Software Features Introduced and Enhanced

Feature	Description
Programmability	
Add Multiple Events In a Policy Map With a Single EEM Script	With this feature, you can add multiple events to a policy map with boolean (AND or OR) correlation. EEM triggers the script when the correlation defined in the policy map for the events is true. Using EEM scripts, you can create a logical correlation of events in the policy map and configure multiple actions for detectors such as timer, object-tracking, and telemetry events via sensor path.
Debug Automation Scripts	Use this feature to collect logs that contain debug information for ltraces and tech-support data. These logs aid in troubleshooting whenever the scripts are not working as expected. This feature introduces the show tech-support script command.
Github Repository for Automation Scripts	You now have access to sample scripts and templates published on the Github repository. You can leverage these samples to use the python packages and libraries developed by Cisco to build your custom automation scripts for your network
Manage Common Script Actions Using YANG RPCs	This feature enables you to use YANG remote procedure calls (RPCs) on <code>Cisco-IOS-XR-infra-script-mgmt-act.yang</code> data model to perform actions on the automation scripts such as add or remove script from the script repository, run, or stop script from running.
Update Automation Scripts from Remote Server	This feature lets you update automation scripts across routers by accessing the master script from a remote site. This eases script management, where you make changes to the master script and then copy it to routers where it is deployed. This feature introduces the auto-update keyword in the script exec command.

Feature	Description
Upgraded IOS XR Python from Version 3.5 to Version 3.9	This upgrade adds new modules and capabilities to create Python scripts and execute the scripts on routers running Cisco IOS XR software. Some of the modules added as part of the upgraded IOS XR Python 3.9 are: hashlib, idna, packaging, pyparsing, six, yaml.
Validate Pre-configuration Using Config Scripts	This feature allows you to use config scripts to validate pre-configuration during a commit or validate operation. Any active config scripts can read and validate (accept, reject or modify) pre-configuration. The pre-configuration is only applied to the system later on, when the relevant hardware is inserted, and does not require further script validation at that point. Previously, config scripts did not allow validating configuration until the corresponding hardware was present.
Telemetry	
Target-Defined Mode for Cached Generic Counters Data	<p>This feature streams telemetry data for cached generic counters using a TARGET_DEFINED subscription. This subscription ensures that any change to the cache streams the latest data to the collector as an event-driven telemetry notification.</p> <p>This feature introduces support for the following sensor path:</p> <pre>Cisco-IOS-XR-infra-statsd-oper:infra- statistics/interfaces/interface/cache/generic-counters</pre>
System Setup and Software Installation	
Check Integrity of Golden ISO (GISO) Files	This feature enables an automated check during install [package] replace operations to ensure the files in GISO has not been corrupted. It does so by calculating the md5sum of the files and comparing it against md5sum value contained within the GISO that was calculated when the image was built.
Enhanced Golden ISO Build Tool	This enhancement provides you with the flexibility to use the <code>gisobuild.py</code> tool to build GISO images using Cisco IOS XR software commands, YAML-based template file, or Docker capability to suit your customized install requirements. When you build a GISO, you can also specify Zero Touch Provisioning (ZTP) initialization file, script initialization file, Cisco IOS XR configuration file, and SMUs in addition to using the base image and optional RPMs to automatically provision the router.
Stream Model-Driven Telemetry (MDT) Data for Install Operations	<p>This feature allows you to stream MDT data—both cadence-driven telemetry (CDT) and event-driven telemetry (EDT) data—for changes detected during install operation. After the install operation is complete, this functionality streams telemetry data such as the GISO label, image version, the status of install operation, and potential information about rectifying the installation process for all the active and committed packages.</p> <p>With this feature, you can stream telemetry data from the following sensor paths:</p> <pre>Cisco-IOS-XR-install-oper:install/request Cisco-IOS-XR-install-oper:install/packages/committed/summary Cisco-IOS-XR-install-oper:install/packages/active/summary Cisco-IOS-XR-install-oper:install/version</pre>

Feature	Description
Supported Software Upgrade or Downgrade IOS XR Versions	<p>You can determine whether a software version can be upgraded or downgraded to another version using this functionality. Before an actual upgrade or downgrade process, you can also view the hardware or software limitations that could cause the upgrade or downgrade to fail. This feature helps you plan successful software upgrades or downgrades.</p> <p>This feature introduces the show install upgrade-matrix command.</p>
Interface and Hardware Component	
SPAN support for bundle as a destination interface	<p>This feature adds the ability to configure a bundle destination for SPAN. Bundle interfaces increase the bandwidth by allowing forwarding across all available members of the bundle.</p> <p>Additionally, they provide redundancy in the case of link failure.</p>
L2VPN and Ethernet Services	
AC-based Virtual Ethernet Segment	<p>This feature allows you to extend the physical links to have VLANs (ACs) that act as Ethernet Virtual Circuits (EVCs). Many such EVCs can be aggregated on a single main interface called Virtual Ethernet Segment (vES). The main interface aggregates many vESs and creates a group to identify these vESs. This mechanism helps to minimize service disruption by mass withdrawal for main peering at the vES level.</p>
Centralized Anycast Gateway for EVPN IRB	<p>This feature enables configuring the IRB interface in a central location called the Centralized Anycast Gateway. Such a centralized, single-point makes it easier to configure and maintain, reducing the overall operational cost. It also makes it easy to configure the IRB because it's configured only on the centralized gateway of edge L2 devices.</p> <p>This feature is supported only on Single-active mode and this feature introduces virtual access-evi command.</p>
EVPN E-TREE Per-AC (Scenario 2)	<p>This feature allows a provider edge (PE) device to have both root and leaf sites for a given EVI. This feature increases the granularity of leaf designation from the entire bridge to AC bridge ports; ACs under a bridge may be root or leaf.</p>
EVPN E-Tree Per-PE (Scenario 1b)	<p>This feature allows you to configure an attachment circuit on a PE device either as a root site or a leaf site using the etree leaf label for a given bridge-domain. By preventing communication among leaf ACs connected to the same PE and belonging to the same bridge-domain, you can segregate traffic received and sent from different geographical locations. This segregation helps in securing traffic and Denial of Service Prevention (DoS).</p> <p>This feature is compliant with RFC 8317.</p>
EVPN IGMPv2 Selective Multicast	<p>Using this feature, you can now forward multicast traffic over the EVPN network only to the receivers in the multicast groups. This targeted and selective forwarding helps eliminate unnecessary flooding of traffic. This feature also helps in optimal forwarding and efficient bandwidth utilization.</p>
MPLS	

Feature	Description
Bandwidth Protection Functions to Enhance auto-tunnel backup Capabilities	<p>This feature introduces bandwidth protection functions for auto-tunnel backups, such as signaled bandwidth, bandwidth protection, and soft-preemption. These functions provide better bandwidth usage and prevent traffic congestion and traffic loss.</p> <p>In earlier releases, auto-tunnel backups provided only link protection and node protection. Backup tunnels were signaled with zero bandwidth, causing traffic congestion when FRR went active.</p> <p>This feature introduces the following commands and keywords:</p> <ul style="list-style-type: none"> • bandwidth-protection maximum-aggregate • signalled-bandwidth • soft-preemption
Multicast	
Flexible Algorithm for MLDP	<p>This feature gives you the flexibility to customize the metrics that IGP uses to route traffic for MLDP tunnels. With this feature, your router can generate two multicast streams for the same feed, thus ensuring low latency and high availability of multicast traffic.</p> <p>This feature introduces the flex-algo keyword.</p>
Modular QoS	
Separate Token Buckets for Percentage Policers	<p>From this release, configuring a percent policer value on a class allocates separate token buckets for each bundle member. In other words, the policer percentage value is calculated on each single bundle member's bandwidth after configuring hw-module all qos-mode bundle-agg policer .</p> <p>This functionality allows you to use both aggregated absolute policers and nonaggregated percent policers. Plus, the percent policers span the entire bundle bandwidth (from 0 through 100%), allowing for better and efficient control over traffic flow.</p> <p>In earlier releases, the policer percentage for the entire bundle was calculated based on the bundle member's bandwidth that you added first. Such a calculation dragged down the traffic rate for the entire bundle.</p>
System Security	
Command Authorization Using Local User Account	<p>This feature allows locally authenticated users—authenticated by the AAA server internal to the router—to run all XR VM commands even if a remote TACACS+ AAA server is not reachable for authorization. It prevents a complete router lockdown. The feature also prevents remotely authenticated users—authenticated using a remote AAA server (say, TACACS+ server)—from running any non-permitted commands on the router, and thus prevents misuse of user privileges.</p> <p>This feature modifies the aaa authorization commands default command to include the local option for XR VM command authorization.</p>
SSD Encryption	<p>This feature enables trust and security in the system's steady state by encrypting data at the disk level. The encrypted data can be accessed <i>only</i> with a specific key stored in the TAM.</p>
Segment Routing	

Feature	Description
BGP Route Leaking	This feature adds support for importing routes from default-VRF to non-default VRF and routes from non-default VRF to default VRF.
IS-IS Flexible Algorithm: Exclude-SRLG Constraint	This feature allows the Flexible Algorithm definition to specify Shared Risk Link Groups (SRLGs) that the operator wants to exclude during the Flex-Algorithm path computation. This allows the setup of disjoint paths between two or more Flex Algos by leveraging deployed SRLG configurations.
Per-Prefix SRv6 Locator Assignment	This feature provides the ability to assign a specific SRv6 locator for a given prefix or a set of prefixes (IPv4/IPv6 GRT, IPv4/IPv6 VPN). The egress PE advertises the prefix with the specified locator. This allows for per-prefix steering into desired transport behaviors, such as Flex Algo.
Prefix Metric support for OSPF Flexible Algorithm	This feature extends the current OSPF Flexible Algorithm functionality to support Flex-Algo Prefix Metric. This feature introduces a Flexible Algorithm-specific prefix-metric in the OSPF prefix advertisement. The prefix-metric provides a way to compute the best end-to-end Flexible Algorithm optimized paths across multiple areas or domains.
SR-PCE: Single PCE scale enhancement	With this feature, support for a single PCE is enhanced to 50000 nodes, 100000 LSPs, 500000 links, and 2000 PCEP sessions.
SR-PCE: Stateful North-Bound API for Tree-SID	The SR-PCE provides a north-bound HTTP-based API to allow communication between SR-PCE and external clients and applications. The Cisco Crosswork Optimization Engine is an application that leverages the SR-PCE. This release adds support for the following: <ul style="list-style-type: none"> • Stateful North-Bound API for Tree-SID using a subscription model • SR-PCE continuous notifications of modified or deleted Tree-SIDs as they occur
Support for iBGP as PE-CE protocol	This feature introduces support for iBGP as PE-CE protocol.
Netflow	
Sampled Flow	Sampled flow (sFlow) allows you to monitor real-time traffic in data networks that contain switches and routers. It uses the sampling mechanism in the sFlow agent software on routers to monitor traffic and to forward the sample data to the central data collector. sFlow uses version 5 export format to forward sampled data.

Important Notes

- Repetitive Smart Licensing evaluation expired warning messages are displayed on the console every hour, but no functionality impact is observed on the device. To stop these repetitive messages, you should register the device again with a new registration token.
- From IOS XR Release 7.0, 1st and 2nd generation of Ethernet ASR 9000 line cards are not supported.
- Country-specific laws, regulations, and licenses—In certain countries, use of these products may be prohibited and subject to laws, regulations, or licenses, including requirements applicable to the use of the products under telecommunications and other laws and regulations; customers must comply with all such applicable laws in the countries in which they intend to use the products.
- Exceeding Cisco testing—If you intend to test beyond the combined maximum configuration tested and published by Cisco, contact your Cisco Account Team or Technical Support representative to discuss how to engineer a large-scale configuration for your purpose.
- Installing a Line Card—For a fully populated Line Card with cable optics, maintenance time required for card replacement is higher. For more information about Line Card installation and removal, refer to the *Cisco ASR 9000 Aggregation Services Router Ethernet Line Card Installation Guide*.
- For ZTP, In Cisco IOS XR Release 7.3.1 and earlier, the system accepts the device sending **user-class = "exr-config"**; however starting Cisco IOS XR Release 7.3.2 and later, you must use only **user-class = "xr-config"**.

In Cisco IOS XR Release 7.3.2 and later, use:

```
host cisco-rp0 {
  hardware ethernet e4:c7:22:be:10:ba;
  fixed-address 172.30.12.54;
  if exists user-class and option user-class = "iPXE" {
    filename = "http://172.30.0.22/boot.ipxe";
  } elseif exists user-class and option user-class = "xr-config" {
    filename = "http://172.30.0.22/scripts/cisco-rp0_ztp.sh";
  }
}
```

Supported Transceiver Modules

To determine the transceivers that Cisco hardware device supports, refer to the [Transceiver Module Group \(TMG\) Compatibility Matrix](#) tool.

Supported Modular Port Adapters

For the compatibility details of Modular Port Adapters (MPAs) on the line cards, see the [datasheet](#) of that specific line card.

Cisco IOS XR MIBs

To determine the MIBs supported by platform and release, refer to the [Cisco IOS XR MIBs](#) tool.

Cisco IOS XR Error messages

To view, search, compare, and download Cisco IOS XR Error Messages, refer to the [Cisco IOS XR Error messages](#) tool.

Production Software Maintenance Updates (SMUs)

A production SMU is a SMU that is formally requested, developed, tested, and released. Production SMUs are intended for use in a live network environment and are formally supported by the Cisco TAC and the relevant development teams. Software bugs identified through software recommendations or Bug Search Tools are not a basis for production SMU requests.

For information on production SMU types, refer the [Production SMU Types](#) section of the *IOS XR Software Maintenance Updates (SMUs)* guide.

Upgrading Cisco IOS XR Software

Cisco IOS XR Software is installed and activated from modular packages, allowing specific features or software patches to be installed, upgraded, or downgraded without affecting unrelated processes. Software packages can be upgraded or downgraded on all supported card types, or on a single card (node).

Software packages are installed from Route Processor Module (RPM) files that contain one or more software components.

The upgrade document is available along with the software images.

Note If you have mLACP/ICCP Redundancy Model setup, ensure that you upgrade the active and standby nodes to the same IOS XR version while upgrading to a newer version of the ASR 9000 router.

Use user-class Option 'xr-config' Instead Of 'exr-config' To Provision ZTP

In Cisco IOS XR Release 7.3.1 and earlier, the system accepts the device sending **user-class = "exr-config"**; however starting Cisco IOS XR Release 7.3.2 and later, you must use only **user-class = "xr-config"**.

In Cisco IOS XR Release 7.3.2 and later, use:

```
host cisco-rp0 {
  hardware ethernet e4:c7:22:be:10:ba;
  fixed-address 172.30.12.54;
  if exists user-class and option user-class = "iPXE" {
    filename = "http://172.30.0.22/boot.ipxe";
  } elseif exists user-class and option user-class = "xr-config" {
    filename = "http://172.30.0.22/scripts/cisco-rp0_ztp.sh";
  }
}
```
