the local Firewall rules. Therefore, be cautious and ensure that the functionalities aren't broken.

Example: Sample Custom Firewall Rules

- dcnm# **appmgr user-firewall add proto tcp port 7777 action deny**

This rule drops all TCP port 7777 traffic on all interfaces.

- dcnm# **appmgr user-firewall add proto tcp port 443 in eth1 action deny**

This rule drops all TCP port 443 incoming traffic on interface eth1.

- dcnm# **appmgr user-firewall add proto tcp port 7000:7050 srcip 1.2.3.4 action deny**

This rule drops TCP port range 10000-10099 traffic coming from IP address 1.2.3.4.

Preserving Custom Firewall Rules

Preserve the custom firewall rules across reboots, using the **appmgr user-firewall commit** command.

Note Each time you modify the rules, you must execute this command to preserve the rules across reboots.

Installing Custom Firewall Rules on Native HA Standby Node

In a Cisco DCNM Native HA setup, when you execute the **appmgr user-firewall commit** on the Active node, the rules are synchronized to the Standby node automatically. However, the new rules are operational only after a system reboot.

To apply the rules immediately, install the custom firewall rules on Standby node using the **appmgr user-firewall user-policy-install** command.

Deleting Custom Firewalls

Delete all the custom firewalls using the **appmgr user-firewall flush-all** command.

To delete the custom firewalls permanently, use the **appmgr user-firewall commit** command.

CHAPTER 10

Secure Client Communications for Cisco DCNM Servers

- [Secure Client Communications for Cisco DCNM Servers, on page 65](#)

Secure Client Communications for Cisco DCNM Servers

This section describes how to configure HTTPS on Cisco Data Center Network Manager Servers.

Note You must enable SSL/HTTPS on the Cisco DCNM before you add a CA signed SSL certificate. Therefore, perform the procedure in the below mentioned order.

This section includes the following topics:

Enabling SSL/HTTPS on Cisco DCNM in HA Environment on Virtual Appliance

To enable SSL/HTTPS on a Virtual Appliance for Cisco DCNM in HA mode, perform the following:

Procedure

Step 1 Configure the primary server with a self signed SSL certificate.

Note In a CA signed certificate, each server has their own certificate generated. Ensure that the certificate is signed by the signing certificate chain which is common for both the servers.

Step 2 On the secondary server, locate the keystore.

Step 3 Rename the keystore located at

```
<DCNM_install_root>/dcm/wildfly-10.1.0.Final/standalone/configuration/fmserver.jks
```

to

```
<DCNM_install_root>/dcm/wildfly-10.1.0.Final/standalone/configuration/fmserver.jks.old
```

Step 4 Copy the file `fmserver.jks` generated in primary server to secondary server into folders

```
<dcnm-home> /dcm/wildfly-10.1.0.Final/standalone/configuration/  
<dcnm-home>/dcm/fm/conf/cert/
```

What to do next

If you have created a self-signed certificate or imported an SSL certificate to the keystore, you must copy the new `fmserver.jks` located at

`/usr/local/cisco/dcm/wildfly-10.1.0.Final/standalone/configuration/etc/elasticsearch`. If you do not copy the `fmserver.jks` file to the `elasticsearch` directory, you will not be able to get the Alarms and Policies. As the `elasticsearch` database will be stabilizing, you cannot configure any Alarm Policy on the Cisco DCNM **Web UI Monitor > Alarms > Alarm Policies**.

CHAPTER 11

Managing Applications in a High-Availability Environment

This chapter describes how to configure a high-availability (HA) environment in your Cisco DCNM Open Virtual Appliance deployment for your Cisco Programmable Fabric solution. It also includes details about the HA functionality for each of the applications bundled within the Cisco DCNM Open Virtual Appliance.

Note Ensure that the NTP server is synchronized between active and standby peers is essential for proper HA functioning in DCNM

This chapter contains the following sections:

- [Information About Application Level HA in the Cisco DCNM Open Virtual Appliance, on page 67](#)
- [Native HA Failover and Troubleshooting, on page 68](#)
- [Application High Availability Details, on page 70](#)

Information About Application Level HA in the Cisco DCNM Open Virtual Appliance

To achieve HA for applications that are run on the Cisco DCNM Open Virtual Appliance, you can run two virtual appliances. You can run one in Active mode and the other in Standby mode.

Note This document refers to these appliances as OVA-A and OVA-B, respectively.

In this scenario:

1. All applications run on both appliances.

The application data is either constantly synchronized or applications share a common database as applicable.

2. Only one of the applications running on the two appliances serves the client requests. Initially this would be the applications running on OVA-A. The application continues to do so until one of the following happens:

- The application on OVA-A crashes.
 - The operating system on OVA-A crashes.
 - OVA-A is powered off for some reason.
3. At this point, the application running on the other appliance (OVA-B) takes over.
For DHCP, when the first node fails, the second node starts serving the IP addresses.
 4. The existing connections to OVA-A are dropped and the new connections are routed to OVA-B.
This scenario demonstrates why one of the nodes (OVA-A) is initially referred to as the Active node and OVA-B is referred as the Standby node.

Automatic Failover

The application-level and virtual machine (VM)-level and switchover process is as follows.

- If any of the applications managed by the load-balancing software (DCNM/AMQP) goes down on OVA-A, the Active node that handles the client requests detects the failure and redirects subsequent requests to the Standby node (OVA-B). This process provides an application-level switchover.
- If the Active node (OVA-A) fails or is powered-off for some reason, the Standby node (OVA-B) detects the failure and enables the VIP address for Cisco DCNM/AMQP on OVA-B. It also sends a gratuitous ARP to the local switch to indicate the new MAC address that is associated with the IP address. For applications not using VIP, the DHCPD running on OVA-B detects the failure of DHCPD on OVA-A and activates itself; whereas LDAP running on OVA-B continues running as LDAP is deployed Active-Active. Consequently, a VM-level failover is accomplished for all four applications (DCNM/AMQP/DHCP/LDAP).

Manually Triggered Failovers

An application-level failover can also be triggered manually. For instance, you might want to run AMQP on OVA-B and the rest of the applications on OVA-A. In that case, you can log in to the SSH terminal of OVA-A and stop AMQP by using the **appmgr stop amqp** command.

This failover triggers the same process that is described in the [Automatic Failover, on page 68](#); subsequent requests to the AMQP Virtual IP address are redirected to OVA-B.

Native HA Failover and Troubleshooting

Due to the nature of Native HA, the role of the host might alternate from Active to Standby or from Standby to Active.

The following sections provide information on troubleshooting in different use cases.

Native HA Failover from Active Host to Standby Host

Perform the following steps when the Native HA failover occurs from Active to Standby host:

1. Log on to DCNM Web UI, and navigate to **Administrator > Native HA**.

2. Verify the status of HA. If the DCNM HA status is not in **OK** mode, you cannot perform Failover operation. Click **Failover**. The Cisco DCNM server will shutdown and the DCNM Standby appliance will be operational.
3. Refresh the Cisco DCNM Web UI.
After the DCNM server is operational, you can log on to the DCNM Web UI.

Note We recommend that you do not run **appmgr stop all** or **appmgr stop ha-apps** commands on the Active host to trigger failover. If Cisco DCNM HA status is not in **OK** mode, a failover may cause loss of data, as the Standby DCNM appliance is not synchronized with the Active appliance before failover.

Issue with DCNM Application Framework

If DCNM Web UI is not accessible, and a failover operation is necessary, execute one of the following commands under Linux console:

appmgr failover—This command triggers the HA heartbeat failover.

Or

reboot -h now—This command triggers the Linux host to reboot, which causes a failover.

However, we recommend that you use DCNM Web UI to perform failover, as all other methods carry a risk of data loss when both HA peers are not in sync.

Stop and Restart DCNM

To completely stop DCNM and restart it, perform the following:

1. On the Standby appliance, stop all the applications by using the **appmgr stop all** command.
2. Check if all the applications have stopped, using the **appmgr status all** command.
3. On the Active appliance, stop all the applications using the **appmgr stop all** command.
4. Verify if all the applications are stopped using the **appmgr status all** command.
5. On the deployed Active host, start all the applications using the **appmgr start all** command.
Verify if all the applications are running. Log on to the DCNM Web UI to check if it is operational.
6. On the deployed Standby host, start all the applications using the **appmgr start all** command.
On the Web UI, navigate to **Administration > Native HA** and ensure that the HA status displays **OK**.

Restart Standby Host

Perform this procedure to restart only the Standby host:

1. On the Standby host, stop all the applications using the **appmgr stop all** command.
2. Verify if all the applications have stopped using the **appmgr status all** command.
3. Start all the applications using the **appmgr start all**.

On the Web UI, navigate to **Administration > Native HA** and ensure that the HA status displays **OK**.

Application High Availability Details

This section describes all of the Cisco Programmable Fabric HA applications.

Cisco DCNM Open Virtual Appliance has two interfaces: one that connects to the Open Virtual Appliance management network and one that connects to the enhanced Programmable Fabric network. Virtual IP addresses are defined for both interfaces.

- From the Open Virtual Appliance management network, the DCNM-REST API, DCNM interface, and AMQP are accessed through the VIP address
- From the enhanced fabric management network, LDAP and DHCP are accessed directly.

Only three Virtual IPs are defined:

- DCNM REST API (on dcnm management network)
- DCNM REST API (on enhanced fabric management network)
- AMQP (on dcnm management network)

Note Although DCNM Open Virtual Appliance in HA sets up a VIP, the VIP is intended to be used for the access of DCNM, REST API. For GUI access, we still recommend that you use the individual IP addresses of the DCNM HA peers and use the same to launch DCNM SAN Java clients, etc.

See the following table for a complete list of Programmable Fabric applications and their corresponding HA mechanisms.

Programmable Fabric Application	HA Mechanism	Use of Virtual IPs	Comments
Data Center Network Manager	DCNM Clustering/Federation	Yes	Two VIPs defined, one on each network
RabbitMQ	RabbitMQ Mirrored Queues	Yes	One VIP defined on the OVA management network
Repositories	—	—	External repositories have to be used

Data Center Network Management

The data center network management function is provided by the Cisco Data Center Network Manager (DCNM) server. Cisco DCNM provides the setup, visualization, management, and monitoring of the data center infrastructure. Cisco DCNM can be accessed from your browser at [http://\[host/ip\]](http://[host/ip]).

Note For more information about Cisco DCNM, see <http://cisco.com/go/dcnm>.

HA Implementation

Cisco DCNMs that run on both OVAs are configured in clustering and federated modes for HA. Cisco DCNM federation is the HA mechanism for SAN devices. Groups of SAN devices can be managed by each node in the DCNM federated setup. All the devices can be managed using a single client interface.

You can enable automatic failover in the Cisco DCNM UI by choosing: **Admin > Federation**. If you enable an automatic failover and the Cisco DCNM that is running on OVA-A fails, the automatic failover moves only the fabrics and shallow-discovered LANs that are managed by OVA-A to OVA-B automatically.

DCNM Virtual IP Usage

An Open Virtual Appliance HA setup has two VIP addresses (one for each network) for the Cisco DCNM at the default HTTP port. These VIPs can be used for accessing the DCNM RESTful services on the Open Virtual Appliance management network and the enhanced fabric management network. For example, external systems such as Cisco UCS Director can point to the VIP in the Open Virtual Appliance management network and the request gets directed to the active Cisco DCNM. Similarly, the switches in an enhanced fabric management network access the VIP address on the enhanced fabric management network during the POAP process.

You can still directly connect to Cisco DCNM real IP addresses and use them as you would in a DCNM in a cluster/federated set up.

Note Cisco recommends that you must use VIP addresses only for accessing DCNM REST API. To access the Cisco DCNM Web or SAN client, you must connect using the IP address of the server.

Licenses

For Cisco DCNM, we recommend that you have licenses on the first instance and a spare matching license on the second instance.

Application Failovers

Enable an automatic failover option in the Cisco DCNM UI when an Open Virtual Appliance HA pair is set up by choosing: **Administration > DCNM Server > Native HA**. This process ensures that if the DCNM that is running on OVA-A fails, all the fabrics and shallow-discovered LANs managed by DCNM-A are managed by DCNM-B automatically after a given time interval (usually about 5 minutes after the failure of DCNM on OVA-A).

The Cisco DCNM VIP address still resides on OVA-A. The Representational State Transfer Web Services (REST) calls initially hit the VIP addresses on OVA-A and get redirected to the Cisco DCNM that is running on OVA-B.

Application Failbacks

When the Cisco DCNM on OVA-A comes up, the VIP address automatically redirects the REST requests to DCNM-A.

Virtual-IP Failovers

The VIP address that is configured for Cisco DCNM REST API on OVA-A can fail due to two reasons:

- The load-balancing software running on OVA-A fails.
- OVA-A fails.

The VIP address of Cisco DCNM automatically migrates to OVA-B. The only difference is which DCNM will be used after the failover.

- If a load-balancing software failure occurs, the VIP address on OVA-B directs the requests to DCNM-A.
- If an OVA-A failure occurs, the VIP address on OVA-B directs the requests to DCNM-B.

The automatic failover ensures that the ownership of all of the fabrics and shallow-discovered LANs managed by DCNM-A automatically change to DCNM-B.

Virtual-IP Failbacks

When OVA-A is brought up and Cisco DCNM is running, the VIP addresses keep running on the Standby node. The failback of Virtual IP addresses from OVA-B to OVA-A occurs only in the following sequence.

1. OVA-A comes up.
2. Cisco DCNM runs on OVA-A.
3. OVA-B goes down or the load-balancing software fails on OVA-B.

RabbitMQ

RabbitMQ is the message broker that provides the Advanced Messaging Queuing Protocol (AMQP).

Note You need to stop and restart AMQP on both DCNM's server in HA within 30 seconds, otherwise AMQP may not start. For more information about RabbitMQ, go to <https://www.rabbitmq.com/documentation.html>.

HA Implementation

Enabling the HA on the Open Virtual Appliance creates a VIP address in the Open Virtual Appliance management network. Orchestration systems such as vCloud Director, set their AMQP broker to the VIP address.

Enabling the HA on the Open Virtual Appliance also configures the RabbitMQ broker that runs on each node to be a duplicate of the broker that is running on the other node. Both OVAs act as “disk nodes” of a RabbitMQ cluster, which means that all the persistent messages stored in durable queues are replicated. The RabbitMQ policy ensures that all the queues are automatically replicated to all the nodes.

Application Failovers

If RabbitMQ-A fails, the VIP address on OVA-A redirects the subsequent AMQP requests to RabbitMQ-B.

Application Failbacks

When RabbitMQ-A comes up, the VIP address automatically starts directing the AMQP requests to RabbitMQ-A.

Virtual-IP Failovers

The VIP address configured for the AMQP broker on OVA-A can fail due to two reasons:

- The load-balancing software running on OVA-A fails.
- OVA-A fails.

In both cases, the VIP address of the AMQP automatically migrates to OVA-B. The only difference is which AMQP broker will be used after the failover.

- In a load-balancing software failure, the VIP address on OVA-B directs the requests to RabbitMQ-A.
- In an OVA-A failure, the VIP address on OVA-B directs the requests to RabbitMQ-B.

Virtual-IP Failbacks

When OVA-A is brought up and AMQP-A is running, the VIP addresses keep running on the OVA-B (directing the requests to AMQP-A). The failback of the RabbitMQ VIP from OVA-B to OVA-A occurs only in the following sequence.

1. OVA-A comes up.
2. RabbitMQ runs on OVA-A.
3. OVA-B goes down or the load-balancing software fails on OVA-B.

Repositories

All repositories must be remote.

CHAPTER 12

Managing Utility Services After DCNM Deployment

This chapter describes how to verify and manage all of the utility services that provide DC3 (Programmable Fabric) central point of management functions after the DCNM is deployed.

Table 1: Cisco DCNM Utility Services

Category	Application	Username	Password	Protocol Implemented
Network Management	Data Center Network Manager	admin	User choice ¹	Network Management

¹ User choice refers to the administration password entered by the user during the deployment.

This chapter contains the following sections:

- [Editing Network Properties Post DCNM Installation, on page 75](#)
- [Convert Standalone Setup to Native-HA Setup, on page 97](#)
- [Utility Services Details, on page 101](#)
- [Managing Applications and Utility Services , on page 102](#)
- [Updating the SFTP Server Address for IPv6, on page 105](#)

Editing Network Properties Post DCNM Installation

The Cisco DCNM OVA or the ISO installation consists of 3 network interfaces:

- dcnm-mgmt network (eth0) interface

This network provides connectivity (SSH, SCP, HTTP, HTTPS) to the Cisco DCNM Open Virtual Appliance. Associate this network with the port group that corresponds to the subnet that is associated with the DCNM Management network.

- enhanced-fabric-mgmt (eth1) interface

This network provides enhanced fabric management of Nexus switches. Associate this network with the port group that corresponds to management network of leaf and spine switches.

- enhanced-fabric-inband (eth2) interface

This network provides in-band connection to fabric. Associate this network with the port group that corresponds to a fabric in-band connection.

The following figure shows the network diagram for the Cisco DCNM Management interfaces.

During Cisco DCNM installation for your deployment type, you can configure these interfaces. However, from Cisco DCNM Release 11.2(1), you can edit and modify the network settings post installation.

Note We recommend that you use **appmgr** commands to update network properties. Do not restart network interfaces manually.

You can modify the parameters as explained in the following sections:

Modifying Network Interfaces (eth0 and eth1) Post DCNM Installation

Along with the eth0 and eth1 IP address (IPv4 and/or IPv6), you can also modify the DNS and the NTP server configuration using the **appmgr update network-properties** command.

For step-by-step instructions on how to modify the network parameters using the **appmgr update network-properties** commands, see the following sections.

- [Modifying Network Properties on DCNM in Standalone Mode, on page 76](#)

[Sample Command Output for Modifying Network Parameters in the Cisco DCNM Standalone Setup, on page 77](#)

- [Modifying Network Properties on DCNM in Native HA Mode, on page 78](#)

[Sample Command Output for Modifying Network Parameters in the Cisco DCNM Native HA Setup, on page 80](#)

Modifying Network Properties on DCNM in Standalone Mode

The following sample shows the output for the **appmgr update network-properties** command for a Cisco DCNM Standalone Appliance.

Note Execute the following commands on the DCNM Appliance console to avoid a premature session timeout.

1. Initiate a session on the console, using the following command:

```
appmgr update network-properties session start
```

2. Update the Network Properties using the following command:

```
appmgr update network-properties set ipv4 {eth0|eth1} <ipv4-address> <network-mask> <gateway>
```

Enter the new IPv4 address for the Management (eth0) interface, along with the subnet mask and gateway IP addresses.

3. View and verify the changes by using the following command:

```
appmgr update network-properties session show {config | changes | diffs}
```

4. After you validate the changes, apply the configuration using the following command:

```
appmgr update network-properties session apply
```

Wait for a few minutes before you can logon to the Cisco DCNM Web UI using the eth0 Management Network IP address.

Sample Command Output for Modifying Network Parameters in the Cisco DCNM Standalone Setup

The following sample example shows how to modify the network parameters post installation for a Cisco DCNM Standalone setup.

```
dcnm# appmgr update network-properties session start

Modifying Network Properties on DCNM in Native HA Mode

The following sample shows output to modify the network parameters using the **appmgr update network-properties** command for a Cisco DCNM Native HA Appliance.

- Note**
- Execute the following commands on the DCNM Active and Standby node console to avoid premature session timeout.
 - Ensure that you execute the commands in the same order as mentioned in the following steps.

1. Stop the DCNM Applications on the Standby node by using the following command:
appmgr stop all
Wait until all the applications stop on the Standby node before you go proceed.
2. Stop the DCNM Applications on the Active node by using the following command:
appmgr stop all
3. Initiate a session on the Cisco DCNM console of both the Active and Standby nodes by using the following command:
appmgr update network-properties session start
4. On the Active node, modify the network interface parameters by using the following commands:
 - a. Configure the IP address for eth0 and eth1 address by using the following command:

```
appmgr update network-properties set ipv4 {eth0|eth1}<ipv4-address> <network-mask>
<gateway>
```

Enter the new IPv4 or IPv6 address for the eth1 interface, along with the subnet mask and gateway IP addresses.

- b. Configure the VIP IP address by using the following command:

```
appmgr update network-properties set ipv4 {vip0|vip1}<ipv4-address> <network-mask>
```

Enter the vip0 address for eth0 interface. Enter the vip1 address for eth1 interface.

- c. Configure the peer IP address by using the following command:

```
appmgr update network-properties set ipv4 {peer0|peer1}<ipv4-address>
```

Enter the eth0 address of the Standby node as peer0 address for Active node. Enter the eth1 address of the Standby node as peer1 address for Active node.

- d. View and validate the changes that you have made to the network parameters by using the following command:

```
appmgr update network-properties session show {config | changes | diffs}
```

View the changes that you have configured by using the following command:

5. On the Standby node, modify the network interface parameters using the commands described in [Step 4](#).

6. After you validate the changes, apply the configuration on the Active node by using the following command:

```
appmgr update network-properties session apply
```

Wait until the prompt returns, to confirm that the network parameters are updated.

7. After you validate the changes, apply the configuration on the Standby node by using the following command:

```
appmgr update network-properties session apply
```

8. Start all the applications on the Active node by using the following command:

```
appmgr start all
```

Note Wait until all the applications are running successfully on the Active node, before proceeding to the next step.

9. Start all the applications on the Standby node by using the following command:

```
appmgr start all
```

10. Establish peer trust key on the Active node by using the following command:

```
appmgr update ssh-peer-trust
```

11. Establish peer trust key on the Standby node by using the following command:

```
appmgr update ssh-peer-trust
```

Sample Command Output for Modifying Network Parameters in the Cisco DCNM Native HA Setup

The following sample example shows how to modify the network parameters post installation for a Cisco DCNM Native HA setup.

Note For example, let us indicate Active and Standby appliances as **dcnm1** and **dcnm2** respectively.

Modifying Network Properties on DCNM in Standalone Mode

Note Execute the following commands on the DCNM Appliance console to avoid a premature session timeout.

To change the Network Properties on Cisco DCNM Standalone setup, perform the following steps:

Procedure

-
- Step 1** Initiate a session on the console, using the following command:
appmgr update network-properties session start
- Step 2** Update the Network Properties using the following command:
appmgr update network-properties set ipv4 {eth0|eth1|eth2}<ipv4-address> <network-mask> <gateway>
- Step 3** View and verify the changes by using the following command:
appmgr update network-properties session show {config | changes | diffs}
- Step 4** After you validate the changes, apply the configuration using the following command:
appmgr update network-properties session apply
- Wait for a few minutes before you can logon to the Cisco DCNM Web UI using the eth0 Management Network IP address.
-

Sample Command Output for Modifying Network Parameters in the Cisco DCNM Standalone Setup

The following sample example shows how to modify the network parameters post installation for a Cisco DCNM Standalone setup.

```

dcnm# appmgr update network-properties session start

dcnm# appmgr update network-properties set ipv4 eth0 172.28.10.244 255.255.255.0 172.28.10.1

Modifying Network Properties on DCNM in Native HA Mode

Note Execute the following commands on the DCNM Appliance console to avoid a premature session timeout. Ensure that you execute the commands in the same order as mentioned in the following steps.

Note Native HA nodes must be considered as a single entity. When you change the Active node eth1 IP address, you must also change the Standby node eth1 IP address.

When you change the eth0 IP address in any node, you must change the eth2 IP address for that node.

To change the Network Properties on Cisco DCNM Native HA setup, perform the following steps:

Procedure

Step 1 Stop the DCNM Applications on the Standby node by using the following command:

appmgr stop all

Wait until all the applications stop on the Standby node before you go proceed.

Step 2 Stop the DCNM Applications on the Active node by using the following command:

appmgr stop all

Step 3 Initiate a session on the Cisco DCNM console of both the Active and Standby nodes by using the following command:

appmgr update network-properties session start

Step 4 On the Active node, modify the network interface parameters by using the following commands:

a) Configure the IP address for eth0, eth1, and eth2 address by using the following command:

```
appmgr update network-properties set ipv4 {eth0|eth1|eth2}<ipv4-address> <network-mask> <gateway>
```

Enter the new IPv4 or IPv6 address for the interface, along with the subnet mask and gateway IP addresses.

b) Configure the VIP IP address by using the following command:

```
appmgr update network-properties set ipv4 {vip0|vip1|vip2}<ipv4-address> <network-mask>
```

Enter the vip0 address for eth0 interface. Enter the vip1 address for eth1 interface. Enter the vip2 address for eth2 interface.

c) Configure the peer IP address by using the following command:

```
appmgr update network-properties set ipv4 {peer0|peer1|peer2}<ipv4-address>
```

Enter the eth0 address of the Standby node as peer0 address for Active node. Enter the eth1 address of the Standby node as peer1 address for Active node. Enter the eth2 address of the Standby node as peer2 address for Active node.

d) View and validate the changes that you have made to the network parameters by using the following command:

```
appmgr update network-properties session show {config | changes | diffs}
```

Step 5 On the Standby node, modify the network interface parameters using the commands described in procedure in [Step 4, on page 87](#).

Step 6 After you validate the changes, apply the configuration on the Active node by using the following command:

appmgr update network-properties session apply

Wait until the prompt returns, to confirm that the network parameters are updated.

Step 7 After you validate the changes, apply the configuration on the Standby node by using the following command:

appmgr update network-properties session apply

Step 8 Start all the applications on the Active node by using the following command:

appmgr start all

Note Wait until all the applications are running successfully on the Active node, before proceeding to the next step.

Step 9 Start all the applications on the Standby node by using the following command:

appmgr start all

Step 10 Establish peer trust key on the Active node by using the following command:

appmgr update ssh-peer-trust

Step 11 Establish peer trust key on the Standby node by using the following command:

appmgr update ssh-peer-trust

Sample Command Output for Modifying Network Parameters in the Cisco DCNM Native HA Setup

The following sample example shows how to modify the network parameters post installation for a Cisco DCNM Native HA setup.

Note For example, let us indicate Active and Standby appliances as **dcnm1** and **dcnm2** respectively.

```

Changing the DCNM Server Password on Standalone Setup

The password to access Cisco DCNM Web UI is configured while installing the Cisco DCNM for your deployment type. However, you can modify this password post installation also, if required.

To change the password post installation, perform the following steps:

Procedure

-
- Step 1** Stop the applications using the **appmgr stop all** command.
- Wait until all the applications stop running.
- Step 2** Change the password for the management interface by using the **appmgr change_pwd ssh {root|poap|sysadmin}[password]** command.
- Ensure that the new password adheres to the following password requirements. If you do not comply with the requirements, the DCNM application might not function properly:
- It must be at least 8 characters long and contain at least one alphabet and one numeral.
 - It can contain a combination of alphabets, numerals, and special characters.
 - Do not use any of these special characters in the DCNM password: <SPACE> " & \$ % ' ^ = <> ; : ` \ | / , . *
- Step 3** Start the application using the **appmgr start all** command.
-

Example

```

dcnm# appmgr stop all

dcnm# appmgr change_pwd ssh root <<new-password>>
dcnm# appmgr change_pwd ssh poap <<new-password>>
dcnm# appmgr change_pwd ssh sysadmin <<new-password>>

dcnm# appmgr start all

```

Changing the DCNM Server Password on Native HA Setup

The password to access Cisco DCNM Web UI is configured while installing the Cisco DCNM for your deployment type. However, you can modify this password post installation also, if required.

To change the password post installation, perform the following steps:

Procedure

-
- Step 1** Stop all the applications on the Standby appliance using the **appmgr stop all** command. Ensure that all the applications have stopped using the **appmgr status all** command.
- Step 2** Stop all the applications on the Active appliance using the **appmgr stop all** command. Ensure that all the applications have stopped using the **appmgr status all** command.
- Step 3** Change the password for the management interface by using the **appmgr change_pwd ssh {root|poap|sysadmin}[password]** command, on both Active and Standby nodes.

Note You provide the same password for both the nodes at the prompt.

Ensure that the new password adheres to the following password requirements. If you do not comply with the requirements, the DCNM application might not function properly:

- It must be at least 8 characters long and contain at least one alphabet and one numeral.
- It can contain a combination of alphabets, numerals, and special characters.
- Do not use any of these special characters in the DCNM password: <SPACE> " & \$ % ' ^ = < > ; : ` \ | / , . *

- Step 4** Start the applications on the Active appliance, using the **appmgr start all** command. Ensure that all the applications have started using the **appmgr status all** command.
- Step 5** Start the applications on the Standby appliance, using the **appmgr start all** command. Ensure that all the applications have started using the **appmgr status all** command.
-

Example

Let us consider Active and standby as dcnm1 and dcnm2, respectively.

```
dcnm1# appmgr stop all
dcnm2# appmgr stop all

dcnm1# appmgr change_pwd ssh root <<new-password>>
dcnm1# appmgr change_pwd ssh poap <<new-password>>
dcnm1# appmgr change_pwd ssh sysadmin <<new-password>>

dcnm2# appmgr change_pwd ssh root <<new-password>>
dcnm2# appmgr change_pwd ssh poap <<new-password>>
dcnm2# appmgr change_pwd ssh sysadmin <<new-password>>
```

```
dcnm1# appmgr start all
dcnm2# appmgr start all
```

Changing the DCNM Database Password on Standalone Setup

To change the Postgres database password on Cisco DCNM Standalone setup, perform the following steps:

Procedure

- Step 1** Stop all the applications using the **appmgr stop all** command.
Ensure that all the applications have stopped using the **appmgr status all** command.
 - Step 2** Change the Postgres password by using the **appmgr change_pwd db** command.
Provide the new password at the prompt.
 - Step 3** Start the application using the **appmgr start all** command.
Ensure that all the applications have started using the **appmgr status all** command.
-

Example

```
dcnm# appmgr stop all
dcnm# appmgr change_pwd db <<new-password>>
dcnm# appmgr start all
```

Changing the DCNM Database Password on Native HA Setup

To change the Postgres database password on Cisco DCNM Native HA setup, perform the following steps:

Procedure

- Step 1** Stop all the applications on the Standby appliance using the **appmgr stop all** command.
Ensure that all the applications have stopped using the **appmgr status all** command.
- Step 2** Stop all the applications on the Active appliance using the **appmgr stop all** command.
Ensure that all the applications have stopped using the **appmgr status all** command.
- Step 3** Change the Postgres password by using the **appmgr change_pwd db** command on both Active and Standby nodes.
Ensure that you provide the same password at the prompt.
- Step 4** Start the applications on the Active appliance, using the **appmgr start all** command.
Ensure that all the applications have started using the **appmgr status all** command.

- Step 5** Start the applications on the Standby appliance, using the **appmgr start all** command. Ensure that all the applications have started using the **appmgr status all** command.

Example

Let us consider Active and standby as **dcnm1** and **dcnm2**, respectively.

```
dcnm1# appmgr stop all
dcnm2# appmgr stop all

dcnm1# appmgr change_pwd db <<new-password>>
dcnm2# appmgr change_pwd db <<new-password>>

dcnm1# appmgr start all
dcnm2# appmgr start all
```

Convert Standalone Setup to Native-HA Setup

To convert an existing Cisco DCNM Standalone setup to a Native HA setup, perform the following steps:

Before you begin

Ensure that the Standalone setup is active and operational, by using the **appmgr show version** command.

```
dcnm# appmgr show version

Cisco Data Center Network Manager
Version:
Install mode: LAN Fabric
Standalone node. HA not enabled.
dcnm#
```

Procedure

- Step 1** On the Standalone setup, launch SSH and enable **root** user access by using the **appmgr root-access permit** command:
- ```
dcnm# appmgr root-access permit
```
- Step 2** Deploy a new DCNM as secondary node. Choose **Fresh installation - HA Secondary**
- For example, let us indicate the existing setup as **dcnm1** and the new DCNM as secondary node as **dcnm2**.
- Caution** If the system configuration does not meet minimum resource requirements, **SYSTEM RESOURCE ERROR** is displayed on the Web Installer, and the installation will be aborted. Modify the system requirements, and launch the Web Installer to complete the installation.
- Step 3** Configure **dcnm2** as the Secondary node. Paste the URL displayed on the Console tab of **dcnm2** and hit Enter. A welcome message appears.
- a) On the **Welcome to Cisco DCNM** screen, click **Get Started**.

**Caution** If the system configuration does not meet minimum resource requirements, **SYSTEM RESOURCE ERROR** is displayed on the Web Installer, and the installation will be aborted. Modify the system requirements, and launch the Web Installer to complete the installation.

- b) On the Cisco DCNM Installer screen, select **Fresh Installation - HA Secondary** radio button, to install **dcnm2** as Secondary node.

Click **Continue**.

- c) On the **Install Mode** tab, from the drop-down list, choose the same installation mode that you selected for the Primary node.

**Note** The HA installation fails if you do not choose the same installation mode as Primary node.

Check the **Enable Clustered Mode** check box, if you have configured the Cisco DCNM Primary in Clustered mode.

Click **Next**.

- d) On the **Administration** tab, enter information about passwords.

**Note** All the passwords must be same as the passwords that you provided while configuring the Primary node.

- e) On the **System Settings**, configure the settings for the DCNM Appliance.

- In the **Fully Qualified Hostname** field, enter the hostname that is a fully qualified domain name (FQDN) as per RFC1123, section 2.1. Hostnames with only digits is not supported.

- In the **DNS Server Address List** field, enter the DNS IP address.

Beginning with Release 11.2(1), you can also configure the DNS server using an IPv6 address.

From Release 11.3(1), you can configure more than one DNS server.

**Note** If you're using Network Insights applications, ensure that the DNS server is valid and reachable.

- In the **NTP Server Address List** field, enter the IP address of the NTP server.

The value must be an IP or IPv6 address or RFC 1123 compliant name.

From Release 11.3(1), you can configure more than one NTP server.

- From the **Timezone** drop-down list, select the timezone in which you are deploying the DCNM.

Click **Next**.

- f) On the **Network Settings** tab, configure the network parameters used to reach the DCNM Web UI.

Figure 14: Cisco DCNM Management Network Interfaces

1. In the **Management Network** area, verify if the auto-populated addresses for **Management IPv4 Address** and **Management Network Default IPv4 Gateway** are correct. Modify, if necessary.

**Note** Ensure that the IP address belongs to the same Management Network configured on the Primary node.

(Optionally) Enter a valid IPv6 address along with the prefix to configure the **Management IPv6 Address** and the **Management Network Default IPv6 Gateway**.

2. In the **Out-of-Band Network** area, enter the **IPv4 address** and **Gateway IPv4 Address**.

If DCNM is on the IPv6 network, configure the network by entering relevant IPv6 Address for **IPv6 address** and **Gateway IPv6 Address**.

**Note** Ensure that the IP addresses belong to the same Out-of-Band network configured on the Primary node.

Out-of-band management provides a connection to the device management ports (Typically mgmt0).

**Note** If the out-of-band network is not configured, you cannot configure Cisco DCNM in Cluster mode.

3. In the **In-Band Network** area, enter the **IPv4 address** and **Gateway IPv4 Address** for the in-band network.

If DCNM is on the IPv6 network, configure the network by entering relevant IPv6 Address for **IPv6 address** and **Gateway IPv6 Address**.

**Note** Ensure that the IP addresses belong to the same In-Band network configured on the Primary node.

The In-Band Network provides reachability to the devices via the front-panel ports.

**Note** If you do not configure in-band network, Endpoint Locator and Telemetry features are not operational.

Click **Next**.

- g) On the **Applications** tab, configure the Internal Applications Services Network, and Cluster mode settings.

1. In the **Internal Application Services Network** area, in the **IPv4 Subnet** field, enter the IP subnet to access the applications that run internally to DCNM.

2. In the **Clustered mode configuration** area, configure the network settings to deploy the DCNM instance in Clustered mode. In Clustered mode, applications run on separate compute nodes.
  - In the **Out-of-Band IPv4 Network Address Pool**, enter the address pool from the Out-of-Band IPv4 network to be used in the Clustered Mode.
 

Optionally, you can also enter an IPv6 address pool in the **Out-of-Band IPv6 Network Address Pool** field.
  - In the **In-Band IPv4 Network Address Pool**, enter the address pool from the In-Band IPv4 network to be used in the Clustered Mode.
 

Optionally, you can also enter an IPv6 address pool in the **In-Band IPv6 Network Address Pool** field.

Ensure that the IP addresses belong to the same pool as configured on the Primary node.

- h) On the **HA Settings** tab, configure the system settings for the Secondary node.
  - In the **Management IPv4 Address of Primary DCNM node** field, enter the appropriate IP Address to access the DCNM UI.
  - In the **VIP Fully qualified Host Name** field, enter hostname that is a fully qualified domain name (FQDN) as per RFC1123, section 2.1. Host names with only digits is not supported.
  - In the **Management Network VIP address** field, enter the IP address used as VIP in the management network.
 

Optionally, you can also enter an IPv6 VIP address in the **Management Network VIPv6 address** field.

**Note** If you have configured the Management network using IPv6 address, ensure that you configure the Management Network VIPv6 Address.
  - In the **Out-of-Band Network VIP Address** field, enter the IP address used as VIP in the Out-of-Band network.
 

Optionally, you can also enter an IPv6 VIP address in the **Out-of-Band Network VIPv6 Address** field.
  - In the **In-Band Network VIP Address** field, enter the IP address used as VIP in the Out-of-Band network.
 

Optionally, you can also enter an IPv6 VIP address in the **In-Band Network VIPv6 Address** field.

**Note** This field is mandatory if you have provided an IP address for In-Band network in the **Network Settings** tab.
  - In the **HA Ping Feature IPv4 Address** field, enter the HA ping IP address and enable this feature, if necessary.
 

**Note** The configured IPv4 address must respond to the ICMP echo pings.

HA\_PING\_ADDRESS, must be different from the DCNM Active and Standby addresses.

You must configure the HA ping IPv4 Address to avoid the Split Brain scenario. This IP address must belong to Enhanced Fabric management network.

Click **Next**.

- i) On the **Summary** tab, review the configuration details.

Click **Previous** to go to the previous tabs and modify the configuration. Click **Start Installation** to complete the Cisco DCNM OVA Installation for the chosen deployment mode.

A progress bar appears to show the completed percentage, description of the operation, and the elapsed time during the installation. After the progress bar shows 100%, click **Continue**.

A success message appears with the URL to access DCNM Web UI.

```

Your Cisco Data Center Network Manager software has been installed.
DCNM Web UI is available at
https://<<IP Address>>
You will be redirected there in 60 seconds.
Thank you

```

**Note** If the Cisco DCNM is running behind a firewall, ensure that you open the port 2443 to launch Cisco DCNM Web UI.

---

### What to do next

Verify the HA role by using the `appmgr show ha-role` command.

On the Active node (old standalone node):

```
dcnm1# appmgr show ha-role
Native HA enabled.
Deployed role: Active
Current role: Active
```

On the Standby node (newly deployed node):

```
dcnm2# appmgr show ha-role
Native HA enabled.
Deployed role: Standby
Current role: Standby
```

## Utility Services Details

This section describes the details of all the utility services within the functions they provide in Cisco DCNM. The functions are as follows:

### Network Management

The data center network management function is provided by the Cisco Data Center Network Manager (DCNM) server. Cisco DCNM provides the setup, visualization, management, and monitoring of the data center infrastructure. Cisco DCNM can be accessed from your browser: `http://<<hostname/IP address>>`.

---

**Note** For more information about Cisco DCNM, see <http://cisco.com/go/dcnm>.

---

## Orchestration

### RabbitMQ

RabbitMQ is the message broker that provides the Advanced Messaging Queuing Protocol (AMQP). The RabbitMQ message broker sends events from the vCloud Director/vShield Manager to the Python script for parsing. You can configure this protocol by using certain CLI commands from the Secure Shell (SSH) console of the firmware.

---

**Note** You need to stop and restart AMQP on both DCNM's server in HA within 30 seconds, otherwise AMQP may not start. For more information about RabbitMQ, go to <https://www.rabbitmq.com/documentation.html>.

---

After upgrade, enable RabbitMQ management service stop the service and start the services using the following commands:

```
dcnm# appmgr stop amqp
dcnm# appmgr start amqp
```

If AMQP is not running, the memory space must be exhausted that is indicated in the file `/var/log/rabbitmq/erl_crash.dump`.

## Device Power On Auto Provisioning

Power On Auto Provisioning (POAP) occurs when a switch boots without any startup configuration. It is accomplished by two components that were installed:

- DHCP Server

The DHCP server parcels out IP addresses to switches in the fabric and points to the location of the POAP database, which provides the Python script and associates the devices with images and configurations.

During the Cisco DCNM installation, you define the IP Address for the inside fabric management address or OOB management network and the subnets associated with the Cisco Programmable Fabric management.

- Repositories

The TFTP server hosts boot scripts that are used for POAP.

The SCP server downloads the database files, configuration files, and the software images.

## Managing Applications and Utility Services

You can manage the applications and utility services for Cisco Programmable Fabric in the Cisco DCNM through commands in an SSH terminal.

Enter the **appmgr** command from the SSH terminal by using the following credentials:

- Username: **root**
- Password: **Administrative password provided during deployment**

**Note** For your reference, context sensitive help is available for the **appmgr** command. Use the **appmgr** command to display help.

Use the **appmgr tech\_support** command to produce a dump of the log files. You can then provide this information to the TAC team for troubleshooting and analysis of your setup.

**Note** This section does not describe commands for Network Services using Cisco Prime Network Services Controller.

This section includes the following:

## Verifying the Application and Utility Services Status after Deployment

After you deploy the OVA/ISO file, you can determine the status of various applications and utility services that were deployed in the file. You can use the **appmgr status** command in an SSH session to perform this procedure.

**Note** Context-sensitive help is available for the **appmgr status** command. Use the **appmgr status ?** command to display help.

### Procedure

- Step 1** Open up an SSH session:
- Enter the **ssh root DCNM network IP address** command.
  - Enter the administrative password to login.

- Step 2** Check the status by using the following command:

**appmgr status all**

#### Example:

```
DCNM Status
PID USER PR NI VIRT RES SHR S %CPU %MEM TIME+ COMMAND
=== ===== == == ===== == == = ===== ===== ===== =====
1891 root 20 02635m 815m 15m S 0.0 21.3 1:32.09 java

LDAP Status
PID USER PR NI VIRT RES SHR S %CPU %MEM TIME+ COMMAND
=== ===== == == ===== == == = ===== ===== ===== =====
1470 ldap 20 0 692m 12m 4508 S 0.0 0.3 0:00.02 slapd

AMQP Status
PID USER PR NI VIRT RES SHR S %CPU %MEM TIME+ COMMAND
=== ===== == == ===== == == = ===== ===== ===== =====
```

```

1504 root 20 0 52068 772 268 S 0.0 0.0 0:00.00 rabbitmq

TFTP Status
PID USER PR NI VIRT RES SHR S %CPU %MEM TIME+ COMMAND
=== ===== === == ===== === === = ===== ===== ===== =====
1493 root 20 0 22088 1012 780 S 0.0 0.0 0:00.00 xinetd

DHCP Status
PID USER PR NI VIRT RES SHR S %CPU %MEM TIME+ COMMAND
=== ===== === == ===== === === = ===== ===== ===== =====
1668 dhcpd 20 0 46356 3724 408 S 0.0 0.0 0:05.23 dhcp

```

## Stopping, Starting, and Resetting Utility Services

Use the following CLI commands for stopping, starting, and resetting utility services:

- To stop an application, use the **appmgr stop** command.

```

dcnm# appmgr stop dhcp
Shutting down dhcpd: [OK]

```

- To start an application, use the **appmgr start** command.

```

dcnm# appmgr start amqp
Starting vsftpd for amqp: [OK]

```

- To restart an application use the **appmgr restart** command.

```

appmgr restart tftp
Restarting TFTP...
Stopping xinetd: [OK]
Starting xinetd: [OK]

```

**Note** From Cisco DCNM Release 7.1.x, when you stop an application by using the **appmgr stop *app\_name*** command, the application will not start during successive reboots.

For example, if DHCP is stopped by using the **appmgr stop dhcp** command, and the OS is rebooted, the DHCP application will still be down after the OS is up and running.

To start again, use the command **appmgr start dhcp**. The DHCP application will be started after reboots also. This is to ensure that when an environment uses an application that is not packaged as part of the virtual appliance (like CPNR instead of DHCP), the application locally packaged with the virtual appliance will not interfere with its function after any OS reboots.

**Note** When a DCNM appliance (ISO/OVA) is deployed, the Cisco SMIS component will not get started by default. However, this component can be managed using the appmgr CLI: **appmgr start/stop dcnm-smis**  
**appmgr start/stop dcnm** will start or stop only the DCNM web component.

## Updating the SFTP Server Address for IPv6

After deploying the DCNM OVA/ISO successfully with EFM IPv4 and IPv6, by default the SFTP address is pointed to IPv4 only. You need to change the IPv6 address manually in the following two places:

- In the DCNM Web Client, choose **Administration > Server Properties** and then update the below fields to IPv6 and click the **Apply Changes** button.

```

GENERAL>xFTP CREDENTIAL

xFTP server's ip address for copying switch files:
server.FileServerAddress
```

- Log in to the DCNM through ssh and update the SFTP address with IPv6 manually in the server.properties file (/usr/local/cisco/dcm/fm/conf/server.properties).

```
xFTP server's ip address for copying switch files:
server.FileServerAddress=2001:420:5446:2006::224:19
```

## CHAPTER 13

# Installing Software Maintenance Update for log4j2 Vulnerability

- [Installing Software Maintenance Update on Cisco DCNM OVA/ISO Deployment, on page 107](#)

## Installing Software Maintenance Update on Cisco DCNM OVA/ISO Deployment

Cisco DCNM provides a Software Maintenance Update (SMU) to address the **CVE-2021-45046** and **CVE-2021-44228** issue in Release 11.5(x). This SMU installation is supported with Release 11.5(1), 11.5(2), and 11.5(3) for your deployment.

This section contains the following topics:

### Installing SMU on Cisco DCNM 11.5(x) Standalone Deployment

This section provides instructions to install Software Maintenance Update (SMU) on Cisco DCNM OVA/ISO appliance to address **CVE-2021-45046** and **CVE-2021-44228** issue. Note that CVE-2021-45105 has a lower severity and not used in DCNM with default configuration, and therefore it is not addressed here.

To apply the Software Maintenance Update (SMU) on Cisco DCNM OVA/ISO in Standalone deployment mode, perform the following steps:

#### Before you begin

- Take a backup of the application data using the **appmgr backup** command on the DCNM appliance.  

```
dcnm# appmgr backup
```

Copy the backup file to a safe location outside the DCNM server.
- If Cisco DCNM appliance is installed in VMware environment, ensure that you take VM snapshots for all nodes. For instructions, refer to *VMware Snapshot Support* section in your [Cisco DCNM Release Notes](#).
- Ensure that you plan for a maintenance window to install SMU.
- Ensure that Cisco DCNM 11.5(x) is up and running.

---

**Note** Only a **root** user can install the SMU on the Cisco DCNM Release 11.5(x) appliance

---

## Procedure

---

### Step 1

Download the SMU file.

a) Go to the following site: <https://software.cisco.com/download/>.

A list of the latest release software for Cisco DCNM available for download is displayed.

b) In the Latest Releases list, choose Release 11.5(x).

c) Locate **DCNM 11.5.x Maintenance Update for VMWare, KVM, Bare-metal, and Appliance servers to address log4j2 CVE-2021-45046 and CVE-2021-44228** file and click **Download** icon.

d) Save the **dcnm-va-patch.11.5.x-p1.iso.zip** file to your directory that is easy to find when you start to apply the SMU.

### Step 2

Unzip the **dcnm-va-patch.11.5.x-p1.iso.zip** file and upload the file to the `/root/` folder in the DCNM node.

### Step 3

Log on to the Cisco DCNM appliance using SSH as a **sysadmin** user.

Run the **su** command to enable **root** user.

```
dcnm# su
Enter the root password:
[root@dcnm]#
```

### Step 4

Run the following command to create a screen session.

```
[root@dcnm]# screen
```

This creates a session which allows you to execute the commands. The commands continue to run even when the window is not visible or if you get disconnected.

### Step 5

Create a folder named **iso** using the **mkdir /mnt/iso** command.

```
[root@dcnm1]# mkdir -p /mnt/iso
```

### Step 6

Mount the DCNM 11.5(x) SMU file in the `/mnt/iso` folder.

```
[root@dcnm]# mount -o loop dcnm-va-patch.11.5.x-p1.iso /mnt/iso
```

### Step 7

Navigate to `/scripts/` directory.

```
[root@dcnm]# cd /mnt/iso/package-files/scripts/
```

### Step 8

Run the **./inline-upgrade.sh** script.

```
[root@dcnm]# ./inline-upgrade.sh
```

The progress is displayed on the screen. When the installation of SMU is complete, a successful message appears.

**Note** After the SMU is installed successfully, the DCNM process restarts. This results in a momentary loss of access to the DCNM Web UI.

**Step 9** Ensure the DCNM application is functional, by using the **appmgr status all** command.

```
[root@dcnm]# appmgr status all
```

**Step 10** Terminate the **screen** session, by using the **exit** command.

```
[root@dcnm]# exit
```

**Step 11** Unmount the **dcnm-va-patch.11.5.x-p1.iso** file from the DCNM setup.

**Note** You must terminate the **screen** session before unmounting the SMU file.

```
[root@dcnm]# umount /mnt/iso
```

---

## Installing SMU on Cisco DCNM 11.5(x) Native HA Deployment

This section provides instructions to install Software Maintenance Update (SMU) on Cisco DCNM OVA/ISO appliance to address **CVE-2021-45046** and **CVE-2021-44228** issue. Note that CVE-2021-45105 has a lower severity and not used in DCNM with default configuration, and therefore it is not addressed here.

To apply the Software Maintenance Update (SMU) on Cisco DCNM OVA/ISO in Native HA deployment mode, perform the following steps:

### Before you begin

- Check and ensure that the Active and Standby servers are operational, using the **appmgr show ha-role** command.

Example:

On the Active node:

```
dcnm1# appmgr show ha-role
Native HA enabled.
Deployed role: Active
Current role: Active
```

On the Standby node:

```
dcnm2# appmgr show ha-role
Native HA enabled.
Deployed role: Standby
Current role: Standby
```

- Take a backup of the application data using the **appmgr backup** command on both Active and Standby appliances.

```
dcnm1# appmgr backup
```

```
dcnm2# appmgr backup
```

Copy the backup file to a safe location outside the DCNM server.

- If Cisco DCNM appliance is installed in VMware environment, ensure that you take VM snapshots for all nodes. For instructions, refer to *VMware Snapshot Support* section in your [Cisco DCNM Release Notes](#).
- Ensure that you plan for a maintenance window to install SMU.

- Ensure that both the Cisco DCNM 11.5(x) Active and Standby peers are up and running.

To apply this software maintenance update on Cisco DCNM Virtual Appliance in Native HA Mode, apply this update on the Active and Standby appliance. Wait until the role of the Active appliance is Active again. Apply the update on the Standby appliance, later.

For Native HA cluster deployments, install the SMU on Active and Standby appliances, before installing SMU on the compute nodes.

---

**Note** Only a **root** user can install the SMU on the Cisco DCNM Release 11.5(x) appliance.

---

## Procedure

---

- Step 1** Download the SMU file.
- Go to the following site: <https://software.cisco.com/download/>.  
A list of the latest release software for Cisco DCNM available for download is displayed.
  - In the Latest Releases list, choose Release 11.5(x).
  - Locate **DCNM 11.5.x Maintenance Update for VMWare, KVM, Bare-metal, and Appliance servers to address log4j2 CVE-2021-45046 and CVE-2021-44228** file and click **Download** icon.
  - Save the **dcnm-va-patch.11.5.x-p1.iso.zip** file to your directory that is easy to find when you start to apply the SMU.
- Step 2** Unzip the **dcnm-va-patch.11.5.x-p1.iso.zip** file and upload the file to the `/root/` folder in both Active and Standby node of the DCNM setup.
- Note** For example, let us indicate Active and Standby appliances as **dcnm1** and **dcnm2** respectively.
- Step 3** Log on to the Cisco DCNM appliance using SSH as a **sysadmin** user.
- Run the **su** command to enable **root** user.
- ```
dcnm1# su
Enter the root password:
[root@dcnm1]#

dcnm2# su
Enter the root password:
[root@dcnm2]#
```
- Step 4** Run the following command to create a screen session.
- ```
[root@dcnm1]# screen

[root@dcnm2]# screen
```
- This creates a session which allows you to execute the commands. The commands continue to run even when the window is not visible or if you get disconnected.
- Step 5** On the Active node, install the SMU.
- Create a folder named **iso** using the **mkdir /mnt/iso** command.
- ```
[root@dcnm1]# mkdir -p /mnt/iso
```

- b) Mount the DCNM 11.5(x) SMU file on the Active node in the `/mnt/iso` folder.

```
[root@dcnm1]# mount -o loop dcnm-va-patch.11.5.x-p1.iso /mnt/iso
```

- c) Navigate to `/scripts/` directory.

```
[root@dcnm1]# cd /mnt/iso/packaged-files/scripts/
```

- d) Run the `./inline-upgrade.sh` script.

```
[root@dcnm1]# ./inline-upgrade.sh
```

The progress is displayed on the screen. When the installation of SMU is complete, a successful message appears.

Note After the SMU is installed successfully, the DCNM process restarts. This results in a momentary loss of access to the DCNM Web UI.

- e) Ensure the DCNM application is functional, by using the `appmgr status all` command.

```
[root@dcnm1]# appmgr status all
```

Note Ensure that all the services are up and running on the Cisco DCNM Active node before proceeding to apply SMU on the Standby node.

Step 6

On the Standby node, install the SMU.

- a) Create a folder named `iso` using the `mkdir /mnt/iso` command.

```
[root@dcnm2]# mkdir -p /mnt/iso
```

- b) Mount the DCNM 11.5(x) SMU file on the Standby node in the `/mnt/iso` folder.

```
[root@dcnm2]# mount -o loop dcnm-va-patch.11.5.x.iso /mnt/iso
```

- c) Navigate to `/scripts/` directory.

```
[root@dcnm2]# cd /mnt/iso/packaged-files/scripts/
```

- d) Run the `./inline-upgrade.sh` script.

```
[root@dcnm2]# ./inline-upgrade.sh --standby
```

The progress is displayed on the screen. When the installation of SMU is complete, a successful message appears.

Note After the SMU is installed successfully, the DCNM process restarts. This results in a momentary loss of access to the DCNM Web UI.

- e) Ensure the DCNM application is functional, by using the `appmgr status all` command.

```
[root@dcnm2]# appmgr status all
```

Step 7

Terminate the `screen` session, by using the `exit` command.

```
[root@dcnm1]# exit
```

```
[root@dcnm2]# exit
```

Step 8

Unmount the `dcnm-va-patch.11.5.x-p1.iso` file in both Active and Standby node of the DCNM setup.

Note You must terminate the `screen` session before unmounting the SMU file.

```
[root@dcnm1]# umount /mnt/iso
```

```
[root@dcnm2]# umount /mnt/iso
```

Installing SMU on Cisco DCNM 11.5(x) Compute Nodes

This section provides instructions to install Software Maintenance Update (SMU) on Cisco DCNM OVA/ISO appliance to address **CVE-2021-45046 and CVE-2021-44228** issue. Note that CVE-2021-45105 has a lower severity and not used in DCNM with default configuration, and therefore it is not addressed here.

To apply the Software Maintenance Update (SMU) on compute nodes in Cisco DCNM clustered setup, perform the following steps:

Before you begin

- You must install the SMU on Cisco DCNM Servers in Native HA mode, before upgrading the DCNM compute nodes.
- If Cisco DCNM appliance is installed in VMware environment, ensure that you take VM snapshots for all nodes. For instructions, refer to *VMware Snapshot Support* section in your [Cisco DCNM Release Notes](#).
- Ensure that you plan for a maintenance window to install SMU.
- Ensure that Cisco DCNM 11.5(x) is up and running.

Note Only a **root** user can install the SMU on the Cisco DCNM Release 11.5(x) appliance.

Procedure

- Step 1** Download the SMU file.
- Go to the following site: <https://software.cisco.com/download/>.
A list of the latest release software for Cisco DCNM available for download is displayed.
 - In the Latest Releases list, choose Release 11.5(x).
 - Locate **DCNM 11.5.x Maintenance Update for VMWare, KVM, Bare-metal, and Appliance servers to address log4j2 CVE-2021-45046 and CVE-2021-44228** file and click **Download** icon.
 - Save the **dcnm-va-patch.11.5.x-p1.iso.zip** file to your directory that is easy to find when you start to apply the SMU.
- Step 2** Unzip the **dcnm-va-patch.11.5.x-p1.iso.zip** file and upload the file to the `/root/` folder in all three compute nodes of the DCNM setup.
- For example, let us indicate the three Compute Nodes as Compute1, Compute2, and Compute3.
- Step 3** Log on to the Cisco DCNM appliance using SSH as a **sysadmin** user.
- Run the **su** command to enable **root** user.

```
dcnm-compute1# su
Enter the root password:
[root@dcnm-compute1]#
```

Step 4 Run the following command to create a screen session.

```
[root@dcnm-compute1]# screen
```

This creates a session which allows you to execute the commands. The commands continue to run even when the window is not visible or if you get disconnected.

Step 5 On Compute1 node, install the SMU.

a) Create a folder named **iso** using the **mkdir /mnt/iso** command.

```
[root@dcnm-compute1]# mkdir -p /mnt/iso
```

b) Mount the DCNM 11.5(x) SMU file on Compute1 node in the **/mnt/iso** folder.

```
[root@dcnm-compute1]# mount -o loop dcnm-va-patch.11.5.x-p1.iso /mnt/iso
```

c) Navigate to **/scripts/** directory.

```
[root@dcnm-compute1]# cd /mnt/iso/packaged-files/scripts/
```

d) Run the **./inline-upgrade.sh** script.

```
[root@dcnm-compute1]# ./inline-upgrade.sh
```

The progress is displayed on the screen. When the installation of SMU is complete, a successful message appears.

If some services are still running, a prompt to stop the services appears. When prompted, press **y** to continue.

e) Ensure the DCNM application is functional, by using the **appmgr status all** command.

```
[root@dcnm-compute1]# appmgr status all
```

Note Ensure that all the services are up and running on the **dcnm-compute1** node.

f) Terminate the **screen** session, by using the **exit** command.

```
[root@dcnm-compute1]# exit
```

g) Unmount the **dcnm-va-patch.11.5.x-p1.iso** file from the Compute1.

Note You must terminate the **screen** session before unmounting the SMU file.

```
[root@dcnm]# umount /mnt/iso
```

Step 6 Install the SMU on the other two Compute nodes also.

Follow the instructions as explained in Step [Step 5, on page 113](#).

What to do next

After the installation is complete, each compute node joins the cluster automatically. On the Web UI, choose **Applications > Compute** to verify if the compute node appears as **Joined**.

Note If you try to install the SMU again, an error message appears stating that the patch is already applied on the Cisco DCNM/Compute.

Sample Output of Commands to address Log4j vulnerability

The following is a sample output while installing the SMU on Cisco DCNM Release 11.5(x).

- [Sample Output to Install SMU in DCNM Standalone Deployment, on page 114](#)
- [Sample output to install SMU in DCNM Native HA Deployment, on page 119](#)
- [Sample Output to Install SMU in DCNM Compute Nodes, on page 126](#)

Sample Output to Install SMU in DCNM Standalone Deployment

```
[root@dcnm]# ./inline-upgrade.sh

Scanning for Log4j2 Vulnerabilities

Download a scanner (such as logpresso) from <https://github.com/logpresso/CVE-2021-44228-Scanner>.

Warning

Use this utility only to scan for vulnerabilities. DO NOT use it to fix anything in the system.

Caution After installing the SMU, ensure that the DCNM Web UI is up and running. Also, ensure that all the processes are up and running, by using the **appmgr status all** command. Ensure that the **Applications > Compute** shows all nodes in **Joined** state.

Before running the scan again, clear the old docker images that are no longer used, by using the following command:

If **docker ps -a** shows many containers in Exited state, then first run the following:

docker container prune

WARNING! This will remove all stopped containers.

Are you sure you want to continue? [y/N] y

Deleted Containers:

```
33d2a44706663870d062b7ee8b4aba18ea94ea6fdc285b6ba1d133334f226d73
9fba3140120f7fbc41993a97d0bc6bec254ffed638da1445e3a91fb04614cba6
67d4cd575d1febdec54fe161d716334908eb18d1a9a5d053a8f21ed1e3089d8c

03e0c0ccaa35e2b4d07c6afae90c758f3db5ea639528afcc550a26e9c1ef1b43
Total reclaimed space: 155.4MB
```

If there are no containers in Exited state, then you can directly run the **docker image prune** to clean up the old images, as follows:

docker image prune -a

WARNING! This will remove all images without at least one container associated to them.

Are you sure you want to continue? [y/N] y

```

Note Installing SMU on Cisco DCNM addresses CVE-2021-44228 and CVE-2021-45046. As CVE-2021-45105 is lower severity, and refers to an issue with a configuration which is not used in Cisco DCNM with the default shipping configuration. Therefore, CVE-2021-45105 is not addressed in this SMU installation.

The backup contains original unaltered files which are still vulnerable. They are not used, but are retained as a reference. If you choose to delete, no functionality will be impacted. There are few files which are inside of container filesystem layers. These files record the changes to the container filesystems and are not a concern until they do not appear in the “merged” container files. These files are not available to processes at run-time. There are no vulnerable files in the merged resultant container filesystems.

Refer to [Upgrading DCNM Release 11.5\(x\) from Previous Versions, on page 130](#) for instructions to install SMU on other DCNM releases. You can upgrade to DCNM Releases through multiple hops from Release 11.0 or later. The log4j2 scanner flags few stale docker/overlay related file system issues. Ensure that you validate the SMU installation. For more information, see [Validating of SMU Installation, on page 129](#).

Note After DCNM HA failover, the log4j2 scan may show some vulnerabilities. This is due to the old docker image package bundle in the Standby server, which is not available for use at run-time for any process. If the CVE reports are still seen, execute the **docker image prune -a** command. This results in clearing the stale entries on the Standby node. After clearing stale entries, there will be no issues during further DCNM HA failovers. If the scan report still shows some CVE errors, we recommend that you contact Cisco TAC.

Validating of SMU Installation

To validate that the patch has been successfully applied on Cisco DCNM appliances and Compute nodes, check the contents of the file located at `/root/packaged-files/properties/dcnm-version.txt`. If the patch is successfully applied, an extra line is included in the `dcnm-version.txt` as shown below:

```
PATCH_LIST=X
```

where,

X is the number of patches installed on your Cisco DCNM appliance.

Note After the SMU is installed, the **Health Monitor** application (previously known as **Watchtower**) will not display any old or new data.

Upgrading DCNM Release 11.5(x) from Previous Versions

When upgrading from an older DCNM 11.x version to 11.5(x) or higher, post upgrade and patch application, the log4j scanner may show more vulnerabilities related to findings in the `/var/lib/docker/overlay` file system. A sample output of a system upgraded from DCNM 11.2(1) to 11.5(1) is shown below after installing the SMU. The sample output shows multiple vulnerabilities all in the `docker/overlay` file system. The two vulnerabilities seen for `docker/overlay2` filesystem for `elasticsearch` doesn't cause any issues.

```
./log4j2-scan /
Logpresso CVE-2021-44228 Vulnerability Scanner 2.2.0 (2021-12-18)

```

From DCNM release 11.3(1), the Application Framework uses the `overlay2` file system for `docker`. You can verify by using the following command:

```
docker info | grep overlay2
Storage Driver: overlay2 /* above command must display this output*/
```

If the output of the above command indicates `docker` is using **overlay2**, the directory `/var/lib/docker/overlay` is not used, and therefore, the errors reported by scanner are remnants, and not used by any running service on the DCNM. To cleanup these remnants, please do the following on the node where errors are reported.

Remove the remnants on the node where additional vulnerabilities are reported by using the following command:

```
rm -rf /var/lib/docker/overlay
```

Caution Ensure that you execute the above command correctly. If `overlay2` is deleted accidentally, the DCNM services will not be operational.

Run the `log4j` scanner. The displayed output shows that all the vulnerabilities related to `/var/lib/docker/overlay` are removed.
