

Configuring eStreamer

After you create a client application, you can connect it to the eStreamer server, start the eStreamer service, and begin exchanging data.

Note

An *eStreamer server* is a Defense Center or managed device (version 4.9 or higher) where the eStreamer service is running.

Perform the following tasks to manage eStreamer and client interaction:

1. Enable eStreamer on the eStreamer server.
See [Configuring eStreamer on the eStreamer Server, page 6-1](#) for information about allowing access to the eStreamer server, adding clients, and generating authentication credentials to establish an authenticated connection.
2. If required, manually run the eStreamer service (eStreamer). You can stop, start, and view the status of the service, and use command line options to debug client-server communication.
See [Managing the eStreamer Service, page 6-6](#) for more information.
3. Optionally, to use the eStreamer reference client to troubleshoot a connection or data stream, set up the reference client on the computer where you plan to run your client.
See [Configuring the eStreamer Reference Client, page 6-8](#).

Configuring eStreamer on the eStreamer Server

License: Any

Before the Defense Center or managed device you want to use as an eStreamer server can begin streaming events to a client application, you must configure the eStreamer server to send events to clients, provide information about the client, and generate a set of authentication credentials to use when establishing communication. You can perform all of these tasks from the Defense Center or managed device user interface.

See the following sections for more information:

- [Configuring eStreamer Event Types, page 6-2](#)
- [Adding Authentication for eStreamer Clients, page 6-3](#)
- [Using an Alternate Management Interface with eStreamer, page 6-4](#)

Configuring eStreamer Event Types

License: Any

You can control which types of events the eStreamer server is able to transmit to client applications that request them.

Available event types on a managed device or a Defense Center include:

- Intrusion events
- Intrusion event packet data
- Intrusion event extra data

Available event types on a Defense Center include:

- Discovery events (this also enables connection events)
- Correlation and white list events
- Impact flag alerts
- User activity events
- Malware events
- File events

Note that the primary and secondary in a stacked 3D9900 pair report intrusion events to the Defense Center as if they were separate managed devices. If you configure communication with an eStreamer client on the primary in a 3D9900 stack, you also must configure the client on the secondary; the client configuration is not replicated. Similarly, when you delete the client, delete it in both places. If you configure an eStreamer client for a Defense Center managing 3D9900s in a stack configuration, note that the Defense Center reports all events received from both managed devices, even if the same event is reported by both.

If you configure an eStreamer client on a Defense Center in a high availability configuration, the client configuration is not replicated from the primary Defense Center to the secondary Defense Center.

To configure the types of events captured by eStreamer:

Access: Admin

Step 1 Select **System > Local > Registration**.

Step 2 Click **eStreamer**.

The eStreamer page appears with the **eStreamer Event Configuration** menu.

Step 3 Select the check boxes next to the types of events you want eStreamer to capture and forward to requesting clients. Note that if a check box is currently cleared, that data is not being captured. Clearing a check box does not delete data that has already been captured.

You can select any or all of the following on a Defense Center or managed device:

- **Intrusion Events** to transmit intrusion events generated by managed devices.
- **Intrusion Event Packet Data** to transmit packets associated with intrusion events.
- **Intrusion Event Extra Data** to transmit additional data associated with intrusion events, such as the URI associated with the originating IP address of a client connecting to a web server through an HTTP proxy or load balancer.

You can also select any or all of the following on a Defense Center:

- **Discovery Events** to transmit host discovery events

Note If you want connection events, then you must enable discovery events.

- **Correlation Events** to transmit correlation and white list events.
- **Impact Flag Alerts** to transmit impact alerts generated by the Defense Center.
- **User Activity Events** to transmit user events.
- **Intrusion Event Extra Data** to transmit additional data for intrusion events, such as the URI associated with the originating IP address of a client connecting to a web server through an HTTP proxy or load balancer.

Note Note that this controls which events the eStreamer server can transmit. Your client application must still specifically request the types of events you want it to receive. For more information, see [Request Flags, page 2-11](#).

Step 4 Click **Save**.

Your settings are saved and the events you selected will be forwarded to eStreamer clients when requested.

Adding Authentication for eStreamer Clients

License: Any

Before eStreamer can send events to a client, you must add the client to the eStreamer server's peers database. You must also copy the authentication certificate generated by the eStreamer server to the client.

To add an eStreamer client:

Access: Admin

Step 1 Select **Local > Registration > eStreamer**.

The **eStreamer** page appears.

Step 2 Click **Create Client**.

The Create Client page appears.

Step 3 In the **Hostname** field, enter the host name or IP address of the host running the eStreamer client.

Note If you use a host name, the host input server **must** be able to resolve the host to an IP address. If you have not configured DNS resolution, you should configure it first or use an IP address.

Step 4 To encrypt the certificate file, enter a password in the **Password** field.

Step 5 Click **Save**.

The eStreamer server allows the client computer to access port 8302 on the Defense Center and creates an authentication certificate to use during client-server authentication. The eStreamer Client page re-appears, with the new client listed under **eStreamer Clients**.

- Step 6** Click the download icon () next to the certificate file.
- Step 7** Save the certificate file to the directory used by your client computer for SSL authentication. The client can now connect to the Defense Center.

Tip To revoke access for a client, click the delete icon () next to the host you want to remove. Note that you do not need to restart the host input service on the Defense Center; access is revoked immediately.

Using an Alternate Management Interface with eStreamer

License: Any

By default, eStreamer uses the primary management interface, `eth0`, to stream data to eStreamer clients. You can configure eStreamer to use the any available management interface. This example uses `eth1`, but you can use any available management interface. eStreamer can only use one interface at a time.

To configure eStreamer to use an alternate management interface

Access: Admin (escalated to Root)

- Step 1** Connect the `eth1` interface on the Defense Center to a broadcast domain that is the same domain as the eStreamer clients and not the same domain as the `eth0` interface.

Caution Placing the `eth0` and `eth1` interfaces in the same broadcast domain impacts performance.

- Step 2** Open an SSH connection to the Defense Center.
- Step 3** Log into the Defense Center and type `sudo su` to get root access. If necessary, type your password again when prompted.
- Step 4** Type the command `configure-network -i eth1 enable` to enable the `eth1` interface.
- Step 5** Configure the `eth1` interface using the prompts.
- The following prompt appears:
- ```
Do you wish to configure IPv4? (y or n)
```
- Step 6** Type `y` and press Enter. If you do not type `y`, you will not be prompted to configure IPv4 or IPv6.
- The following prompt appears:
- ```
Management IP address? [10.5.60.199]
```
- Step 7** Type the desired IP address and press Enter.
- The following prompt appears:
- ```
Management netmask? [255.255.0.0]
```
- Step 8** Type the netmask and press Enter.

The following prompt appears:

```
Management default gateway? [10.5.1.1]
```

**Step 9** The default gateway is loaded from the `eth0` interface. You cannot set the default gateway specifically for eStreamer.

**Step 10** Press Enter to accept the default gateway from the `eth0` interface.

The following prompt appears:

```
Are these settings correct? (y or n)
```

**Step 11** Check the settings. If they are correct, type `y` and press Enter.

The following prompt appears:

```
Do you wish to configure IPv6? (y or n)
```

**Step 12** IPv6 is not supported for this feature. Type `n` and press Enter.

The Defense Center confirms that the `eth1` interface is configured:

```
Updated network configuration.
```

**Step 13** After you configure `eth1`, type the command `manage_estreamer.pl` to start the eStreamer configuration utility.

The following menu appears:

```
***** Configuration Utility *****
1 status
2 disable
3 enable
4 restart
5 send IDS events
6 don't send IDS events
7 send Packet Data
8 don't send Packet Data
9 add Client
10 delete Client
11 set EStreamer Interface
0 Exit
```

```

Enter choice:
```

**Step 14** Type choice `11` and press Enter.

**Step 15** Type `eth1` and press Enter.

```

Enter choice: 11
Enter Interface Name% eth1
Reloading EStreamer... at /usr/local/sf/lib/perl/5.10.1/SF/EStreamer.pm line 449.

***** Configuration Utility *****
```

If you have not configured `eth1`, you will receive the warning:

```
IPv4 or IPv6 addresses are not assigned to the interface: eth1..
```

**Step 16** Type `0` and press Enter to exit the script.

At this point, eStreamer sends information out via the `eth1` interface rather than `eth0`.

#### Caution

The script can configure eStreamer to use the `eth1` interface even if the `eth1` interface is not connected. However, eStreamer cannot stream data over the interface unless the eStreamer client is on a host that is reachable from that interface.

**To configure eStreamer to use the primary management interface****Access:** Root

- 
- Step 1** Open an SSH connection to the Defense Center.
- Step 2** Log into the Defense Center.
- Step 3** Type `sudo su` to get root access. If necessary, type your password again when prompted.
- Step 4** Type the command `manage_estreamer.pl` to start the eStreamer configuration utility.

The following menu appears:

```

***** Configuration Utility *****
1 status
2 disable
3 enable
4 restart
5 send IDS events
6 don't send IDS events
7 send Packet Data
8 don't send Packet Data
9 add Client
10 delete Client
11 set EStreamer Interface
0 Exit

Enter choice:

```

- Step 5** Type 11 and press Enter.
- Step 6** Type `eth0` and press Enter.
- ```

Reloading EStreamer... at /usr/local/sf/lib/perl/5.10.1/SF/EStreamer.pm line 449.
***** Configuration Utility *****

```
- Step 7** Type 0 and press Enter to exit the script.
- Step 8** Type the command `configure-network -i eth1 disable` to disable the `eth1` interface.
-

Managing the eStreamer Service

License: Any

You can manage the eStreamer service from the user interface. However, you can also use the command line to start and stop the service. The following sections describe eStreamer command line options:

- [Starting and Stopping the eStreamer Service, page 6-7](#) describes how to start and stop the eStreamer service.
- [eStreamer Service Options, page 6-7](#) describes the command line options available for the eStreamer service and how to use them.

Starting and Stopping the eStreamer Service

License: Any

You can manage the eStreamer service using the `manage_estreamer.pl` script, which allows you to start, stop, reload, and restart the service.

Tip

You can also add command line options to the eStreamer initialization script. See [eStreamer Service Options, page 6-7](#) for more information.

The following table describes the options in the `manage_estreamer.pl` script you can use on the Defense Center or managed device.

Table 6-1 eStreamer Management Options

Option	Description	Select option Number...
enable	Starts the service.	3
disable	Stops the service.	2
restart	Restarts the service.	4
status	Indicates whether the service is running.	1

eStreamer Service Options

License: Any

eStreamer provides many service options that allow you to troubleshoot the service. You can use the options described in the following table with the eStreamer service.

Table 6-2 eStreamer Service Options

Option	Description
<code>--debug</code>	Runs eStreamer with debug-level logging. Errors are saved in the syslog and (when used in conjunction with <code>--nodaemon</code>) appear on screen.
<code>--nodaemon</code>	Runs eStreamer as a foreground process. Errors appear on-screen.
<code>--nohostcheck</code>	Runs eStreamer with host name checking disabled. That is, if the client host name does not match the host name contained in the <code>subjectAltName:dNSName</code> entry in the client certificate, access is still allowed. The <code>nohostcheck</code> option is useful in cases where the network DNS and/or NAT configuration prevent the host name check from succeeding. Note that all other security checks are performed.
	 <p>Caution Enabling this option can negatively affect the security of your system.</p>

Use the above options by first stopping the eStreamer service, then running it with the options you want, and finally restarting the service. For example, you can follow the instructions provided in [Running the eStreamer Service in Debug Mode, page 6-8](#) to debug eStreamer functionality.

Running the eStreamer Service in Debug Mode

License: Any

You can run the eStreamer service in debug mode to view each status message the service generates on your terminal screen. Use the following procedure to do debugging.

To run the eStreamer service in debug mode:

Access: Admin

-
- Step 1** Log into the Defense Center or managed device using SSH.
- Step 2** Use `manage_estreamer.pl` and select option 2 to stop the eStreamer service.
- Step 3** Use `./usr/local/sf/bin/sfestreamer --nodaemon --debug` to restart the eStreamer service in debug mode.
- Status messages for the service appear on the terminal screen.
- Step 4** When you are finished debugging, restart the service in normal mode by using `manage_estreamer.pl` and selecting option 4.
-

Configuring the eStreamer Reference Client

The *reference client* provided with the eStreamer SDK is a set of sample client scripts and Perl modules included to illustrate how the eStreamer API can be used. You can run them to familiarize yourself with eStreamer output, or you can use them to debug problems with installations of your custom-built client.

For more information on setting up the reference client, see the following sections:

- [Setting Up the eStreamer Perl Reference Client, page 6-8](#)
- [Running the eStreamer Perl Reference Client, page 6-13](#)

Setting Up the eStreamer Perl Reference Client

To use the eStreamer Perl reference client, you must first configure the sample scripts to fit your environment and requirements.

For more information, see the following sections:

- [Understanding the eStreamer Perl Reference Client, page 6-9](#)
- [Configuring Communications for the eStreamer Reference Client, page 6-9](#)
- [Loading General Prerequisites for the Perl Reference Client, page 6-10](#)
- [Loading Prerequisites for the Perl SNMP Reference Client, page 6-10](#)
- [Understanding the Data Requested by a Test Script, page 6-10](#)
- [Modifying the Type of Data Requested by a Test Script, page 6-11](#)
- [Creating a Certificate for the Perl Reference Client, page 6-13](#)

Understanding the eStreamer Perl Reference Client

You can download the `eStreamerSDK.zip` package, which contains the eStreamer Perl reference client, from the [Cisco support site](#). The following files are included in the `eStreamerSDK.zip` package:

- `SF_CUSTOM_ALERT.MIB`
This MIB file is used by the `snmp.pm` file to set up traps for SNMP.
- `SFRecords.pm`
This Perl module contains definitions of discovery message record blocks.
- `SFStreamer.pm`
This Perl module contains the functions called by the Perl clients.
- `SFPkcs12.pm`
This Perl module parses the client certificate and allows the client to connect to the eStreamer server.
- `SFRNABlocks.pm`
This Perl module contains definitions of discovery data blocks.
- `ssl_test.pl`
You can use this Perl script to test an intrusion event request over an SSL connection.
- `OutputPlugins/csv.pm`
This Perl module prints intrusion events to a comma-separated value (CSV) format.
- `OutputPlugins/print.pm`
This Perl module prints events to a human-readable format.
- `OutputPlugins/snmp.pm`
This Perl module sends events to the specified SNMP server.
- `OutputPlugins/pcap.pm`
This Perl module stores packet captures as a pcap file.
- `OutputPlugins/syslog.pm`
This Perl module sends events to the local syslog server.

Configuring Communications for the eStreamer Reference Client

The reference client uses the Secure Sockets Layer (SSL) for data communication. You must install OpenSSL on the computer you plan to use as a client and configure it appropriately for your environment.

**Note**

For initial installations on Linux operating systems, you must install the `libssl-dev` component as part of this download.

To set up SSL on your client:

- Step 1** Download OpenSSL from <http://openssl.org/source/>.
- Step 2** Unpack the source to `/usr/local/src`.
- Step 3** Configure the source by running the `Configure` script.

Step 4 Make and install the compiled source.

Loading General Prerequisites for the Perl Reference Client

Before you can run the eStreamer Perl reference client, you must install the `IO::Socket::SSL` Perl module on the client computer. You can install the module manually or use `cpan` to do so.

Note

If the `Net::SSLLeay` module is not installed on the client computer, install that module as well. `Net::SSLLeay` is required for communication with OpenSSL.

You also must install and configure OpenSSL to support an SSL connection to the eStreamer server. For more information, see [Configuring Communications for the eStreamer Reference Client, page 6-9](#).

Loading Prerequisites for the Perl SNMP Reference Client

Before you can run the eStreamer SNMP module of the Perl reference client, you must install the latest `net-snmp` Perl modules available for the client operating system on the client computer.

Downloading and Unpacking the Perl Reference Client

You can download the `EventStreamerSDK.zip` file that contains the eStreamer Perl reference client the [Cisco support site](#).

Unpack the zip file to a computer running the Linux operating system, where you plan to run the client.

Understanding the Data Requested by a Test Script

By default, when you use the `ssl_test -o` setting in the reference client, you request data as indicated in the following table.

Table 6-3 Default Requests Made by Output Plugins

This syntax...	Calls plugin...	And sends...	To request the following data...
<code>./ssl_test.pl eStreamerServerName -h HostIPAddresses</code>	N/A	Host request, message type 5, with bit 11 set to 1	Host data (see Host Data and Multiple Host Data Message Format, page 2-27)
<code>./ssl_test.pl eStreamerServerName -o print -f TextFile</code>	OutputPlugins/pri nt.pm	Event stream request, message type 2, with bits 2 and 20-24 set to 1	Event data (see Event Stream Request Message Format, page 2-10 , Correlation Policy Record, page 3-18 , Correlation Rule Record, page 3-20 , Metadata for Discovery Events, page 4-6 , Host Discovery Structures by Event Type, page 4-36 , and User Data Structures by Event Type, page 4-54) eStreamer transmits type 1 intrusion events because bit 2 is set on the event stream request.

Table 6-3 Default Requests Made by Output Plugins (continued)

This syntax...	Calls plugin...	And sends...	To request the following data...
<code>./ssl_test.pl eStreamerServerName -o pcap -f TargetPCAPFile</code>	OutputPlugins/ pcap.pm	Event stream request, message type 2, with bits 0 and 23 set to 1	Packet data (see Event Data Message Format, page 2-17 and Packet Record 4.8.0.2+, page 3-4) eStreamer transmits only packet data because bit 0 is set on the event stream request.
<code>./ssl_test.pl eStreamerServerName -o csv -f CSVFile</code>	OutputPlugins/ csv.pm	Event stream request, message type 2, with bits 2 and 23 set to 1	Intrusion event data (see Event Data Message Format, page 2-17 and Intrusion Event Record 5.3.1+, page 3-6) eStreamer transmits type 1 intrusion events because bit 2 is set on the event stream request.
<code>./ssl_test.pl eStreamerServerName -o snmp -f SNMPServer</code>	OutputPlugins/ snmp.pm	Event stream request, message type 2, with bits 2, 20, and 23 set to 1	Intrusion event data (see Event Data Message Format, page 2-17 and Intrusion Event Record 5.3.1+, page 3-6) eStreamer transmits type 1 intrusion events because bit 2 is set on the event stream request.
<code>./ssl_test.pl eStreamerServerName -o syslog</code>	OutputPlugins/ syslog.pm	Event stream request, message type 2, with bits 2, 20, and 23 set to 1	Intrusion event data (see Event Data Message Format, page 2-17 and Intrusion Event Record 5.3.1+, page 3-6) eStreamer transmits type 1 intrusion events because bit 2 is set on the event stream request.

Modifying the Type of Data Requested by a Test Script

The `SFStreamer.pm` Perl module defines several request flag variables that you can use in the sample scripts to request data. The following table indicates what request flag variable to call to set each request flag in an event stream request message. If you want to request different data using one of the output modules, you can edit the `$FLAG` settings in the module.

For more information on the request flags, the data they request, and the product versions corresponding to each flag, see [Request Flags, page 2-11](#).

Table 6-4 Request Flag Variables Used in Sample Scripts

Variable	Sets Request Flag...	To request the following data...
<code>\$FLAG_PKTS</code>	0	Packet data
<code>\$FLAG_METADATA</code>	1	Version 1 metadata
<code>\$FLAG_IDS</code>	2	Type 1 intrusion events
<code>\$FLAG_RNA</code>	3	Version 1 discovery events
<code>\$FLAG_POLICY_EVENTS</code>	4	Version 1 correlation events
<code>\$FLAG_IMPACT_ALERTS</code>	5	Intrusion impact alerts
<code>\$FLAG_IDS_IMPACT_FLAG</code>	6	Type 7 intrusion events
<code>\$FLAG_RNA_EVENTS_2</code>	7	Version 2 discovery events
<code>\$FLAG_RNA_FLOW</code>	8	Version 1 connection data
<code>\$FLAG_POLICY_EVENTS_2</code>	9	Version 2 correlation events

Table 6-4 Request Flag Variables Used in Sample Scripts (continued)

Variable	Sets Request Flag...	To request the following data...
\$FLAG_RNA_EVENTS_3	10	Version 3 discovery events
\$FLAG_HOST_ONLY	11	When sent in conjunction with \$FLAG_HOST_SINGLE (for one host) or \$FLAG_HOST_MULTI (for multiple hosts), only host data with no event data
\$FLAG_RNA_FLOW_3	12	Version 3 connection data
\$FLAG_POLICY_EVENTS_3	13	Version 3 correlation events
\$FLAG_METADATA_2	14	Version 2 metadata
\$FLAG_METADATA_3	15	Version 3 metadata
\$FLAG_RNA_EVENTS_4	17	Version 4 discovery events
\$FLAG_RNA_FLOW_4	18	Version 4 connection data
\$FLAG_POLICY_EVENTS_4	19	Version 4 correlation events
\$FLAG_METADATA_4	20	Version 4 metadata
\$FLAG_RUA	21	User activity events
\$FLAG_POLICY_EVENTS_5	22	Version 5 correlation events
\$FLAGS_SEND_ARCHIVE_TIMESTAMP	23	Extended event headers that include the timestamp applied when the event was archived for eStreamer server to process
\$FLAG_RNA_EVENTS_5	24	Version 5 discovery events
\$FLAG_RNA_EVENTS_6	25	Version 6 discovery events
\$FLAG_RNA_FLOW_5	26	Version 5 connection data
\$FLAG_EXTRA_DATA	27	Intrusion event extra data record
\$FLAG_RNA_EVENTS_7	28	Version 7 discovery events
\$FLAG_POLICY_EVENTS_6	29	Version 6 correlation events
\$FLAG_DETAIL_REQUEST	30	Extended request to eStreamer

**Caution**

In all event types, prior to version 5.x, the reference client labels detection engine ID fields as sensor ID.

Creating a Certificate for the Perl Reference Client

License: Any

Before you can use the Perl reference client, you must create a certificate on the Defense Center or managed device for the computer where you want to run the client. You then download the certificate file to the client computer and use it to create a certificate (`server.crt`) and RSA key file (`server.key`).

To create a certificate for the Perl Reference Client:

Access: Admin

Step 1 Select **Operations > Configuration > eStreamer**.

The eStreamer page appears.

Step 2 Click **Create Client**.

The Create Client page appears.

Step 3 In the **Hostname** field, enter the host name or IP address of the host running the eStreamer client.

Note

If you use a host name, the host input server **must** be able to resolve the host to an IP address. If you have not configured DNS resolution, you should configure it first or use an IP address.

Step 4 If you want to encrypt the certificate file, enter a password in the **Password** field.

Step 5 Click **Save**.

The eStreamer server allows the client computer to access port 8302 on the Defense Center and creates an authentication certificate to use during client-server authentication. The eStreamer Client page reappears, with the new client listed under **eStreamer Clients**.

Step 6 Click the download icon () next to the certificate file.

Step 7 Save the certificate file to the directory used by your client computer for SSL authentication.

The client can now connect to the Defense Center.

Tip

To revoke access for a client, click the delete icon () next to the host you want to remove. Note that you do not need to restart the host input service on the Defense Center; access is revoked immediately.

Running the eStreamer Perl Reference Client

The eStreamer Perl reference client scripts are designed for use on a 64-bit operating system with the Linux kernel but should work on any POSIX-based 64-bit operating system, as long as the client machine meets the prerequisites defined in [Setting Up the eStreamer Perl Reference Client, page 6-8](#).

For more information, see the following sections:

- [Testing a Client Connection over SSL Using a Host Request, page 6-14](#)
- [Capturing a PCAP Using the Reference Client, page 6-14](#)
- [Capturing CSV Records Using the Reference Client, page 6-14](#)

- [Sending Records to an SNMP Server Using the Reference Client, page 6-15](#)
- [Logging Events to the Syslog Using the Reference Client, page 6-15](#)
- [Connecting to an IPv6 Address, page 6-15](#)

Testing a Client Connection over SSL Using a Host Request

You can use the `ssl_test.pl` script to test the connection between the eStreamer server and the eStreamer client. The `ssl_test.pl` script handles any record type and prints it to STDOUT or to an output plugin you specify. When you use the `-h` option without an output option, it streams host data for the specified hosts to your terminal.

Note

You cannot use this script to stream packet data without directing it to an output plugin because printing raw packet data to STDOUT interferes with your terminal.

Use the following syntax to use the `ssl_test.pl` script to send host data to the standard output:

```
./ssl_test.pl eStreamerServerIPAddress -h HostIPAddresses
```

For example, to test receipt of host data for the hosts in the 10.0.0.0/8 subnet over a connection to an eStreamer server with an IP address of 10.10.0.4:

```
./ssl_test.pl 10.10.0.4 -h 10.0.0.0/8
```

Capturing a PCAP Using the Reference Client

You can use the reference client to capture streamed packet data in a PCAP file to see the structure of the data the client receives. Note that you must use `-f` to specify a target file when you use the `-o pcap` output option.

Use the following syntax to capture streamed packet data in a PCAP file using the `ssl_test.pl` script:

```
./ssl_test.pl eStreamerServerIPAddress -o pcap -f ResultingPCAPFile
```

For example, to create a PCAP file named `test.pcap` using events streamed from an eStreamer server with an IP address of 10.10.0.4:

```
./ssl_test.pl 10.10.0.4 -o pcap -f test.pcap
```

Capturing CSV Records Using the Reference Client

You can also use the reference client to capture streamed intrusion event data in a CSV file to see the structure of the data the client receives.

Use the following syntax to run the `streamer_csv.pl` script:

```
./ssl_test.pl eStreamerServerIPAddress -o csv -f ResultingCSVFile
```

For example, to create a CSV file named `test.csv` using events streamed from an eStreamer server with an IP address of 10.10.0.4:

```
./ssl_test.pl 10.10.0.4 -o csv -f test.csv
```

Sending Records to an SNMP Server Using the Reference Client

You can also use the reference client to stream intrusion event data to an SNMP server. Use the `-f` option to indicate the name of the SNMP trap server that should receive events. Note that this output method requires a binary named `snmptrapd` in the path and therefore only works on UNIX-like systems.

Use the following syntax to send intrusion events to an SNMP server:

```
./ssl_test.pl eStreamerServerIPAddress -o snmp  
-f SNMPServerName
```

For example, to send events to an SNMP server at 10.10.0.3 using events streamed from an eStreamer server with an IP address of 10.10.0.4:

```
./ssl_test.pl 10.10.0.4 -o snmp -f 10.10.0.3
```

Logging Events to the Syslog Using the Reference Client

You can also use the reference client to stream intrusion events to the local syslog server on the client.

Use the following syntax to send events to the syslog:

```
./ssl_test.pl eStreamerServerIPAddress -o syslog
```

For example, to log events streamed from an eStreamer server with an IP address of 10.10.0.4:

```
./ssl_test.pl 10.10.0.4 -o syslog
```

Connecting to an IPv6 Address

You can use the reference client to connect to a Defense Center with an IPv6 address through the primary management interface. You must have the `Socket6` and `IO::Socket::INET6` Perl modules installed on the client machine and use the `-ipv6` option or the shortened form `-i`.

Use the following syntax to specify an IPv6 address using the `ssl_test.pl` script:

```
./ssl_test.pl -ipv6 eStreamerServerIPAddress
```

or

```
./ssl_test.pl -i eStreamerServerIPAddress
```

For example, to connect to a Defense Center with the IPv6 address `2001:470:e09c:20:7c1e:5248:1bf7:2ea0` use the following:

```
./ssl_test.pl -ipv6 2001:470:e09c:20:7c1e:5248:1bf7:2ea0
```
