

## IPv6 Multicast: Routable Address Hello Option

The routable address hello option adds a PIM hello message option that includes all the addresses on the interface on which the PIM hello message is advertised.

### Information About the Routable Address Hello Option

When an IPv6 interior gateway protocol is used to build the unicast routing table, the procedure to detect the upstream device address assumes the address of a PIM neighbor is always same as the address of the next-hop device, as long as they refer to the same device. However, it may not be the case when a device has multiple addresses on a link.

Two typical situations can lead to this situation for IPv6. The first situation can occur when the unicast routing table is not built by an IPv6 interior gateway protocol such as multicast BGP. The second situation occurs when the address of an RP shares a subnet prefix with downstream devices (note that the RP address has to be domain-wide and therefore cannot be a link-local address).

The routable address hello option allows the PIM protocol to avoid such situations by adding a PIM hello message option that includes all the addresses on the interface on which the PIM hello message is advertised. When a PIM device finds an upstream device for some address, the result of RPF calculation is compared with the addresses in this option, in addition to the PIM neighbor's address itself. Because this option includes all the possible addresses of a PIM device on that link, it always includes the RPF calculation result if it refers to the PIM device supporting this option.

Because of size restrictions on PIM messages and the requirement that a routable address hello option fits within a single PIM hello message, a limit of 16 addresses can be configured on the interface.

# How to Configure IPv6 Multicast: Routable Address Hello Option

## Configuring the Routable Address Hello Option

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ipv6 pim hello-interval** *seconds*

### DETAILED STEPS

---

**Step 1**    **enable****Example:**

```
Device> enable
```

Enables privileged EXEC mode.

- Enter your password if prompted.

**Step 2**    **configure terminal****Example:**

```
Device# configure terminal
```

Enters global configuration mode.

**Step 3**    **interface** *type number***Example:**

```
Device(config)# interface FastEthernet 1/0
```

Specifies an interface type and number, and places the device in interface configuration mode.

**Step 4**    **ipv6 pim hello-interval** *seconds***Example:**

```
Device(config-if)# ipv6 pim hello-interval 45
```

Configures the frequency of PIM hello messages on an interface.

---

# Configuration Example for the Routable Address Hello Option

The following example shows output from the **show ipv6 pim neighbor** command using the **detail** keyword to identify the additional addresses of the neighbors learned through the routable address hello option:

```
Device# show ipv6 pim neighbor detail

Neighbor Address(es)      Interface    Uptime      Expires DR pri Bidir
FE80::A8BB:CCFF:FE00:401  Ethernet0/0 01:34:16   00:01:16 1      B
60::1:1:3
FE80::A8BB:CCFF:FE00:501  Ethernet0/0 01:34:15   00:01:18 1      B
60::1:1:4
```

## Feature Information for IPv6 Multicast: Routable Address Hello Option

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.
