Support for Flex Links

Flex Link is a pair of Layer 2 interfaces, where one interface is configured to act as a backup to the other. The feature provides an alternative solution to the Spanning Tree Protocol (STP), allowing you to turn off STP and still provide basic link redundancy. Flex Links are typically configured in service provider or enterprise networks, where, you do not want to run STP on the router.

For more information, see LAN Switching Configuration Guide (Cisco NCS 520 Series).
