access-class

To restrict incoming and outgoing connections between a particular VTY and the addresses in an access list, use the **access-class** command. To remove access restrictions, use the **no** form of this command.

access-class *access-list-name/number* { in | out }

no access-class *access-list-name* { **in** | **out** }

Syntax Description	access-list-name/number	You can either enter a name of the access-list or a number.	
		Name of the IPv4 ACL class. The name can be a maximum of 64 alphanumeric characters. The name cannot contain a space or quotation mark.	
		Number of an IP access list. This is a decimal number from 1 to 199 or from 1300 to 2699 .	
	in	Restricts incoming connections between a particular Cisco device and the addresses in the access list.	
	out	Restricts outgoing connections between a particular Cisco device and the addresses in the access list.	

None **Command Default** Line configuration mode (config-line) **Command Modes**

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.
Usage Guidelines For usage guidelines, see the Cisco IOS XE access-class command.		as-class command.
Examples	This example shows how to configure an access c	lass on a VTV line

This example shows how to configure an access class on a VTY line:

Device (config) # line vty 0 5 Device(config-line) # access-class TEST in

address prefix

To specify an address prefix for address assignment, use the **address prefix** command in interface configuration mode. To remove the address prefix, use the **no** form of this command.

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.7.1a	This command was introduced.

Usage Guidelines For usage guidelines, see the Cisco IOS XE address prefix command.

Examples

The following example shows how to configure a pool called engineering with an IPv6 address prefix:

```
Device(config)# ipv6 dhcp pool engineering
Device(config-dhcpv6)# address prefix 2001:1000::0/64 lifetime infinite
```

arp timeout

To configure how long a dynamically learned IP address and its corresponding Media Control Access (MAC) address remain in the Address Resolution Protocol (ARP) cache, use the **arp timeout** command in interface configuration mode. To restore the default value, use the **no** form of this command.

arp timeout seconds no arp timeout

Syntax Description	seconds Time (in seconds) that an entry remains in the ARP cache.				
		The general recommended value for ARP timeout is the configured default value, which is 4 hours. If the network has frequent changes to cache entries, change the default to a shorter time period. As you reduce the ARP timeout, your network traffic increases. A low ARP timeout value might lead to network outage, and a value less than an hour (or 3600 seconds) will generate significantly increased traffic across the network.			
		,			
Command Default	14400 sec	conds (4 hours))		
Command Modes	Interface of	configuration (config-if)		
Command History	Release			Modification	
	Cisco IOS	S XE Catalyst S	SD-WAN Release 17.2.1v	Qualified for use in Cisco vManage CLI templates	
Usage Guidelines	For the us	age guidelines	, see arp timeout.		

Examples

```
Device(config)# interface GigabitEthernet 1
Device(config-if)# arp timeout 7200
```

cdp enable

To enable Cisco Discovery Protocol on an interface, use the **cdp enable** command in interface configuration mode. To disable Cisco Discovery Protocol on an interface, use the **no**form of this command.

	cdp enable no cdp enable			
Syntax Description	This command has no arguments or keywords.			
Command Default	This command is enabled at the global configuration level and is supported on all interfaces.			
Command Modes	- Interface configuration (config-if)			
Command History	Release	Modification		
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Qualified for use in Cisco vManage CLI templates.		
Usage Guidelines	For the usage guidelines, see cdp enable.			
Examples	Device(config)# interface GigabitEthernet Device(config-if)# cdp enable	1		

cdp run

cdp run

To enable Cisco Discovery Protocol, use the **cdp run**command in global configuration mode. To disable Cisco Discovery Protocol, use the **no**form of this command.

templates.

	no cdp run		
Syntax Description	This command has no arguments or keywords.		
Command Default	This command is enabled on all the platforms.		
Command Modes	- Global configuration		
Command History	Release	Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI	

Usage Guidelines	For usage guidelines, see the Cisco IOS XE cdp run command.
Examples	In the following example, Cisco Discovery Protocol is enabled globally.
	Device(config)# cdp run

default-router

To specify the default router list for a Dynamic Host Configuration Protocol (DHCP) client, use the **default-router** command in DHCP pool configuration mode. To remove the default router list, use the **no** form of this command.

default-router address [address2 ... address8] no default-router

Syntax Description	address	Specifies the IP address of a router. One IP address is required, although you can specify up to eight addresses in one command line.
	address2address8	(Optional) Specifies up to eight addresses in the command line.

Command Default No default behavior or values.

Command Modes DHCP pool configuration (dhcp-config)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.

Usage Guidelines For usage guidelines, see the Cisco IOS XE default-router command.

Examples The following example specifies 10.1.19.15 as the IP address of the default router:

Device(config)# ip dhcp pool POOL1
Device(dhcp-config)# default-router 10.1.19.15

dns-server

To specify the Domain Name System (DNS) IP servers available to a Dynamic Host Configuration Protocol (DHCP) client, use the **dns-server** command in DHCP pool configuration mode. To remove the DNS server list, use the **no** form of this command.

dns-server address [address2 ... address8] no dns-server

Syntax Description	address	The IP address of a DNS server. One IP address is required, although you can specify up to eight addresses in one command line.		
	address2address8	(Optional) Specifies up to eight addresses in the command line. The server address should be specified in the order of preference.		
Command Default	If DNS IP servers are r	not configured for a DHCP cl	ient, the client cannot correlate host names to IP addresses.	
Command Modes	DHCP pool configuration (dhcp-config)			
Command History	Release		Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v		Command qualified for use in Cisco vManage CLI templates.	
Usage Guidelines	Servers are listed in order of preference (address1 is the most preferred server, address2 is the next most preferred server, and so on).			
Examples	The following example	e specifies 10.12.1.99 as the I	P address of the domain name server of the client:	

Device(config)# ip dhcp pool POOL1
Device(dhcp-config)# dns-server 10.12.1.99

domain-name

To specify the default domain for a Domain Name System (DNS) view to use to complete unqualified hostnames (names without a dotted-decimal domain name), use the **domain-name** command in DHCP pool configuration mode. To remove the specification of the default domain name for a DNS view, use the **no** form of this command.

domain-name domain-name no domain-name

Syntax Description	<i>domain-name</i> Default domain name used to complete unqualified hostnames.			
		Note	Do not include th the domain name	e initial period that separates an unqualified name from
Command Default	No default domain name is defined for the DNS view.			
Command Modes	DHCP pool con	figuration (dh	cp-config)	
Command History	Release			Modification
	Cisco IOS XE	Catalyst SD-W	AN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.

Usage Guidelines	For usage guidelines, see the Cisco IOS XE domain name command.
Examples	The following example shows how to define dns1 as the default DNS view for the DHCP pool named POOL1.
	Device(config)# ip dhcp pool POOL1 Device(dhcp-config)# domain-name dns1

ip address

To set a primary or secondary IP address for an interface, use the **ip address** command in interface or sub-interface configuration mode. To remove an IP address or disable IP processing, use the **no** form of this command.

ip address *ip-address* [mask] no ip address [*ip-address*] [mask]

Syntax Description	ip-address	IP address.			
	mask	(Optional) Mask for the associated II	subnet.		
Command Default	No IP addres	ss is defined for the interface.			
Command Modes	- Interface configuration (config-if)				
	Sub-interfac	e configuration (config-subif)			
Command History	Release		Modific	ation	
	Cisco IOS X	KE Catalyst SD-WAN Release 17.2.1v	Qualifie	d for use in Cisco vManage CLI templates.	
Usage Guidelines	For the usag	e guidelines, see the Cisco IOS XE ip	address	command.	
Examples	Device(cont	fig)# interface ATM 0/3/0.1 poir	it-to-po	int	
	Device(config-if)# ip address 192.10.6.5				
	<pre>Device(config) # interface ATM 0/3/0.1</pre>				
	Device(cont	<pre>fig-subif)# ip address 10.0.0.0</pre>	255.255	.255.252	
	Device(config)# interface Serial 0/1/0.2				
	Device(config-if)# ip address 10.1.1.1 255.255.255.0				
	Device(config)# interface Serial 0/0/1:5				
	Device(config-if)# ip address 10.1.1.1 255.255.255.0				

I

Device (config) # interface MFR1

Device(config-if) # ip address 10.4.4.4 255.255.255.0

ip address dhcp

To acquire an IP address on an interface from the DHCP, use the **ip address dhcp**command in interface configuration mode. To remove any address that was acquired, use the **no** form of this command.

ip address dhcp [client-id interface-type number]
no ip address dhcp [client-id interface-type number]

Syntax Description	client-id	(Optional) Specifies the client ide The client-id <i>interface-type numb</i> address of the named interface.	entifier. By default, the client identifier is an ASCII value. <i>Peroption sets the client identifier to the hexadecimal MAC</i>		
	interface-type	(Optional) Interface type. For more information, use the question mark (?) online help function.			
	number	(Optional) Interface or subinterface number. For more information about the numbering syntax for your networking device, use the question mark (?) online help function.			
Command Default	The client ident	ifier is an ASCII value.			
Command Modes	Interface config	uration (config-if)			
Command History	Release		Modification		
	Cisco IOS XE	Catalyst SD-WAN Release 17.2.1v	Qualified for use in Cisco vManage CLI templates.		
Usage Guidelines	For the usage g	uidelines, see ip address dhcp.			
Examples	Device(config)# interface GigabitEthernet	1		

Device(config-if) # ip address dhcp client-id GigabitEthernet 1

ip arp proxy disable

To globally disable proxy Address Resolution Protocol (ARP), use the **ip arp proxy disable** command in global configuration mode. To reenable proxy ARP, use the **no** form of this command.

ip arp proxy disable no ip arp proxy disable

Syntax Description This command has no arguments or keywords.

I

Command Default	Proxy ARP is enabled.			
Command Modes	Global configuration	Global configuration		
Command History Release Modification		Modification		
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.		
Usage Guidelines	The ip arp proxy disable command overrides any proxy command returns proxy ARP to the default	/ proxy ARP interface configuration. The default ip arp behavior, which is enabled.		
Examples	The following example disables proxy ARP:			
	Device (config) # ip arp proxy disable The following example enables proxy ARP:			
	Device(config)# no ip arp proxy disable			

ip bootp server

To enable the Bootstrap Protocol (BOOTP) service on your routing device, use the **ip bootp server** command in global configuration mode. To disable BOOTP services, use the **no** form of the command.

	ip bootp server no ip bootp server		
Syntax Description	This command has no arguments or keywords.		
Command Default	Enabled		
Command Modes	Global configuration		
Command History	/ Release Modification		
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.	
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ip bo	otp server command.	
Examples	In the following example, the BOOTP service is enabled and disabled on the router:		
	Device(config)# ip bootp server		
	Device (config) # no ip bootp server		

ip cef load-sharing algorithm

To select a Cisco Express Forwarding load-balancing algorithm for IPv4, use the **ip cef load-sharing algorithm** command in global configuration mode. To return to the default universal load-balancing algorithm, use the **no** form of this command.

ip cef load-sharing algorithm { universal [id] | include-ports [source [id] | destination [id]] | src-only [id] }

no	ip	cef	load-sharing	algorithm
----	----	-----	--------------	-----------

	universal [id] Sets the load-ba a source and desi		ancing algorithm to the universal algorithm that uses ination IP. (This is set as default).	
	id	(Optional) Fixed	identifier.	
	include-ports {source [id] destination[id]	Sets the load-bala port.	Sets the load-balancing algorithm to include source port and destination port.	
	<pre>src-only [id]</pre>	Sets the load-bala	incing algorithm to include source-only port.	
Command Default	The universal load-balancing algorithm is selected. If you do not configure the fixed identifier for a load-balancing algorithm, the router automatically generates a unique ID.			
Command Modes	Global configuration (config)			
	Command History			
	Release		Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.6.1a		This command was introduced.	
	Cisco IOS XE Catalyst SD-WAN F	Release 17.8.1a	This command was modified. The src-only algorithm is added.	
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ip cef load-sharing algorithm command.		-sharing algorithm command.	
	You can enable ECIVIP keying to se	end the configuratio	ns for both IPV4 and IPV6.	
Examples	The following example shows how to enable the CEI		oad-balancing algorithm for universal:	
	Device# config-transaction Device(config)# ip cef load-sh	aring algorithm	universal	
	The following example shows how and destination ports algorithm:	to enable the IP CE	F load-sharing algorithm to include source	
	Device# config-transaction Device(config)# ip cef load-sh Device(config)# commit	aring algorithm	include-ports source destination	
	The following example shows how to enable CEF load-sharing algorithm to src-only port algorithm:		sharing algorithm to src-only port algorithm:	

```
Device# config-transaction
Device(config)# ip cef load-sharing algorithm src-only [id]
Device(config)# commit
```

ip-clear-dont-fragment

ip clear-dont-fragment—Clear the Don't Fragment (DF) bit in the IPv4 packet header for packets being transmitted out the interface. When the DF bit is cleared, packets larger than that interface's MTU are fragmented before being sent.

Note

ip clear-dont-fragment clears the DF bit when there is fragmentation needed and the DF bit is set. For packets not requiring fragmentation, the DF bit is not affected.

The option to clear the Dont Fragment bit is available for Cisco SD-WAN tunnels interfaces only.

By default, the clearing of the DF bit is disabled.

vManage Feature Template

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.5.1a	Qualified for use in Cisco vManage CLI templates

Usage Guidelines For more information about this command, see the Cisco IOS XE clear-dont-fragment

Example

This example shows how to clear the DF bit in IPv4 packets being sent out an interface:

```
Device# config-transaction
Device(config)#interface Tunnel 1
Device(config-if)#ip unnumbered GigabitEthernet1
Device(config-if)#ip clear-dont-fragment
Device(config-if)#
```

ip dhcp client vendor-class

By default the DHCP client carries PID (Product ID) of the device in option-124. This default behaviour can be overridden by configuring below CLI:

ip dhcp client vendor-class [mac-address | ascii | hex | disable]

Syntax Description	mac-address	The mac address of the device.			
	ascii	The user defined string in ascii form	nat.		
	hex	The user defined string in hexadeci	mal format.		
	disable	Disables sending option-124 to DHC	CP messages.		
Command Default	By default option	on-124 carries PID of the device.			
Command Modes	- Interface config	guration (config-if)			
Command History	Release		Modification]
	Cisco IOS XE	Catalyst SD-WAN Release 17.10.1a	This comman	d was introduced.	
Usage Guidelines	By default the I by configuring	DHCP client carries PID of the device the ip dhcp client vendor-class com	e in option-124 nmand.	. This default beha	aviour can be overridden
Examples	The following e	example shows the configuration to c	override the de	cive PID with MA	AC address:
	interface Gig ip addres ip dhcp c !	abitEthernet 0/0/0 s dhcp lient vendor-class mac-address			
	The DHCP ven	dor-class option, overrides the Devic	e PID with M	AC Address.	
	The following e in hex or in asc	example shows the configuration to c ii format:	override the dev	vice PID with use	r defined string
	interface Gig ip addres ip dhcp c !	abitEthernet 0/0/0 s dhcp lient vendor-class hex aabbcc			
	interface Gig ip addres ip dhcp c	abitEthernet 0/0/0 s dhcp lient vendor-class ascii cisco			
	The following e	example shows the configuration to c	lisable option-	124 in DHCP mes	ssages:

```
interface GigabitEthernet 0/0/0
    ip address dhcp
    ip dhcp client vendor-class disable
   !
```

ip dhcp use

To control what information the Dynamic Host Configuration Protocol (DHCP) server accepts or rejects during address allocation, use the **ip dhcp use** command in global configuration mode.

To disable the use of Dynamic Host Configuration Protocol (DHCP) parameters during address allocation, use the no form of this command.

```
ip dhcp use { class | vrf remote }
no ip dhcp use class
```

Syntax Description	yntax Description class Specifies that the DHCP server use DHCP classes during address allocation.		P classes during address allocation.	
	vrf	vrf Specifies whether the DHCP server ignores or uses the receiving VPN routing and forwarding (VRF) interface during address allocation.		
Command Default	The D	HCP server allocates addresses by default.		
Command Modes	Global	configuration		
Command History	Relea	se	Modification	
	Cisco	IOS XE Catalyst SD-WAN Release 17.2.1v	Qualified for use in Cisco vManage CLI templates.	
Usage Guidelines	When either the no For usa	the Cisco IOS DHCP server code is allocation enable or disable the use of VRF configured ip dhcp use class command, the DHCP cla age guidelines, see Cisco IOS XE ip dhcp	ng addresses, you can use the ip dhcp use command to on the interface, or to configure DHCP classes. If you use ass configuration is not deleted. use command.	
Examples	The fo option	llowing example shows how to configure th during address allocation:	e DHCP server to use the relay agent information	
	Device(config)# ip dhcp use class			
The follow configure		The following example shows how to configure the DHCP server to enable the use of the VRF onfigured on the interface during address allocation:		
	Device(config)# ip dhcp use vrf remote			
	The following example shows how to configure the DHCP server to disable the use of class during address allocation:			
	Device	config)# no ip dhcp use class		

ip dhcp smart-relay

To allow the Cisco Dynamic Host Configuration Protocol (DHCP) relay agent to switch the gateway address (giaddr field of a DHCP packet) to secondary addresses when there is no DHCPOFFER message from a DHCP server, use the **ip dhcp smart-relay** command in global configuration mode. To disable this smart-relay functionality and restore the default behavior, use the **no** form of this command.

ip dhcp smart-relay

	no ip dhcp smart-relay	
Syntax Description	This command has no arguments or keywords.	
Command Default	Command is disabled	
Command Modes	Global configuration (config)	
Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.13.1a	This command was introduced.
Usage Guidelines	The DHCP relay agent attempts to forward the prim and no response, the relay agent automatically swite	ary address as the gateway address. After three attempts hes to secondary addresses.
	Example	
	The following example enables the DHCP relay age pools:	nt to automatically switch to secondary address
	Device (config) # service dhcp	

```
Device(config)# interface GigabitEthernet0/0
Device(config)# ip address 172.16.0.1 255.255.0.0
Device(config)# secondary ip address 192.168.255.254 255.255.0.0
Device(config)# ip helper-address 10.0.0.1
Device(config)# ip dhcp smart-relay
Device(config)# end
!
```

ip dhcp use hardware-address client-id

To set the hardware-address as a client-id on all dhcp requests, use the **ip dhcp use hardware-address client-id** command in global configuration mode. To remove the hardware-address as the client-id, use the **no** form of this command.

ip dhcp use hardware-address client-id no ip dhcp use hardware-address client-id

Syntax Description This command has no keywords or arguments.

Command Default	None					
Command Modes	Global configuration (config)					
Command History	Release	Modification				
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command is qualified for use in Cisco SD-WAN Manager CLI templates.				
Usage Guidelines	Subscriber-id, vrf-id, hardware-address can be hardware-address client-id command to set	used as client-id in DHCP requests. Use this ip dhcp use the hardware-address as a client-id on all DHCP requests.				
	Examples					
	The following example shows how to set the c	The following example shows how to set the client-id of dhcp requests to use the hardware-address.				
	Device(config)# ip dhcp use hardware-address client-id					
	Table 1: Related Commands					
	Commands	Description				
	ip dhcp use class	DHCP server to use the relay agent information optic during address allocation.				
	ip dhcp use subscriber-id	DHCP server to use the subscriber-id information option during address allocation.				
		option during address allocation.				

ip directed-broadcast

To enable the translation of a directed broadcast to physical broadcasts, use the **ip directed-broadcast** interface configuration command. To disable this function, use the **no** form of this command.

ip directed-broadcast

no ip directed-broadcast

Syntax Description This command has no arguments or keywords.

Command Default Disabled; all IP directed broadcasts are dropped.

Command Modes Interface configuration (config-if)

Command History	Release	Modification
	Cisco IOS XE Release Amsterdam 17.2.1v	Qualified for use in Cisco vManage CLI templates

Usage Guidelines	For the usage guidelines, see ip directed-broadcast.
Examples	csr8k(config)# interface GigabitEthernet 1.101

```
csr8k(config-if)# ip address 192.168.66.1
csr8k(config-if)# ip directed-broadcast
```

ip dns server

To enable the Domain Name System (DNS) server on a router, use the **ip dns server** command in global configuration mode. To disable the DNS server, use the **no** form of the command.

ip dns server no ip dns server

Syntax Description This command has no arguments or keywords.

Command Default The DNS server is disabled.

Command Modes Global configuration

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	Qualified for use in Cisco vManage CLI templates.
Usage Guidelines	Use this command to enable the DNS server as ne	eeded.
Examples	In the following example, the DNS server is enable	led:

Device(config) # ip dns server

ip domain lookup

To enable the Domain Name Server (DNS) lookup feature, use the **ip domain-lookup** command. Use the **no** form of this command to disable this feature.

ip domain lookup no ip domain lookup

Syntax Description

This command has no arguments or keywords.

Command Default None

IP Commands

Command Modes

Global configuration

Command History	Release	Modification		
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1r Command qualified for use in Cisco vManage CLI templates.			
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ip do	omain lookup command.		
Examples	This example shows how to disable the DNS server lookup feature: Device (config) # no ip domain-lookup			

ip finger

To configure a system to accept Finger protocol requests (defined in RFC 742), use the **ip finger** command in global configuration mode. To disable this service, use the **no**form of this command.

	ip finger no ip finger		
Command Default	Disabled		
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.	
		1	

Examples The following example disables the Finger protocol:

Device(config) # no ip finger

ip helper-address

To enable forwarding of User Datagram Protocol (UDP) broadcasts, including Bootstrap Protocol (BOOTP), received on an interface, use the **ip helper-address** command in interface configuration mode. To disable forwarding of broadcast packets to specific addresses, use the**no** form of this command.

ip helper-address address no ip helper-address address

Syntax Description	addressDestination broadcast or host address to be used when forwarding UDP broadcasts. There can be more than one helper address per interface.		
Command Default	UDP broadcasts are not forwarded.		
Command Modes	Interface configuration (config-if)		
Command History	Release	Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.	
Usage Guidelines	For the usage guidelines, see ip helper-address.		
Examples	amples The following example shows how to define an address that acts as a helper address:		
	Device(config)# interface GigabitEthernet 1.101 Device(config-if)# ip nbar protocol-discovery Device(config-if)# ip helper-address 10.8.4.5		

ip host

To define static hostname-to-address mappings in the Domain Name System (DNS) hostname cache for a DNS view, use the **ip host** command in global configuration mode. If the hostname cache does not exist yet, it is automatically created. To remove a hostname-to-address mapping, use the **no** form of this command.

ip host [vrf vrf-name] [ip-address1 . . . [ip-addressn]]
no ip host [vrf vrf-name] [ip-address1 . . . [ip-addressn]]

Syntax Description	vrf vrf-name	(Optional) The <i>vrf-name</i> argument specifies the name of the Virtual Private Network (VRF) routing and forwarding (VRF) instance whose hostname cache is to store the mappings. Default is the global VRF (that is, the VRF whose name is a NULL string).	
	hostname	Name of the host. The first character can be either a letter or a number. If you use a number, the types of operations you can perform (such as ping) are limited.	
<i>ip-ad</i> <i>i</i> j	ip-address1 ip-addressn	Associated host IP address. You can specify an IPv4 or IPv6 address for the hos IP address and additional IP addresses.	
		(Optional) Additional associated IP addresses, delimited by a single space.	
		Note The ellipses in the syntax description are used to indicate a range of values. Do not use ellipses when entering host IP addresses.	

Command Default No static hostname-to-address mapping is added to the DNS hostname cache.

Command Modes Global configuration

Command History	Release Modification			
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	Qualified for use in Cisco vManage CLI templates.		
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ip host command.			
Examples	The following example shows how to add two mapping entries to the hostname that is associated with the VRF 101 and then remove one of those entries from that hostname cache:			
	Device(config)# ip host vrf 101 test-1 192.0.2.141 192.0.2.241			
	Device(config) # no ip host vrf 101 test-1 192.0.2.141			

ip host ip-address

To define static hostname-to-address mappings in the Domain Name System (DNS) hostname cache for a DNS view, use the **ip host** command in global configuration mode. If the hostname cache does not exist yet, it is automatically created. To remove a hostname-to-address mapping, use the **no** form of this command.

ip host [ip-address1 . . . [ip-addressn]]
no ip host [ip-address1 . . . [ip-addressn]]

Syntax Description	ip-address1IP address of Cisco Catalyst SD-WAN Validator. You can specify an IPv4 of address for the host IP address and additional IP addresses.(Optional) Additional associated IP addresses, delimited by a single space. configure a maximum of 24 IP addresses.NoteThe ellipses in the syntax description are used to indicate a ram values. Do not use ellipses when entering host IP addresses.		lyst SD-WAN Validator. You can specify an IPv4 or IPv6 ldress and additional IP addresses. sociated IP addresses, delimited by a single space. You can 24 IP addresses.
			in the syntax description are used to indicate a range of not use ellipses when entering host IP addresses.
Command Default	No static hostname-to	o-address mapping is added	to the DNS hostname cache.
Command Modes	Global configuration		
Command History	Release		Modification
	Cisco IOS XE Cataly	vst SD-WAN Release 17.2.1r	Qualified for use in Cisco vManage CLI templates.
Examples	The following examp IP hosts, and how to a	ble shows how to add two Ci remove one of them.	sco Catalyst SD-WAN Validator IP addresses as
	Device(config)# ip host 192.0.2.141 192.0.2.241		.2.241
	Device(config)# no ip host 192.0.2.141		

ip http authentication

To specify a particular authentication method for HTTP server users, use the **ip http authentication** command in global configuration mode. To disable a configured authentication method, use the **no** form of this command.

	ip http authentication local no ip http authentication [local]		
Syntax Description	local Indicates that the login user name, password and privilege level access combination specified in the local system configuration (by the username global configuration command) should be used for authentication and authorization.		
Command Default	The "enable" password is required when users (clients) connect to the HTTP server. Three command privilege levels exist on the router.		
Command Modes	- Global configuration		
Command History	Release	Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.	
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ip ht	up authentication command.	
Examples	The following example shows how to specify that the login user name, password and privilege level access combination specified in the local system configuration should be used for authentication and authorization.		
	Device(config)# ip http authentication loc	al	

ip http client source-interface

To enable HTTP client on your IP or IPv6 system, use the **ip http client** command in global configuration mode. To disable the HTTP client, use the **no** form of this command.

Supported Parameters

type	Name of the source interface.
number	Number of the source interface.

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.5.1a	Command qualified for use in Cisco vManage CLI templates.
Usage Guidelines	For more information about this command, see the	e Cisco IOS XE ip http client source-interface command.

Example

Device(config) # ip http client source-interface GigabitEthernet0/0/2

ip http secure-server

To enable a secure HTTP (HTTPS) server, use the **ip http secure-server** command in global configuration mode. To disable an HTTPS server, use the **no** form of this command.

ip http secure-server no ip http secure-server

Syntax Description This command has no arguments or keywords.

Command Default The HTTPS server is disabled.

Command Modes Global configuration

Command History Usage Guidelines	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.
	For usage guidelines, see the Cisco IOS XE ip http secure-server command.	

Examples In the following example the HTTPS server is disabled:

Device(config) # no ip http secure-server

ip http server

To enable the HTTP server on your IP or IPv6 system, including the Cisco web browser user interface, use the **ip http server** command in global configuration mode. To disable the HTTP server, use the **no** form of this command.

ip http server no ip http server

Syntax Description	This command has no arguments or keywords.		
Command Default	The HTTP server is disabled by default.		
Command Modes	- Global configuration		
Command History	Release Modification		
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.	
Usage Guidelines	For usage guidelines, see the Cisco IOS XEip http server command.		
Examples	The following example shows how to disable the HTTP server:		
	Device(config) #no ip http server		

ip http tls-version

To configure TLS version for HTTPS Server and HTTPS client sessions, use the **ip http tls-version** command in global configuration mode. To remove the configuration, use the **no** form of this command.

ip http tls-version *tls-version* **no ip http tls-version** *tls-version*

Syntax Description	tls-version Specifies TLS versions—TLSv1.0, TLSv1.1, TLSv1.2, and TLSv1.3.		
Command Default	None		
Command Modes	Global configuration (confi	g)	
Command History	Release		Modification
	Cisco IOS XE Catalyst SD	-WAN Release 17.10.1a	This command was introduced.
Usage Guidelines	The ip http tls-version com The underlying SSL infrastr the HTTPS provides the op	mand allows you to set a pructure supports the option to specify the individ	particular version used for HTTP secure-server sessions. of specifying either all or only one TLS version. Hence ual version.
	By default, three TLS version a particular version use this	ons used for HTTPS sessi command.	ons are supported—TLSv1.2 and TLSv1.3. To enable
Examples	The following shows how t	o configure TLS version 1	.0 for the HTTPS session:
	Device(config)# ip http tls-version TLSv1.0		

ip icmp rate-limit unreachable

To limit the rate at which Internet Control Message Protocol (ICMP) unreachable messages are generated for a destination, use the **ip icmp rate-limit unreachable** command in global configuration mode.

To use the default, use the **no** form of this command.

ip icmp rate-limit unreachable ms no ip icmp rate-limit unreachable

		1			
Syntax Description	<i>ms</i> The optional ms argument is a time limit in milliseconds (ms) in which one unreachable message i generated.				
		The valid range is a	from 1 ms to 4294967295	5 ms.	
		Note Counting begins as soon as this command is configured.			
Command Default	The	default value is one I	ICMP destination unreact	nable message per 500 ms.	
Command Modes	Global configuration (config)				
Command History	Release			Modification	
	Cisc	co IOS XE Catalyst S	D-WAN Release 17.3.1a	Command qualified for use in Cisco vManage CLI templates.	
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ip icmp rate-limit unreachable command.				
Examples	The following example sets the rate of the ICMP destination unreachable message to one message every 10 ms:			destination unreachable message to one message	
				able 10	
	The following example turns off the previously configured rate limit: Device (config) # no ip icmp rate-limit unreachable				

ip icmp redirect

To control the type of Internet Control Message Protocol (ICMP) redirect message that is sent, use the **ip icmp redirect** command in global configuration mode. To set the value back to the default, use the **no**form of this command.

ip icmp redirect { host | subnet }
no ip icmp redirect

Syntax Description host Sends ICMP host redirects.

	subnet	Sends ICMP subnet redirects.		
Command Default	The route	S.		
	Because the ip icmp redirect subnet command is the default, the command will not be displayed in the configuration.			
Command Modes	Global co	onfiguration (config)		
Command History	Release			Modification
	Cisco IC 17.3.1ae	OS XE Catalyst SD-WAN Relea exit	se	Command qualified for use in Cisco vManage CLI templates.
Usage Guidelines	For usage	e guidelines, see the Cisco IOS	XE ip icmp	predirect command.
Examples	The following example enables the router to send out ICMP host redirects:			
	Device(config)# ip icmp redirect host			
	The following example sets the value back to the default, which is subnet redirects:			

Device(config) # ip icmp redirect subnet

ip igmp ssm-map query dns

To configure Domain Name System (DNS)-based Source Specific Multicast (SSM) mapping, use the **ip igmp ssm-map query dns** command in global configuration mode. To disable DNS-based SSM mapping, use the **no** form of this command.

	ip igmp ssm-map query dns no ip igmp ssm-map query dns		
Syntax Description	This command has no arguments.		
Command Default	This command is enabled by default when the ip igmp ssm-map enable command is enabled.		
Command Modes	Global configuration (config)		
Command History	istory Release Modification		
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.	
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ip igmp ssm-map query dns command.		
Examples	The following example shows how to disable DNS-based SSM mapping:		

Device(config) # no ip igmp ssm-map query dns

ip load-sharing algorithm

To enable load balancing algorithm on an interface for IPv4, use the **ip load-sharing algorithm** command in Cisco Catalyst SD-WAN configuration mode. To disable load balancing algorithm on an interface, use the **no** form of this command.

```
ip load-sharing algorithm { ip-and-ports | src-dst-ip | src-ip-only }
no ip load-sharing algorithm { ip-and-ports | src-dst-ip | src-ip-only }
```

Syntax Description	ip-and-ports Sets the load-balancing algorithm to the include-ports algorithm that uses Layer 4 source and destination ports.				
	src-dst-ip	Sets the load-balancing algorithm to the src-dst-ip algorithm that uses a source and destination ip.			
	src-ip-only	Sets the load-balancing algorithm to	the src-ip algorithm that uses source ip.		
Command Default	src-dst-ip algorithm is enabled by default.				
Command Modes	SD-WAN configuration (config-sdwan)				
Command History	Release		Modification		
	Cisco IOS XE	Catalyst SD-WAN Release 17.8.1a	This command was introduced.		
Usage Guidelines	When the load-balancing algorithm is set to src-dst-ip mode, each router on the network can make a different load sharing decision for each source-destination address pair.				
	The ip-and-ports algorithm allows you to use the Layer 4 source and destination ports as part of the load-balancing decision. This method benefits traffic streams running over equal-cost paths that are not loadshared because the majority of the traffic is between peer addresses that use different port numbers, such as Real-Time Protocol (RTP) streams.				
Examples	The following example shows how to enable load-balancing algorithm for source, destination ip and port:				
	Device(config)# sdwan Device(config-sdwan)# ip load-sharing algorithm ip-and-ports				
	The following example shows how to enable load balancing algorithm for source, destination ip:				
	Device(config)# sdwan Device(config-sdwan)# ip load-sharing algorithm src-dst-ip				
	The following example shows how to enable load balancing algorithm for source ip only:				
	Device(config)# sdwan				

Device(config-sdwan) # ip load-sharing algorithm src-ip-only

L

ip mtu

To set the maximum transmission unit (MTU) size of IP packets that are sent on an interface, use the **ip mtu** command in interface configuration mode. To restore the default MTU size, use the **no** form of this command.

ip mtu bytes no ip mtu

Syntax DescriptionbytesMTU size, in bytes.

Command Default The default MTU value depends on the interface type.

Table 2: Default MTU Values by Interface Type

Interface Type	Default MTU (Bytes)
ATM	4470
Ethernet	1500
FDDI	4470
High-Speed Serial Interface High Speed Access (HSSI HSA)	4470
Serial	1500
Token Ring	4464
VRF-Aware Service Infrastructure (VASI)	9216

Command ModesInterface configuration (config-if)
Subinterface configuration (config-subif)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Qualified for use in Cisco vManage CLI templates.
Usage Guidelines	For the usage guidelines, see the IOS XE ip mtu c	ommand.
Examples	Device(config)# interface GigabitEthernet Device(config-if)# ip mtu 1500	1
	Device(config)# interface ATM 0/2/0.1 poir	nt-to-point

Device(config-if)# ip mtu 1500

ip multicast route-limit

To limit the number of multicast routes (mroutes) that can be added to a multicast routing table, use the **ip multicast route-limit**command in global configuration mode. To disable this configuration, use the **no** form of this command.

ip multicast route-limit *limit* no ip multicast route-limit *limit*

Syntax Description	<i>limit</i> The number of mroutes that can be added. The range is from 1 to 2147483647. The default is 2147483647.				
Command Default	limit :	limit : 2147483647			
Command Modes	Global	Global configuration			
Command History	Release Modification				
	Cisco	IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.		
Usage Guidelines	The ip multicast route-limit command limits the number of multicast routes that can be added to a router and generates an error message when the limit is exceeded.				
	For usage guidelines, see the Cisco IOS XE ip multicast route-limit command.				
Examples	The following example shows how to set the mroute limit to 200,000:				
	Device	Device(config-transaction)# ip multicast route-limit 200000			

ip name-server

To specify the address of one or more name servers to use for name and address resolution, use the **ip name-server** command in global configuration mode. To remove the addresses specified, use the **no** form of this command.

ip name-server [vrf server-address]
no ip name-server [vrf server-address]

Syntax Description	vrf	Defines a virtual private network's routing and forwarding instance (VRF) table.
	server-address	IPv4 address of a name server.

Command Default No name server addresses are specified.

Command Modes	Global configuration (config)			
Command History	Release	Modification		
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.		
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ip name	me-server command.		
	For backward compatibility of Cisco Catalyst SD-WAN Manager Release 20.12.1 with devices running Cisco IOS XE Catalyst SD-WAN Release 17.11.1a, when using CLI device templates or CLI add on feature templates, use a different form of ip name-server command. If ip name-server command is configured in VRF, use the following form of the command:			
	ip name-server vrf vrf server-ip-list list of DNS servers			
	If ip name-server command is configured in a glo	bal mode, use ip name-server no-vrf list of DNS servers		
Examples	The following example shows how to specify IPv4 host 10.0.0.0 as the name server:			
	Device(config)# ip name-server 10.0.0.0			

ip pim

To enable Protocol Independent Multicast (PIM) on an interface, use the **ip pim** command in interface configuration or virtual network interface configuration mode. To disable PIM on the interface, use the **no** form of this command.

Supported Parameters

sparse-mode Enables sparse mode of operation.

Command History	Release	Modification		
	Cisco IOS XE Catalyst SD-WAN Release 17.5.1aCommand qualified for use in Cisco SD-WAN Manager CLI templates.			
Usage Guidelines	For more information about this command, see the Cisco IOS XE ip pim command.			
Examples	ip pim vrf 1 bsr-candidate GigabitEthe ip pim vrf 1 rp-address 172.16.255.116 ip pim vrf 1 rp-candidate GigabitEther	rnet5 net5 interval 10 priority 5		

ip pim sparse-mode

spt-only

ip pim bsr-candidate

To configure a router to announce its candidacy as a bootstrap router (BSR), use the **ip pim bsr-candidate** command in global configuration mode. To remove this router as a BSR candidate, use the **no** form of this command.

ip pim [**vrf** *vrf-name*] **bsr-candidate** *interface-type interface-number* [*hash-mask-length* [*priority* [**accept-rp-candidate** [*acl-number acl-name*]]]]

no ip pim [**vrf** *vrf*-*name*] **bsr-candidate** *interface-type interface-number* [*hash-mask-length* [*priority* [**accept-rp-candidate** [*acl-number acl-name*]]]]

Syntax Description	vrf vrf-name	(Optional) Configures the router to announce its candidacy as a BSR for the multicast virtual private network's (MVPN) multicast routing and forwarding instance (MVRF) specified for the <i>vrf-name</i> argument.				
	interface-type interface-number	Interface type and number of the router from which the BSR address is derived. This address is sent in BSR messages.				
		Note This interface must be enabled for Protocol-Independent Multicast (PIM) using the ip pim command.				
	hash-mask-length	(Optional) Length of a mask (32 bits maximum) that is to be combined with the group address before the PIMv2 hash function is called. All the groups with the same seed hash correspond to the same rendezvous point (RP). For example, if this value is 24, only the first 24 bits of the group addresses matter. The hash mask length allows one RP to be used for multiple groups. The default hash mask length is 0.				
	priority	(Optional) Priority of the candidate BSR (C-BSR). The range is from 0 to 255. The default priority is 0. The C-BSR with the highest priority value is preferred.				
		Note The Cisco IOS and Cisco IOS XE implementation of PIM BSR uses the value 0 as the default priority for candidate BSRs. This implementation predates RFC 5059, which specifies that 64 be used as the default priority value. The Cisco IOS and Cisco IOS XE implementation, thus, deviates from RFC 5059. To comply with the default priority value specified in the RFC, you must explicitly set the priority value to 64.				
	accept-rp-candidate	(Optional) Specifies that the C-RP candidate is to be filtered.				
	acl-number	(Optional) Number of the access control list (ACL) to be used to filter C-RP advertisements. The range is 100 to 199 for standard ACL numbers and 2000 to 2699 for extended ACLs.				
		Note You must have a valid standard or extended ACL in order to use an ACL in your configuration.				
	acl-name	(Optional) Name of the ACL to be used to filter C-RP advertisements.				
		Note You must have a valid standard or extended ACL in order to use an ACL in your configuration.				

Command Default	The router is not configured to announce itself as a candidate BSR.			
Command Modes	Global configuration (config)			
Command History	Release Modification			
	Cisco IOS XE Catalyst SD-WAN Release 17.5.1a	Command qualified for use in Cisco SD-WAN Manager CLI templates.		
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ip	pim bsr-candidate command.		
Examples The following example shows how to config 0/0 to be a BSR C-RP with a hash mask le		the IP address of a router on GigabitEthernet interface of 0 and a priority of 192:		
	Device(config)# ip pim vrf 1 bsr-candidate GigabitEthernet 0/0 0 192			

10

ip pim rp-address

To statically configure the address of a Protocol Independent Multicast (PIM) rendezvous point (RP) for multicast groups, use the **ip pim rp-address** command in global configuration mode. To remove an RP address, use the **no** form of this command.

1 . 1

DOD

Supported Parameters

vrf vrf-name	(Optional) Specifies that the static group-to-RP mapping be associated with the Multicast Virtual Private Network (MVPN) routing and forwarding (MVRF) instance specified for the <i>vrf-name</i> argument.
rp-address	IP address of the RP to be used for the static group-to-RP mapping. This is a unicast IP address in four-part dotted-decimal notation.

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.5.1a	Command qualified for use in Cisco SD-WAN Manager CLI templates.

Usage Guidelines For more information about this command, see the Cisco IOS XE ip pim rp-address command.

Examples

```
ip pim vrf 1 bsr-candidate GigabitEthernet5
ip pim vrf 1 rp-address 172.16.255.116
ip pim vrf 1 rp-candidate GigabitEthernet5 interval 10 priority 5
ip pim sparse-mode
```

spt-only

ip pim rp-candidate

To configure a router to advertise itself to the bootstrap router (BSR) as a Protocol-Indepedente Multicast (PIM) Version 2 (PIMv2) candidate rendezvous point (C-RP), use the **ip pim rp-candidate** command in global configuration mode. To remove this router as a C-RP, use the **no** form of this command.

ip pim [**vrf** *vrf-name*] **rp-candidate** *interface-type interface-number* [**group-list** *access-list*] [**interval** *seconds*] [**priority** *value*]

no ip pim [vrf vrf-name] rp-candidate

Syntax Description	vrf vrf-name	(Optional) Configure the router to advertise itself to the BSR as PIMv2 C-RP for the multicast virtual private network's (MVPN) multicast routing and forwarding instance (MVRF) specified for the <i>vrf-name</i> argument.				
	interface-type interface-number	IP address associated with this interface type and number to be advertised as a C-RP address.				
	group-list access-list	t access-list (Optional) Specifies the standard IP access list number or name that defines the group refixes that are advertised in association with the RP address. The access list name cannot contain a space or quotation mark, and must begin with an alphabetic character to avoid confusion with numbered access lists.				
		Note You must have a valid standard or extended ACL in order to use an ACL in your configuration.				
	interval seconds	(Optional) Specifies the C-RP advertisement interval, in seconds. The range is from 1 to 16383. The default value is 60.				
	priority value	(Optional) Specifies the priority of the C-RP. The range is from 0 to 255. The default priority value is 0. The BSR C-RP with the lowest priority value is preferred.				
		Note The Cisco IOS and Cisco IOS XE implementation of PIM BSR uses the value 0 as the default priority for candidate RPs. This implementation predates the draft-ietf-pim-sm-bsr IETF draft, the first IETF draft to specify 192 as the default priority value. The Cisco IOS and Cisco IOS XE implementation, thus, deviates from the IETF draft. To comply with the default priority value specified in the draft, you must explicitly set the priority value to 192.				
Command Default	The router is not confi	gured to announce itself to the BSR as a PIMv2 C-RP.				
Command Modes	Global configuration (config)				

Command History	Release	Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.5.1a	Command qualified for use in Cisco SD-WAN Manager CLI templates.	

Usage Guidelines For usage guidelines, see the Cisco IOS XE ip pim rp-candidate command.

Examples

The following example shows how to configure a router to advertise itself as a C-RP to the BSR in its PIM domain. The standard access list number 4 specifies the group prefix associated with the RP that has the address identified by Gigabit Ethernet interface 0/0. That RP is responsible for the groups with the prefix 239.

```
Device (config) # ip pim vrf 1 rp-candidate GigabitEthernet5 interval 10 priority 5
Device (config) # access-list 4 permit 239.0.0.0 0.255.255.255
```

ip prefix-list

To create a prefix list or to add a prefix list entry, use the **ip prefix-list** command in global configuration mode. To delete a prefix list entry, use the **no** form of this command.

ip prefix-list *list-name* **permit** *network / length* **no ip prefix-list** *list-name* **permit** *network / length*

Syntax Descriptionlist-nameName to identify the prefix list. Do not use the words detail or summary as a list na they are keywords in the show ip prefix-list command.permitPermits access for a matching condition.					
					Command Default
Command Modes	Global configuration (config)				
Command History	Release		Modification		
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1r Command qualified for use in Cisco vManage CLI templates.				
Usage Guidelines	For usage g	e guidelines, see the Cisco IOS XE ip prefix-list command.			
Examples	In the following example, a prefix list is configured to permit the default route 10.0.0.0/8:				
	Device(config)# ip prefix-list TEST permit 10.0.0.0/8				

ip redirects

To enable the task of sending Internet Control Message Protocol (ICMP) redirect messages if the software is forced to resend a packet through the same interface on which it was received, use the **ip redirects** command in interface configuration mode. To disable the task of sending redirect messages, use the **no** form of this command.

ip redirects no ip redirects

Syntax Description	This command has no arguments or keywords.			
Command Default	ICMP redirect messages are sent.			
Command Modes	Interface configuration (config-if)			
Command History	Release Modification			
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Qualified for use in Cisco vManage CLI templates.		
Usage Guidelines	For the usage guidelines, see ip redirects.			
Examples	The following example shows how to enable the sending of ICMP redirect messages on GigabitEthernet interface 1:			
	Device(config)# interface GigabitEthernet Device(config-if)# ip redirects	1		
	The following example shows how to disable the s interface 1:	sending of ICMP redirect messages on Tunnel		
	Device(config)# interface Tunnel 1 Device(config-if)# no ip redirects			
ip rcmd				
	To enable the IP remote command (rcmd) option, To disable the IP remote command (rcmd) option,	use the ip rcmd command in global configuration mode use the no form of this command.		

ip ren	nd { do	main-lookup	rcp-enable	rsh-enab	le }
no ip	rcmd {	domain-looki	up rcp-enal	ble rsh-e	nable }

Syntax Description	domain-lookup	Re-enables basic Domain Name System (DNS) security check for Remote Copy Protocol (RCP) and remote shell (rsh).			
	rcp-enable	Allows remote users to copy files to and from the router using RCP.			
	rsh-enable	Allows remote users to execute commands on it using rsh.			
Command Default	Domain-lookup is	enabled.			
	rcp-enable is disabled.				
	rsh-enable is disabled.				
Command Modes	Global configurati	on (config)			
Command History	Release		Modification		
	Cisco IOS XE Ca 17.2.1v	talyst SD-WAN Release	Command qualified for use in Cisco SD-WAN Manager CLI templates.		

Usage Guidelines	The abbreviation RCMD (remote command) is used to indicate both rsh and RCP. DNS lookup for RCMD is enabled by default and is performed as a basic security check. RCP-enable allows a remote user to execute RCP commands on the router. rsh, used as a client process, gives users the ability to remotely get router information, such as status, without the need to connect to the router and then disconnect. RSH-enable enables the router to receive rsh requests from remote users.
Examples	The following example shows how to enable RCP and rsh.
	Device(config)# ip rcmd rcp-enable Device(config)# ip rcmd rsh-enable

ip rcmd rcp-enable

To allow remote users to copy files to and from a router using Remote Copy Protocol (RCP), use the **ip rcmd rcp-enable** command in global configuration mode. To disable RCP on the device, use the **no** form of this command.

ip rcmd rcp-enable no ip rcmd rcp-enable

Syntax Description This command has no arguments or keywords.

Command Default To ensure security, the router is not enabled for RCP by default.

Command Modes Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.

Usage Guidelines For usage guidelines, see the Cisco IOS XE ip rcmd rcp-enable command.

Examples The following example shows how to enable RCP for copying files to and from a router: Device (config) **#ip rcmd rcp-enable**

ip rcmd rsh-enable

To configure a router to allow remote users to execute commands on it using remote shell protocol (rsh), use the **ip rcmd rsh-enable** command in global configuration mode. To disable a router that is enabled for rsh, use the **no** form of this command.

ip rcmd rsh-enable no ip rcmd rsh-enable

Syntax Description

This command has no arguments or keywords.

m

Command Default	To ensure security, the router is not enabled for rsh by default.	
Command Modes	Global configuration (config)	
Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ip rcmd rsh-enable command.	
Examples	The following example shows how to enable a router as an rsh server:	
	Device(config)# ip rcmd rsh-enable	

11 10

. .

1 0 1

ip route vrf

To establish static routes for a virtual private network's routing and forwarding (VRF) instance, use the **ip route vrf** command in global configuration mode. To disable static routes, use the **no** form of this command.

ip route vrf *vrf-name prefix mask* [*interface interface-number*][*next-hop-address* [**tag** *tag*][**track** *number*]]

no ip route vrf *vrf-name prefix mask* [*interface interface-number*][*next-hop-address* [**tag** *tag*][**track** *number*]]

Syntax Description	vrf-name	Name of the VRF for the static route.
	prefix	IP route prefix for the destination, in dotted decimal format.
	mask	Prefix mask for the destination, in dotted decimal format.
	next-hop-address	(Optional) IP address of the next hop (the forwarding router that can be used to reach that network).
	interface	(Optional) Name of network interface to use.
interface-number		(Optional) Number identifying the network interface to use.
	tag tag	(Optional) Specifies the label (tag) value that can be used for controlling redistribution of routes through route maps.
	track number	(Optional) Associates a track object with this route. Valid values for the number argument range from 1 to 500.

Command Default No default behavior or values.

Command Modes Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.
	Cisco IOS XE Catalyst SD-WAN Release 17.3.1a	Additional parameters qualified: prefix mask for destination address, next-hop address, interface type and number, tag.

Usage Guidelines For usage guidelines, see the Cisco IOS XE ip route vrf command.

```
Examples
```

```
Device (config)# ip route vrf 1 192.0.2.1 255.255.255.0 198.51.100.1 track 10
Device (config)# ip route vrf 1 192.0.2.1 255.255.255.0 198.51.100.1 tag 2
Device (config)# ip route vrf 1 192.0.2.1 255.255.255.0 198.51.100.1
Device (config)# ip route vrf 1 192.0.2.1 255.255.255.0 GigabitEthernet2
Device (config)# ip route vrf 1 192.0.2.1 255.255.255.0
```

ip route

To establish a static route, use the **ip route** command in global configuration mode. To remove static routes, use the **no** form of this command.

ip route prefix mask [ip-address | interface-type-interface-number [ip-address] | **Null0** distance] [**tag** tag | **track**]

no ip route prefix mask [ip-address | interface-type-interface-number [ip-address] | **Null0** distance] [**tag** tag | **track**]

Syntax Description	prefix	IP route prefix for the destination.
	mask	Prefix mask for the destination.
	ip-address	IP address of the next hop that can be used to reach the network.
	interface-type interface-number	Network interface type and interface number. Valid values for the <i>number</i> argument range from 1 to 500.
	track	(Optional) Associates a track object with this route.
	tag tag	(Optional) Tag value that can be used as a match value for controlling redistribution through route maps.
	Null0	Specifies null0 as the interface to prevent routing loops.
	distance	(Optional) Administrative distance. The range is 1 to 255. The default administrative distance for a static route is 1.

Command Default No static routes are established.

Command Modes Global configuration (config)

IP Commands

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.
	Cisco IOS XE Catalyst SD-WAN Release 17.3.1a	Additional parameters qualified: next-hop-address, Dialer, tag, track, Null0, distance.
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ip routecommand.	
Examples	The following example shows how to route packets for network 192.0.2.1 to a router at 19	
	ip route 192.0.2.1 255.255.255.0 198.51.	100.1
	<pre>Device(config)# ip route 192.0.2.1 255.255.255.0 198.51.100.1 track <> ip route 192.0.2.1 255.255.0 Dialer2 198.51.100.1 tag <> ip route 192.0.2.1 255.255.0 198.51.100.1 tag <> ip route 192.0.2.1 255.255.255.0 Dialer2 tag <> ip route 192.0.2.1 255.255.255.0 Dialer2 198.51.100.1 <> ip route 192.0.2.1 255.255.255.0 198.51.100.1 <> ip route 192.0.2.1 255.255.255.0 Dialer2 <> ip route 192.0.2.1 255.255.255.0 Dialer2 <> </pre>	

ip source-route

To allow the Cisco IOS software to handle IP datagrams with source-routing header options, use the **ip source-route** command in global configuration mode. To have the software discard any IP datagram containing a source-route option, use the **no** form of this command.

ip source-route no ip source-route

Syntax Description This command has no arguments or keywords.

Command Default Enabled

Command Modes Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.

Examples

The following example shows how to disable the handling of IP datagrams with source-routing header options:

Device(config) # no ip source-route

ip ssh version

To specify the version of Secure Shell (SSH) to be run on a router, use the **ip ssh version**command in global configuration mode. To disable the version of SSH that is configured and to return to compatibility mode, use the **no** form of this command.

ip ssh version 2 no ip ssh version

Syntax Description	2 Router runs only SSH Version 2.		
Command Default	If this command is not configured, SSH operates in compatibility mode, that is, Version 1 and Version 2 are both supported.		
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.	
Usage Guidelines	Use this command with the keyword 2 to ensure that your router will not inadvertently establish a weaker SSH Version 1 connection.		
Examples	The following example shows that SSH Version 2 support is configured: Router (config-transaction) # ip ssh version 2 The following example shows that SSH Version 2 configuration is removed:		
	Router (config-transaction)# no ip ssh version		

ip tcp adjust-mss

To adjust the maximum segment size (MSS) value of TCP synchronize/start (SYN) packets that go through a router, use the **ip tcp adjust-mss** command in interface configuration mode. To return the MSS value to the default setting, use the **no** form of this command.

	ip tcp adjust-mss max-segment-size no ip tcp adjust-mss	
Syntax Description	max-segment-size	Maximum segment size, in bytes. The range is from 500 to 1460.
Command Default	The MSS is determined by the originating host.	

Command Modes	Interface configuration (config-if)		
Command History	Release	Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Qualified for use in Cisco vManage CLI templates.	
Usage Guidelines	For the usage guidelines, see ip tcp adjust-mss.		
Examples	Device(config)# interface GigabitEthernet Device(config-if)# ip tcp adjust-mss 1100	1	

ip tcp mss

To enable a maximum segment size (MSS) for TCP connections originating or terminating on a router, use the **ip tcp mss** command in global configuration mode. To disable the configuration of the MSS, use the no form of this command.

ip tcp mss bytes no ip tcp mss

Syntax Description	<i>bytes</i> Maximum segment size for TCP connections in bytes. Valid values are from 0 to 10000.		
Command Default	This command is disabled.		
Command Modes	Global configuration		
Command History	Release	Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.	
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ip tcp mass command.		
Examples	The following example sets the MSS value at 1200:		

Device(config) # ip tcp mss 1200

ip unnumbered

To enable IP processing on an interface without assigning an explicit IP address to the interface, use the **ip unnumbered** command in interface configuration mode or subinterface configuration mode. To disable the IP processing on the interface, use the **no** form of this command.

ip unnumbered type

L

	no ip unnumbered		
Syntax Description	<i>type</i> Type of interface. For more information, use the question mark (?) online help function.		
Command Default	Unnumbered interfaces are not supported.		
Command Modes	Interface configuration (config-if)		
Command History	Release	Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.	
Jsage Guidelines	For usage guidelines, see the Cisco IOS XE ip unnumbered command.		
Examples	The following example shows how to configure GigabitEthernet 1 as an IP unnumbered interface.		
	Device(config)# interface Tunnel 1 Device(config-if)# ip unnumbered GigabitEt	chernet1	

ip virtual-reassembly

ip virtual-reassemly command is used to enable a virtual packet reassembly on a Cisco IOS XE Catalyst SD-WAN device's interface. Virtual packet reassembly is a mechanism that helps in handling fragmented packets. To disable virtual reassembly, use the no form of this command.

ip virtual-reassembly [max-reassemblies number] [max-fragments number] [timeout seconds] [drop-fragments]

no ip virtual-reassembly [max-reassemblies number] [max-fragments number] [timeout seconds] [drop-fragments]

Syntax Description

max-reassemblies	(Optional) The number specifies the maximum number of IP packet reassemblies that can be held in the reassembly queue.
max-fragments	(Optional) The number specifies the upper limit on the number of fragments that can be created from a single IP packet.
timeout	(Optional) The timeout parameter defines the time window during which all fragments belonging to a particular IP packet are expected to arrive.
drop-fragments	(Optional) The drop-fragments parameter allows you to specify how the router should handle alone fragments that do not belong to any active reassembly process.

Command Default	Disabled; all IP	directed virtual	fragmentation	are dropped.
-----------------	------------------	------------------	---------------	--------------

Command Modes

Interface Configuration (config-if)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.12.1a	Qualified for use in Cisco vManage CLI templates

Example

This example shows how to enable virtual reassemly:

```
Device# config-transaction
Device(config)#interface GigabitEthernet 3
Device(config-if)#ip virtual-reassembly max-reassemblies 3
Device(config-if)#ip virtual-reassembly max-reassemblies 3 max-fragments 60
```

ipv6 access-class

To create or configure an IPv6 access class to restrict incoming or outgoing traffic on a virtual terminal line (VTY), use the **ipv6 access-class** command. To remove the access class, use the **no** form of this command

ipv6 access-class access-list-name

no ipv6 access-class

Syntax Description				
Syntax Description	<i>access-list-name</i> Name of the IPv6 ACL class. The name can be a maximum of 64 characters. The name can contain characters, numbers, hyphens, and underscores. The name cannot contain a space or quotation mark.			
Command Default	None			
Command Modes	Line configuration mode (config-line)			
Command History	Release		Modification	
	Cisco IOS XE Ca	talyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.	
Usage Guidelines	For usage guidelir	nes, see the Cisco IOS XE ipv6	access-class command.	
Examples	This example shows how to configure an access class on a VTY line:			
	Device(config)# line vty 0 4 Device(config-line)# ipv6 access-class TEST			

ipv6 address

To configure an IPv6 address and enable IPv6 processing on an interface, use the **ipv6 address** command in interface configuration mode. To remove the address from the interface, use the **no** form of this command.

ipv6 address *ipv6-address* no ipv6 address *ipv6-address*

Syntax Description	ipv6-address	The IPv6 address to be used.			
Command Default	No IPv6 addres	No IPv6 addresses are defined for any interface.			
Command Modes	Interface configuration (config-if)				
Command History	Release		Modification		
	Cisco IOS XE	Catalyst SD-WAN Release 17.2.1v	Qualified for use in Cisco vManage CLI templates.		
Usage Guidelines	For the usage g	guidelines, see the Cisco IOS ipv6 a	ddress command.		
Examples	Device(config Device(config	g)# interface GigabitEthernet g-if)# ipv6 address 2001:DB8::	1.101		

ipv6 address autoconfig

To enable automatic configuration of IPv6 addresses using stateless autoconfiguration on an interface and enable IPv6 processing on the interface, use the **ipv6 address autoconfig** command in interface configuration mode. To remove the address from the interface, use the **no** form of this command.

Command History	Release	Modification			
	Cisco IOS XE Catalyst SD-WAN Release 17.7.1a This command was introduced.				
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ipv6 address autoconfig command.				
Examples	The following example assigns the IPv6 address automatically:				
	Device(config)# interface ethernet 0 Device(config-if)# ipv6 address autoconfig				

ipv6 address dhcp client request

To configure an IPv6 client to request a vendor-specific option from a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server, use the **ipv6 address dhcp client request** command in interface configuration mode. To remove the request, use the **no** form of this command.

Cisco IOS XE Catalyst SD-WAN Release 17.7.1a This command was intro		Nodification	Release	Command History
Cisco 105 All Cutaryst of White Release 17.7.14 Time commune was made	duced.	This command was introduc	Cisco IOS XE Catalyst SD-WAN Release 17.7.1a	

Usage Guidelines For usage guidelines, see the Cisco IOS XE ipv6 address dhcp client request command.

Examples

The following example shows how to configure an interface to request vendor-specific options:

```
Device(config)# interface fastethernet 0/0
Device(config-if)# ipv6 address dhcp client request vendor
```

ipv6 cef load-sharing algorithm

To select a Cisco Express Forwarding load-balancing algorithm for IPv6, use the **ipv6 cef load-sharing algorithm** command in global configuration mode. To return to the default universal load-balancing algorithm, use the **no** form of this command.

ipv6 cef load-sharing algorithm { universal [id] | include-ports [source [id] | destination [id]
] | src-only [id] }

no ipv6 cef load-sharing algorithm

universal[id]	Sets the load-balancing algorithm to the universal algorithm that uses a source and destination IP. (This is set as default).
id	(Optional) Fixed identifier.
include-ports{source[id] destination[id]}	Sets the load-balancing algorithm to one that uses the source port and destination port.
src-only [id]	Sets the load-balancing algorithm to include source-only port.

Command Default

efault The universal load-balancing algorithm is selected. If you do not configure the fixed identifier for a load-balancing algorithm, the router automatically generates a unique ID.

Command Modes Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.6.1a	This command was introduced.

	Release	Modification			
	Cisco IOS XE Catalyst SD-WAN Release 17.8.1a	This command was modified. The src-only algorithm is added.			
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ipv6 cef lo	oad-sharing algorithm command.			
	You can enable ECMP keying to send the configuration	ons for both IPv4 and IPv6.			
Examples	The following example shows how to enable the IPv6 CEF load-balancing algorithm for universal:				
	Device# config-transaction Device (config-if)# ipv6 cef load-sharing algorithm universal				
	The following example shows how to enable the IPv6 CEF load-sharing algorithm for include-ports:				
	Device# config-transaction Device(config) # ipv6 cef load-sharing algorithm include-ports source destination				
	The following example shows how to enable IPv6 CEF load-sharing algorithm to src-only port algorithm:				
	Device# config-transaction Device(config)# ipv6 cef load-sharing algorithm src-only				
	Device(config)# commit				

ipv6 dhcp client pd

To enable the Dynamic Host Configuration Protocol (DHCP) for IPv6 client process and enable request for prefix delegation through a specified interface, use the **ipv6 dhcp client pd** command in interface configuration mode. To disable requests for prefix delegation, use the **no** form of this command.

Command History	listory Release Modification				
	Cisco IOS XE Catalyst SD-WAN Release 17.7.1a	This command was introduced.			
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ipv6 dhcp client pd command.				
Examples	The following example enables prefix delegation: Device(config-if)# ipv6 dhcp client pd dhcp-prefix				
The following example configures a hint for prefix-delegating routers: Device(config-if)# ipv6 dhcp client pd hint 2001:0DB8:1/48					

ipv6 dhcp client vendor-class

By default the DHCP client carries PID (Product ID) of the device in option-16. This default behaviour can be overridden by configuring below CLI:

ipv6 dhcp client vendor-class [mac-address | ascii | hex | disable]

Syntax Description	mac-address	The mac address of the device.			
	ascii	The user defined string in ascii format.			
	hex	The user defined string in hexadecin	mal format.		
	disable	Disables sending option-16 to DHCI	P messages.		
Command Default	By default option	on-16 carries PID of the device.			
Command Modes	- Interface config	guration (config-if)			
Command History	Release		Modificatio	on]
	Cisco IOS XE	Catalyst SD-WAN Release 17.10.1a	This comma	and was introduced.	
Usage Guidelines	By default the I by configuring	DHCP client carries PID of the devic the ipv6 dhcp client vendor-class co	e in option-1 ommand.	6. This default beha	aviour can be overridden
Examples	The following example shows the configuration to override the decive PID with MAC address:				
	interface GigabitEthernet 0/0/0 ipv6 address dhcp ipv6 dhcp client vendor-class mac-address !				
	The DHCPv6 vendor-class option, overrides the Device PID with MAC Address.				
	The following example shows the configuration to override the device PID with user defined string in hex or in ascii format:				
	interface GigabitEthernet 0/0/0 ipv6 address dhcp ipv6 dhcp client vendor-class hex aabbcc !				
	interface Gig ipv6 addr ipv6 dhcp !	abitEthernet 0/0/0 ess dhcp o client vendor-class ascii ciso	co		

The following example shows the configuration to disable option-16 in DHCP messages:

```
interface GigabitEthernet 0/0/0
    ipv6 address dhcp
    ipv6 dhcp client vendor-class disable
   !
```

ipv6 dhcp pool

To configure a Dynamic Host Configuration Protocol (DHCP) for IPv6 server configuration information pool and enter DHCP for IPv6 pool configuration mode, use the **ipv6 dhcp pool** command in global configuration mode. To delete a DHCP for IPv6 pool, use the **no** form of this command.

Command History	Release	Modification		
	Cisco IOS XE Catalyst SD-WAN Release 17.7.1a	This command was introduced.		
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ipv6 d	hcp pool command.		
Examples	The following example specifies a DHCP for IPv6 of places the router in DHCP for IPv6 pool configura	configuration information pool nation mode:	amed cisco1 and	
	Device(config)# ipv6 dhcp pool cisco1 Device(config-dhcpv6)#			
	The following example shows how to configure an pool cisco1:	IPv6 address prefix for the IPv6	configuration	
	Device(config-dhcpv6)# address prefix 2001:1000:::0/64			
	The following example shows how to configure a pool named engineering with three link-ac prefixes and an IPv6 address prefix:		ee link-address	
	Device(config)#ipv6 dhcp pool engineering Device(config-dhcpv6)# link-address 2001:1001::0/64 Device(config-dhcpv6)# link-address 2001:1002::0/64 Device(config-dhcpv6)# Device(config-dhcpv6)# address prefix 2001:1003::0/64			
	The following example shows how to configure a pool named 350 with vendor-specific options:			
	Device(config)# ipv6 dhcp pool 350 Device(config-dhcpv6)# vendor-specific 9 Device(config-dhcpv6-vs)# suboption 1 addr Device(config-dhcpv6-vs)# suboption 2 asci	ess 1000:235D::1 i "IP-Phone"		

ipv6 dhcp relay destination

To specify a destination address to which client messages are forwarded and to enable Dynamic Host Configuration Protocol (DHCP) for IPv6 relay service on the interface, use the **ipv6 dhcp relay destination** command in interface configuration mode. To remove a relay destination on the interface or to delete an output interface for a destination, use the **no** form of this command.

Command History	Release	Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.7.1a	This command was introduced.	
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ipv6 d	hcp relay destination command.	
Examples	The following example sets the relay destination address on Ethernet interface 4/3:		
	Device(config-if)# ipv6 dhcp relay destination FE80::250:A2FF:FEBF:A056 ethernet 4/3		
	The following example shows how to set the relay on a Cisco CMTS router:	destination address on the Ether	net interface 4/3
	Device(config-if)# ipv6 dhcp relay destina ethernet 4/3	tion 2001:db8:1234:5678:9ab	c:def1:2345:6789

ipv6 dhcp-relay option vpn

To enable the DHCP for IPv6 relay VRF-aware feature, use the **ipv6 dhcp-relay option vpn** command in global configuration mode. To disable the feature, use the **no** form of this command.

Command History	Release	Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.7.1a	This command was introduced.	
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ipv6 dhcp-relay option vpn command.		
Examples	The following example enables the DHCPv6 relay	VRF-aware feature globally on	the router:
	Device(config)# ipv6 dhcp-relay option vpn		

ipv6 dhcp server

To enable Dynamic Host Configuration Protocol (DHCP) for IPv6 service on an interface, use the **ipv6 dhcp server** in interface configuration mode. To disable DHCP for IPv6 service on an interface, use the **no** form of this command.

Command History	Release Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.7.1a	This command was introduced.
Usage Guidelines	For usage guidelines, see the Cisco IOS XE ipv6 d	hcp server command.
Examples	The following example enables DHCP for IPv6 for the local prefix pool named server	

Device(config-if)# ipv6 dhcp server server1

ipv6 enable

To enable IPv6 processing on an interface that has not been configured with an explicit IPv6 address, use the **ipv6 enable**command in interface configuration mode. To disable IPv6 processing on an interface that has not been configured with an explicit IPv6 address, use the **no** form of this command.

ipv6 enable no ipv6 enable

Syntax Description This command has no arguments or keywords.

Command Default IPv6 is disabled.

Command Modes

Interface configuration (config-if)

Command History	Release	Modification
	Cisco IOS XE Release Amsterdam 17.2.1v	Qualified for use in Cisco vManage CLI templates.

Usage Guidelines The **ipv6 enable**command automatically configures an IPv6 link-local unicast address on the interface while also enabling the interface for IPv6 processing. The no **ipv6 enable**command does not disable IPv6 processing on an interface that is configured with an explicit IPv6 address.

Examples

Device(config)# interface GigabitEthernet 1.101
Device(config-if)# ipv6 enable

ipv6 load-sharing algorithm

To enable load balancing algorithm on an interface for IPv6, use the **ipv6 load-sharing algorithm** command in Cisco Catalyst SD-WAN configuration mode. To disable load balancing algorithm on an interface, use the **no** form of this command.

ipv6 load-sharing algorithm { ip-and-ports | src-dst-ip | src-ip-only }
no ipv6 load-sharing algorithm { ip-and-ports | src-dst-ip | src-ip-only }

ip-and-ports	Sets the load-balancing algorithm to the include-ports algorithm that uses Layer 4 source and destination ports.
src-dst-ip	Sets the load-balancing algorithm to the src-dst-ip algorithm that uses a source and destination ip.
src-ip-only	Sets the load-balancing algorithm to the src-ip algorithm that uses source ip.

Command Default src-dst-ip algorithm is enabled by default.

Command Modes SD-WAN configuration (config-sdwan)

	Release	Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.8.1a	This command was introduced.	
Usage Guidelines	When the load-balancing algorithm is set to src-dst-ip mode, each router on the network can make a different load sharing decision for each source-destination address pair.		
	The ip-and-ports algorithm allows you to use the Lay load-balancing decision. This method benefits traffic loadshared because the majority of the traffic is betwee as Real-Time Protocol (RTP) streams.	er 4 source and destination ports as part of the streams running over equal-cost paths that are not een peer addresses that use different port numbers, such	
Examples	The following example shows how to enable load-balancing algorithm for source, destination ip and port:		
	Device(config)# sdwan Device(config-sdwan)# ipv6 load-sharing algo :	rithm ip-and-ports	
	The following example shows how to enable load bal	lancing algorithm for source, destination ip:	
	Device(config)# sdwan Device(config-sdwan)# ipv6 load-sharing algo :	rithm src-dst-ip	
	The following example shows how to enable load bal	lancing algorithm for source ip only:	
	Device(config)# sdwan Device(config-sdwan)# ipv6 load-sharing algo :	rithm src-ip-only	

ipv6 nd other-config-flag

To set the "other stateful configuration" flag in IPv6 router advertisements, use the **ipv6 nd other-config-flag** command in interface configuration mode. To clear the flag from IPv6 router advertisements, use the **no** form of this command.

ipv6 nd other-config-flag no ipv6 nd other-config-flag

Command Default	None		
Command Modes	interface configuration (config-if)		
Command History	Release	Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco SD-WAN Manager CLI templates.	
Usage Guidelines	The setting of the "other stateful configuration how they can obtain autoconfiguration inform should use stateful autoconfiguration to obtain	" flag in IPv6 router advertisements indicates to attached hosts ation other than addresses. If the flag is set, the attached hosts in the other (nonaddress) information.	

Example

The following example configures the "other stateful configuration" flag in ipv6 router advertisements on GigabitEthernet 0/0/2.

```
Device(config) # interface GigabitEthernet 0/0/2
Device(config-if) # ipv6 nd other-config-flag
```

Table 3: Related Commands

Command	Description
ipv6 nd managed-config-flag	Sets the "managed address configuration" flag in ipv6 router advertisements.

ipv6 nd prefix

To configure ipv6 prefixes that are included in IPv6 neighbor discovery router advertisements, use the **ipv6 nd prefix** command in interface configuration mode. To remove the prefixes, use the **no** form of this command.

ipv6 nd prefix ipv6-prefix /prefix-length [no-advertise] no ipv6 nd prefix ipv6-prefix /prefix-length [no-advertise]

Syntax Description	ipv6-prefix	Specifies the ipv6 network number to include the router advertisements (RA).		
	/ prefix-length	ix-length Specifies the length of the ipv6 prefix.		
	no-advertise	(Optional) specifies that the	prefix is not advertised.	
Command Default	All prefixes cont lifetime of 2,592	figured on interfaces that originate IPv6 router advertisements are advertised with a valid 2,000 seconds (30 days) and a preferred lifetime of 604,800 seconds (7 days).		
Command Modes	Interface configuration (config-if)			
Command History	Release		Modification	
	Cisco IOS XE C 17.2.1v	Catalyst SD-WAN Release	Command qualified for use in Cisco SD-WAN Manager CLI templates.	
Usage Guidelines	The ipv6 nd pre prefix should be	fix command allows control advertised or not.	over individual parameters per prefix, including whether the	
Example				
	The following example includes the ipv6 prefix 2001:0DB8::/35 in router advertisements sent out GigabitEthernet 0/0/2. Device (config) # interface GigabitEthernet 0/0/2 Device (config-if) # ipv6 nd prefix 2001:0DB8::/35		x 2001:0DB8::/35 in router advertisements sent out	

ipv6 nd ra suppress

To suppress IPv6 router advertisement transmissions on an interface, use the **ipv6 nd ra suppress** command in interface configuration mode. To reenable the sending of IPv6 router advertisement transmissions on an interface, use the **no** form of this command.

ipv6 nd ra suppress [all] no ipv6 nd ra suppress [all]

Syntax Description all (optional) suppress all router advertisements (RAs) on an interface.

Command Default IPv6 router advertisements are automatically sent on Ethernet and FDDI interfaces if IPv6 unicast routing is enabled on the interfaces. IPv6 router advertisements are not sent on other types of interfaces.

Command Modes Interface configuration (config-if)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco SD-WAN Manager CLI templates.

Usage Guidelines The **ipv6 nd ra suppress** command only suppresses periodic unsolicited RAs. It does not suppress RAs sent in response to a router solicitation. To suppress all RAs, including those sent in response to a router solicitation, use the **ipv6 nd ra suppress** command with the all keyword.

Example

The following example shows how to suppress IPv6 router advertisements on interface GigabitEthernet 0/0/2.

Device(config) # interface GigabitEthernet 0/0/2
Device(config-if) # ipv6 nd ra suppress

Table 4: Related Commands

Command	Description
show ipv6 interface	Displays the usability status of interfaces configured for IPv6.

ipv6 nd router-preference

To configure a default router preference (DRP) for the router on a specific interface, use the **ipv6 nd router-preference** command in interface configuration mode. To return to the default DRP, use the **no** form of this command.

ipv6 nd router-preference { *high* | *medium* | *low* }

L

	no ipv6 nd router-preference { <i>high</i> <i>medium</i> <i>low</i> }		
Syntax Description	high	<i>high</i> Preference for the router specified on an interface is high.	
	<i>medium</i> Preference for the router specified on an interface is medium.		on an interface is medium.
	low	Preference for the router specified	on an interface is low.
Command Default	Router A	dvertisements (RAs) are sent with the	e medium preference.
Command Modes	Interface	configuration (config-if)	
Command History	Release		Modification
	Cisco IO 17.2.1v	S XE Catalyst SD-WAN Release	Command qualified for use in Cisco SD-WAN Manager CLI templates.
Usage Guidelines	Router Ad If no DRI for examp that hosts	dvertisement messages are sent with th P is configured, Router Advertisemer ole, two routers on a link may provide should prefer one of the routers.	e DRP configured by the ipv6 nd router-preference command. Its are sent with a medium preference. A DRP is useful when, equivalent, but not equal-cost, routing, and policy may dictate
	Example		

The following example configures a DRP of high for the router on GigabitEthernet 0/0/2.

Device(config) # interface GigabitEthernet 0/0/2
Device(config-if) # ipv6 nd router-preference High

ipv6 redirects

To enable the sending of Internet Control Message Protocol (ICMP) IPv6 redirect messages if Cisco IOS software is forced to resend a packet through the same interface on which the packet was received, use the **ipv6 redirects** command in interface configuration mode. To disable the sending of redirect messages, use the **no** form of this command.

	ipv6 redirects no ipv6 redirects	
Syntax Description	This command has no arguments or keywords.	
Command Default	The sending of ICMP IPv6 redirect messages is er	abled.
Command Modes	Interface configuration (config-if)	
Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.

Usage Guidelines Examples	The following example disa	bles the sending of ICMP IPv6 redirect messages on Tunnel interface 1:
	Device(config)# interfa Device(config-if)# ipv6 Device(config-if)# no i j	ce Tunnel 1 unnumbered GigabitEthernet0/2.101 pv6 redirects
Related Commands	Command	Description

ipv6 route

To establish static IPv6 routes, use the **ipv6 route**command in global configuration mode. To remove a previously configured static route, use the **no** form of this command.

Configures the interval for IPv6 ICMP error messages.

ipv6 route vrf vrf-name ipv6-prefix/prefix-length
no ipv6 route vrf vrf-name ipv6-prefix/prefix-length

ipv6 icmp error-interval

Syntax Description	ipv6-prefix	The IPv6 network that is the destination of the static route. Can also be a host name when static host routes are configured.			
	/ prefix-length	The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.			
	vrf vrf-name	rf vrf-nameSpecifies all virtual private network (VPN) routing/forwarding instance (VRF) tables or a specific VRF table for an IPv6 address.			
Command Default	No static routes are established.				
Command Modes	- Global configurat	ion			
Command History	Release		Modification		
	Cisco IOS XE Ca	atalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.		
Usage Guidelines	For usage guideli	nes, see the Cisco IOS XE ipv6	route command.		
Examples	The following exa	ample configures a static route for	or use in a VRF for IPv6:		

ipv6 route vrf TEST 2001:DB8::/32

I

ipv6-strict-control

To configure IPv6 as a default option on Cisco IOS XE Catalyst SD-WAN devices, Cisco SD-WAN Manager, and Cisco Catalyst SD-WAN Controller, use the **ipv6-strict-control** command in system configuration mode. To remove the option from the interface, use the **no** form of this command.

ipv6-strict-control { true | false }
no ipv6-strict-control

Syntax Description	<i>true</i> Enables IPv6 as the default connection option for connecting to Cisco SD-WAN Manager, Cisco Catalyst SD-WAN Controller, and Cisco IOS XE Catalyst SD-WAN devices.			
Command Default	An IPv4 connection is defined for an interface.			
Command Modes	System configuration (config-system)			
Command History	Release Modification			
	Cisco IOS XE Catalyst SD-WAN Release 17.10.1a	Qualified for use in Cisco SD-WAN Manager CLI templates.		
Examples	The following example shows how to configure IPv6 as a default connection option on a Cisco IOS XE Catalyst SD-WAN device to connect to Cisco SD-WAN Manager and Cisco Catalyst SD-WAN Controller:			
	Device(config-system)# gps-location latitude 32.0			
	Device(config-system)# gps-location longitude -100.0			
	Device(config-system)# system-ip 10.16.255.14			
	Device(config-system)# domain-id 1			
	Device(config-system)# site-id 400			
	Device(config-system)# ipv6-strict-control true			
	Device(config-system)# admin-tech-on-failure			
	Device(config-system)# organization-name "Cisco"			
	Device(config-system)# vbond vbond			

ipv6 unnumbered

To enable IPv6 processing on an interface without assigning an explicit IPv6 address to the interface, use the **ipv6 unnumbered** command in interface configuration mode. To disable IPv6 on an unnumbered interface, use the **no** form of this command.

	no ipv6 unnumbered			
Syntax Description	interface-type	The interface type of the source address that the unnumbered interface uses in the IPv6 packets that it originates. The source address cannot be another unnumbered interface.		
	interface-number	The interface number of the source address that the unnumbered interface uses in the IPv6 packets that it originates.		
Command Default	This command is disabled.			
Command Modes	- Interface configura	tion (config-if)		
Command History	Release	Modification		
	Cisco IOS XE Cata	alyst SD-WAN Release 17.2.1v Command qualified for use in Cisco vManage CLI templates.		
Usage Guidelines	IPv6 packets that a specified in the ipv <i>interface</i> command the source address	IPv6 packets that are originated from an unnumbered interface use the global IPv6 address of the interface specified in the ipv6 unnumbered command as the source address for the packets. The ipv6 unnumbered <i>interface</i> command is used as a hint when doing source address selection; that is, when trying to determine the source address of an outgoing packet.		
Examples	Device(config)# interface Tunnel 1 Device(config-if)# ipv6 unnumbered GigabitEthernet0/2.101			
lease				
	To configure the duration of the lease for an IP address that is assigned from a Cisco IOS Dynamic Host Configuration Protocol (DHCP) server to a DHCP client, use the lease command in DHCP pool configuration mode. To restore the default value, use the no form of this command. lease <i>days</i> [<i>hours</i> [<i>minutes</i>]] no lease			
Syntax Description	days Specifie	es the duration of the lease in numbers of days.		
	hours (Option can con	al) Specifies the number of hours in the lease. A <i>days</i> value must be supplied before you figure an <i>hours</i> value.		
	<i>minutes</i> (Option be supp	<i>vinutes</i> (Optional) Specifies the number of minutes in the lease. A <i>days</i> value and an <i>hours</i> value must be supplied before you can configure a <i>minutes</i> value.		
	infinite Specifie	es that the duration of the lease is unlimited.		
Command Default	1 day			

inv6 unnumbered interface-type interface-number

Command Modes	DHCP pool configuration (dhcp-config)		
Command History	Release Modification		
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.	
Fxamples			

The following example shows a 365 day lease:

Device (config) # ip dhcp pool POOL1 Device(dhcp-config) # lease 365 0 0

network (DHCP)

To configure the network number and mask for a Dynamic Host Configuration Protocol (DHCP) address pool primary subnet on a DHCP server, use the **network** command in DHCP pool configuration mode. To remove the subnet number and mask, use the **no** form of this command.

network network-number [mask]

Syntax Description	network-number	<i>network-number</i> The IP address of the primary DHCP address pool.		
	mask(Optional) The bit combination that renders which portion of the address of the DHCP address pool refers to the network or subnet and which part refers to the host.			
Command Default	This command is disabled by default.			
Command Modes	DHCP pool configuration (dhcp-config)			
Command History	Release		Modification	
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v		Command qualified for use in Cisco vManage CLI templates.	
Usage Guidelines	For usage guidelines, see the Cisco IOS XE network (DHCP) command.			
Examples	The following example shows how to configure 255.255.255.0 as the subnetwork number and mask of the DHCP pool named pool1.			
	Device(config)# ip dhcp pool pool1 Device(dhcp-config)# network 172.16.0.0 255.255.255.0			

option (DHCP)

To configure DHCP server options, use the **option** command in DHCP pool configuration mode. To remove the options, use the **no** form of this command.

option *code* [**ip** *list-name*] **no option** *code*

Syntax Description	code	Specifies the DHCP option code. The range is from 0 to 254.
	ip address	Specifies an IP address. Up to eight IP addresses can be specified.
	string	Hexadecimal value truncated to 180 characters entered. Each byte in hexadecimal character strings is two hexadecimal digits. Each byte can be separated by a period, colon, or white space.

Command Default The default instance number is 0.

Command Modes DHCP pool configuration (dhcp-config)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.

Examples

The following example shows how to configure DHCP option 150 for an IP list containing two IP addresses.

```
Device (config) # ip dhcp pool POOL1
Device (dhcp-config) # option 150 ip 10.10.10.1 10.10.10.2
```

prefix-delegation

To specify a manually configured numeric prefix to be delegated to a specified client (and optionally a specified identity association for prefix delegation [IAPD] for that client), use the **prefix-delegation** command in DHCP for IPv6 pool configuration mode. To remove the prefix, use the **no** form of this command.

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.7.1a	This command was introduced.
Usage Guidelines	For usage guidelines, see the Cisco IOS XE prefix	-delegation command.
Examples	The following example configures an IAPD for a s	pecified client:
	Device(config) # prefix-delegation 2001:0DB	8::/64 00030001000BBFAA2408

prefix-delegation pool

To specify a named IPv6 local prefix pool from which prefixes are delegated to Dynamic Host Configuration Protocol (DHCP) for IPv6 clients, use the **prefix-delegation pool** command in DHCP for IPv6 pool configuration mode. To remove a named IPv6 local prefix pool, use the **no** form of this command.

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.7.1a	This command was introduced.
Usage Guidelines	For usage guidelines, see the Cisco IOS XE prefix	-delegation pool command.
Examples The following example specifies that prefix requests should be satisfied fr		

The following example specifies that prefix requests should be satisfied from the pool called client-prefix-pool. The prefixes should be delegated with the valid lifetime set to 1800 seconds, and the preferred lifetime is set to 600 seconds:

Device(config)# prefix-delegation pool client-prefix-pool lifetime 1800 600

spt-only

To configure multicast routing in Cisco SD-WAN to use shortest-path first trees (SPT) only, use the **spt-only** command in VRF configuration mode. To disable SPT-only use the **no** form of this command.

spt-only

no spt-only

This command has no keywords or arguments.

Command Default SPT-only is not configured.

Command Modes VRF configuration (config-vrf-<vrf-id>)

Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.5.1a	Command qualified for use in Cisco vManage CLI templates.

Usage Guidelines Enable spt-only on all Cisco IOS XE SD-WAN devices that have Cisco SD-WAN multicast overlay configured for the VRF.

Example

Device(config)# sdwan multicast address-family ipv4 vrf 1
Device(config-vrf-1)# spt-only

vlan internal allocation policy

To configure the allocation direction of the internal VLAN, use the **vlaninternalallocationpolicy** command in global configuration mode. To return the default setting, use the **no** form of this command to return.

vlan internal allocation policy ascending no vlan internal allocation policy

Syntax Description	ascending Allocates internal VLANs from 1006 to 4094.				
Command Default	ascending				
Command Modes	Global configuration (config)				
Command History	Release		Modification		
	Cisco IOS X	E Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco vManage CLI templates.		
Usage Guidelines	For usage guidelines, see the Cisco IOS XE vlan internal allocation policy command.				
Examples					
	Device (config) # vlan internal allocation policy ascending				

vendor-specific

To configures vendor-defined options for the IPv6 address pool, use the **vendor-specific** command in global configuration mode. To disable the feature, use the **no** form of this command.

	vendor-specific vendor-id	
Syntax Description	<i>vendor-id</i> Specify an ID for the vendor.	
Command History	Release	Modification
	Cisco IOS XE Catalyst SD-WAN Release 17.7.1a	This command was introduced.
Examples	The following example configures vendor-defined	options for the IPv6 address pool:
	<pre>Device(config)# vendor-specific 10</pre>	

vrf (DHCP pool)

To associate the on-demand address pool with a VPN routing and forwarding instance (VRF) name, use the **vrf** command in DHCP pool configuration mode. To remove the VRF name, use the **no** form of this command.

vrf name no vrf name

Syntax Description	<i>name</i> Name of the VRF to which the address pool is associated.					
Command Default	No default behavior or values					
Command Modes	DHCP pool configuration (dhcp-config)					
Command History	Release	Modification				
	Cisco IOS XE Catalyst SD-WAN Rel	ease 17.2.1v Command qualified for use in Cisco vManage CLI templates.				
Usage Guidelines	For usage guidelines, see the Cisco IOS XE vrf (DHCP Pool) command.					
Examples	The following example associates the address pool with a VRF named TEST:					
	Device(config)# ip dhcp pool POOL1 Device(dhcp-config)# vrf TEST
