

NBAR2 Custom Protocol

Network-Based Application Recognition (NBAR) supports the use of custom protocols to identify custom applications. Custom protocols support static port-based protocols and applications that NBAR does not support.

- Prerequisites for Creating a Custom Protocol, on page 1
- Information About Creating a Custom Protocol, on page 1
- How to Create a Custom Protocol, on page 4
- Configuration Examples for Creating a Custom Protocol, on page 13
- Additional References, on page 15
- Feature Information for NBAR2 Custom Protocol, on page 16

Prerequisites for Creating a Custom Protocol

Before creating a custom protocol, read the information in the "Classifying Network Traffic Using NBAR" module.

Information About Creating a Custom Protocol

NBAR and Custom Protocols

NBAR supports the use of custom protocols to identify custom applications. Custom protocols support static port-based protocols and applications that NBAR does not currently support.

Note

For a list of NBAR-supported protocols, see the "Classifying Network Traffic Using NBAR" module.

With NBAR supporting the use of custom protocols, NBAR can map static TCP and UDP port numbers to the custom protocols.

Initially, NBAR included the following features related to custom protocols and applications:

• Custom protocols had to be named custom-xx, with xx being a number.

• Ten custom applications can be assigned using NBAR, and each custom application can have up to 16 TCP and 16 UDP ports each mapped to the individual custom protocol. The real-time statistics of each custom protocol can be monitored using Protocol Discovery.

NBAR includes the following characteristics related to user-defined custom protocols and applications:

- The ability to inspect the payload for certain matching string patterns at a specific offset.
- The ability to allow users to define the names of their custom protocol applications. The user-named protocol can then be used by Protocol Discovery, the Protocol Discovery MIB, the **match protocol** command, and the **ip nbar port-map** command as an NBAR-supported protocol.
- The ability of NBAR to inspect the custom protocols specified by traffic direction (that is, traffic heading toward a source or a destination rather than traffic in both directions).
- CLI support that allows a user configuring a custom application to specify a range of ports rather than specify each port individually.
- The http/dns/ssl keyword group that lets you add custom host and URL signatures.

Note

Defining a user-defined custom protocol restarts the NBAR feature, whereas defining predefined custom protocol does not restart the NBAR feature.

MQC and **NBAR** Custom Protocols

NBAR recognizes and classifies network traffic by protocol or application. You can extend the set of protocols and applications that NBAR recognizes by creating a custom protocol. Custom protocols extend the capability of NBAR Protocol Discovery to classify and monitor additional static port applications and allow NBAR to classify nonsupported static port traffic. You define a custom protocol by using the keywords and arguments of the **ip nbar custom** command. However, after you define the custom protocol, you must create a traffic class and configure a traffic policy (policy map) to use the custom protocol when NBAR classifies traffic. To create traffic classes and configure traffic polices, use the functionality of the Modular Quality of Service (QoS) Command-Line Interface (CLI) (MQC). The MQC is a command-line interface that allows you to define traffic classes, create and configure traffic policies (policy maps), and then attach these traffic policies to interfaces. For more information about NBAR and the functionality of the MQC, see the "Configuring NBAR Using the MQC" module.

IP Address and Port-based Custom Protocol

IP address and port-based custom protocol includes supporting an IP subnet or a list of IP addresses with a specific TCP or UDP transport. This enables Network-Based Application Recognition (NBAR) to recognize traffic based on IP addresses and to associate an application ID to traffic from and to specified IP addresses. You define a custom protocol transport by using the keywords and arguments of the **ip nbar custom transport** command.

To support the IP address and port-based custom protocol option, the custom configuration mode (config-custom) is introduced with the **ip nbar custom transport** command. This mode supports options to specify a maximum of eight individual IP addresses, subnet IP addresses, and subnet mask length. You can also specify a list of eight ports or a start port range and an end port range.

Comparison of Custom NBAR Protocols: Based on a Single Network Protocol or Based on Multiple Network Protocols

Note

In this description, the term "protocol" is used in two ways: as an NBAR protocol used for identifying traffic, and as a network protocol (HTTP, SSL, and so on).

NBAR provides:

Custom NBAR protocols based on single network protocol

Useful for identifying a single type of traffic (HTTP, SSL, and so on) according to a specified pattern.

Syntax: ip nbar custom protocol name> <traffic type> <criteria>

Custom NBAR protocols based on multiple network protocols (called a "composite" custom NBAR protocol)

Useful for identifying traffic using signatures for multiple network protocols. Currently, the composite method provides an option, "server-name" (value for <composite_option> in the CLI syntax) that identifies all HTTP, SSL, and DNS traffic associated with a specific server.

Useful for identifying multiple types of traffic (HTTP, SSL, and so on) according to a specified pattern, using a single protocol.

Syntax: ip nbar custom corposite <composite <composite <pre>option> <criteria>

Example Use Case: Custom NBAR Protocol Based on Multiple Network Protocols

- Objective: Identify all HTTP, SSL, and DNS traffic associated with the abc example.com server.
- **Preferred method**: Use a composite custom NBAR protocol.
- CLI: ip nbar custom abc example custom composite server-name *abc example

Limitations of Custom Protocols

The following limitations apply to custom protocols:

- NBAR supports a maximum of 120 custom protocols. All custom protocols are included in this maximum, including single-signature and composite protocols.
- Cannot define two custom protocols for the same target regular expression.

For example, after configuring ip nbar custom labcd http url www.abcdef.com, cannot then configure:

ip nbar custom 2abcd http url www.abcdef.com

Attempting to do so results in an error.

Maximum length for the regular expression that defines the custom protocol: 30 characters

How to Create a Custom Protocol

Defining a Custom NBAR Protocol Based on a Single Network Protocol

Custom protocols extend the capability of NBAR Protocol Discovery to classify and monitor additional static port applications and allow NBAR to classify non-supported static port traffic.

This procedure creates a custom NBAR protocol based on a single network protocol (HTTP, SSL, and so on).

Note

NBAR supports a maximum of 120 custom protocols. All custom protocols are included in this maximum, including single-signature and composite protocols.

To define a custom protocol, perform the following steps.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. ip nbar custom** *protocol-name* [offset [format value]] [**variable** field-name field-length] [source | destination] [**tcp** | **udp**] [**range** start end | port-number]
- 4. end

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	ip nbar custom protocol-name [offset [format value]] [variable field-name field-length] [source destination] [tcp udp] [range start end port-number]	Extends the capability of NBAR Protocol Discovery to classify and monitor additional static port applications or allows NBAR to classify non-supported static port traffic.
	Example:	Creates a custom NBAR protocol that identifies traffic based on a single network protocol.
	Router(config)# ip nbar custom app_sales1 5 ascii SALES source tcp 4567	• Useful for identifying a single type of traffic (HTTP, SSL, and so on) according to a specified pattern.
		Enter the custom protocol name and any other optional keywords and arguments.

	Command or Action	Purpose
Step 4	end	(Optional) Exits global configuration mode.
	Example:	
	Router(config)# end	

Examples

In the following example, the custom protocol LAYER4CUSTOM will look for TCP packets that have a destination or source port of 6700:

```
Device# configure terminal
Device(config)# ip nbar custom LAYER4CUSTOM transport tcp id 14
Device(config-custom)# port 6700
```

To display other options besides port:

```
Device# configure terminal
Device (config) # ip nbar custom LAYER4CUSTOM transport tcp id 14
Device(config-custom)# ?
Custom protocol commands:
  direction Flow direction
            DSCP in IPv4 and IPv6 packets
            Exit from custom configuration mode
  exit
             ip address
  ip
  ipv6
             ipv6 address
  no
             Negate a command or set its defaults
  port
             ports
```

Defining a Custom NBAR Protocol Based on Multiple Network Protocols

Custom protocols extend the capability of NBAR Protocol Discovery to classify and monitor additional static port applications and allow NBAR to classify non-supported static port traffic.

This procedure creates a custom NBAR protocol based on multiple network protocols.

Note

In this description, the term "protocol" is used in two ways: as an NBAR protocol used for identifying traffic, and as a network protocol (HTTP, SSL, and so on).

Note

NBAR supports a maximum of 120 custom protocols. All custom protocols are included in this maximum, including single-signature and composite protocols.

To define a composite-signature custom protocol, perform the following steps.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. ip nbar custom protocol-name composite server-name server-name
- 4. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	ip nbar custom protocol-name composite server-name server-name	Extends the capability of NBAR Protocol Discovery to classify and monitor additional static port applications or
	<pre>Example: Router(config) # ip nbar custom abc_example_custom composite server-name *abc_example</pre>	 allows NBAR to classify non-supported static port traffic. Creates a custom NBAR protocol that identifies traffic using signatures for multiple network protocols. Currently, the only option for composite-option is server-name, which identifies all HTTP, SSL, and DNS traffic associated with a specific server. Useful for identifying multiple types of traffic (HTTP, SSL, and so on) according to a specified pattern, using a single protocol. In the example, the objective is to identify all HTTP, SSL, and DNS traffic associated with the abc_example.com server.
Step 4	end	(Optional) Exits global configuration mode.
	Example:	
	Router(config)# end	

Configuring a Traffic Class to Use the Custom Protocol

Traffic classes can be used to organize packets into groups on the basis of a user-specified criterion. For example, traffic classes can be configured to match packets on the basis of the protocol type or application recognized by NBAR. In this case, the traffic class is configured to match on the basis of the custom protocol.

To configure a traffic class to use the custom protocol, perform the following steps.

Note

The **match protocol**command is shown at Step 4. For the *protocol-name* argument, enter the protocol name used as the match criteria. For a custom protocol, use the protocol specified by the *name* argument of the **ip nbar custom**command. (See Step 3 of the Defining a Custom Protocol task.)

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. class-map [match-all | match-any] class-map-name
- 4. match protocol protocol-name
- **5**. end

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	class-map [match-all match-any] class-map-name	Creates a class map to be used for matching packets to a
	Example:	specified class and enters class-map configuration mode.
	Router(config) # class-map cmap1	• Enter the name of the class map.
Step 4	match protocol protocol-name	Configures NBAR to match traffic on the basis of the
	Example:	specified protocol.
	Router(config-cmap)# match protocol app_sales1	• For the <i>protocol-name</i> argument, enter the protocol name used as the match criterion. For a custom protocol, use the protocol specified by the <i>name</i> argument of the ip nbar custom command. (See Step 3 of the "Defining a Custom Protocol" task.)
Step 5	end	(Optional) Exits class-map configuration mode.
	Example:	
	Router(config-cmap)# end	

Examples

In the following example, the **variable** keyword is used while creating a custom protocol, and class maps are configured to classify different values within the variable field into different traffic classes. Specifically, in the example below, variable scid values 0x15, 0x21, and 0x27 will be classified into class map active-craft, while scid values 0x11, 0x22, and 0x25 will be classified into class map passive-craft.

```
Router(config)#
  ip nbar custom ftdd 23 variable scid 1 tcp range 5001 5005

Router(config)#
  class-map active-craft
Router(config-cmap)# match protocol ftdd scid 0x15
Router(config-cmap)# match protocol ftdd scid 0x21
Router(config-cmap)# match protocol ftdd scid 0x27

Router(config)#
  class-map passive-craft
Router(config-cmap)# match protocol ftdd scid 0x11
Router(config-cmap)# match protocol ftdd scid 0x22
Router(config-cmap)# match protocol ftdd scid 0x22
Router(config-cmap)# match protocol ftdd scid 0x25
```

Configuring a Traffic Policy

Traffic that matches a user-specified criterion can be organized into specific classes. The traffic in those classes can, in turn, receive specific QoS treatment when that class is included in a policy map.

To configure a traffic policy, perform the following steps.

Note

The **bandwidth** command is shown at Step 5. The **bandwidth** command configures the QoS feature class-based weighted fair queuing (CBWFQ). CBWFQ is just an example of a QoS feature that can be configured. Use the appropriate command for the QoS feature that you want to use.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. policy-map policy-map-name
- 4. class {class-name | class-default}
- **5.** bandwidth {bandwidth-kbps| remaining percent percentage| percent percentage}
- 6. end

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.

	Command or Action	Purpose
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	policy-map policy-map-name	Creates or modifies a policy map that can be attached to
	Example:	one or more interfaces and enters policy-map configuration mode.
	Router(config) # policy-map policy1	• Enter the name of the policy map.
Step 4	class {class-name class-default}	Specifies the name of the class whose policy you want to
	Example:	create or change and enters policy-map class configuration mode.
	Router(config-pmap)# class class1	Enter the specific class name or enter the class-defaultkeyword.
Step 5	bandwidth {bandwidth-kbps remaining percent percentage percent percentage}	(Optional) Specifies or modifies the bandwidth allocated for a class belonging to a policy map.
	Example: Router(config-pmap-c)# bandwidth percent 50	• Enter the amount of bandwidth as a number of kbps, a relative percentage of bandwidth, or an absolute amount of bandwidth.
		Note The bandwidth command configures the QoS feature class-based weighted fair queuing (CBWFQ). CBWFQ is just an example of a QoS feature that can be configured. Use the appropriate command for the QoS feature that you want to use.
Step 6	end	(Optional) Exits policy-map class configuration mode.
	Example:	
	Router(config-pmap-c)# end	

Attaching the Traffic Policy to an Interface

After a traffic policy (policy map) is created, the next step is to attach the policy map to an interface. Policy maps can be attached to either the input or output direction of the interface.

Note

Depending on the needs of your network, you may need to attach the policy map to a subinterface, an ATM PVC, a Frame Relay DLCI, or other type of interface.

To attach the traffic policy to an interface, perform the following steps.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. interface** *type number* [*name-tag*]
- 4. pvc [name] vpi / vci [ilmi| qsaal| smds| l2transport]
- 5. exit
- **6.** service-policy $\{input \mid output\}$ policy-map-name
- **7**. end

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	interface type number [name-tag]	Configures an interface type and enters interface
	Example:	configuration mode.
	Router(config)# interface ethernet 2/4	Enter the interface type and the interface number.
Step 4	pvc [name] vpi / vci [ilmi qsaal smds l2transport]	(Optional) Creates or assigns a name to an ATM permanent
	Example:	virtual circuit (PVC), specifies the encapsulation type on an ATM PVC, and enters ATM virtual circuit configuration
	Router(config-if)# pvc cisco 0/16	mode.
		• Enter the PVC name, the ATM network virtual path identifier, and the network virtual channel identifier.
		Note This step is required only if you are attaching the policy map to an ATM PVC. If you are not attaching the policy map to an ATM PVC, advance to Step 6.
Step 5	exit	(Optional) Returns to interface configuration mode.
	<pre>Example: Router(config-atm-vc)# exit</pre>	Note This step is required only if you are attaching the policy map to an ATM PVC and you completed Step 4. If you are not attaching the policy map to
	Accept (Coming dom ve/ # GAIL	an ATM PVC, advance to Step 6.

	Command or Action	Purpose
Step 6	service-policy {input output} policy-map-name	Attaches a policy map to an input or output interface.
	Example:	• Enter the name of the policy map.
	Router(config-if)# service-policy input policyl	Note Policy maps can be configured on ingress or egress routers. They can also be attached in the input or output direction of an interface. The direction (input or output) and the router (ingress or egress) to which the policy map should be attached vary according to your network configuration. When using the service-policy command to attach the policy map to an interface, be sure to choose the router and the interface direction that are appropriate for your network configuration.
Step 7	end	(Optional) Returns to privileged EXEC mode.
	Example:	
	Router(config-if)# end	

Displaying Custom Protocol Information

After you create a custom protocol and match traffic on the basis of that custom protocol, you can use the **show ip nbar port-map** command to display information about that custom protocol.

To display custom protocol information, complete the following steps.

SUMMARY STEPS

- 1. enable
- **2. show ip nbar port-map** [protocol-name]
- 3. exit

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	show ip nbar port-map [protocol-name]	Displays the current protocol-to-port mappings in use by
	Example:	NBAR. • (Optional) Enter a specific protocol name.
	Router# show ip nbar port-map	

	Command or Action	Purpose
Step 3	exit	(Optional) Exits privileged EXEC mode.
	Example:	
	Router# exit	

Configuring IP Address and Port-based Custom Protocol

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. ip nbar custom name transport {tcp | udp} {id id } {ip address ip-address | subnet subnet-ip subnet-mask}| ipv6 address {ipv6-address | subnet subnet-ipv6 ipv6-prefix} | port {port-number | range start-range end-range} | direction {any | destination | source}
- **4.** ip nbar custom name transport {tcp | udp} {id id}
- **5**. enc

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	ip nbar custom name transport {tcp udp} {id id } {ip address ip-address subnet subnet-ip subnet-mask} ipv6 address {ipv6-address subnet subnet-ipv6 ipv6-prefix} port {port-number range start-range end-range} direction {any destination source}	Configures the custom protocol, with options to specify IP address, subnet, port, direction, and so on. In the examples given, the command is executed on multiple lines, using the custom configuration mode, rather than the single-line format.
	Example:	
	Specifies the IP address.	
	Device(config)# ip nbar custom mycustomprotocol transport tcp id 100 Device(config-custom)# ip address 10.2.1.1	
	Example:	
	Specifies the subnet IP and a subnet mask of 0.	

	Command or Action	Purpose
	Device(config)# ip nbar custom mycustomprotocol transport tcp Device(config-custom)# ip subnet 255.255.255.255	
Step 4	<pre>ip nbar custom name transport {tcp udp} {id id} Example: Device(config) # ip nbar custom mycustom transport</pre>	Specifies TCP or UDP as the transport protocol and enters custom configuration mode.
	tcp id 100 Device(config-custom)#	
Step 5	end	(Optional) Exits custom configuration mode.
	Example:	
	Device(config-custom)# end	

Configuration Examples for Creating a Custom Protocol

Example Creating a Custom Protocol

In the following example, the custom protocol called app_sales1 identifies TCP packets that have a source port of 4567 and that contain the term SALES in the first payload packet:

```
Router> enable
Router# configure terminal
Router(config)# ip nbar custom app_sales1 5 ascii SALES source tcp 4567
Router(config)# end
```

Example Configuring a Traffic Class to Use the Custom Protocol

In the following example, a class called cmap1 has been configured. All traffic that matches the custom app_sales1 protocol will be placed in the cmap1 class.

```
Router> enable
Router# configure terminal
Router(config)# class-map cmap1
Router(config-cmap)# match protocol app sales1
```

```
Router(config-cmap) # end
```

Example Configuring a Traffic Policy

In the following example, a traffic policy (policy map) called policy1 has been configured. Policy1 contains a class called class1, within which CBWFQ has been enabled.

```
Router* enable

Router# configure terminal

Router(config)# policy-map policy1

Router(config-pmap)# class class1

Router(config-pmap-c)# bandwidth percent 50

Router(config-pmap-c)# end
```

Note

In the above example, the **bandwidth** command is used to enable Class-Based Weighted Fair Queuing (CBWFQ). CBWFQ is only an example of one QoS feature that can be applied in a traffic policy (policy map). Use the appropriate command for the QoS feature that you want to use.

Example Attaching the Traffic Policy to an Interface

In the following example, the traffic policy (policy map) called policy 1 has been attached to ethernet interface 2/4 in the input direction of the interface.

```
Router* configure terminal

Router(config)# interface ethernet 2/4

Router(config-if)# service-policy input policy1

Router(config-if)# end
```

Example Displaying Custom Protocol Information

The following is sample output of the **show ip nbar port-map** command. This command displays the current protocol-to-port mappings in use by NBAR. Use the display to verify that these mappings are correct.

```
Router# show ip nbar port-map
port-map bgp udp 179
port-map bgp tcp 179
port-map cuseeme udp 7648 7649
port-map cuseeme tcp 7648 7649
port-map dhcp udp 67 68
port-map dhcp tcp 67 68
```

If the **ip nbar port-map** command has been used, the **show ip nbar port-map** command displays the ports assigned to the protocol.

If the **no ip nbar port-map**command has been used, the **show ip nbar port-map** command displays the default ports. To limit the display to a specific protocol, use the *protocol-name* argument of the **show ip nbar port-map** command.

Example: Configuring IP Address and Port-based Custom Protocol

The following example shows how to enter custom configuration mode from global configuration mode and configure a subnet IP address and its mask length:

```
Device(config) # ip nbar custom mycustomprotocol transport tcp id 100 Device(config-custom) # ip subnet 10.1.2.3 22
```

The following example configures two custom protocols, one for TCP and one for UDP traffic. In each, the subnet, subnet mask, DSCP value, and direction are configured.

```
Device(config) # ip nbar custom mycustomprotocol_tcp transport tcp
Device(config-custom) # ip subnet 255.255.255.255 0
Device(config-custom) # dscp 18
Device(config-custom) # direction any
Device(config-custom) # end
Device(config) # ip nbar custom mycustomprotocol_udp transport udp
Device(config-custom) # ip subnet 255.255.255.255 0
Device(config-custom) # dscp 18
Device(config-custom) # direction any
```
