About Telemetry

Collecting data for analyzing and troubleshooting has always been an important aspect in monitoring the health of a network.

Cisco NX-OS provides several mechanisms such as SNMP, CLI, and Syslog to collect data from a network. These mechanisms have limitations that restrict automation and scale. One limitation is the use of the pull model, where the initial request for data from network elements originates from the client. The pull model does not scale when there is more than one network management station (NMS) in the network. With this model, the server sends data only when clients request it. To initiate such requests, continual manual intervention is required. This continual manual intervention makes the pull model inefficient.

A push model continuously streams data out of the network and notifies the client. Telemetry enables the push model, which provides near-real-time access to monitoring data.

Telemetry Components and Process

Telemetry consists of four key elements:

• Data Collection — Telemetry data is collected from the Data Management Engine (DME) database in branches of the object model specified using distinguished name (DN) paths. The data can be retrieved periodically (frequency-based) or only when a change occurs in any object on a specified path (event-based). You can use the NX-API to collect frequency-based data.

• **Data Encoding** — The telemetry encoder encapsulates the collected data into the desired format for transporting.

NX-OS encodes telemetry data in the Google Protocol Buffers (GPB) and JSON format.

 Data Transport — NX-OS transports telemetry data using HTTP for JSON encoding and the Google remote procedure call (gRPC) protocol for GPB encoding. The gRPC receiver supports message sizes greater than 4 MB. (Telemetry data using HTTPS is also supported if a certificate is configured.)

Starting with Cisco NX-OS Release 9.2(1), telemetry now supports streaming to IPv6 destinations and IPv4 destinations.

Starting with Cisco NX-OS Release 7.0(3)I7(1), UDP and secure UDP (DTLS) are supported as telemetry transport protocols. You can add destinations that receive UDP. The encoding for UDP and secure UDP can be GPB or JSON.

Use the following command to configure the UDP transport to stream data using a datagram socket either in JSON or GPB:

```
destination-group num
  ip address xxx.xxx.xxx.xxx port xxxx protocol UDP encoding {JSON | GPB }
Example for an IPv4 destination:
destination-group 100
  ip address 171.70.55.69 port 50001 protocol UDP encoding GPB
Example for an IPv6 destination:
destination-group 100
  ipv6 address 10:10::1 port 8000 protocol gRPC encoding GPB
The UDP telemetry is with the following header:
typedef enum tm encode {
  TM ENCODE DUMMY,
  TM ENCODE GPB,
 TM ENCODE JSON,
  TM ENCODE XML,
  TM ENCODE MAX,
} tm_encode_type_t;
typedef struct tm pak hdr {
```

Use the first 6 bytes in the payload to process telemetry data using UDP, using one of the following methods:

- Read the information in the header to determine which decoder to use to decode the data, JSON or GPB, if the receiver is meant to receive different types of data from multiple endpoints.
- Remove the header if you are expecting one decoder (JSON or GPB) but not the other.

uint8_t version; /* 1 */
uint8_t encoding;
uint16_t msg_size;
uint8_t secure;
uint8 t padding;

}__attribute__ ((packed, aligned (1))) tm_pak_hdr_t;

Note

Depending on the receiving operation system and the network load, using the UDP protocol may result in packet drops.

• **Telemetry Receiver** — A telemetry receiver is a remote management system or application that stores the telemetry data.

The GPB encoder stores data in a generic key-value format. The encoder requires metadata in the form of a compiled .proto file to translate the data into GPB format.

In order to receive and decode the data stream correctly, the receiver requires the .proto file that describes the encoding and the transport services. The encoding decodes the binary stream into a key value string pair.

A telemetry .proto file that describes the GPB encoding and gRPC transport is available on Cisco's GitLab: https://github.com/CiscoDevNet/nx-telemetry-proto

High Availability of the Telemetry Process

High availability of the telemetry process is supported with the following behaviors:

- **System Reload** During a system reload, any telemetry configuration and streaming services are restored.
- **Supervisor Failover** Although telemetry is not on hot standby, telemetry configuration and streaming services are restored when the new active supervisor is running.
- **Process Restart** If the telemetry process freezes or restarts for any reason, configuration, and streaming services are restored when telemetry is restarted.

Licensing Requirements for Telemetry

Product	License Requirement
Cisco NX-OS	Telemetry requires no license. Any feature not included in a license package is bundled with the Cisco NX-OS image and is provided at no extra charge to you. For a complete explanation of the Cisco NX-OS licensing scheme, see the <i>Cisco NX-OS Licensing Guide</i> .

Installing and Upgrading Telemetry

Installing the Application

The telemetry application is packaged as a feature RPM and included with the NX-OS release. The RPM is installed by default as part of the image bootup. After installation, you can start the application using the **feature telemetry** command. The RPM file is located in the /rpms directory and is named as follows:

telemetry-version-build_ID.libn32_n3000.rpm

As in the following example:

```
telemetry-2.0.0-7.0.3.I5.1.lib32 n3000.rpm
```

Installing Incremental Updates and Fixes

Copy the RPM to the device bootflash and use the following commands from the bash prompt:

```
feature bash run bash sudo su
```

Then copy the RPM to the device bootflash. Use the following commands from the bash prompt:

```
yum upgrade telemetry new version.rpm
```

The application is upgraded and the change appears when the application is started again.

Downgrading to a Previous Version

To downgrade the telemetry application to a previous version, use the following command from the bash prompt:

```
yum downgrade telemetry
```

Verifying the Active Version

To verify the active version, run the following command from the switch exec prompt:

show install active

Note

The show install active command will only show the active installed RPM after an upgrade has occurred. The default RPM that comes bundled with the NX-OS will not be displayed.

Guidelines and Limitations for Model Driven Telemetry

Telemetry has the following configuration guidelines and limitations:

- Cisco NX-OS releases that support the data management engine (DME) Native Model support Telemetry.
- Support is in place for the following:
 - DME data collection
 - · NX-API data sources
 - Google protocol buffer (GPB) encoding over Google Remote Procedure Call (gRPC) transport
 - JSON encoding over HTTP
- The smallest sending interval (cadence) supported is five seconds for a depth of 0. The minimum cadence values for depth values greater than 0 depends on the size of the data being streamed out. Configuring any cadences below the minimum value may result in undesirable system behavior.
- Telemetry supports up to five remote management receivers (destinations). Configuring more than five remote receivers may result in undesirable system behavior.
- Telemetry can consume up to 20% of the CPU resource.

• To configure SSL certificate-based authentication and the encryption of streamed data, you can provide a self-signed SSL certificate with **certificate** *SSL cert path* **hostname** "CN" command.

Configuration Commands After Downgrading to an Older Release

After a downgrade to an older release, some configuration commands or command options can fail because the older release may not support them. When downgrading to an older release, unconfigure and reconfigure the telemetry feature after the new image comes up. This sequence avoids the failure of unsupported commands or command options.

The following example shows this procedure:

• Copy the telemetry configuration to a file:

```
switch# show running-config | section telemetry
feature telemetry
telemetry
  destination-group 100
   ip address 1.2.3.4 port 50004 protocol gRPC encoding GPB
   use-chunking size 4096
  sensor-group 100
   path sys/bgp/inst/dom-default depth 0
  subscription 600
   dst-grp 100
    snsr-grp 100 sample-interval 7000
switch# show running-config | section telemetry > telemetry running config
switch# show file bootflash:telemetry running config
feature telemetry
telemetry
  destination-group 100
   ip address 1.2.3.4 port 50004 protocol gRPC encoding GPB
   use-chunking size 4096
  sensor-group 100
   path sys/bgp/inst/dom-default depth 0
  subscription 600
   dst-grp 100
   snsr-grp 100 sample-interval 7000
switch#
```

• Execute the downgrade operation. When the image comes up and the switch is ready, copy the telemetry configurations back to the switch.

```
switch# copy telemetry_running_config running-config echo-commands
`switch# config terminal`
`switch(config)# feature telemetry`
`switch(config)# telemetry)
`switch(config-telemetry)# destination-group 100`
`switch(config-telemetry)# ip address 1.2.3.4 port 50004 protocol gRPC encoding GPB `
`switch(conf-tm-dest)# sensor-group 100`
`switch(conf-tm-sensor)# path sys/bgp/inst/dom-default depth 0`
`switch(conf-tm-sensor)# subscription 600`
`switch(conf-tm-sub)# dst-grp 100`
`switch(conf-tm-sub)# snsr-grp 100 sample-interval 7000`
`switch(conf-tm-sub)# end`
Copy complete, now saving to disk (please wait)...
Copy complete.
switch#
```

gRPC Error Behavior

The switch client disables the connection to the gRPC receiver if the gRPC receiver sends 20 errors. Unconfigure then reconfigure the receiver's IP address under the destination group to enable the gRPC receiver. Errors include:

- The gRPC client sends the wrong certificate for secure connections.
- The gRPC receiver takes too long to handle client messages and incurs a timeout. Avoid timeouts by processing messages using a separate message processing thread.

Telemetry Compression for gRPC Transport

Telemetry compression support is available for gRPC transport. You can use the **use-compression gzip** command to enable compression. (Disable compression with the **no use-compression gzip** command.)

The following example enables compression:

```
switch(config) # telemetry
switch(config-telemetry) # destination-profile
switch(config-tm-dest-profile) # use-compression gzip
```

The following example shows that compression is enabled:

switch(conf-tm-dest)# show telemetry transport 0 stats

```
Session Id:
Connection Stats
  Connection Count
                               0
  Last Connected:
                              Never
  Disconnect Count
  Last Disconnected:
                              Never
Transmission Stats
  Compression:
                              gzip
                              loopback1(1.1.3.4)
  Source Interface:
  Transmit Count:
  Last TX time:
                              None
  Min Tx Time:
                              0
                                                   ms
  Max Tx Time:
                                                   ms
  Avg Tx Time:
                               Ω
                                                   ms
  Cur Tx Time:
                               0
                                                   ms
switch2(config-if)# show telemetry transport 0 stats
Session Id: 0
Connection Stats
Connection Count 0
Last Connected: Never
Disconnect Count 0
Last Disconnected: Never

Max Tx Time: 0 ms
Avg Tx Time: 0 ms
Cur Tx Time: 0 ms
switch2(config-if)#
```

The following is an example of use-compression as a POST payload.

NX-API Sensor Path Limitations

NX-API can collect and stream switch information not yet in the DME using **show** commands. However, using the NX-API instead of streaming data from the DME has inherent scale limitations as outlined:

- The switch backend dynamically processes NX-API calls such as **show** commands,
- NX-API spawns several processes that can consume up to a maximum of 20% of the CPU.
- NX-API data translates from the CLI to XML to JSON.

The following is a suggested user flow to help limit excessive NX-API sensor path bandwidth consumption:

1. Check whether the **show** command has NX-API support. You can confirm whether NX-API supports the command from the VSH with the pipe option: show <command> | json or show <command> | json pretty.

Note

Avoid commands that take the switch more than 30 seconds to return JSON output.

- 2. Refine the **show** command to include any filters or options.
 - Avoid enumerating the same command for individual outputs; for example, show vlan id 100, show vlan id 101, and so on. Instead, use the CLI range options; for example, show vlan id 100-110,204, whenever possible to improve performance.

If only the summary or counter is needed, then avoid dumping a whole show command output to limit the bandwidth and data storage that is required for data collection.

- **3.** Configure telemetry with sensor groups that use NX-API as their data sources. Add the **show** commands as sensor paths
- **4.** Configure telemetry with a cadence of five times the processing time of the respective **show** command to limit CPI usage.
- 5. Receive and process the streamed NX-API output as part of the existing DME collection.

Telemetry VRF Support

Telemetry VRF support allows you to specify a transport VRF, which means that the telemetry data stream can egress through front-panel ports and avoid possible competition between SSH or NGINX control sessions.

You can use the **use-vrf** vrf-name command to specify the transport VRF.

The following example specifies the transport VRF:

```
switch(config)# telemetry
switch(config-telemetry)# destination-profile
switch(config-tm-dest-profile)# use-vrf test vrf
```

The following is an example of use-vrf as a POST payload:

Support for Node ID

Beginning in NX-OS release 9.3.1, you can configure a custom Node ID string for a telemetry receiver through the **use-nodeid** command. By default, the hostname is used, but support for a node ID enables you to set or change the identifier for the node id str of the telemetry receiver data.

You can assign the node ID through the telemetry destination profile, by using the **usenode-id** command. This command is optional.

The following example shows configuring the node ID.

```
switch-1(config) # telemetry
switch-1(config-telemetry) # destination-profile
switch-1(conf-tm-dest-profile) # use-nodeid test-srvr-10
switch-1(conf-tm-dest-profile) #
```

The following example shows a telemetry notification on the receiver after the node ID is configured.

Support for Streaming of YANG Models

Starting with Release 9.2(1), telemetry supports the YANG ("Yet Another Next Generation") data modeling language. Telemetry supports data streaming for both device YANG and OpenConfig YANG.

Configuring Telemetry Using the CLI

Configuring Telemetry Using the NX-OS CLI

The following steps enable streaming telemetry and configuring the source and destination of the data stream. These steps also include optional steps to enable and configure SSL/TLS certificates and GPB encoding.

Procedure

	Command or Action	Purpose	
Step 1	(Optional) openssl argument	Create an SSL or TLS certificate on the server	
	Example:	that receives the data, where the private. key file is the private key and the	
	Generate an SSL/TLS certificate using a specific argument, such as the following:	public.crt is the public key.	
	• To generate a private RSA key: openssl genrsa -cipher- out filename.key cipher-bit-length		
	For example:		
	switch# openss1 genrsa -des3 -out server.key 2048		
	• To write the RSA key: openssl rsa -in filename.key -out filename.key		
	For example:		
	<pre>switch# openssl rsa -in server.key -out server.key</pre>		
	 To create a certificate that contains the public or private key: openssl req 		
	-encoding-standard -new -new filename.key -out filename.csr -subj '/CN=localhost'		
	For example:		
	<pre>switch# openssl req -sha256 -new -key server.key -out server.csr -subj '/CN=localhost'</pre>		
	 To create a public key: openssl x509 -req -encoding-standard -days timeframe -in filename.csr -signkey filename.key -out filename.csr 		

	Command or Action	Purpose
	For example: switch# openss1 x509 -req -sha256 -days 365 -in server.csr -signkey server.key -out server.crt	
Step 2	<pre>configure terminal Example: switch# configure terminal switch(config)#</pre>	Enter the global configuration mode.
Step 3	feature telemetry	Enable the streaming telemetry feature.
Step 4	feature nxapi	Enable NX-API.
Step 5	nxapi use-vrf management	Enable the VRF management to be used for NX-API communication.
Step 6 Step 7	<pre>telemetry Example: switch(config)# telemetry switch(config-telemetry)# (Optional) certificate certificate_path</pre>	Enter configuration mode for streaming telemetry. Use an existing SSL/TLS certificate.
	host_URL Example: switch(config-telemetry)# certificate /bootflash/server.key localhost	
Step 8	(Optional) Specify a transport VRF or enable telemetry compression for gRPC transport. Example: switch(config-telemetry) # destination-profile switch(conf-tm-dest-profile) # use-vrf default switch(conf-tm-dest-profile) # use-compression gzip switch(conf-tm-dest-profile) # use-retry size 10 switch(conf-tm-dest-profile) # source-interface loopback1	 Enter the destination-profile command to specify the default destination profile. Enter any of the following commands: use-vrf vrf to specify the destination VRF. use-compression gzip to specify the destination compression method. use-retry size size to specify the send retry details, with a retry buffer size between 10–1500 megabytes. source-interface interface-name to stream data from the configured interface to a destination with the source IP address.

	Command or Action	Purpose		
		After configuring the use-vrf command, you must configure a new destination IP address within the new VRF. However, you may re-use the same destination IP address by unconfiguring and reconfiguring the destination. This action ensures that the telemetry data streams to the same destination IP address in the new VRF.		
Step 9	sensor-group sgrp_id Example:	Create a sensor group with ID <i>srgp_id</i> and enter sensor group configuration mode.		
	<pre>switch(config-telemetry) # sensor-group 100 switch(conf-tm-sensor) #</pre>	Currently only numeric ID values are supported. The sensor group defines nodes that will be monitored for telemetry reporting.		
Step 10	(Optional) data-source data-source-type Example:	Select a data source. Select from either YANG, DME or NX-API as the data source.		
	switch(config-telemetry)# data-source NX-API	Note DME is the default data source.		
Step 11	<pre>path sensor_path depth 0 [filter-condition filter] [alias path_alias]</pre>	Add a sensor path to the sensor group. • Beginning with the Cisco NX-OS 9.3(5)		
	Example:	 release, the alias keyword is introduced. The depth setting specifies the retrieval level for the sensor path. Depth settings 		
	The following command is applicable for DME, not for NX-API or YANG: The following command is applicable for DME, not for NX-API or YANG: The following command is applicable for DME, not for NX-API or YANG: The following command is applicable for DME, not for NX-API or YANG: The following command is applicable for DME, not for NX-API or YANG: The following command is applicable for DME, not for NX-API or YANG: The following command is applicable for DME, not for NX-API or YANG: The following command is applicable for DME, not for NX-API or YANG: The following command is applicable for DME, not for NX-API or YANG: The following command is applicable for DME, not for NX-API or YANG: The following command is applicable for DME, not followed the following command is applicable for DME. 	<pre>switch(conf-tm-sensor)# path sys/bd/bd-[vlan-100] depth 0</pre>	of 0 - 32 , unbounded are supported. Note depth 0 is the default depth.		
	filter-condition eq(12BD.operSt, "down") Use the following syntax for state-based	NX-API-based sensor paths can only use depth 0 .		
	filtering to trigger only when operSt changes from up to down, with no notifications of when the MO changes.	If a path is subscribed for the event collection, the depth only supports 0 and		
	<pre>switch(conf-tm-sensor) # path sys/bd/bd-[vlan-100] depth 0 filter-condition</pre>	unbounded. Other values would be treated as 0.		
	and (updated (12HD. operSt), eq (12HD. operSt, "down")) Use the following syntax to distinguish the path on the UTR side.	 The optional filter-condition parameter can be specified to create a specific filter for event-based subscriptions. 		
	<pre>switch(conf-tm-sensor) # path sys/ch/ftslot-1/ft alias ft_1</pre>	For state-based filtering, the filter returns both when a state has changed and when		
	• The following command is applicable for NX-API, not for DME or YANG:	an event has occurred during the specified		

Command or Action

switch(conf-tm-sensor)# path "show interface" depth 0

 The following command is applicable for device YANG:

switch(conf-tm-sensor)# path
Cisco-NX-OS-device:System/bgp-items/inst-items

• The following commands are applicable for OpenConfig YANG:

switch(conf-tm-sensor) # path
openconfig-bgp:bgp

switch(conf-tm-sensor) # path
Cisco-NX-OS-device:System/bqp-items/inst-items
alias bgp_alias

 The following command is applicable for NX-API:

switch(conf-tm-sensor) # path "show
interface" depth 0 alias
sh int alias

• The following command is applicable for OpenConfig:

switch(conf-tm-sensor)# path
openconfig-bgp:bgp alias
oc bgp alias

Purpose

state. That is, a filter condition for the DN sys/bd/bd-[vlan] of eq(l2Bd.operSt, "down") triggers when the operSt changes, and when the DN's property changes while the operSt remains down, such as a no shutdown command is issued while the VLAN is operationally down.

Note

query-condition parameter — For DME, based on the DN, the query-condition parameter can be specified to fetch MOTL and ephemeral data with the following syntax: query-condition "rsp-foreign-subtree=applied-config"; query-condition "rsp-foreign-subtree=ephemeral".

- For the YANG model, the sensor path format is as follows: *module_name*: *YANG_path*, where *module_name* is the name of the YANG model file. For example:
 - For device YANG:

Cisco-NX-OS device:System/bgp-items/inst-items

• For OpenConfig YANG:

openconfig-bgp:bgp

Note

The depth, filter-condition, and query-condition parameters are not supported for YANG currently.

For the openconfig YANG models, go to https://github.com/YangModels/yang/tree/master/vendor/cisco/nx and navigate to the appropriate folder for the latest release.

Instead of installing a specific model, you can install the openconfig-all RPM which has all the OpenConfig models.

For example:

	Command or Action	Purpose		
			all add pencr ii gbgp-10000 7031HD81B 52 <u>r</u> 9000qm vate	
Step 12	destination-group $dgrp_id$ Example:	Create a destination group and enter destination group configuration mode.		
	<pre>switch(conf-tm-sensor) # destination-group 100 switch(conf-tm-dest) #</pre>	Currently values.	dgrp_id only supports numeric ID	
Step 13	(Optional) ip address <i>ip_address</i> port <i>port</i> protocol <i>procedural-protocol</i>		n IPv4 IP address and port to receive telemetry data.	
	encoding encoding-protocol Example:	Note	gRPC is the default transport protocol.	
	switch(conf-tm-sensor)# ip address 171.70.55.69 port 50001 protocol gRPC encoding GPB switch(conf-tm-sensor)# ip address 171.70.55.69 port 50007 protocol HTTP encoding JSON		GPB is the default encoding.	
	<pre>switch(conf-tm-sensor)# ip address 171.70.55.69 port 50009 protocol UDP encoding JSON</pre>			
Step 14	(Optional) ipv6 address ipv6_address port port protocol procedural-protocol		n IPv6 IP address and port to receive relemetry data.	
	encoding encoding-protocol Example:	Note	gRPC is the default transport protocol.	
	<pre>switch(conf-tm-sensor) # ipv6 address 10:10::1 port 8000 protocol gRPC encoding GPB switch(conf-tm-sensor) # ipv6 address 10:10::1 port 8001 protocol HTTP encoding JSON switch(conf-tm-sensor) # ipv6 address 10:10::1 port 8002 protocol UDP encoding JSON</pre>		GPB is the default encoding.	
Step 15	<pre>ip_version address ip_address port portnum Example:</pre>		destination profile for the outgoing are <i>ip_version</i> is either ip (for IPv4) for IPv6).	
	• For IPv4: switch(conf-tm-dest) # ip address 1.2.3.4 port 50003	subscripti	destination group is linked to a tion, telemetry data is sent to the IP and port that is specified by this	
	• For IPv6: switch(conf-tm-dest)# ipv6 address 10:10::1 port 8000			

	Command or Action	Purpose
Step 16	(Optional) use-chunking size chunking_size Example: switch(conf-tm-dest) # use-chunking size 64	size, between 64-4096 bytes. See the section "Support for gRPC Chunking" for more
Step 17	<pre>subscription sub_id Example: switch(conf-tm-dest)# subscription 100 switch(conf-tm-sub)#</pre>	values. Note When subscribing to a DN, check whether the DN is supported by DME using REST to ensure that
Step 18	<pre>snsr-grp sgrp_id sample-interval interval Example: switch(conf-tm-sub) # snsr-grp 100 sample-interval 15000</pre>	Link the sensor group with ID <i>sgrp_id</i> to this subscription and set the data sampling interval in milliseconds. An interval value of 0 creates an event-based subscription, in which telemetry data is sent only upon changes under the specified MO. An interval value greater than 0 creates a frequency-based subscription, in which telemetry data is sent periodically at the specified interval. For example, an interval value of 15000 results in the sending of telemetry data every 15 seconds.
Step 19	<pre>dst-grp dgrp_id Example: switch(conf-tm-sub)# dst-grp 100</pre>	Link the destination group with ID <i>dgrp_id</i> to this subscription.

Configuring Cadence for YANG Paths

The cadence for YANG paths must be greater than the total streaming time. If the total streaming time and cadence are incorrectly configured, gathering telemetry data can take longer than the streaming interval. In this situation, you can see:

- Queues that incrementally fill because telemetry data is accumulating faster than it is streaming to the receiver.
- Stale telemetry data which is not from the current interval.

Configure the cadence to a value greater than the total streaming time.

Procedure

	Command or Action	P
Step 1	show telemetry control database sensor-groups	T
	Example:	1 i1
	switch-1# show telemetry control database sensor-groups Sensor Group Database size = 2

Purpose

Calculate the total streaming time.

The total streaming time is the sum of the individual current streaming times of each sensor group. Individual streaming times are displayed in Streaming time in ms (Cur). In this example, total streaming time is 2.664 seconds (2515 milliseconds plus 149 milliseconds).

Compare the configured cadence to the total streaming time for the sensor group.

The cadence is displayed in sample-interval. In this example, the cadence is correctly configured because the total streaming time (2.664 seconds) is less than the cadence (5.000 seconds, which is the default).

	Command or Action	Purpose
	dst-grp 1 snsr-grp 1 sample-interval 5000 snsr-grp 2 sample-interval 5000	
Step 2	<pre>sensor group number Example: switch-1(config-telemetry) # sensor group1</pre>	If the total streaming time is not less than the cadence, enter the sensor group for which you want to set the interval.
Step 3	subscription number	Edit the subscription for the sensor group.
	<pre>Example: switch-1(conf-tm-sensor) # subscription 100</pre>	
Step 4	<pre>snsr-grp number sample-interval milliseconds Example: switch-1(conf-tm-sub) # snsr-grp number sample-interval 5000</pre>	For the appropriate sensor group, set the sample interval to a value greater than the total streaming time. In this example, the sample interval is set to 5.000 seconds, which is valid because it is larger than the total streaming time of 2.664 seconds.
Step 5	## Show system resources Example:	

Configuration Examples for Telemetry Using the CLI

The following steps describe how to configure a single telemetry DME stream with a ten second cadence with GPB encoding.

```
switch# configure terminal
switch(config)# feature telemetry
switch(config)# telemetry
switch(config-telemetry)# destination-group 1
switch(config-tm-dest)# ip address 171.70.59.62 port 50051 protocol gRPC encoding GPB
switch(config-tm-dest)# exit
```

```
switch(config-telemetry) # sensor group sg1
switch(config-tm-sensor) # data-source DME
switch(config-tm-dest) # path interface depth unbounded query-condition keep-data-type
switch(config-tm-dest) # subscription 1
switch(config-tm-dest) # dst-grp 1
switch(config-tm-dest) # snsr grp 1 sample interval 10000
```

This example creates a subscription that streams data for the sys/bgp root MO every 5 seconds to the destination IP 1.2.3.4 port 50003.

```
switch(config) # telemetry
switch(config-telemetry) # sensor-group 100
switch(conf-tm-sensor) # path sys/bgp depth 0
switch(conf-tm-sensor) # destination-group 100
switch(conf-tm-dest) # ip address 1.2.3.4 port 50003
switch(conf-tm-dest) # subscription 100
switch(conf-tm-sub) # snsr-grp 100 sample-interval 5000
switch(conf-tm-sub) # dst-grp 100
```

This example creates a subscription that streams data for sys/intf every 5 seconds to destination IP 1.2.3.4 port 50003, and encrypts the stream using GPB encoding that is verified using the test.pem.

```
switch(config) # telemetry
switch(config-telemetry) # certificate /bootflash/test.pem foo.test.google.fr
switch(conf-tm-telemetry) # destination-group 100
switch(conf-tm-dest) # ip address 1.2.3.4 port 50003 protocol gRPC encoding GPB
switch(config-dest) # sensor-group 100
switch(conf-tm-sensor) # path sys/bgp depth 0
switch(conf-tm-sensor) # subscription 100
switch(conf-tm-sub) # snsr-grp 100 sample-interval 5000
switch(conf-tm-sub) # dst-grp 100
```

This example creates a subscription that streams data for sys/cdp every 15 seconds to destination IP 1.2.3.4 port 50004.

```
switch(config) # telemetry
switch(config-telemetry) # sensor-group 100
switch(conf-tm-sensor) # path sys/cdp depth 0
switch(conf-tm-sensor) # destination-group 100
switch(conf-tm-dest) # ip address 1.2.3.4 port 50004
switch(conf-tm-dest) # subscription 100
switch(conf-tm-sub) # snsr-grp 100 sample-interval 15000
switch(conf-tm-sub) # dst-grp 100
```

This example creates a cadence-based collection of **show** command data every 750 seconds.

```
switch(config) # telemetry
switch(config-telemetry) # destination-group 1
switch(conf-tm-dest) # ip address 172.27.247.72 port 60001 protocol gRPC encoding GPB
switch(conf-tm-dest) # sensor-group 1
switch(conf-tm-sensor # data-source NX-API
switch(conf-tm-sensor) # path "show system resources" depth 0
switch(conf-tm-sensor) # path "show version" depth 0
switch(conf-tm-sensor) # path "show environment power" depth 0
switch(conf-tm-sensor) # path "show environment fan" depth 0
switch(conf-tm-sensor) # path "show environment temperature" depth 0
switch(conf-tm-sensor) # path "show process cpu" depth 0
switch(conf-tm-sensor) # path "show process cpu" depth 0
switch(conf-tm-sensor) # path "show nve peers" depth 0
```

```
switch(conf-tm-sensor)# path "show nve vni" depth 0
switch(conf-tm-sensor)# path "show nve vni 4002 counters" depth 0
switch(conf-tm-sensor)# path "show int nve 1 counters" depth 0
switch(conf-tm-sensor)# path "show policy-map vlan" depth 0
switch(conf-tm-sensor)# path "show ip access-list test" depth 0
switch(conf-tm-sensor)# path "show system internal access-list resource utilization" depth
0
switch(conf-tm-sensor)# subscription 1
switch(conf-tm-sub)# dst-grp 1
switch(conf-tm-dest)# snsr-grp 1 sample-interval 750000
```

This example creates an event-based subscription for sys/fm. Data is streamed to the destination only if there is a change under the sys/fm MO.

```
switch(config) # telemetry
switch(config-telemetry) # sensor-group 100
switch(conf-tm-sensor) # path sys/fm depth 0
switch(conf-tm-sensor) # destination-group 100
switch(conf-tm-dest) # ip address 1.2.3.4 port 50005
switch(conf-tm-dest) # subscription 100
switch(conf-tm-sub) # snsr-grp 100 sample-interval 0
switch(conf-tm-sub) # dst-grp 100
```

During operation, you can change a sensor group from frequency-based to event-based, and change event-based to frequency-based by changing the sample-interval. This example changes the sensor-group from the previous example to frequency-based. After the following commands, the telemetry application will begin streaming the sys/fm data to the destination every 7 seconds.

```
switch(config) # telemetry
switch(config-telemetry) # subscription 100
switch(conf-tm-sub) # snsr-grp 100 sample-interval 7000
```

Multiple sensor groups and destinations can be linked to a single subscription. The subscription in this example streams the data for Ethernet port 1/1 to four different destinations every 10 seconds.

```
switch(config) # telemetry
switch(config-telemetry) # sensor-group 100
switch(conf-tm-sensor) # path sys/intf/phys-[eth1/1] depth 0
switch(conf-tm-sensor) # destination-group 100
switch(conf-tm-dest) # ip address 1.2.3.4 port 50004
switch(conf-tm-dest) # ip address 1.2.3.4 port 50005
switch(conf-tm-sensor) # destination-group 200
switch(conf-tm-dest) # ip address 5.6.7.8 port 50001 protocol HTTP encoding JSON
switch(conf-tm-dest) # ip address 1.4.8.2 port 60003
switch(conf-tm-dest) # subscription 100
switch(conf-tm-sub) # snsr-grp 100 sample-interval 10000
switch(conf-tm-sub) # dst-grp 100
switch(conf-tm-sub) # dst-grp 200
```

A sensor group can contain multiple paths, a destination group can contain multiple destination profiles, and a subscription can be linked to multiple sensor groups and destination groups, as shown in this example.

```
switch(config)# telemetry
switch(config-telemetry)# sensor-group 100
switch(conf-tm-sensor)# path sys/intf/phys-[eth1/1] depth 0
```

```
switch(conf-tm-sensor) # path sys/epId-1 depth 0
switch(conf-tm-sensor)# path sys/bgp/inst/dom-default depth 0
switch(config-telemetry) # sensor-group 200
switch(conf-tm-sensor) # path sys/cdp depth 0
switch(conf-tm-sensor)# path sys/ipv4 depth 0
switch(config-telemetry)# sensor-group 300
switch(conf-tm-sensor) # path sys/fm depth 0
switch(conf-tm-sensor)# path sys/bgp depth 0
switch(conf-tm-sensor)# destination-group 100
switch(conf-tm-dest) # ip address 1.2.3.4 port 50004
switch(conf-tm-dest) # ip address 4.3.2.5 port 50005
switch(conf-tm-dest) # destination-group 200
switch(conf-tm-dest) # ip address 5.6.7.8 port 50001
switch(conf-tm-dest) # destination-group 300
switch(conf-tm-dest)# ip address 1.2.3.4 port 60003
switch(conf-tm-dest) # subscription 600
switch(conf-tm-sub) # snsr-grp 100 sample-interval 7000
switch(conf-tm-sub)# snsr-grp 200 sample-interval 20000
switch(conf-tm-sub)# dst-grp 100
switch(conf-tm-sub) # dst-grp 200
switch(conf-tm-dest) # subscription 900
switch(conf-tm-sub)# snsr-grp 200 sample-interval 7000
switch(conf-tm-sub) # snsr-grp 300 sample-interval 0
switch(conf-tm-sub) # dst-grp 100
switch(conf-tm-sub)# dst-grp 300
```

You can verify the telemetry configuration using the **show running-config telemetry** command, as shown in this example.

```
switch(config) # telemetry
switch(config-telemetry) # destination-group 100
switch(conf-tm-dest) # ip address 1.2.3.4 port 50003
switch(conf-tm-dest) # ip address 1.2.3.4 port 50004
switch(conf-tm-dest) # end
switch # show run telemetry
!Command: show running-config telemetry
!Time: Thu Oct 13 21:10:12 2016

version 7.0(3) I5(1)
feature telemetry

telemetry
destination-group 100
ip address 1.2.3.4 port 50003 protocol gRPC encoding GPB
ip address 1.2.3.4 port 50004 protocol gRPC encoding GPB
```

You can specify transport VRF and telemetry data compression for gRPC using the **use-vrf** and **use-compression gzip** commands, as shown in this example.

```
switch(config) # telemetry
switch(config-telemetry) # destination-profile
switch(conf-tm-dest-profile) # use-vrf default
```

```
switch(conf-tm-dest-profile) # use-compression gzip
switch(conf-tm-dest-profile) # sensor-group 1
switch(conf-tm-sensor) # path sys/bgp depth unbounded
switch(conf-tm-sensor) # destination-group 1
switch(conf-tm-dest) # ip address 1.2.3.4 port 50004
switch(conf-tm-dest) # subscription 1
switch(conf-tm-sub) # dst-grp 1
switch(conf-tm-sub) # snsr-grp 1 sample-interval 10000
```

Displaying Telemetry Configuration and Statistics

Use the following NX-OS CLI **show** commands to display telemetry configuration, statistics, errors, and session information.

show telemetry yang direct-path cisco-nxos-device

This command displays YANG paths that are directly encoded to perform better than other paths.

```
switch# show telemetry yang direct-path cisco-nxos-device
) Cisco-NX-OS-device:System/ldp-items
2) Cisco-NX-OS-device:System/acl-items
3) Cisco-NX-OS-device:System/mac-items
4) Cisco-NX-OS-device:System/intf-items
5) Cisco-NX-OS-device:System/procsys-items/sysload-items
6) Cisco-NX-OS-device:System/procsys-items
7) Cisco-NX-OS-device:System/procsys-items
8) Cisco-NX-OS-device:System/procsys-items
9) Cisco-NX-OS-device:System/ipqos-items/queuing-items/policy-items/out-items
9) Cisco-NX-OS-device:System/mac-items/static-items
10) Cisco-NX-OS-device:System/ch-items
11) Cisco-NX-OS-device:System/cdp-items
12) Cisco-NX-OS-device:System/bd-items
13) Cisco-NX-OS-device:System/eps-items
14) Cisco-NX-OS-device:System/ipv6-items
```

show telemetry control database

This command displays the internal databases that reflect the configuration of telemetry.

```
switch# show telemetry control database ?

```

show telemetry transport <session-id> errors

This command displays detailed error statistics for a specific transport session.

Displaying Telemetry Log and Trace Information

Use the following NX-OS CLI commands to display the log and trace information.

show tech-support telemetry

This NX-OS CLI command collects the telemetry log contents from the tech-support log. In this example, the command output is redirected into a file in bootflash.

```
switch# show tech-support telemetry > bootflash:tmst.log
```

show system internal telemetry trace

The **show system internal telemetry trace** [tm-events | tm-errors | tm-logs | all] command displays system internal telemetry trace information.

```
switch# show system internal telemetry trace all
Telemetry All Traces:
Telemetry Error Traces:
[07/26/17 15:22:29.156 UTC 1 28577] [3960399872][tm cfg api.c:367] Not able to destroy dest

Configuring Telemetry Using the NX-API

Configuring Telemetry Using the NX-API

In the object model of the switch DME, the configuration of the telemetry feature is defined in a hierarchical structure of objects as shown in the section "Telemetry Model in the DME." Following are the main objects to be configured:

- **fmEntity** Contains the NX-API and Telemetry feature states.
 - **fmNxapi** Contains the NX-API state.
 - **fmTelemetry** Contains the Telemetry feature state.
- **telemetryEntity** Contains the telemetry feature configuration.
 - **telemetrySensorGroup** Contains the definitions of one or more sensor paths or nodes to be monitored for telemetry. The telemetry entity can contain one or more sensor groups.
 - **telemetryRtSensorGroupRel** Associates the sensor group with a telemetry subscription.
 - **telemetrySensorPath** A path to be monitored. The sensor group can contain multiple objects of this type.
 - **telemetryDestGroup** Contains the definitions of one or more destinations to receive telemetry data. The telemetry entity can contain one or more destination groups.
 - telemetryRtDestGroupRel Associates the destination group with a telemetry subscription.
 - **telemetryDest** A destination address. The destination group can contain multiple objects of this type.
 - **telemetrySubscription** Specifies how and when the telemetry data from one or more sensor groups is sent to one or more destination groups.
 - telemetryRsDestGroupRel Associates the telemetry subscription with a destination group.
 - telemetryRsSensorGroupRel Associates the telemetry subscription with a sensor group.
 - telemetry Certificate Associates the telemetry subscription with a certificate and hostname.

To configure the telemetry feature using the NX-API, you must construct a JSON representation of the telemetry object structure and push it to the DME with an HTTP or HTTPS POST operation.

Note

For detailed instructions on using the NX-API, see the *Cisco Nexus 3000 and 9000 Series NX-API REST SDK User Guide and API Reference*.

Before you begin

Your switch must be configured to run the NX-API from the CLI:

```
switch(config)# feature nxapi
nxapi use-vrf vrf_name
nxapi http port port_number
```

Procedure

	Command or Action	Purpose
Step 1	Enable the telemetry feature. Example:	The root element is fmTelemetry and the base path for this element is sys/fm. Configure the adminSt attribute as enabled.
	<pre>{ "fmEntity" : { "children" : [{ "fmTelemetry" : { "attributes" : { "adminSt" : "enabled"</pre>	
Step 2	Create the root level of the JSON payload to describe the telemetry configuration.	The root element is telemetryEntity and the base path for this element is sys/tm. Configure
	Example:	the dn attribute as sys/tm.
	<pre>{ "telemetryEntity": { "attributes": {</pre>	
Step 3	Create a sensor group to contain the defined sensor paths.	A telemetry sensor group is defined in an object of class telemetrySensorGroup .
	Example:	Configure the following attributes of the object:
	"telemetrySensorGroup": { "attributes": { "id": "10", "rn": "sensor-10"	• id — An identifier for the sensor group. Currently only numeric ID values are supported.
	"dataSrc": "NX-API" }, "children": [{ }]	• rn — The relative name of the sensor group object in the format: sensor-id.
	}	• dataSrc — Selects the data source from DEFAULT, DME, YANG, or NX-API.
		Children of the sensor group object include

sensor paths and one or more relation objects

	Command or Action	Purpose
		(telemetryRtSensorGroupRel) to associate the sensor group with a telemetry subscription.
Step 4	<pre>(Optional) Add an SSL/TLS certificate and a host. Example: { "telemetryCertificate": { "attributes": { "filename": "root.pem" "hostname": "c.com" } } }</pre>	The telemetryCertificate defines the location of the SSL/TLS certificate with the telemetry subscription/destination.
Step 5	<pre>Define a telemetry destination group. Example: { "telemetryDestGroup": { "attributes": { "id": "20" } } }</pre>	A telemetry destination group is defined in telemetryEntity . Configure the id attribute.
Step 6	<pre>Define a telemetry destination profile. Example: { "telemetryDestProfile": { "attributes": { "adminSt": "enabled" }, "children": [</pre>	A telemetry destination profile is defined in telemetryDestProfile. • Configure the adminSt attribute as enabled. • Under telemetryDestOptSourceInterface, configure the name attribute with an interface name to stream data from the configured interface to a destination with the source IP address.
Step 7	Define one or more telemetry destinations, consisting of an IP address and port number to which telemetry data will be sent. Example:	A telemetry destination is defined in an object of class telemetryDest . Configure the following attributes of the object: • addr — The IP address of the destination.
	<pre>{ "telemetryDest": { "attributes": {</pre>	• port — The port number of the destination.

	Command or Action	Purpose
	"addr": "1.2.3.4",	 rn — The relative name of the destination object in the format: path-[path]. enc — The encoding type of the telemetry data to be sent. NX-OS supports:
	}	• Google protocol buffers (GPB) for gRPC.
		• JSON for C.
		• GPB or JSON for UDP and secure UDP (DTLS).
		• proto — The transport protocol type of the telemetry data to be sent. NX-OS supports:
		• gRPC
		• HTTP
		• VUDP and secure UDP (DTLS)
		Supported encoded types are:
		• HTTP/JSON YES
		 HTTP/Form-data YES Only supported for Bin Logging.
		GRPC/GPB-Compact YES Native Data Source Only.
		• GRPC/GPB YES
		• UDP/GPB YES
		• UDP/JSON YES
Step 8	Enable gRPC chunking and set the chunking size, between 64 and 4096 bytes.	See #unique_289 unique_289_Connect_42_section_ebt_1kr_h2b for more information.
	Example:	
	<pre>{ "telemetryDestGrpOptChunking": { "attributes": {</pre>	

creates an event-based subscription, in

which telemetry data is sent only upon

changes under the specified MO. An

Command or Action Purpose Step 9 Create a telemetry subscription to configure A telemetry subscription is defined in an object of class telemetrySubscription. Configure the telemetry behavior. the following attributes of the object: Example: • id — An identifier for the subscription. Currently only numeric ID values are "telemetrySubscription": { "attributes": { supported. "id": "30", "rn": "subs-30" • rn — The relative name of the "children": [{ subscription object in the format: **subs-***id*. }] Children of the subscription object include relation objects for sensor groups (telemetryRsSensorGroupRel) and destination groups (telemetryRsDestGroupRel). Step 10 Add the sensor group object as a child object to the **telemetrySubscription** element under the root element (telemetryEntity). Example: "telemetrySubscription": { "attributes": { "id": "30" "children": [{ "telemetryRsSensorGroupRel": { "attributes": { "sampleIntvl": "5000", "tDn": "sys/tm/sensor-10" Step 11 Create a relation object as a child object of the The relation object is of class subscription to associate the subscription to telemetryRsSensorGroupRel and is a child the telemetry sensor group and to specify the object of **telemetrySubscription**. Configure data sampling behavior. the following attributes of the relation object: Example: • rn — The relative name of the relation object in the format: "telemetryRsSensorGroupRel": { rssensorGroupRel-[sys/tm/sensor-group-id]. "attributes": { "rType": "mo", • sampleIntvl — The data sampling period "rn": in milliseconds. An interval value of 0 "rssensorGroupRel-[sys/tm/sensor-10]",

"sampleIntvl": "5000",

"tType": "mo"

"tCl": "telemetrySensorGroup",

"tDn": "sys/tm/sensor-10",

	Command or Action	Purpose
	}	interval value greater than 0 creates a frequency-based subscription, in which telemetry data is sent periodically at the specified interval. For example, an interval value of 15000 results in the sending of telemetry data every 15 seconds.
		• tCl — The class of the target (sensor group) object, which is telemetrySensorGroup.
		• tDn — The distinguished name of the target (sensor group) object, which is sys/tm /sensor-group-id.
		• rType — The relation type, which is mo for managed object.
		• tType — The target type, which is mo for managed object.
Step 12	Define one or more sensor paths or nodes to be monitored for telemetry.	A sensor path is defined in an object of class telemetrySensorPath. Configure the following ettributes of the object:
	Example:	following attributes of the object:
	Single sensor path	• path — The path to be monitored.
	{ "telemetrySensorPath": {	• rn — The relative name of the path object in the format: path-[path]
	"attributes": { "path": "sys/cdp", "rn": "path-[sys/cdp]", "excludeFilter": "",	• depth — The retrieval level for the sensor path. A depth setting of 0 retrieves only the root MO properties.
	"filterCondition": "", "path": "sys/fm/bgp", "secondaryGroup": "0", "secondaryPath": "", "depth": "0", "alias": "cdp_alias", } }	• filterCondition — (Optional) Creates a specific filter for event-based subscriptions. The DME provides the filter expressions. For more information about filtering, see the Cisco APIC REST API Usage Guidelines on composing queries: https://www.cisco.com/c/en/us/td/docs/switches/datacenter/aci/apic/sw/
	Example: Single sensor path for NX-API	2-x/rest_cfg/2_1_x/b_Cisco_APIC_ REST_API_Configuration_Guide/b_ Cisco_APIC_REST_API_Configuration_ Guide_chapter_01.html#d25e1534a1635
	<pre>"telemetrySensorPath": { "attributes": { "path": "show interface", "path": "show bgp", "rn": "path-[sys/cdp]", "excludeFilter": "",</pre>	• alias - Specify an alias for this path.

Command or Action Purpose "filterCondition": "", "path": "sys/fm/bgp", "secondaryGroup": "0", "secondaryPath": "", "depth": "0" } **Example:** Multiple sensor paths "telemetrySensorPath": { "attributes": { "path": "sys/cdp", "rn": "path-[sys/cdp]", "excludeFilter": "", "filterCondition": "", "path": "sys/fm/bgp", "secondaryGroup": "0", "secondaryPath": "", "depth": "0" } } "telemetrySensorPath": { "attributes": { "excludeFilter": "", "filterCondition": "", "path": "sys/fm/dhcp", "secondaryGroup": "0", "secondaryPath": "", "depth": "0" } **Example:** Single sensor path filtering for BGP disable events: "telemetrySensorPath": { "attributes": { "path": "sys/cdp", "rn": "path-[sys/cdp]", "excludeFilter": "", "filterCondition": "eq(fmBgp.operSt.\"disabled\")", "path": "sys/fm/bgp", "secondaryGroup": "0", "secondaryPath": "", "depth": "0"

	Command or Action	Purpose
	}	
Step 13	Add sensor paths as child objects to the sensor group object (telemetrySensorGroup).	
Step 14	Add destinations as child objects to the destination group object (telemetryDestGroup).	
Step 15	Add the destination group object as a child object to the root element (telemetryEntity).	
Step 16	Create a relation object as a child object of the telemetry sensor group to associate the sensor group to the subscription. Example:	The relation object is of class telemetryRtSensorGroupRel and is a child object of telemetrySensorGroup. Configure the following attributes of the relation object: • rn — The relative name of the relation
	"telemetryRtSensorGroupRel": { "attributes": { "rn":	object in the format: rtsensorGroupRel-[sys/tm/subscription-id].
	"rtsensorGroupRel-[sys/tm/subs-30]", "tCl": "telemetrySubscription",	• tCl — The target class of the subscription object, which is telemetrySubscription.
	"tDn": "sys/tm/subs-30" } }	• tDn — The target distinguished name of the subscription object, which is sys/tm/ subscription-id.
Step 17	Create a relation object as a child object of the telemetry destination group to associate the destination group to the subscription. Example:	The relation object is of class telemetryRtDestGroupRel and is a child object of telemetryDestGroup . Configure the following attributes of the relation object:
	"telemetryRtDestGroupRel": { "attributes": { "rn":	• rn — The relative name of the relation object in the format: rtdestGroupRel-[sys/tm/subscription-id].
	"rtdestGroupRel-[sys/tm/subs-30]", "tCl": "telemetrySubscription",	• tCl — The target class of the subscription object, which is telemetrySubscription.
	"tDn": "sys/tm/subs-30" } }	• tDn — The target distinguished name of the subscription object, which is sys/tm / <i>subscription-id</i> .
Step 18	Create a relation object as a child object of the subscription to associate the subscription to the telemetry destination group.	The relation object is of class telemetryRsDestGroupRel and is a child object of telemetrySubscription. Configure
	<pre>Example: "telemetryRsDestGroupRel": { "attributes": { "rType": "mo", "rn":</pre>	 the following attributes of the relation object: rn — The relative name of the relation object in the format: rsdestGroupRel-[sys/tm/destination-group-id].

	Command or Action	Purpose
	<pre>"rsdestGroupRel-[sys/tm/dest-20]", "tCl": "telemetryDestGroup", "tDn": "sys/tm/dest-20", "tType": "mo" } }</pre>	 tCl — The class of the target (destination group) object, which is telemetryDestGroup. tDn — The distinguished name of the target (destination group) object, which is sys/tm/destination-group-id. rType — The relation type, which is mo for managed object.
		• tType — The target type, which is mo for managed object.
Step 19	Send the resulting JSON structure as an HTTP/HTTPS POST payload to the NX-API endpoint for telemetry configuration.	The base path for the telemetry entity is sys/tm and the NX-API endpoint is: {{URL}}/api/node/mo/sys/tm.json

Example

The following is an example of all the previous steps that are collected into one POST payload (note that some attributes may not match):

```
"telemetryEntity": {
  "children": [{
    "telemetrySensorGroup": {
      "attributes": {
        "id": "10"
      "children": [{
        "telemetrySensorPath": {
          "attributes": {
            "excludeFilter": "",
            "filterCondition": "",
            "path": "sys/fm/bgp",
            "secondaryGroup": "0",
            "secondaryPath": "",
            "depth": "0"
    "telemetryDestGroup": {
      "attributes": {
        "id": "20"
      "children": [{
        "telemetryDest": {
          "attributes": {
            "addr": "10.30.217.80",
            "port": "50051",
            "enc": "GPB",
```

```
"proto": "gRPC"
  ]
}
"telemetrySubscription": {
  "attributes": {
    "id": "30"
  "children": [{
    "telemetryRsSensorGroupRel": {
      "attributes": {
        "sampleIntvl": "5000",
        "tDn": "sys/tm/sensor-10"
    }
  },
    "telemetryRsDestGroupRel": {
      "attributes": {
        "tDn": "sys/tm/dest-20"
 ]
```

Configuration Example for Telemetry Using the NX-API

Streaming Paths to a Destination

This example creates a subscription that streams paths sys/cdp and sys/ipv4 to a destination 1.2.3.4 port 50001 every five seconds.

```
POST https://192.168.20.123/api/node/mo/sys/tm.json
Payload:
    "telemetryEntity": {
        "attributes": {
            "dn": "sys/tm"
        "children": [{
            "telemetrySensorGroup": {
                "attributes": {
                    "id": "10",
                    "rn": "sensor-10"
                }, "children": [{
                    "telemetryRtSensorGroupRel": {
                        "attributes": {
                            "rn": "rtsensorGroupRel-[sys/tm/subs-30]",
                            "tCl": "telemetrySubscription",
                            "tDn": "sys/tm/subs-30"
```

```
"telemetrySensorPath": {
            "attributes": {
                "path": "sys/cdp",
                "rn": "path-[sys/cdp]",
                "excludeFilter": "",
                "filterCondition": "",
                "secondaryGroup": "0",
                "secondaryPath": "",
                "depth": "0"
        }
        "telemetrySensorPath": {
            "attributes": {

                "enc": "GPB",
                "port": "50001",
                "proto": "gRPC",
                "rn": "addr-[1.2.3.4]-port-50001"
        }
    } ]
}
"telemetrySubscription": {
    "attributes": {
        "id": "30",
        "rn": "subs-30"
    "children": [{
        "telemetryRsDestGroupRel": {
            "attributes": {
                "rType": "mo",
```

```
"rn": "rsdestGroupRel-[sys/tm/dest-20]",
                         "tCl": "telemetryDestGroup",
                         "tDn": "sys/tm/dest-20",
                         "tType": "mo"
                }
                 "telemetryRsSensorGroupRel": {
                     "attributes": {
                         "rType": "mo",
                         "rn": "rssensorGroupRel-[sys/tm/sensor-10]",
                         "sampleIntvl": "5000",
                         "tCl": "telemetrySensorGroup",
                         "tDn": "sys/tm/sensor-10",
                         "tType": "mo"
                }
            } ]
       }
   } ]
}
```

Filter Conditions on BGP Notifications

The following example payload enables notifications that trigger when the BFP feature is disabled as per the filterCondition attribute in the telemetrySensorPath MO. The data is streamed to 10.30.217.80 port 50055.

```
POST https://192.168.20.123/api/node/mo/sys/tm.json
Payload:
  "telemetryEntity": {
    "children": [{
      "telemetrySensorGroup": {
        "attributes": {
          "id": "10"
        "children": [{
          "telemetrySensorPath": {
            "attributes": {
              "excludeFilter": "",
              "filterCondition": "eq(fmBgp.operSt, \"disabled\")",
              "path": "sys/fm/bgp",
              "secondaryGroup": "0",
              "secondaryPath": "",
              "depth": "0"
          }
        }
        ]
      }
    },
      "telemetryDestGroup": {
        "attributes": {
          "id": "20"
        "children": [{
          "telemetryDest": {
            "attributes": {
```

```
"addr": "10.30.217.80",
        "port": "50055",
       "enc": "GPB",

Using Postman Collection for Telemetry Configuration

An example Postman collection is an easy way to start configuring the telemetry feature, and can run all telemetry CLI equivalents in a single payload. Modify the file in the preceding link using your preferred text editor to update the payload to your needs, then open the collection in Postman and run the collection.

Telemetry Model in the DME

The telemetry application is modeled in the DME with the following structure:

```
model
|----package [name:telemetry]
| @name:telemetry
|----objects
|----mo [name:Entity]
| @name:Entity
| @label:Telemetry System
|--property
| @name:adminSt
| @type:AdminState
|
|----mo [name:SensorGroup]
| @name:SensorGroup
| @label:Sensor Group
```

```
|--property
         @name:id [key]
           @type:string:Basic
         @name:dataSrc
           @type:DataSource
    |----mo [name:SensorPath]
         | @name:SensorPath
               @label:Sensor Path
         |--property
              @name:path [key]
                @type:string:Basic
              @name:filterCondition
                @type:string:Basic
              @name:excludeFilter
                @type:string:Basic
              @name:depth
                @type:RetrieveDepth
|----mo [name:DestGroup]
        @name:DestGroup
           @label:Destination Group
    |--property
         @name:id
           @type:string:Basic
    |----mo [name:Dest]
            @name:Dest
               @label:Destination
         |--property
              @name:addr [key]
               @type:address:Ip
              @name:port [key]
                @type:scalar:Uint16
              @name:proto
               @type:Protocol
              @name:enc
                @type:Encoding
|----mo [name:Subscription]
       @name:Subscription
          @label:Subscription
    |--property

              @cardinality:ntom
              @label:Link to destGroup entry
```

Telemetry Path Labels

About Telemetry Path Labels

Beginning with NX-OS release 9.3(1), model-driven telemetry supports path labels. Path labels provide an easy way to gather telemetry data from multiple sources at once. With this feature, you specify the type of telemetry data you want collected, and the telemetry feature gathers that data from multiple paths. The feature then returns the information to one consolidated place, the path label. This feature simplifies using telemetry because you no longer must:

- Have a deep and comprehensive knowledge of the Cisco DME model.
- Create multiple queries and add multiple paths to the subscription, while balancing the number of collected events and the cadence.
- Collect multiple chunks of telemetry information from the switch, which simplifies serviceability.

Path labels span across multiple instances of the same object type in the model, then gather and return counters or events. Path labels support the following telemetry groups:

- Environment, which monitors chassis information, including fan, temperature, power, storage, supervisors, and line cards.
- Interface, which monitors all the interface counters and status changes.
- This label supports predefined keyword filters that can refine the returned data by using the **query-condition** command.
- Resources, which monitors system resources such as CPU utilization and memory utilization.
- VXLAN, which monitors VXLAN EVPNs including VXLAN peers, VXLAN counters, VLAN counters, and BGP Peer data.

Polling for Data or Receiving Events

The sample interval for a sensor group determines how and when telemetry data is transmitted to a path label. The sample interval can be configured either to periodically poll for telemetry data or gather telemetry data when events occur.

- When the sample interval for telemetry is configured as a non-zero value, telemetry periodically sends the data for the environment, interfaces, resources, and VXLAN labels during each sample interval.
- When the sample interval is set to zero, telemetry sends event notifications when the environment, interfaces, resources, and VXLAN labels experience operational state updates, as well as creation and deletion of MOs.

Polling for data or receiving events are mutually exclusive. You can configure polling or event-driven telemetry for each path label.

Guidelines and Limitations for Path Labels

The telemetry path labels feature has the following guidelines and limitations:

- The feature supports only Cisco DME data source only.
- You cannot mix and match usability paths with regular DME paths in the same sensor group. For example, you cannot configure <code>sys/intf</code> and <code>interface</code> in the same sensor group. Also, you cannot configure the same sensor group with <code>sys/intf</code> and <code>interface</code>. If this situation occurs, NX-OS rejects the configuration.
- User filter keywords, such as oper-speed and counters=[detailed], are supported only for the interface path.
- The feature does not support other sensor path options, such as depth or filter-condition.

Configuring the Interface Path to Poll for Data or Events

The interface path label monitors all the interface counters and status changes. It supports the following interface types:

- Physical
- Subinterface
- Management
- Loopback
- VLAN
- Port Channel

You can configure the interface path label to either periodically poll for data or receive events. See Polling for Data or Receiving Events, on page 42.

Note

The model does not support counters for subinterface, loopback, or VLAN, so they are not streamed out.

	Command or Action	Purpose
Step 1	configure terminal	Enter configuration mode.
	Example:	
	<pre>switch-1# configure terminal switch-1(config)#</pre>	
Step 2	telemetry	Enter configuration mode for the telemetry
	Example:	features.
	<pre>switch-1(config) # telemetry switch-1(config-telemetry) #</pre>	

	Command or Action	Purpose
Step 3	sensor-group sgrp_id	Create a sensor group for telemetry data.
	Example:	
	switch-1(config-telemetry)# sensor-group 6	
	switch-1(conf-tm-sensor)#	
Step 4	path interface	Configure the interface path label, which
	<pre>Example: switch-1(conf-tm-sensor)# path interface switch-1(conf-tm-sensor)#</pre>	enables sending one telemetry data query for multiple individual interfaces. The label
		Depending on how the polling interval is configured, interface data is sent based on a periodic basis or whenever the interface state changes.
Step 5	destination-group grp_id	Enter telemetry destination group submode and
	Example:	configure the destination group.
	<pre>switch-1(conf-tm-sensor) # destination-group 33 switch-1(conf-tm-dest) #</pre>	
Step 6	ip address ip_addr port port	Configure the telemetry data for the subscription
	Example:	to stream to the specified IP address and port.
	switch-1(conf-tm-dest)# ip address	
	1.2.3.4 port 50004 switch-1(conf-tm-dest)#	
Step 7	subscription sub_id	Enter telemetry subscription submode, and
-	Example:	configure the telemetry subscription.
	<pre>switch-1(conf-tm-dest)# subscription 33 switch-1(conf-tm-sub)#</pre>	
Step 8	snsr-group sgrp_id sample-interval interval	Link the sensor group to the current subscription
	Example:	and set the data sampling interval in milliseconds. The sampling interval determines
	<pre>switch-1(conf-tm-sub) # snsr-grp 6 sample-interval 5000</pre>	whether the switch sends telemetry data
	switch-1 (conf-tm-sub) #	periodically, or when interface events occur.
Step 9	dst-group dgrp_id	Link the destination group to the current
-	Example:	subscription. The destination group that you specify must match the destination group that
	<pre>switch-1(conf-tm-sub) # dst-grp 33 switch-1(conf-tm-sub) #</pre>	you configured in the destination-group command.

Configuring the Interface Path for Non-Zero Counters

You can configure the interface path label with a predefined keyword filter that returns only counters that have nonzero values. The filter is counters=[detailed].

By using this filter, the interface path gathers all the available interface counters, filters the collected data, then forwards the results to the receiver. The filter is optional, and if you do not use it, all counters, including zero-value counters, are displayed for the interface path.

Note

Using the filter is conceptually similar to issuing show interface mgmt0 counters detailed

	Command or Action	Purpose
Step 1	configure terminal	Enter configuration mode.
	Example:	
	<pre>switch-1# configure terminal switch-1(config)#</pre>	
Step 2	telemetry	Enter configuration mode for the telemetry
	Example:	features.
	<pre>switch-1(config)# telemetry switch-1(config-telemetry)#</pre>	
Step 3	sensor-group sgrp_id	Create a sensor group for telemetry data.
	Example:	
	switch-1(config-telemetry)# sensor-group	
	<pre>6 switch-1(conf-tm-sensor)#</pre>	
Step 4	path interface query-condition counters=[detailed]	Configure the interface path label and query for only the nonzero counters from all interfaces.
	Example:	
	<pre>switch-1(conf-tm-sensor)# path interface query-condition counters=[detailed] switch-1(conf-tm-sensor)#</pre>	
Step 5	destination-group grp_id	Enter telemetry destination group submode and configure the destination group.
	Example:	
	<pre>switch-1 (conf-tm-sensor) # destination-group 33 switch-1 (conf-tm-dest) #</pre>	
Step 6	ip address ip_addr port port	Configure the telemetry data for the subscription
	Example:	to stream to the specified IP address and port.
	<pre>switch-1(conf-tm-dest) # ip address 1.2.3.4 port 50004 switch-1(conf-tm-dest) #</pre>	

	Command or Action	Purpose
Step 7	subscription sub_id	Enter telemetry subscription submode, and configure the telemetry subscription.
	Example:	
	<pre>switch-1(conf-tm-dest) # subscription 33 switch-1(conf-tm-sub) #</pre>	
Step 8	snsr-group sgrp_id sample-interval interval	Link the sensor group to the current subscription
	Example:	and set the data sampling interval in milliseconds. The sampling interval determines
	<pre>switch-1(conf-tm-sub) # snsr-grp 6 sample-interval 5000 switch-1(conf-tm-sub) #</pre>	whether the switch sends telemetry data periodically, or when interface events occur.
Step 9	dst-group dgrp_id	Link the destination group to the current
	Example:	subscription. The destination group that you specify must match the destination group that
	<pre>switch-1(conf-tm-sub) # dst-grp 33 switch-1(conf-tm-sub) #</pre>	you configured in the destination-group command.

Configuring the Interface Path for Operational Speeds

You can configure the interface path label with a pre-defined keyword filter that returns counters for interfaces of specified operational speeds. The filter is <code>oper-speed=[]</code>. The following operational speeds are supported: auto, 10M, 100M, 1G, 10G, 40G, 200G, and 400G.

By using this filter, the interface path gathers the telemetry data for interfaces of the specified speed, then forwards the results to the receiver. The filter is optional. If you do not use it, counters for all interfaces are displayed, regardless of their operational speed.

The filter can accept multiple speeds as a comma-separated list, for example oper-speed=[1G, 10G] to retrieve counters for interfaces that operate at 1 and 10 Gbps. Do not use a blank space as a delimiter.

Note

Interface types subinterface, loopback, and VLAN do not have operational speed properties, so the filter does not support these interface types.

	Command or Action	Purpose
Step 1	configure terminal	Enter configuration mode.
	Example:	
	<pre>switch-1# configure terminal switch-1(config)#</pre>	
Step 2	telemetry	Enter configuration mode for the telemetry
	Example:	features.
	<pre>switch-1(config) # telemetry switch-1(config-telemetry) #</pre>	

	Command or Action	Purpose
Step 3	<pre>snsr-group sgrp_id sample-interval interval Example: switch-1(conf-tm-sub) # snsr-grp 6 sample-interval 5000 switch-1(conf-tm-sub) #</pre>	Link the sensor group to the current subscription and set the data sampling interval in milliseconds. The sampling interval determines whether the switch sends telemetry data periodically, or when interface events occur.
Step 4	<pre>path interface query-condition oper-speed=[speed] Example: switch-1(conf-tm-sensor) # path interface query-condition oper-speed=[1G,40G] switch-1(conf-tm-sensor) #</pre>	Configure the interface path label and query for counters from interfaces running the specified speed, which in this example, is 1 and 40 Gbps only.
Step 5	<pre>destination-group grp_id Example: switch-1 (conf-tm-sensor) # destination-group 33 switch-1 (conf-tm-dest) #</pre>	Enter telemetry destination group submode and configure the destination group.
Step 6	<pre>ip address ip_addr port port Example: switch-1(conf-tm-dest) # ip address 1.2.3.4 port 50004 switch-1(conf-tm-dest) #</pre>	Configure the telemetry data for the subscription to stream to the specified IP address and port.
Step 7	<pre>subscription sub_id Example: switch-1(conf-tm-dest) # subscription 33 switch-1(conf-tm-sub) #</pre>	Enter telemetry subscription submode, and configure the telemetry subscription.
Step 8	<pre>snsr-group sgrp_id sample-interval interval Example: switch-1(conf-tm-sub) # snsr-grp 6 sample-interval 5000 switch-1(conf-tm-sub) #</pre>	Link the sensor group to the current subscription and set the data sampling interval in milliseconds. The sampling interval determines whether the switch sends telemetry data periodically, or when interface events occur.
Step 9	<pre>dst-group dgrp_id Example: switch-1(conf-tm-sub) # dst-grp 33 switch-1(conf-tm-sub) #</pre>	Link the destination group to the current subscription. The destination group that you specify must match the destination group that you configured in the destination-group command.

Configuring the Interface Path with Multiple Queries

You can configure multiple filters for the same query condition in the interface path label. When you do so, the individual filters you use are ANDed.

Separate each filter in the query condition by using a comma. You can specify any number of filters for the query-condition, but the more filters you add, the more focused the results become.

	Command or Action	Purpose
Step 1	configure terminal	Enter configuration mode.
	Example:	
	<pre>switch-1# configure terminal switch-1(config)#</pre>	
Step 2	telemetry	Enter configuration mode for the telemetry
	Example:	features.
	<pre>switch-1(config) # telemetry switch-1(config-telemetry) #</pre>	
Step 3	sensor-group sgrp_id	Create a sensor group for telemetry data.
	Example:	
	switch-1(config-telemetry)# sensor-group	
	6 switch-1(conf-tm-sensor)#	
Step 4	path interface query-condition counters=[detailed],oper-speed=[1G,40G]	Configures multiple conditions in the same query. In this example, the query does both of
	Example:	the following:
	<pre>switch-1(conf-tm-sensor) # path interface query-condition counters=[detailed],oper-speed=[1G,40G] switch-1(conf-tm-sensor) #</pre>	• Gathers and returns non-zero counters on interfaces running at 1 Gbps.
		• Gathers and returns non-zero counters on interfaces running at 40 Gbps.
Step 5	destination-group grp_id	Enter telemetry destination group submode and
	Example:	configure the destination group.
	switch-1(conf-tm-sensor)#	
	<pre>destination-group 33 switch-1(conf-tm-dest)#</pre>	
Step 6	ip address ip_addr port port	Configure the telemetry data for the subscription
	Example:	to stream to the specified IP address and port.
	<pre>switch-1 (conf-tm-dest) # ip address 1.2.3.4 port 50004 switch-1 (conf-tm-dest) #</pre>	
Step 7	subscription sub_id	Enter telemetry subscription submode, and
	Example:	configure the telemetry subscription.
	<pre>switch-1(conf-tm-dest)# subscription 33 switch-1(conf-tm-sub)#</pre>	

	Command or Action	Purpose
Step 8	<pre>snsr-group sgrp_id sample-interval interval Example: switch-1(conf-tm-sub) # snsr-grp 6 sample-interval 5000 switch-1(conf-tm-sub) #</pre>	Link the sensor group to the current subscription and set the data sampling interval in milliseconds. The sampling interval determines whether the switch sends telemetry data periodically, or when interface events occur.
Step 9	<pre>dst-group dgrp_id Example: switch-1(conf-tm-sub)# dst-grp 33 switch-1(conf-tm-sub)#</pre>	Link the destination group to the current subscription. The destination group that you specify must match the destination group that you configured in the destination-group command.

Configuring the Environment Path to Poll for Data or Events

The environment path label monitors chassis information, including fan, temperature, power, storage, supervisors, and line cards. You can configure the environment path to either periodically poll for telemetry data or get the data when events occur. For information, see Polling for Data or Receiving Events, on page 42.

You can set the resources path to return system resource information through either periodic polling or based on events. This path does not support filtering.

	Command or Action	Purpose
Step 1	configure terminal	Enter configuration mode.
	Example:	
	<pre>switch-1# configure terminal switch-1(config)#</pre>	
Step 2	telemetry	Enter configuration mode for the telemetry
	<pre>Example: switch-1(config) # telemetry switch-1(config-telemetry) #</pre>	features.
Step 3	sensor-group sgrp_id	Create a sensor group for telemetry data.
	Example:	
	<pre>switch-1(config-telemetry) # sensor-group 6 switch-1(conf-tm-sensor) #</pre>	
Step 4	path environment	Configures the environment path label, which
	Example:	enables telemetry data for multiple individual
	<pre>switch-1 (conf-tm-sensor) # path environment switch-1 (conf-tm-sensor) #</pre>	environment objects to be sent to the label. The label consolidates the multiple data inputs into one output.

	Command or Action	Purpose
		Depending on the sample interval, the environment data is either streaming based on the polling interval, or sent when events occur.
Step 5	<pre>destination-group grp_id Example: switch-1(conf-tm-sensor) # destination-group 33 switch-1(conf-tm-dest) #</pre>	Enter telemetry destination group submode and configure the destination group.
Step 6	<pre>ip address ip_addr port port Example: switch-1(conf-tm-dest) # ip address 1.2.3.4 port 50004 switch-1(conf-tm-dest) #</pre>	Configure the telemetry data for the subscription to stream to the specified IP address and port.
Step 7	<pre>subscription sub_id Example: switch-1(conf-tm-dest) # subscription 33 switch-1(conf-tm-sub) #</pre>	Enter telemetry subscription submode, and configure the telemetry subscription.
Step 8	<pre>snsr-group sgrp_id sample-interval interval Example: switch-1(conf-tm-sub) # snsr-grp 6 sample-interval 5000 switch-1(conf-tm-sub) #</pre>	Link the sensor group to the current subscription and set the data sampling interval in milliseconds. The sampling interval determines whether the switch sends telemetry data periodically, or when environment events occur.
Step 9	<pre>dst-group dgrp_id Example: switch-1(conf-tm-sub) # dst-grp 33 switch-1(conf-tm-sub) #</pre>	Link the destination group to the current subscription. The destination group that you specify must match the destination group that you configured in the destination-group command.

Configuring the Resources Path for Poll for Events or Data

The resources path monitors system resources such as CPU utilization and memory utilization. You can configure this path to either periodically gather telemetry data, or when events occur. See Polling for Data or Receiving Events, on page 42.

This path does not support filtering.

	Command or Action	Purpose
Step 1	configure terminal	Enter configuration mode.
	Example:	
	<pre>switch-1# configure terminal switch-1(config)#</pre>	

	Command or Action	Purpose
Step 2	<pre>telemetry Example: switch-1(config) # telemetry switch-1(config-telemetry) #</pre>	Enter configuration mode for the telemetry features.
Step 3	<pre>sensor-group sgrp_id Example: switch-1(config-telemetry) # sensor-group 6 switch-1(conf-tm-sensor) #</pre>	Create a sensor group for telemetry data.
Step 4	<pre>path resources Example: switch-1(conf-tm-sensor) # path resources switch-1(conf-tm-sensor) #</pre>	Configure the resources path label, which enables telemetry data for multiple individual system resources to be sent to the label. The label consolidates the multiple data inputs into one output. Depending on the sample interval, the resource data is either streaming based on the polling interval, or sent when system memory changes to Not OK.
Step 5	<pre>destination-group grp_id Example: switch-1(conf-tm-sensor) # destination-group 33 switch-1(conf-tm-dest) #</pre>	Enter telemetry destination group submode and configure the destination group.
Step 6	<pre>ip address ip_addr port port Example: switch-1 (conf-tm-dest) # ip address 1.2.3.4 port 50004 switch-1 (conf-tm-dest) #</pre>	Configure the telemetry data for the subscription to stream to the specified IP address and port.
Step 7	<pre>subscription sub_id Example: switch-1(conf-tm-dest) # subscription 33 switch-1(conf-tm-sub) #</pre>	Enter telemetry subscription submode, and configure the telemetry subscription.
Step 8	<pre>snsr-group sgrp_id sample-interval interval Example: switch-1(conf-tm-sub) # snsr-grp 6 sample-interval 5000 switch-1(conf-tm-sub) #</pre>	Link the sensor group to the current subscription and set the data sampling interval in milliseconds. The sampling interval determines whether the switch sends telemetry data periodically, or when resource events occur.
Step 9	<pre>dst-group dgrp_id Example: switch-1(conf-tm-sub)# dst-grp 33 switch-1(conf-tm-sub)#</pre>	Link the destination group to the current subscription. The destination group that you specify must match the destination group that

Command or Action	Purpose
	you configured in the destination-group
	command.

Configuring the VXLAN Path to Poll for Events or Data

The VXLAN path label provides information about the switch's Virtual Extensible LAN EVPNs, including VXLAN peers, VXLAN counters, VLAN counters, and BGP Peer data. You can configure this path label to gather telemetry information either periodically, or when events occur. See Polling for Data or Receiving Events, on page 42.

This path does not support filtering.

	Command or Action	Purpose
Step 1	configure terminal	Enter configuration mode.
	Example:	
	<pre>switch-1# configure terminal switch-1(config)#</pre>	
Step 2	telemetry	Enter configuration mode for the telemetry
	Example:	features.
	<pre>switch-1(config)# telemetry switch-1(config-telemetry)#</pre>	
Step 3	sensor-group sgrp_id	Create a sensor group for telemetry data.
	Example:	
	<pre>switch-1(config-telemetry) # sensor-group 6 switch-1(conf-tm-sensor) #</pre>	
Step 4	vxlan environment	Configure the VXLAN path label, which
	Example:	enables telemetry data for multiple individual
	switch-1(conf-tm-sensor)# vxlan	VXLAN objects to be sent to the label. The label consolidates the multiple data inputs into
	<pre>environment switch-1(conf-tm-sensor)#</pre>	one output. Depending on the sample interval,
		the VXLAN data is either streaming based on the polling interval, or sent when events occur.
Step 5	destination-group grp_id	Enter telemetry destination group submode and
	Example:	configure the destination group.
	switch-1(conf-tm-sensor)#	
	<pre>destination-group 33 switch-1(conf-tm-dest)#</pre>	
Step 6	ip address ip_addr port port	Configure the telemetry data for the subscription
	Example:	to stream to the specified IP address and port.

	Command or Action	Purpose
	<pre>switch-1(conf-tm-dest) # ip address 1.2.3.4 port 50004 switch-1(conf-tm-dest) #</pre>	
Step 7	<pre>subscription sub_id Example: switch-1(conf-tm-dest) # subscription 33 switch-1(conf-tm-sub) #</pre>	Enter telemetry subscription submode, and configure the telemetry subscription.
Step 8	<pre>snsr-group sgrp_id sample-interval interval Example: switch-1(conf-tm-sub) # snsr-grp 6 sample-interval 5000 switch-1(conf-tm-sub) #</pre>	Link the sensor group to the current subscription and set the data sampling interval in milliseconds. The sampling interval determines whether the switch sends telemetry data periodically, or when VXLAN events occur.
Step 9	<pre>dst-group dgrp_id Example: switch-1(conf-tm-sub) # dst-grp 33 switch-1(conf-tm-sub) #</pre>	Link the destination group to the current subscription. The destination group that you specify must match the destination group that you configured in the destination-group command.

Verifying the Path Label Configuration

At any time, you can verify that path labels are configured, and check their values by displaying the running telemetry configuration.

	Command or Action	Purpose
Step 1	show running-config-telemetry	Displays the current running config for
·	Example: switch-1(conf-tm-sensor) # show running-config telemetry !Command: show running-config telemetry !Running configuration last done at: Mon Jun 10 08:10:17 2019 !Time: Mon Jun 10 08:10:17 2019	telemetry, In this example, sensor group 4 is configured to gather non-zero counters from interfaces running at 1 and 10 Gbps. Sensor group 6 is configured to gather all counters from interface
	version 9.3(1) Bios:version feature telemetry	
	telemetry destination-profile use-nodeid tester sensor-group 4 path interface query-condition and(counters=[detailed],oper-speed=[1G,10G])	
	sensor-group 6 path interface query-condition oper-speed=[1G,40G]	

Command or Action	Purpose
subscription 6 snsr-grp 6 sample-interval 6000 nxosv2(conf-tm-sensor)#	

Displaying Path Label Information

Path Label Show Commands

Through the **show telemetry usability** commands, you can display the individual paths that the path label walks when you issue a query.

Command	Shows
show telemetry usability {all environment interface resources vxlan}	Either all telemetry paths for all path labels, or all telemetry paths for a specified path label. Also, the output shows whether each path reports telemetry data based on periodic polling or events. For the interfaces path label, also any keyword filters or query conditions you configured.
show running-config telemetry	The running configuration for telemetry and selected path information.

Command Examples

Note

The **show telemetry usability all** command is a concatenation of all the individual commands that are shown in this section.

The following shows an example of the **show telemetry usability environment** command.

```
switch-1# show telemetry usability environment
```

Native Data Source Paths

switch-1#

About Native Data Source Paths

NX-OS Telemetry supports the native data source, which is a neutral data source that is not restricted to a specific infrastructure or database. Instead, the native data source enables components or applications to hook into and inject relevant information into the outgoing telemetry stream. This feature provides flexibility because the path for the native data source does not belong to any infrastructure, so any native applications can interact with NX-OS Telemetry.

The native data source path enables you to subscribe to specific sensor paths to receive selected telemetry data. The feature works with the NX-SDK to support streaming telemetry data from the following paths:

- RIB path, which sends telemetry data for the IP routes.
- MAC path, which sends telemetry data for static and dynamic MAC entries.
- Adjacency path, which sends telemetry data for IPv4 and IPv6 adjacencies.

When you create a subscription, all telemetry data for the selected path streams to the receiver as a baseline. After the baseline, only event notifications stream to the receiver.

Streaming of native data source paths supports the following encoding types:

- Google Protobuf (GPB)
- JavaScript Object Notation (JSON)
- Compact Google Protobuf (compact GPB)

Telemetry Data Streamed for Native Data Source Paths

For each source path, the following table shows the information that is streamed when the subscription is first created (the baseline) and when event notifications occur.

Path Type	Subscription Baseline	Event Notifications
RIB	Sends all routes	Sends event notifications for create, update, and delete events. The following values are exported through telemetry for the RIB path:
		• Next-hop routing information:
		• Address of the next hop
		Outgoing interface for the next hop
		• VRF name for the next hop
		• Owner of the next hop
		• Preference for the next hop
		• Metric for the next hop
		• Tag for the next hop
		• Segment ID for the next hop
		• Tunnel ID for the next hop
		• Encapsulation type for the next hop
		Bitwise OR of flags for the Next Hop Type
		• For Layer-3 routing information:
		• VRF name of the route
		Route prefix address
		Mask length for the route
		• Number of next hops for the route
		• Event type
		• Next hops

Path Type	Subscription Baseline	Event Notifications
MAC	Executes a GETALL from DME for static and dynamic MAC entries	Sends event notifications for add, update, and delete events. The following values are exported through telemetry for the MAC path:
		• MAC address
		MAC address type
		• VLAN number
		Interface name
		• Event types
		Both static and dynamic entires are supported in event notifications.
Adjacency	Sends the IPv4 and IPv6 adjacencies	Sends event notifications for add, update, and delete events. The following values are exported through telemetry for the Adjacency path:
		• IP address
		• MAC address
		Interface name
		Physical interface name
		• VRF name
		Preference
		Source for the adjacency
		Address family for the adjacency
		Adjacency event type

For additional information, refer to Github https://github.com/CiscoDevNet/nx-telemetry-proto.

Guidelines and Limitations for Native Data Source Path

The native data source path feature has the following guidelines and limitations:

• For streaming from the RIB, MAC, and Adjacency native data source paths, sensor-path property updates do not support custom criteria like **depth**, **query-condition**, or **filter-condition**.

Configuring the Native Data Source Path for Routing Information

You can configure the native data source path for routing information, which sends information about all routes that are contained in the URIB. When you subscribe, the baseline sends all the route information. After the baseline, notifications are sent for route update and delete operations for the routing protocols that the switch supports. For the data sent in the RIB notifications, see Telemetry Data Streamed for Native Data Source Paths, on page 57.

Before you begin

If you have not enabled the telemetry feature, enable it now (feature telemetry).

	Command or Action	Purpose
Step 1	configure terminal	Enter configuration mode.
	Example:	
	<pre>switch-1# configure terminal switch-1(config)#</pre>	
Step 2	telemetry	Enter configuration mode for the telemetry
	Example:	features.
	<pre>switch-1(config)# telemetry switch-1(config-telemetry)#</pre>	
Step 3	sensor-group sgrp_id	Create a sensor group.
	Example:	
	<pre>switch-1(conf-tm-sub)# sensor-grp 6 switch-1(conf-tm-sub)#</pre>	
Step 4	data-source native	Set the data source to native so that any natiapplication can use the streamed data without the stream data and the stream data are streamed data without the stream data and the stream data are streamed data without the stream data are streamed data without the streamed data withou
	Example:	
	switch-1(conf-tm-sensor)# data-source	requiring a specific model or database.
	<pre>native switch-1(conf-tm-sensor)#</pre>	
Step 5	path rib	Configure the RIB path which streams routes
	Example:	and route update information.
	nxosv2(conf-tm-sensor)# path rib	
	nxosv2(conf-tm-sensor)#	
Step 6		Enter telemetry destination group submode
	Example:	and configure the destination group.
	switch-1(conf-tm-sensor)#	
	<pre>destination-group 33 switch-1(conf-tm-dest)#</pre>	

	Command or Action	Purpose
Step 7	ip address ip_addr port port protocol { HTTP gRPC } encoding { JSON GPB GPB-compact }	Configure the telemetry data for the subscription to stream to the specified IP address and port and set the protocol and
	Example:	encoding for the data stream.
	<pre>switch-1(conf-tm-dest) # ip address 192.0.2.11 port 50001 protocol http encoding json switch-1(conf-tm-dest) #</pre>	
	Example:	
	<pre>switch-1(conf-tm-dest) # ip address 192.0.2.11 port 50001 protocol grpc encoding gpb switch-1(conf-tm-dest) #</pre>	
	Example:	
	<pre>switch-1(conf-tm-dest) # ip address 192.0.2.11 port 50001 protocol grpc encoding gpb-compact switch-1(conf-tm-dest) #</pre>	
Step 8	subscription sub_id Example:	Enter telemetry subscription submode, and configure the telemetry subscription.
	<pre>switch-1(conf-tm-dest)# subscription 33 switch-1(conf-tm-sub)#</pre>	
Step 9	snsr-group sgrp_id sample-interval interval	Link the sensor group to the current
	Example:	subscription and set the data sampling interval in milliseconds. The sampling interval
	<pre>switch-1(conf-tm-sub) # snsr-grp 6 sample-interval 5000 switch-1(conf-tm-sub) #</pre>	determines whether the switch sends telemetry data periodically, or when interface events occur.
Step 10	dst-group dgrp_id	Link the destination group to the current
	Example:	subscription. The destination group that you
	<pre>switch-1(conf-tm-sub) # dst-grp 33 switch-1(conf-tm-sub) #</pre>	specify must match the destination group that you configured in the destination-group command.

Configuring the Native Data Source Path for MAC Information

You can configure the native data source path for MAC information, which sends information about all entries in the MAC table. When you subscribe, the baseline sends all the MAC information. After the baseline, notifications are sent for add, update, and delete MAC address operations. For the data sent in the MAC notifications, see Telemetry Data Streamed for Native Data Source Paths, on page 57.

Note

For update or delete events, MAC notifications are sent only for the MAC addresses that have IP adjacencies.

Before you begin

If you have not enabled the telemetry feature, enable it now (feature telemetry).

	Command or Action	Purpose
Step 1	configure terminal	Enter configuration mode.
	Example: switch-1# configure terminal switch-1 (config) #	
Step 2	<pre>telemetry Example: switch-1(config) # telemetry switch-1(config-telemetry) #</pre>	Enter configuration mode for the telemetry features.
Step 3	<pre>sensor-group sgrp_id Example: switch-1(conf-tm-sub) # sensor-grp 6 switch-1(conf-tm-sub) #</pre>	Create a sensor group.
Step 4	<pre>data-source native Example: switch-1(conf-tm-sensor) # data-source native switch-1(conf-tm-sensor) #</pre>	Set the data source to native so that any native application can use the streamed data without requiring a specific model or database.
Step 5	<pre>path mac Example: nxosv2(conf-tm-sensor)# path mac nxosv2(conf-tm-sensor)#</pre>	Configure the MAC path which streams information about MAC entries and MAC notifications.
Step 6	<pre>destination-group grp_id Example: switch-1(conf-tm-sensor) # destination-group 33 switch-1(conf-tm-dest) #</pre>	Enter telemetry destination group submode and configure the destination group.
Step 7	<pre>ip address ip_addr port port protocol { HTTP gRPC } encoding { JSON GPB GPB-compact } Example: switch-1(conf-tm-dest) # ip address 192.0.2.11 port 50001 protocol http encoding json switch-1(conf-tm-dest) # Example:</pre>	Configure the telemetry data for the subscription to stream to the specified IP address and port and set the protocol and encoding for the data stream.

	Command or Action	Purpose
	<pre>switch-1(conf-tm-dest) # ip address 192.0.2.11 port 50001 protocol grpc encoding gpb switch-1(conf-tm-dest) #</pre>	
	Example:	
	<pre>switch-1(conf-tm-dest) # ip address 192.0.2.11 port 50001 protocol grpc encoding gpb-compact switch-1(conf-tm-dest) #</pre>	
Step 8	<pre>subscription sub_id Example: switch-1(conf-tm-dest) # subscription 33 switch-1(conf-tm-sub) #</pre>	Enter telemetry subscription submode, and configure the telemetry subscription.
Step 9	<pre>snsr-group sgrp_id sample-interval interval Example: switch-1(conf-tm-sub) # snsr-grp 6 sample-interval 5000 switch-1(conf-tm-sub) #</pre>	Link the sensor group to the current subscription and set the data sampling interval in milliseconds. The sampling interval determines whether the switch sends telemetry data periodically, or when interface events occur.
Step 10	<pre>dst-group dgrp_id Example: switch-1(conf-tm-sub) # dst-grp 33 switch-1(conf-tm-sub) #</pre>	Link the destination group to the current subscription. The destination group that you specify must match the destination group that you configured in the destination-group command.

Configuring the Native Data Source Path for All MAC Information

You can configure the native data source path for MAC information, which sends information about all entries in the MAC table from Layer 3 and Layer 2. When you subscribe, the baseline sends all the MAC information. After the baseline, notifications are sent for add, update, and delete MAC address operations. For the data sent in the MAC notifications, see Telemetry Data Streamed for Native Data Source Paths, on page 57.

Note

For update or delete events, MAC notifications are sent only for the MAC addresses that have IP adjacencies.

Before you begin

If you have not enabled the telemetry feature, enable it now (feature telemetry).

	Command or Action	Purpose
Step 1	configure terminal	Enter configuration mode.
	Example:	

	Command or Action	Purpose
	<pre>switch-1# configure terminal switch-1 (config) #</pre>	
Step 2	<pre>telemetry Example: switch-1(config) # telemetry switch-1(config-telemetry) #</pre>	Enter configuration mode for the telemetry features.
Step 3	<pre>sensor-group sgrp_id Example: switch-1(conf-tm-sub) # sensor-grp 6 switch-1(conf-tm-sub) #</pre>	Create a sensor group.
Step 4	<pre>data-source native Example: switch-1(conf-tm-sensor) # data-source native switch-1(conf-tm-sensor) #</pre>	Set the data source to native so that any native application can use the streamed data without requiring a specific model or database.
Step 5	<pre>path mac-all Example: nxosv2(conf-tm-sensor)# path mac-all nxosv2(conf-tm-sensor)#</pre>	Configure the MAC path which streams information about all MAC entries and MAC notifications.
Step 6	<pre>destination-group grp_id Example: switch-1 (conf-tm-sensor) # destination-group 33 switch-1 (conf-tm-dest) #</pre>	Enter telemetry destination group submode and configure the destination group.
Step 7	<pre>ip address ip_addr port port protocol { HTTP gRPC } encoding { JSON GPB GPB-compact } Example: switch-1(conf-tm-dest) # ip address 192.0.2.11 port 50001 protocol http encoding json switch-1(conf-tm-dest) # Example: switch-1(conf-tm-dest) # ip address 192.0.2.11 port 50001 protocol grpc encoding gpb switch-1(conf-tm-dest) # Example: switch-1(conf-tm-dest) # ip address 192.0.2.11 port 50001 protocol grpc encoding gpb-compact switch-1(conf-tm-dest) #</pre>	Configure the telemetry data for the subscription to stream to the specified IP address and port and set the protocol and encoding for the data stream.

	Command or Action	Purpose
Step 8	<pre>subscription sub_id Example: switch-1(conf-tm-dest) # subscription 33 switch-1(conf-tm-sub) #</pre>	Enter telemetry subscription submode, and configure the telemetry subscription.
Step 9	<pre>snsr-group sgrp_id sample-interval interval Example: switch-1(conf-tm-sub) # snsr-grp 6 sample-interval 5000 switch-1(conf-tm-sub) #</pre>	Link the sensor group to the current subscription and set the data sampling interval in milliseconds. The sampling interval determines whether the switch sends telemetry data periodically, or when interface events occur.
Step 10	<pre>dst-group dgrp_id Example: switch-1(conf-tm-sub) # dst-grp 33 switch-1(conf-tm-sub) #</pre>	Link the destination group to the current subscription. The destination group that you specify must match the destination group that you configured in the destination-group command.

Configuring the Native Data Path for IP Adjacencies

You can configure the native data source path for IP adjacency information, which sends information about all IPv4 and IPv6 adjacencies for the switch. When you subscribe, the baseline sends all the adjacencies. After the baseline, notifications are sent for add, update, and delete adjacency operations. For the data sent in the adjacency notifications, see Telemetry Data Streamed for Native Data Source Paths, on page 57.

Before you begin

If you have not enabled the telemetry feature, enable it now (**feature telemetry**).

	Command or Action	Purpose
Step 1	configure terminal	Enter configuration mode.
	Example:	
	<pre>switch-1# configure terminal switch-1(config)#</pre>	
Step 2	telemetry	Enter configuration mode for the telemetry features.
	Example:	
	<pre>switch-1(config) # telemetry switch-1(config-telemetry) #</pre>	
Step 3	sensor-group sgrp_id	Create a sensor group.
	Example:	
	<pre>switch-1(conf-tm-sub)# sensor-grp 6 switch-1(conf-tm-sub)#</pre>	

	Command or Action	Purpose
Step 4	<pre>data-source native Example: switch-1(conf-tm-sensor) # data-source native switch-1(conf-tm-sensor) #</pre>	Set the data source to native so that any native application can use the streamed data.
Step 5	<pre>path adjacency Example: nxosv2(conf-tm-sensor) # path adjacency nxosv2(conf-tm-sensor) #</pre>	Configure the Adjacency path which streams information about the IPv4 and IPv6 adjacencies.
Step 6	<pre>destination-group grp_id Example: switch-1(conf-tm-sensor) # destination-group 33 switch-1(conf-tm-dest) #</pre>	Enter telemetry destination group submode and configure the destination group.
Step 7	<pre>ip address ip_addr port port protocol { HTTP gRPC } encoding { JSON GPB GPB-compact } Example: switch-1(conf-tm-dest) # ip address</pre>	Configure the telemetry data for the subscription to stream to the specified IP address and port and set the protocol and encoding for the data stream.
Step 8	<pre>subscription sub_id Example: switch-1(conf-tm-dest) # subscription 33 switch-1(conf-tm-sub) #</pre>	Enter telemetry subscription submode, and configure the telemetry subscription.
Step 9	<pre>snsr-group sgrp_id sample-interval interval Example: switch-1(conf-tm-sub) # snsr-grp 6 sample-interval 5000 switch-1(conf-tm-sub) #</pre>	Link the sensor group to the current subscription and set the data sampling interval in milliseconds. The sampling interval determines whether the switch sends telemetry data periodically, or when interface events occur.

	Command or Action	Purpose
Step 10	dst-group $dgrp_id$ Example:	Link the destination group to the current subscription. The destination group that you
	switch-1(conf-tm-sub)# dst-grp 33 switch-1(conf-tm-sub)#	specify must match the destination group that you configured in the destination-group command.

Displaying Native Data Source Path Information

Use the NX-OS **show telemetry event collector** commands to display statistics and counters, or errors for the native data source path.

Displaying Statistics

You can issue **show telemetry event collector stats** command to display the statistics and counters for each native data source path.

An example of statistics for the RIB path:

switch-1# show telemetry event collector stats

Row ID	Collection Count	Latest Collection Time	Sensor Path(GroupId)
1	4	Mon Jul 01 13:53:42.384 PS	T rib(1)
switch-1#			

An example of the statistics for the MAC path:

switch-1# show telemetry event collector stats

Row ID	Collection Count	Latest Collection Time Sensor Path(GroupId)
1	3	Mon Jul 01 14:01:32.161 PST mac(1)
switch-1#		

An example of the statistics for the Adjacency path:

switch-1# show telemetry event collector stats

Row ID	Collection Count	Latest Collection Time Sensor Path(GroupId)
1	7	Mon Jul 01 14:47:32.260 PST adjacency(1)
switch-1#		

Displaying Error Counters

You can use the **show telemetry event collector stats** command to display the error totals for all the native data source paths.

Dme Event Subscription Init Failures	- 0
Event Data Enqueue Failures	- 0
Event Subscription Failures	- 0
Pending Subscription List Create Failures	- 0
Subscription Hash Table Create Failures	- 0
Subscription Hash Table Destroy Failures	- 0
Subscription Hash Table Insert Failures	- 0
Subscription Hash Table Remove Failures	- 0
switch-1#	

Streaming Syslog

About Streaming Syslog for Telemetry

Beginning with Cisco NX-OS release 9.3(3), model-driven telemetry supports streaming of syslogs using YANG as a data source. When you create a subscription, all the syslogs are streamed to the receiver as a baseline. This feature works with the NX-SDK to support streaming syslog data from the following syslog paths:

- Cisco-NX-OS-Syslog-oper:syslog
- Cisco-NX-OS-Syslog-oper:syslog/messages

After the baseline, only syslog event notifications stream to the receiver. Streaming of syslog paths supports the following encoding types:

- Google Protobuf (GPB)
- JavaScript Object Notation (JSON)

Configuring the Native Data Source Path for Routing Information

You can configure the native data source path for routing information, which sends information about all routes that are contained in the URIB. When you subscribe, the baseline sends all the route information. After the baseline, notifications are sent for route update and delete operations for the routing protocols that the switch supports. For the data sent in the RIB notifications, see Telemetry Data Streamed for Native Data Source Paths, on page 57.

Before you begin

If you have not enabled the telemetry feature, enable it now (**feature telemetry**).

	Command or Action	Purpose
Step 1	configure terminal	Enter configuration mode.
	Example:	
	<pre>switch-1# configure terminal switch-1(config)#</pre>	

	Command or Action	Purpose
Step 2	telemetry	Enter configuration mode for the telemetry
	Example:	features.
	<pre>switch-1(config) # telemetry switch-1(config-telemetry) #</pre>	
Step 3	sensor-group sgrp_id	Create a sensor group.
	Example:	
	<pre>switch-1(conf-tm-sub) # sensor-grp 6 switch-1(conf-tm-sub) #</pre>	
Step 4	data-source native	Set the data source to native so that any native
	Example:	application can use the streamed data without requiring a specific model or database.
	<pre>switch-1(conf-tm-sensor)# data-source native switch-1(conf-tm-sensor)#</pre>	requiring a specific moder of database.
Step 5	path rib	Configure the RIB path which streams routes
•	Example:	and route update information.
	nxosv2(conf-tm-sensor)# path rib nxosv2(conf-tm-sensor)#	
Step 6	destination-group grp_id	Enter telemetry destination group submode and configure the destination group.
-	Example:	
	<pre>switch-1 (conf-tm-sensor) # destination-group 33 switch-1 (conf-tm-dest) #</pre>	
Step 7	ip address ip_addr port port protocol { HTTP gRPC } encoding { JSON GPB GPB-compact }	Configure the telemetry data for the subscription to stream to the specified IP address and port and set the protocol and
	Example:	encoding for the data stream.
	<pre>switch-1(conf-tm-dest) # ip address 192.0.2.11 port 50001 protocol http encoding json switch-1(conf-tm-dest) #</pre>	
	Example:	
	<pre>switch-1(conf-tm-dest) # ip address 192.0.2.11 port 50001 protocol grpc encoding gpb switch-1(conf-tm-dest) #</pre>	
	Example:	
	<pre>switch-1(conf-tm-dest) # ip address 192.0.2.11 port 50001 protocol grpc encoding gpb-compact switch-1(conf-tm-dest) #</pre>	
Step 8	subscription sub_id	Enter telemetry subscription submode, and
	Example:	configure the telemetry subscription.

	Command or Action	Purpose
	<pre>switch-1(conf-tm-dest) # subscription 33 switch-1(conf-tm-sub) #</pre>	
Step 9	<pre>snsr-group sgrp_id sample-interval interval Example: switch-1(conf-tm-sub)# snsr-grp 6 sample-interval 5000 switch-1(conf-tm-sub)#</pre>	Link the sensor group to the current subscription and set the data sampling interval in milliseconds. The sampling interval determines whether the switch sends telemetry data periodically, or when interface events occur.
Step 10	<pre>dst-group dgrp_id Example: switch-1(conf-tm-sub) # dst-grp 33 switch-1(conf-tm-sub) #</pre>	Link the destination group to the current subscription. The destination group that you specify must match the destination group that you configured in the destination-group command.

Telemetry Data Streamed for Syslog Path

For each source path, the following table shows the information that is streamed when the subscription is first created "the baseline" and when event notifications occur.

Path	Subscription Baseline	Event Notification
Cisco-1W-CS-Syslag-aper:syslag/nessages	Stream all the existing syslogs from the switch.	Sends event notification for syslog occurred on the switch:
		• message-id
		• node-name
		• time-stamp
		• time-of-day
		• time-zone
		• category
		• message-name
		• severity
		• text

Displaying Syslog Path Information

Use the Cisco NX-OS **show telemetry event collector** commands to display statistics and counters, or errors for the syslog path.

Displaying Statistics

You can enter the **show telemetry event collector stats** command to display the statistics and counters for each syslog path.

The following is an example of statistics for the syslog path:

switch# show telemetry event collector stats

```
Row ID Collection Count Latest Collection Time Sensor Path(GroupId)

1 138 Tue Dec 03 11:20:08.200 PST Cisco-NX-OS-Syslog-oper:syslog(1)

2 138 Tue Dec 03 11:20:08.200 PST
Cisco-NX-OS-Syslog-oper:syslog/messages(1)
```

Displaying Error Counters

You can use the **show telemetry event collector errors** command to display the error totals for all the syslog paths.

switch(config-if)# show telemetry event collector errors

```
______
Error Description
                                         Error Count
Dme Event Subscription Init Failures
                                                - 0
                                                - 0
Event Data Enqueue Failures
Event Subscription Failures
                                                - 0
Pending Subscription List Create Failures
Subscription Hash Table Create Failures
Subscription Hash Table Destroy Failures
                                                - 0
                                                - 0
Subscription Hash Table Insert Failures
Subscription Hash Table Remove Failures
```

Sample JSON Output

The following is a sample of JSON output:

```
