

Cisco Catalyst SD-WAN BFD

Table 1: Feature History

Feature Name	Release Information	Description
Automatically Suspend Unstable Cisco Catalyst SD-WAN BFD Sessions	Cisco IOS XE Catalyst SD-WAN Release 17.10.1a Cisco Catalyst SD-WAN Control Components Release 20.10.1	With this feature, you can automatically suspend an unstable Cisco Catalyst SD-WAN Bidirectional Forwarding Detection (BFD) session based on flap-cycle parameters or on Service-Level Agreement (SLA) parameters. You can also monitor the suspended BFD sessions and manually reset suspended BFD sessions. With this feature, you can automatically suspend an unstable Cisco Catalyst SD-WAN Bidirectional Forwarding Detection (BFD) session based on flap-cycle parameters or on Service-Level Agreement (SLA) parameters.

- Restrictions for Automatically Suspending BFD Sessions, on page 4
- Configure Automatic Suspension of BFD Sessions Using a CLI Template, on page 5
- Verify Automatic Suspension of BFD Sessions, on page 6

Information About Cisco Catalyst SD-WAN BFD

Within Cisco Catalyst SD-WAN, there are the following types of BFD:

Cisco Catalyst SD-WAN BFD

This type of BFD detects failures in the overlay tunnel and has the following characteristics:

- Is enabled by default and cannot be disabled
- Is typically enabled for the Cisco Catalyst SD-WAN Overlay Management Protocol (OMP)
- Besides link failures, Cisco Catalyst SD-WAN BFD also measures latency, loss, jitter, and other link statistics used by application-aware routing

For more information on Cisco Catalyst SD-WAN BFD for measuring latency, loss, and jitter used by application-aware routing, see Application-Aware Routing.

• BFD Support for Routing Protocols in Cisco Catalyst SD-WAN

This type of BFD supports BGP, OSFP, and EIGRP routing protocols in Cisco Catalyst SD-WAN.

For more information on BFD for routing protocols, see BFD for Routing Protocols in Cisco Catalyst SD-WAN.

Information About Automatically Suspending BFD Sessions

Minimum supported releases: Cisco IOS XE Catalyst SD-WAN Release 17.10.1a and Cisco Catalyst SD-WAN Control Components Release 20.10.1

BFD sessions may experience flapping, meaning that the BFD session enters a down state and then returns to an up state. This can occur when one device that is part of the BFD session becomes unavailable and then returns to being available. When a BFD session flaps, applications running on that tunnel are disrupted. The unstable BFD session can be brought up, but due to the unstable connection, the BFD session can quickly become disrupted again. With this feature, you avoid the impact of application traffic getting steered unnecessarily from one overlay path to another path because of an unstable BFD session.

To avoid the cycle of BFD session flaps, Cisco Catalyst SD-WAN provides an automatic suspension mechanism for suspending BFD sessions based on the following parameters:

• Flap cycle

A flap cycle is defined only as the following:

- BFD session is in the up state
- · BFD session is in the down state
- BFD session is coming back up

· SLA threshold

An SLA threshold is the threshold by which the BFD session is added to the suspended list. An SLA threshold is a threshold value for a traffic metric, such as loss, latency, or jitter. If one of these metrics indicates that traffic performance has degraded to a point defined by a threshold, the BFD session state changes to suspended. These thresholds reflect the level of traffic performance specified in the SLA.

Note

An SLA threshold is an optional configuration. If you configure a SLA threshold, configure higher metrics for loss, latency, and jitter, so the SLA threshold does not conflict with the SLA parameters as defined in the SLA classes. For more information on SLA classes, see the Cisco Catalyst SD-WAN Policies Configuration Guide.

Benefits of Automatically Suspending BFD Sessions

- Supports manual removal of the affected circuit or tunnel interface from the BFD suspended list.
- Provides monitoring of a suspended tunnel.

How Automatically Suspending BFD Sessions Works

Minimum supported releases: Cisco IOS XE Catalyst SD-WAN Release 17.10.1a and Cisco Catalyst SD-WAN Control Components Release 20.10.1

Configure the following BFD session parameters using a Cisco SD-WAN Manager device CLI template or a CLI add-on template:

Table 2: BFD Session Flap Cycle and SLA Parameters

Field	Description
enable-lr	Enable last resort upon BFD suspension.
	For more information on enabling a last resort on a tunnel interface, see last-resort-circuit.
duration	Duration of time for which the BFD session remains in the suspended state.
flapping-window	Time frame or window to detect the BFD session flap.
flap-count	Number of BFD session flaps after which the BFD session is suspended. The recommended flap-count is 3.
thresholds	SLA threshold triggering a BFD session to be suspended.

BFD Session Suspension Workflow

If a BFD session exceeds the flap-count value within the configured flapping-window interval, then the BFD session must remain suspended until the configured duration interval.

For a BFD session in the suspended state, the following occurs:

- 1. If a session reflaps or exceeds the threshold parameters defined, the session is moved back to suspended state and the duration is reset again.
- **2.** If the session does not flap and is within the threshold range, the session is automatically removed out of the suspended state after the duration interval expires.
- 3. You can also manually remove suspended BFD sessions by using the **request platform software sdwan auto-suspend reset** command. For more information, see the Cisco IOS XE SD-WAN Qualified Command Reference Guide.

Regular SLA measurement and echo response or path maximum transmission unit (PMTU) control traffic only is sent across the suspended BFD session.

Note	Data traffic is not sent across the overlay network when a BFD session is in the suspended state.
Note	This feature does not manipulate the state of the BFD session.
Note	As the BFD suspension feature is for forward data traffic, you should enable BFD suspension on the remote-end

Restrictions for Automatically Suspending BFD Sessions

node to block the reverse data traffic to avoid dropping data traffic.

Minimum supported releases: Cisco IOS XE Catalyst SD-WAN Release 17.10.1a and Cisco Catalyst SD-WAN Control Components Release 20.10.1

- For a Cisco IOS XE Catalyst SD-WAN device with a single TLOC, automatic suspension of a BFD session may cause BFD sessions to be dropped.
- The last-resort circuit may not work for a single site unless all BFD sessions are down for a tunnel interface. The last-resort circuit is enabled only if all BFD sessions on the non last-resort circuit are suspended or down.
- Cisco SD-WAN Manager feature templates do not support configuration of automatic suspension of BFD sessions.
- Support is provided only for configuring BFD automatic suspension using a device CLI or a CLI add-on template.
- If duplicated traffic is sent on a different BFD session, the duplicated traffic may get routed through a BFD suspended session.

Configure Automatic Suspension of BFD Sessions Using a CLI Template

Minimum supported releases: Cisco IOS XE Catalyst SD-WAN Release 17.10.1a and Cisco Catalyst SD-WAN Control Components Release 20.10.1

For more information about using CLI templates, see CLI Add-On Feature Templates and CLI Templates.

Note

By default, CLI templates execute commands in global config mode.

1. Enable BFD automatic suspension with or without last resort.

```
auto-suspend
enable-lr
auto-suspend
no enable-lr
```

Note

Before enabling last resort for the BFD automatic suspension feature, you must enable the last-resort circuit on a tunnel interface.

For more information on last resort, see last-resort-circuit.

2. Configure the following flap parameters:

```
duration sec
flapping-window sec
flap-count flap-count
```

Note

When using SLA-based BFD automatic suspension, **duration** should be more than the number of the **bfd multiplier** x the **bfd poll interval**. We recommend that you configure BFD automatic suspension duration to be more than 30 minutes.

3. (Optional) Configure SLA parameters.

```
thresholds
color
all
jitter jitter-value
latency latency-value
loss loss-value
!
```

Prior to enabling SLA thresholds, configure BFD session flapping parameters and duration.

Here is a complete configuration example for configuring BFD automatic suspension with last resort enabled.

```
auto-suspend
enable-lr
duration 3600
```

```
flapping-window 300
flap-count 1
thresholds
color
all
latency 10
loss 10
jitter 10
```

Note

If you enable **color all** and a specific **color**, the specific color takes precedence over the **color all** parameter. For more information on BFD colors, see **bfd color**.

Verify Automatic Suspension of BFD Sessions

Minimum supported releases: Cisco IOS XE Catalyst SD-WAN Release 17.10.1a and Cisco Catalyst SD-WAN Control Components Release 20.10.1

The following sample output from the **show sdwan bfd sessions suspend** command displays the total suspend count, indicating the number of times that the BFD session has been suspended:

Device# snow sdwan bid sessions suspend												
		SOURCE TLOC	REMOTE TLOC		DST PUBLIC	DST PUBLIC		RE-SUSPEND	SUSPEND	TOTAL	SUSPEND	
SYSTEM IP	STATE	COLOR	COLOR	SOURCE IP	IP	PORT	ENCAP	COUNT	TIME LEFT	COUNT	DURATION	
172.16.255.14	up	lte	lte	10.1.15.15	10.1.14.14	12426	ipsec	0	0:00:19:52	18	0:00:00:07	

The following columns are added for analyzing BFD session suspension metrics: RE-SUSPEND COUNT, SUSPEND TIME LEFT, TOTAL COUNT, and SUSPEND DURATION.

The following sample output from the **show sdwan bfd sessions alt** command displays if a suspended flag has been added to a BFD session and other BFD session metrics:

Device# show sdwan bfd sessions alt

*Sus = Suspend *NA = Flag Not Set

SYSTEM IP	SITE ID	STATE	COLOR	COLOR	SOURCE IP	IP	PORT	ENCAP	BFD-LD	FLAGS	UPTIME
172.16.255.14	400	up	3g	lte	10.0.20.15	10.1.14.14	12426	ipsec	20004	NA	0:19:30:40
172.16.255.14	400	up	lte	lte	10.1.15.15	10.1.14.14	12426	ipsec	20003	Sus	0:00:02:46
172.16.255.16	600	up	3g	lte	10.0.20.15	10.0.106.1	12366	ipsec	20002	NA	0:19:30:40
172.16.255.16	600	up	lte	lte	10.1.15.15	10.0.106.1	12366	ipsec	20001	NA	0:19:20:14

The following columns are added for BFD suspension: BFD-LD and FLAGS.

Local discriminator (LD) is a unique identifier for all BFD sessions. The value for LD must be a nonzero value. LD is an internal value that Cisco Technical Assistance Center (TAC) uses for troubleshooting BFD sessions.

A BFD session flag, sus, is added for identifying BFD sessions that are suspended.

The following sample output displays the BFD sessions for which the sus flag is added to the BFD session:

Device# show sdwan bfd history

				DST PUBLIC	DST PUBLIC			RX	TX		
SYSTEM IP	SITE ID	COLOR	STATE	IP	PORT	ENCAP	TIME	PKTS	PKTS	DEL	FLAGS
172.16.255.16	600	lte	up	10.0.106.1	12366	ipsec	06/03/22 02:51:06	0	0	0	[]
172.16.255.16	600	lte	up	10.0.106.1	12366	ipsec	06/03/22 02:52:04	153	154	0	[Sus]
172.16.255.16	600	1te	down	10.0.106.1	12366	ipsec	06/03/22 03:00:50	1085	1085	0	[Sus]

The following sample output displays a BFD session summary, including which BFD sessions are up, down, flapped, or that have been suspended:

Device# show sdwan bfd summary sessions-total 4 sessions-up 4

```
sessions-max 4
sessions-flap 4
poll-interval 60000
sessions-up-suspended 1
sessions-down-suspended 0
```

The following fields are added for BFD session suspension: sessions-flap, sessions-up-suspended, and sessions-down-suspended.

Verify Automatic Suspension of BFD Sessions
