INDEX

APPENDIX A ACTONYMS A-1

APPENDIX B Acknowledgments for Open-Source Software B-1

Contents

Preface

This preface describes the audience, organization, and conventions of this publication, and provides information on how to obtain related documentation.

Audience

This publication is for experienced network administrators who are responsible for configuring and maintaining Catalyst4500 series switches.

Organization

Chapter	Title	Description
Chapter 1	Command-Line Interface	Describes the Catalyst4500 series switch CLI.
Chapter 2	Cisco IOS Commands for the Catalyst 4500 Series Switches	Lists all Catalyst4500 series CiscoIOS commands alphabetically and provides detailed information on each command.
Appendix A	Acronyms	Defines the acronyms used in this publication.
Appendix B	Acknowledgments for Open-Source Software	Provides the acknowledgments for Open-Source Software.

This publication is organized as follows:

Related Documentation

The Catalyst4500 series Cisco IOS documentation set includes these publications:

- Catalyst4500 Series Switch InstallationGuide
- Catalyst 4500 Series Switch Supervisor Engine III Installation Note
- Catalyst 4500 Series Switch Supervisor Engine IV Installation Note
- Catalyst4500 Series Switch Cisco IOS Software Configuration Guide

- Catalyst4500 Series Switch Cisco IOS System Message Guide
- Release Notes for Catalyst 4500 Series Switch Software Release 12.1(13)EW

Other documents in the Cisco IOS documentation set include:

- Cisco IOS Release 12.1 Configuration Guides
- Cisco IOS Release 12.1 Command References

For information about MIBs, refer to this URL:

http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml

Conventions

This document uses these conventions:

Convention	Description	
boldface font	Boldface text indicates commands and keywords that you enter literally as shown.	
italic font	<i>Italic</i> text indicates arguments for which you supply values.	
[x]	Square brackets enclose an optional element (keyword or argument).	
	A vertical line indicates a choice within an optional or required set of keywords or arguments.	
$[\mathbf{x} \mid y]$	Square brackets enclosing keywords or arguments separated by a vertical line indicate an optional choice.	
$\{\mathbf{x} \mid y\}$	Braces enclosing keywords or arguments separated by a vertical line indicate a required choice.	
$[x \{y z\}]$	Braces and a vertical line within square brackets indicate a required choice within an optional element.	
string	A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.	
screen font	Terminal sessions and information the system displays are in screen font.	
boldface screen font	Information you must enter is in boldface screenfont.	
italic screen font	Arguments for which you supply values are in <i>italic screen</i> font.	
٨	The symbol ^ represents the key labeled Control—for example, the key combination ^D in a screen display means hold down the Control key while you press the D key.	
< >	Nonprinting characters, such as passwords, are in angle brackets.	

Convention	Description	
[]	Default responses to system prompts are in square brackets.	
!, #	An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.	

Notes use this convention:

Note

Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the publication.

Cautions use this convention:

Caution

Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

Obtaining Documentation

Cisco documentation and additional literature are available on Cisco.com. Cisco also provides several ways to obtain technical assistance and other technical resources. These sections explain how to obtain technical information from Cisco Systems.

Cisco.com

You can access the most current Cisco documentation at this URL:

http://www.cisco.com/univercd/home/home.htm

You can access the Cisco website at this URL:

http://www.cisco.com

You can access international Cisco websites at this URL:

http://www.cisco.com/public/countries_languages.shtml

Ordering Documentation

You can find instructions for ordering documentation at this URL:

http://www.cisco.com/univercd/cc/td/doc/es_inpck/pdi.htm

You can order Cisco documentation in these ways:

• Registered Cisco.com users (Cisco direct customers) can order Cisco product documentation from the Ordering tool:

http://www.cisco.com/en/US/partner/ordering/index.shtml

• Nonregistered Cisco.com users can order documentation through a local account representative by calling Cisco Systems Corporate Headquarters (California, USA) at 408526-7208 or, elsewhere in North America, by calling 800553-NETS (6387).

Documentation Feedback

You can send comments about technical documentation to bug-doc@cisco.com.

You can submit comments by using the response card (if present) behind the front cover of your document or by writing to the following address:

Cisco Systems Attn: Customer Document Ordering 170 West Tasman Drive San Jose, CA 95134-9883

We appreciate your comments.

Obtaining Technical Assistance

For all customers, partners, resellers, and distributors who hold valid Cisco service contracts, Cisco Technical Support provides 24-hour-a-day, award-winning technical assistance. The Cisco Technical Support Website on Cisco.com features extensive online support resources. In addition, Cisco Technical Assistance Center (TAC) engineers provide telephone support. If you do not hold a valid Cisco service contract, contact your reseller.

Cisco Technical Support Website

The Cisco Technical Support Website provides online documents and tools for troubleshooting and resolving technical issues with Cisco products and technologies. The website is available 24 hours a day, 365 days a year at this URL:

http://www.cisco.com/techsupport

Access to all tools on the Cisco Technical Support Website requires a Cisco.com user ID and password. If you have a valid service contract but do not have a user ID or password, you can register at this URL:

http://tools.cisco.com/RPF/register/register.do

Submitting a Service Request

Using the online TAC Service Request Tool is the fastest way to open S3 and S4 service requests. (S3 and S4 service requests are those in which your network is minimally impaired or for which you require product information.) After you describe your situation, the TAC Service Request Tool automatically provides recommended solutions. If your issue is not resolved using the recommended resources, your service request will be assigned to a Cisco TAC engineer. The TAC Service Request Tool is located at this URL:

http://www.cisco.com/techsupport/servicerequest

For S1 or S2 service requests or if you do not have Internet access, contact the Cisco TAC by telephone. (S1 or S2 service requests are those in which your production network is down or severely degraded.) Cisco TAC engineers are assigned immediately to S1 and S2 service requests to help keep your business operations running smoothly.

To open a service request by telephone, use one of the following numbers:

Asia-Pacific: +61 2 8446 7411 (Australia: 1 800 805 227) EMEA: +32 2 704 55 55 USA: 1 800 553 2447

For a complete list of Cisco TAC contacts, go to this URL:

http://www.cisco.com/techsupport/contacts

Definitions of Service Request Severity

To ensure that all service requests are reported in a standard format, Cisco has established severity definitions.

Severity 1 (S1)—Your network is "down," or there is a critical impact to your business operations. You and Cisco will commit all necessary resources around the clock to resolve the situation.

Severity 2 (S2)—Operation of an existing network is severely degraded, or significant aspects of your business operation are negatively affected by inadequate performance of Cisco products. You and Cisco will commit full-time resources during normal business hours to resolve the situation.

Severity 3 (S3)—Operational performance of your network is impaired, but most business operations remain functional. You and Cisco will commit resources during normal business hours to restore service to satisfactory levels.

Severity 4 (S4)—You require information or assistance with Cisco product capabilities, installation, or configuration. There is little or no effect on your business operations.

Obtaining Additional Publications and Information

Information about Cisco products, technologies, and network solutions is available from various online and printed sources.

• Cisco Marketplace provides a variety of Cisco books, reference guides, and logo merchandise. Visit Cisco Marketplace, the company store, at this URL:

http://www.cisco.com/go/marketplace/

• The Cisco *Product Catalog* describes the networking products offered by Cisco Systems, as well as ordering and customer support services. Access the Cisco Product Catalog at this URL:

http://cisco.com/univercd/cc/td/doc/pcat/

• *Cisco Press* publishes a wide range of general networking, training and certification titles. Both new and experienced users will benefit from these publications. For current Cisco Press titles and other information, go to Cisco Press at this URL:

http://www.ciscopress.com

• *Packet* magazine is the Cisco Systems technical user magazine for maximizing Internet and networking investments. Each quarter, Packet delivers coverage of the latest industry trends, technology breakthroughs, and Cisco products and solutions, as well as network deployment and troubleshooting tips, configuration examples, customer case studies, certification and training information, and links to scores of in-depth online resources. You can access Packet magazine at this URL:

http://www.cisco.com/packet

• *iQ Magazine* is the quarterly publication from Cisco Systems designed to help growing companies learn how they can use technology to increase revenue, streamline their business, and expand services. The publication identifies the challenges facing these companies and the technologies to help solve them, using real-world case studies and business strategies to help readers make sound technology investment decisions. You can access iQ Magazine at this URL:

http://www.cisco.com/go/iqmagazine

• *Internet Protocol Journal* is a quarterly journal published by Cisco Systems for engineering professionals involved in designing, developing, and operating public and private internets and intranets. You can access the Internet Protocol Journal at this URL:

http://www.cisco.com/ipj

• World-class networking training is available from Cisco. You can view current offerings at thisURL:

http://www.cisco.com/en/US/learning/index.html

Command-Line Interface

This chapter provides information for understanding and using the Cisco IOS command-line interface (CLI) on the Catalyst4500 series switch. This chapter includes the following sections:

- Getting Help, page 1-1
- How to Find Command Options, page 1-2
- Understanding Command Modes, page 1-4
- Using the No and Default Forms of Commands, page 1-6
- Using the CLI String Search, page 1-6
- Saving Configuration Changes, page 1-11

For an overview of the Catalyst4500 series switch Cisco IOS configuration, refer to the *Catalyst4500* Series Switch Cisco IOS Software Configuration Guide.

Getting Help

To display a list of commands that you can use within a command mode, enter a question mark (?) at the system prompt. You also can display keywords and arguments for each command with this context-sensitive help feature.

Table1-1 lists commands you can enter to get help that is specific to a command mode, a command, a keyword, or an argument.

Command	Purpose	
abbreviated-command-entry?	Displays a list of commands that begin with a particular character string. (Do not leave a space between the command and question mark.)	
abbreviated-command-entry <tab></tab>	Completes a partial command name.	
?	Lists all commands for the command mode.	
command ?	Lists all keywords for the command. Leave a space between the command and the question mark.	
command keyword ?	Lists all arguments for the keyword. Leave a space between the keyword and the question mark.	

Table1-1 Getting Help

How to Find Command Options

This section provides an example of how to display syntax for a command. The syntax can consist of optional or required keywords. To display keywords for a command, enter a question mark (?) at the command prompt or after entering part of a command followed by a space. The Catalyst4500 series switch software displays a list of available keywords along with a brief description of the keywords. For example, if you are in global configuration mode and want to see all the keywords for the **arap** command, you enter **arap**?.

Table1-2 shows examples of how you can use the question mark (?) to assist you in entering commands and also guides you through entering the following commands:

- interface gigabitethernet 1/1
- channel-group 1 mode auto

Table1-2	How to Find Command Options
----------	-----------------------------

Command	Purpose
Switch> enable Password: <password> Switch#</password>	Enter the enable command and password to access privileged EXEC commands.
	You are in privileged EXEC mode when the prompt changes to switch#.
Switch# configure terminal	Enter global configuration mode.
Enter configuration commands, one per line. End with CNTL/Z. Switch(config)#	You are in global configuration mode when the prompt changes to Switch(config)#.
<pre>Switch(config)# interface gigabitethernet ? <1-9> GigabitEthernet interface number Switch(config)# interface gigabitethernet 1/1 Switch(config-if)#</pre>	Enter interface configuration mode by specifying the Gigabit Ethernet interface that you want to configure using the interface gigabitethernet global configuration command.
	Enter a ? to display what you must enter next on the command line. In this example, you must enter an interface number from 1 to 9 in the format <i>module-number/port-number</i> . You are in interface configuration mode when the prompt changes to
	<pre>mode when the prompt changes to Switch(config-if)#.</pre>

Command		Purpose	
Switch(config-if)#?		Enter a ? to display a list of all the	
Interface configuration commands:		interface configuration commands	
access-expression	Build a bridge boolean access expression	available for the Gigabit Ethernet	
apollo	Apollo interface subcommands	interface.	
appletalk	Appletalk interface subcommands	Interface.	
arp	Set arp type (arpa, probe, snap) or timeout		
backup	Modify backup parameters		
bandwidth	Set bandwidth informational parameter		
bgp-policy	Apply policy propogated by bgp community string		
bridge-group	Transparent bridging interface parameters		
carrier-delay	Specify delay for interface transitions		
cdp	CDP interface subcommands		
channel-group	Etherchannel/port bundling configuration		
clns	CLNS interface subcommands		
cmns	OSI CMNS		
	Assign a custom queue list to an interface		
decnet	Interface DECnet config commands		
default	Set a command to its defaults		
delay	Specify interface throughput delay		
description	Interface specific description		
dlsw	DLSw interface subcommands		
dspu	Down Stream PU

Switch(config-if)# channel-group 1 mode auto ? <cr> Switch(config-if)#</cr>	In this example, the auto keyword is entered. After you enter the auto keyword, enter a? to display what you must enter next on the command line.
	Because a <cr>> is displayed, it indicates that you can press Return to complete the command. If additional keywords are listed, you can enter more keywords or press Return to complete the command.</cr>
Switch(config-if)# channel-group 1 mode auto Switch(config-if)#	In this example, press Return to complete the command.

Understanding Command Modes

The CiscoIOS user interface on the Catalyst4500 series switch has many different modes. The commands that are available to you depend on which mode you are currently in. You can obtain a list of commands available for each command mode by entering a question mark (?) at the system prompt.

When you start a session on the Catalyst4500 series switch, you begin in user mode, often called EXEC mode. Only a limited subset of the commands are available in EXEC mode. In order to have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From privileged EXEC mode, you can enter any EXEC command or enter global configuration mode. Most EXEC commands are one-time commands, such as **show** commands, which show the current status of a given item, and **clear** commands, which clear counters or interfaces. The EXEC commands are not saved across reboots of the Catalyst4500 series switch.

The configuration modes provide a way for you to make changes to the running configuration. When you save changes to the configuration, the changes remain intact when the Catalyst 4500 series switch reboots. From global configuration mode, you can enter interface configuration mode, subinterface configuration mode, and other protocol-specific modes.

ROM-monitor mode is a separate mode used when the Catalyst4500 series switch cannot boot properly. If your Catalyst4500 series switch or access server does not find a valid system image when it is booting, or if its configuration file is corrupted at startup, the system might enter ROM-monitor mode.

Table1-3 provides a summary of the main command modes.

Command Mode	Access Method	Prompt	Exit Method
User EXEC	Log in.	Switch>	Use the logout command.
Privileged EXEC	From user EXEC mode, enter the enable EXEC command.	Switch#	To exit to user EXEC mode, enter the disable command.
			To enter global configuration mode, enter the configure terminal privileged EXEC command.
Global configuration	From privileged EXEC mode, enter the configure terminal privileged EXEC command.	Switch(config)#	To exit to privileged EXEC mode, enter the exit or end command or press Ctrl-Z . To enter interface configuration mode, enter an interface configuration command.
Interface configuration	From global configuration mode, enter by specifying an interface with an interface command.	Switch(config-if)#	To exit to global configuration mode, enter the exit command. To exit to privileged EXEC mode, enter the exit command or press Ctrl-Z .
			To enter subinterface configuration mode, specify a subinterface with the interface command.

Table 1-3 Summary of Main Command Modes

Command Mode	Access Method	Prompt	Exit Method
Subinterface configuration	From interface configuration mode,		To exit to global configuration mode, enter the exit command.
	specify a subinterface with an interface command.		To enter privileged EXEC mode, enter the end command or press Ctrl-Z .
ROM monitor	From privileged EXEC mode, enter the reload EXEC command. Press the Break key during the first 60 seconds while the system is booting.	Rommon>	To exit ROM-monitor mode, you must reload the image by entering the boot command. If you use the boot command without specifying a file or any other boot instructions, the system boots from the default Flash image (the first image in onboard Flash memory). Otherwise, you can instruct the system to boot from a specific Flash image (using the boot system flash <i>filename</i> command).

Table1-3 Summary of Main Command Modes (continued)

For more information on command modes, refer to the "Using the Command Line Interface" chapter of the *Configuration Fundamentals Configuration Guide*.

Using the No and Default Forms of Commands

Almost every configuration command has a **no** form. In general, enter the **no** form to disable a function. Use the command without the keyword **no** to reenable a disabled function or to enable a function that is disabled by default. For example, IP routing is enabled by default. To disable IP routing, specify the **no iprouting** command and specify **ip routing** to reenable it. This publication provides the complete syntax for the configuration commands and describes what the **no** form of a command does.

Some configuration commands have a **default** form. The **default** form of a command returns the command setting to its default settings. Most commands are disabled by default, so the **default** form is the same as the **no** form. However, some commands are enabled by default, with variables set to certain default values. In these cases, the **default** form of the command enables the command and returns its variables to their default values.

Using the CLI String Search

The pattern in the command output is referred to as a string. The CLI string search feature allows you to search or filter any **show** or **more** command output and allows you to search and filter at --More-- prompts. This feature is useful when you need to sort though large amounts of output, or if you want to exclude output that you do not need to see.

With the search function, you can begin unfiltered output at the first line that contains a regular expression you specify. You can then specify a maximum of one filter per command or start a new search from the --More-- prompt.

A regular expression is a pattern (a phrase, number, or more complex pattern) software uses to match against **show** or **more** command output. Regular expressions are case sensitive and allow for complex matching requirements. Examples of simple regular expressions are Serial, misses, and 138. Examples of complex regular expressions are 00210..., (is), and [Oo]utput.

You can perform three types of filtering:

- Use the **begin** keyword to begin output with the line that contains a specified regular expression.
- Use the **include** keyword to include output lines that contain a specified regular expression.
- Use the **exclude** keyword to exclude output lines that contain a specified regular expression.

You can then search this filtered output at the --More-- prompts.

Note

The CLI string search function does not allow you to search or filter backward through previous output; filtering cannot be specified using HTTP access to the CLI.

Regular Expressions

A regular expression can be a single character that matches the same single character in the command output or multiple characters that match the same multiple characters in the command output. This section describes how to create both single-character patterns and multiple-character patterns and how to create more complex regular expressions using multipliers, alternation, anchoring, and parentheses.

Single-Character Patterns

The simplest regular expression is a single character that matches the same single character in the command output. You can use any letter (A-Z, a-z) or digit (0-9) as a single-character pattern. You can also use other keyboard characters (such as ! or ~) as single-character patterns, but certain keyboard characters have special meaning when used in regular expressions. Table1-4 lists the keyboard characters that have special meaning.

Character	Special Meaning		
•	Matches any single character, including white space.		
*	Matches 0 or more sequences of the pattern.		
+	Matches 1 or more sequences of the pattern.		
?	Matches 0 or 1 occurrences of the pattern.		
^	Matches the beginning of the string.		
\$	Matches the end of the string.		
_ (underscore)	Matches a comma (,), left brace ({), right brace (}), left parenthesis ((), right parenthesis ()), the beginning of the string, the end of the string, or a space.		

Table1-4 Characters with Special Meaning

To enter these special characters as single-character patterns, remove the special meaning by preceding each character with a backslash (\). These examples are single-character patterns matching a dollar sign, an underscore, and a plus sign, respectively.

\\$ _ \+

You can specify a range of single-character patterns to match against command output. For example, you can create a regular expression that matches a string containing one of the following letters: a, e, i, o, or u. One and only one of these characters must exist in the string for pattern matching to succeed. To specify a range of single-character patterns, enclose the single-character patterns in square brackets ([]).For example,

[aeiou]

matches any one of the five vowels of the lowercase alphabet, while

[abcdABCD]

matches any one of the first four letters of the lower- or uppercase alphabet.

You can simplify ranges by entering only the end points of the range separated by a dash (-). Simplify the previous range as follows:

[a-dA-D]

To add a dash as a single-character pattern in your range, include another dash and precede it with a backslash:

[a-dA-D\-]

You can also include a right square bracket (]) as a single-character pattern in your range. To do so, enter the following:

[a-dA-D\-\]]

The previous example matches any one of the first four letters of the lower- or uppercase alphabet, a dash, or a right square bracket.

You can reverse the matching of the range by including a caret (^) at the start of the range. This example matches any letter except the ones listed:

[^a-dqsv]

This example matches anything except a right square bracket (]) or the letter d:

[^\]d]

Multiple-Character Patterns

When creating regular expressions, you can also specify a pattern containing multiple characters. You create multiple-character regular expressions by joining letters, digits, or keyboard characters that do not have special meaning. For example, a4% is a multiple-character regular expression. Put a backslash in front of the keyboard characters that have special meaning when you want to remove their special meaning.

With multiple-character patterns, order is important. The regular expression a4% matches the character a followed by a 4 followed by a % sign. If the string does not have a4%, in that order, pattern matching fails. This multiple-character regular expression:

a.

uses the special meaning of the period character to match the letter a followed by any single character. With this example, the strings ab, a!, or a2 are all valid matches for the regular expression.

You can remove the special meaning of the period character by putting a backslash in front of it. In the following expression:

a∖.

only the string a. matches this regular expression.

You can create a multiple-character regular expression containing all letters, all digits, all keyboard characters, or a combination of letters, digits, and other keyboard characters. These examples are all valid regular expressions:

telebit 3107 v32bis

Multipliers

You can create more complex regular expressions to match multiple occurrences of a specified regular expression by using some special characters with your single- and multiple-character patterns. Table 1-5 lists the special characters that specify "multiples" of a regular expression.

Table1-5 Special Characters Used as Multipliers

Character	Description	
*	Matches 0 or more single- or multiple-character patterns.	
+	Matches 1 or more single- or multiple-character patterns.	
?	Matches 0 or 1 occurrences of the single- or multiple-character patterns.	

This example matches any number of occurrences of the letter a, including none:

a*

This pattern requires that at least one letter a in the string is matched:

a+

This pattern matches the string bb or bab:

ba?b

This string matches any number of asterisks (*):

**

To use multipliers with multiple-character patterns, you enclose the pattern in parentheses. In the following example, the pattern matches any number of the multiple-character string ab:

(ab)*

As a more complex example, this pattern matches one or more instances of alphanumeric pairs (but not none; that is, an empty string is not a match):

([A-Za-z][0-9])+

The order for matches using multipliers (*, +, or ?) is to put the longest construct first. Nested constructs are matched from outside to inside. Concatenated constructs are matched beginning at the left side of the construct. Thus, the regular expression matches A9b3, but not 9Ab3 because the letters are specified before the numbers.

Alternation

Alternation allows you to specify alternative patterns to match against a string. You separate the alternative patterns with a vertical bar (|). Exactly one of the alternatives can match the string. For example, the regular expression

codex | telebit

matches the string codex or the string telebit, but not both codex and telebit.

Anchoring

You can match a regular expression pattern against the beginning or the end of the string. That is, you can specify that the beginning or end of a string contains a specific pattern. You "anchor" these regular expressions to a portion of the string using the special characters shown in Table1-6.

Table1-6 Special Characters Used for Anchoring

Character	Description
٨	Matches the beginning of the string.
\$	Matches the end of the string.

This regular expression matches a string only if the string starts with abcd:

^abcd

In contrast, this expression is in a range that matches any single letter, as long as it is not the letters a, b, c, or d:

[^abcd]

With this example, the regular expression matches a string that ends with .12:

\$\.12

Contrast these anchoring characters with the special character underscore (_). The underscore matches the beginning of a string (^), the end of a string (\$), parentheses (), space (), braces {}, comma (,), or underscore (_). With the underscore character, you can specify that a pattern exist anywhere in the string.

For example:

1300

matches any string that has 1300 somewhere in the string. The string's 1300 can be preceded by or end with a space, brace, comma, or underscore. For example:

{1300_

matches the regular expression, but 21300 and 13000 do not.

Using the underscore character, you can replace long regular expression lists, such as the following:

```
^1300$ ^1300(space) (space)1300 {1300, ,1300, {1300} ,1300, (1300
```

with

1300

Parentheses for Recall

As shown in the "Multipliers" section on page1-9, you use parentheses with multiple-character regular expressions to multiply the occurrence of a pattern. You can also use parentheses around a single- or multiple-character pattern to remember a pattern for use elsewhere in the regular expression.

To create a regular expression that recalls a previous pattern, you use parentheses to indicate a remembered specific pattern and a backslash (\) followed by an integer to reuse the remembered pattern. The integer specifies the occurrence of the parentheses in the regular expression pattern. If you have more than one remembered pattern in your regular expression, then \1 indicates the first remembered pattern, \2indicates the second remembered pattern, and so on.

This regular expression uses parentheses for recall:

a(.)bc(.) |1|2

This regular expression matches an a followed by any character (call it character 1), followed by bc followed by any character (character 2), followed by character 1 again, followed by character 2 again. So, the regular expression can match aZbcTZT. The software remembers that character 1 is Z and character 2 is T and then uses Z and T again later in the regular expression.

Saving Configuration Changes

To save your configuration changes to your startup configuration so that they will not be lost if there is a system reload or power outage, enter the following command:

```
Switch# copy system:running-config nvram:startup-config
Building configuration...
```

It might take a minute or two to save the configuration. After the configuration has been saved, the following output appears:

[OK] Switch#

On most platforms, this step saves the configuration to NVRAM. On the Class A Flash file system platforms, this step saves the configuration to the location specified by the CONFIG_FILE environment variable. The CONFIG_FILE environment variable defaults to NVRAM.

show platform Commands

You should use these commands only when you are working directly with your technical support representative, while troubleshooting a problem. Do not use these commands unless your technical support representative asks you to do so.

The show platform commands are not described in this document.

Cisco IOS Commands for the Catalyst 4500 Series Switches

This chapter contains an alphabetical listing of CiscoIOS commands for the Catalyst4500 series switches. For information about Cisco IOS commands that are not included in this publication, refer to CiscoIOS Release 12.1 ConfigurationGuides and CommandReferences at this URL:

http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/products_product_indices_list.html

#macro keywords

To specify the help string for the macro keywords, use the **#macro keywords** command.

#macro keywords [keyword1] [keyword2] [keyword3]

Syntax Description	keyword 1	(Optional) Specifies a keyword that is needed while applying a macro to an interface.			
	keyword 2	(Optional) Specifies a keyword that is needed while applying a macro to an interface.			
	keyword 3	(Optional) Specifies a keyword that is needed while applying a macro to an interface.			
Defaults	This command has no default settings.				
Command Modes	Global configuration				
Command History	Release	Modification			
-	12.2(18)EW	Support for this command was introduced on the Catalyst 4500 series switch.			
Examples		ou need to include to make the syntax valid.			
Examples	This example shows how to specify the help string for keywords associated with a macro named test: Switch(config)# macro name test				
	macro name test	mands one per line. End with the character '@'.			
	Switch(config)# int gil/1 Switch(config-if)# macro apply test ? WORD Keyword to replace with a value e.g \$VLAN, \$MAX << It is shown as help <cr></cr>				
Related Commands	macro apply ciso macro apply ciso macro apply ciso macro apply ciso	co-phone co-router			

aaa accounting dot1x default start-stop group radius

To enable accounting for 802.1X authentication sessions, use the **aaa accounting dot1x default start-stop group radius** command. To disable accounting, use the **no** form of this command.

aaa accounting dot1x default start-stop group radius

no aaa accounting dot1x default start-stop group radius

Syntax Description	This command has no argume	nts or keywords.
--------------------	----------------------------	------------------

- Defaults Accounting is disabled.
- Command Modes Global configuration

 Release
 Modification

 12.2(18)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Switch(config)# aaa accounting dot1x default start-stop group radius

Usage Guidelines

nes 802.1X accounting requires a RADIUS server.

This example shows how to configure 802.1X accounting:

This command enables the Authentication, Authorization, and Accounting (AAA) client's accounting feature to forward 802.1X update and watchdog packets from the 802.1X supplicant (workstation client) to the authentication (RADIUS) server. (Watchdog packets are defined as EAPOL-LOGON, EAPOL-LOGOFF, and EAPOL-INTERIM messages.) Successful authentication and authorization of the supplicant by the authentication server is required before these packets are considered valid and are forwarded. When the client is reauthenticated, an interim-update accounting notice is sent to the accounting server.

Examples

Note

The RADIUS authentication server must be properly configured to accept and log update or watchdog packets from the AAA client.

Related Commands aaa accounting system default start-stop group radius

aaa accounting system default start-stop group radius

To receive the session termination messages after the switch reboots, use the **aaa accounting system default start-stop group radius** command. To disable accounting, use the **no** form of this command.

aaa accounting system default start-stop group radius

no aaa accounting system default start-stop group radius

- Syntax Description This command has no arguments or keywords.
- Defaults Accounting is disabled.
- Command Modes Global configuration mode

 Release
 Modification

 12.2(18)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines

802.1X accounting requires the RADIUS server.

This command enables the AAA client's accounting feature to forward 802.1X update and watchdog packets from the 802.1X supplicant (workstation client) to the authentication (RADIUS) server. (Watchdog packets are defined as EAPOL-LOGON, EAPOL-LOGOFF, and EAPOL-INTERIM messages.) Successful authentication and authorization of the supplicant by the authentication server is required before these packets are considered valid and are forwarded. When the client is reauthenticated, an interim-update accounting notice is sent to the accounting server.

Examples

This example shows how to generate a logoff after a switch reboots:

Switch(config)# aaa accounting system default start-stop group radius

Note

The RADIUS authentication server must be properly configured to accept and log update or watchdog packets from the AAA client.

Related Commands aaa accounting dot1x default start-stop group radius

access-group mode

To specify the override modes (for example, VACL overrides PACL) and the non-override modes (for example, merge or strict mode), use the **access-group mode** command. To return to preferred port mode, use the **no** form of this command.

access-group mode {prefer {port | vlan} | merge}

no access-group mode {prefer {port | vlan} | merge }

Syntax Description	prefer port	Specifies that the PACL mode take precedence if PACLs are configured. If no PACL features are configured on the port, other features applicable to the interface are merged and applied on the interface.	
	prefer vlan	Specifies that the VLAN-based ACL mode take precedence. If no VLAN-based ACL features are configured on the port's VLAN, the PACL features on the port are applied.	
	merge	Merges applicable ACL features before they are programmed into the hardware.	
Defaults	PACL override 1	node	
Command Modes	Interface configu	iration	
Command History	Release	Modification	
	12.1(19)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Usage Guidelines	-	nterface, prefer port, prefer VLAN, and merge modes are supported. A Layer2 interface ACL applied in either direction (one inbound and one outbound).	
Examples	This example sh	ows how to make the PACL mode on the switch take effect:	
	(config-if)# access-group mode prefer port		
	This example sh	ows how to merge applicable ACL features:	
	(config-if)# a	ccess-group mode merge	
Related Commands	show ip interfac	oup mode interface ce (refer to Cisco IOS documentation) s-group interface	

access-list hardware entries

To designate how ACLs are programmed into the switch hardware, use the **access-list hardware entries** command.

access-list hardware entries {packed | scattered }

Syntax Description	packed	Directs the software to use the first entry with a matching mask when selecting an entry from the ACL TCAM for programming the ACEs in an ACL.
	scattered	Directs the software to use the first entry with a free mask when selecting an entry from the ACL TCAM for programming the ACEs in an ACL.
Defaults	The ACLs are p	programmed as packed.
Command Modes	Global configur	ration
Command History	Release	Modification
	12.2(20)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	these resources consumed, but t to make the mas The goal is to us entries. To com show platform	ardware resources are used when ACLs are programmed: entries and masks. If one of is consumed, no additional ACLs can be programmed into the hardware. If the masks are the entries are available, change the programming algorithm from packed to scattered sks available. This action allows additional ACLs to be programmed into the hardware. se TCAM resources more efficiently; that is, to minimize the number of masks per ACL pare TCAM utilization when using the scattered or packed algorithms, use the hardware acl statistics utilization brief command. To change the algorithm from sered , use the access-list hardware entries command.
Examples		nows how to program A CLs into the hardware as packed. After they are programmed, you reent of the masks to program only 49 percent of the ACL entries.
	Switch(config) Switch(config) Switch# 01:15:34: %SYS Switch#	ration commands, one per line. End with CNTL/Z. # access-list hardware entries packed

	Input	Acl(PortAndVlan)	2016	/	4096	(49)	460	/	512	(89)
	Input	Acl(PortOrVlan)	6	/	4096	(0)	4	/	512	(0)
	Input	Qos(PortAndVlan)	0	/	4096	(0)	0	/	512	(0)
	Input	Qos(PortOrVlan)	0	/	4096	(0)	0	/	512	(0)
	Output	Acl(PortAndVlan)	0	/	4096	(0)	0	/	512	(0)
	Output	Acl(PortOrVlan)	0	/	4096	(0)	0	/	512	(0)
	Output	Qos(PortAndVlan)	0	/	4096	(0)	0	/	512	(0)
	Output	Qos(PortOrVlan)	0	/	4096	(0)	0	/	512	(0)
	L40ps:	used 2 out of 64										
Switch#												

This example shows how to reserve space (scatter) between ACL entries in the hardware. The number of masks required to program 49 percent of the entries has decreased to 49 percent.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware entries scattered
Switch(config)# end
Switch#

Switch#

action

To specify an action to be taken when a match occurs in a VACL, use the **action** command. To remove an action clause, use the **no** form of this command.

action {drop | forward}

no action {drop | forward }

Syntax Description	drop	Sets the action to drop packets.	
Syntax Description	forward	Sets the action to forward packets.	
Defaults	This comman	nd has no default settings.	
Command Modes	VLAN acces	ss-map	
Command History	Release	Modification	
,	12.1(12c)EV	V Support for this command was introduced on the Catalyst 4500 series switch.	
Usage Guidelines	In a VLAN access map, if at least one ACL is configured for a packet type (IP or MAC), the default action for the packet type is drop (deny).		
	If an ACL is	not configured for a packet type, the default action for the packet type is forward (permit).	
		or a packet type is configured and the ACL is empty or undefined, the configured action will o the packet type.	
Examples	This example	e shows how to define a drop action:	
		ig-access-map)# action drop ig-access-map)#	
	This example	e shows how to define a forward action:	
		ig-access-map)# action forward ig-access-map)#	
Related Commands	match show vlan a vlan access-		

apply

L

apply

To implement a new VLAN database, increment the configuration number, save the configuration number in NVRAM, and propagate the configuration number throughout the administrative domain, use the **apply** command.

apply

Syntax Description	This command has no arguments or keywords.				
Defaults	This command h	as no default settings.			
Command Modes	VLAN configuration				
Command History	Release	Modification			
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.			
Usage Guidelines	The apply command implements the configuration changes that you made after you entered VLAN database mode and uses them for the running configuration. This command keeps you in VLAN database mode. You cannot use this command when the switch is in the VTP client mode. You can verify that the VLAN database changes occurred by entering the show vlan command from privileged EXEC mode.				
Examples	This example sho current database:	ows how to implement the proposed new VLAN database and to recognize it as the			
	Switch(config-v Switch(config-v				
Related Commands	exit (refer to Cis reset show vlan shutdown vlan (isco IOS documentation) co IOS documentation) refer to Cisco IOS documentation) iguration mode)			

arp access-list

To define an ARP access list or add clauses at the end of a predefined list, use the **arp access-list** command.

arp access-list name

Syntax Description	name Specifi	ies the access control list name.		
Defaults	None			
Command Modes	Configuration			
Command History	Release	Modification		
	12.1(19)EW	Support for this command was introduced on the Catalyst 4500 series switch.		
Examples	This example shows	how to define an ARP access list named static-hosts:		
	Switch(config)# ar Switch(config)#	p access-list static-hosts		
Related Commands	deny ip arp inspection fil permit	ter vlan		

attach module

To remotely connect to a specific module, use the **attach module** configuration command.

attach module mod

Syntax Description	<i>mod</i> Target module for the command.				
Defaults	This command has no default settings.				
Command Modes	Privileged				
Command History	Release Modification				
	12.1(19)EW This command was first introduced.				
Usage Guidelines	This command applies only to the Access Gateway Module on Catalyst 4500 series switches.				
	The valid values for <i>mod</i> depend on the chassis that are used. For example, if you have a Catalyst 4006 chassis, valid values for the module are from 2 to 6. If you have a 4507R chassis, valid values are from 3 to 7.				
	When you execute the attach module mod command, the prompt changes to Gateway#.				
	This command is identical in the resulting action to the session module <i>mod</i> and the remote login module <i>mod</i> commands.				
Examples	This example shows how to remotely log in to an Access Gateway Module:				
	Switch# attach module 5 Attaching console to module 5 Type 'exit' at the remote prompt to end the session				
	Gateway>				
Related Commands	remote login module session module				

auto qos voip

To automatically configure quality of service (auto-QoS) for voice over IP (VoIP) within a QoS domain, use the **auto qos voip** interface configuration command. To change the auto-QoS configuration settings to the standard QoS defaults, use the **no** form of this command.

auto qos voip { cisco-phone | trust}

no auto qos voip {cisco-phone | trust}

Syntax Description	cisco-phone	Connects the interface to a Cisco IP phone and automatically configures QoS for VoIP. The CoS labels of incoming packets are trusted only when the telephone is detected.					
	trust	Connects the interface to a trusted switch or router and automatically configures QoS for VoIP. The CoS and DSCP labels of incoming packets are trusted.					
Defaults	Auto-QoS is disabled on all interfaces.						
Command Modes	Interface config	guration					
Command History	Release	Modification					
-	12.1(19)EW	Support for this command was introduced on the Catalyst 4500 series switch.					
Usage Guidelines		nd to configure the QoS that is appropriate for VoIP traffic within the QoS domain. The cludes the switch, the interior of the network, and the edge devices that can classify c for QoS.					
	Use the cisco-p phones. The swi	hone keyword on the ports at the edge of the network that are connected to Cisco IP tch detects the telephone through the Cisco Discovery Protocol (CDP) and trusts the Cos					
	labels in packets that are received from the telephone. Use the trust keyword on the ports that are connected to the interior of the network. Because it is assumed that the traffic has already been classified by the other edge devices, the CoS/DSCP labels in these packets are trusted.						
	When you enable the auto-QoS feature on the specified interface, these actions automatically occur:						
	• QoS is globally enabled (qos global configuration command).						
	• DBL is enabled globally (qos dbl global configuration command).						
	• When you	enter the auto qos voip cisco-phone interface configuration command, the trusted					

specific interface is set to trust the CoS label that is received in the packet because some old phones do not mark DSCP. When a Cisco IP phone is absent, the ingress classification is set to not trust the CoS label in the packet.

• When you enter the **auto qos voip trust** interface configuration command, the ingress classification on the specified interface is set to trust the CoS label that is received in the packet if the specified interface is configured as Layer 2 (and is set to trust DSCP if the interface is configured as Layer 3).

You can enable auto-QoS on static, dynamic-access, voice VLAN access, and trunk ports.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging.

To disable auto-QoS on an interface, use the **no auto qos voip** interface configuration command. When you enter this command, the switch enables standard QoS and changes the auto-QoS settings to the standard QoS default settings for that interface. This action will not change any global configuration performed by auto-QoS; the global configuration remains the same.

Examples

This example shows how to enable auto-QoS and to trust the CoS and DSCP labels that are received in the incoming packets when the switch or router that is connected to Gigabit Ethernet interface 1/1 is a trusted device:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# auto qos voip trust
```

This example shows how to enable auto-QoS and to trust the CoS labels that are received in incoming packets when the device connected to Fast Ethernet interface 2/1 is detected as a Cisco IP phone:

Switch(config)# interface fastethernet2/1
Switch(config-if)# auto qos voip cisco-phone

This example shows how to display the QoS configuration that is automatically generated when auto-QoS is enabled:

```
Switch# debug auto qos
AutoOoS debugging is on
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# auto qos voip trust
Switch(config-if)#
00:00:56:qos
00:00:57:qos map cos 3 to dscp 26
00:00:57:qos map cos 5 to dscp 46

auto-sync

L

To enable automatic synchronization of the configuration files in NVRAM, use the **auto-sync** command. To disable automatic synchronization, use the **no** form of this command.

auto-sync {startup-config | config-register | bootvar | standard }

no auto-sync {startup-config | config-register | bootvar | standard}

Syntax Description	startup-config	Specifies automatic synchronization of the startup configuration.
	config-register	Specifies automatic synchronization of the configuration register configuration.
	bootvar	Specifies automatic synchronization of the BOOTVAR configuration.
	standard	Specifies automatic synchronization of the startup configuration, BOOTVAR, and configuration registers.
Defaults	Standard automat	tic synchronization of all configuration files
Command Modes	Redundancy main	n-cpu
Command History	Release	Modification
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch (Catalyst4507R only).
Usage Guidelines	If you enter the n	o auto-sync standard command, no automatic synchronizations occur.
Examples	-	ows how (from the default configuration) to enable automatic synchronization of the sister in the main CPU:
	Switch# config Switch (config) Switch (config- Switch (config-	terminal # redundancy r)# main-cpu r-mc)# no auto-sync standard r-mc)# auto-sync configure-register
Related Commands	redundancy	

channel-group

To assign and configure an EtherChannel interface to an EtherChannel group, use the **channel-group** command. To remove a channel group configuration from an interface, use the **no** form of this command.

channel-group *number* mode {active | on | auto [non-silent]} | { passive | desirable [non-silent]}

no channel-group

Syntax Description	number	Specifies the channel-group number; valid values are from 1 to 64.		
	mode	Specifies the EtherChannel mode of the interface.		
	active	Enables LACP unconditionally.		
	on	Forces the port to channel without PAgP.		
	auto	Places a port into a passive negotiating state, in which the port responds to PAgP packets it receives but does not initiate PAgP packet negotiation.		
	non-silent	(Optional) Used with the auto or desirable mode when traffic is expected from the other device.		
	passive	Enables LACP only if an LACP device is detected.		
	desirable	Places a port into an active negotiating state, in which the port initiates negotiations with other ports by sending PAgP packets.		
Defaults	No channel gro	ups are assigned.		
Command Modes	Interface config	guration		
Command History	Release	Modification		
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.		
	12.1(13)EW	Support for LACP was added.		
Usage Guidelines	group. If a port-	te to create a port-channel interface before assigning a physical interface to a channel -channel interface has not been created, it is automatically created when the first physical e channel group is created.		
	If a specific channel number is used for the PAgP-enabled interfaces of a channel group, that same channel number cannot be used for configuring a channel that has LACP-enabled interfaces or vice versa.			
	channel number			
	channel number versa. You can also cr Layer 3 port cha command befor			

Any configuration or attribute changes that you make to the port-channel interface are propagated to all interfaces within the same channel group as the port channel (for example, configuration changes are also propagated to the physical interfaces that are not part of the port channel, but are part of the channel group).

You can create in on mode a usable EtherChannel by connecting two port groups together.

<u>Caution</u>	Do not enable Layer3 addresses on the physical EtherChannel interfaces. Do not assign bridge groups on the physical EtherChannel interfaces because it creates loops.			
Examples	This example shows how to add Gigabit Ethernet interface 1/1 to the EtherChannel group that is specified by port-channel 45:			
	Switch(config-if)# channel-group 45 mode on Creating a port-channel interface Port-channel45 Switch(config-if)#			
Related Commands				

ited Commands interface port-channel show interfaces port-channel (refer to Cisco IOS documentation)

channel-protocol

To enable LACP or PAgP on an interface, use the **channel-protocol** command. To disable the protocols, use the **no** form of this command.

channel-protocol {lacp | pagp}

no channel-protocol {lacp | pagp}

Syntax Description	lacp	Enables LACP to manage channeling.			
	pagp	Enables PAgP to manage channeling.			
Defaults	PAgP				
Command Modes	Interface cor	nfiguration			
Command History	Release	Modification			
	12.1(13)EW	Support for this command was introduced on the Catalyst4500 series switches.			
Usage Guidelines	This comma	nd is not supported on systems that are configured with a Supervisor Engine I.			
	You can also select the protocol using the channel-group command.				
	If the interface belongs to a channel, the no form of this command is rejected.				
	All ports in an EtherChannel must use the same protocol; you cannot run two protocols on one module.				
	PAgP and LACP are not compatible; both ends of a channel must use the same protocol.				
	You can manually configure a switch with PAgP on one side and LACP on the other side in the on mode.				
	You can change the protocol at any time, but this change causes all existing EtherChannels to reset to the default channel mode for the new protocol. You can use the channel-protocol command to restrict anyone from selecting a mode that is not applicable to the selected protocol.				
	Configure al for LACP m	l ports in an EtherChannel to operate at the same speed and duplex mode (full duplex only ode).			
	-	ete list of guidelines, refer to the "Configuring EtherChannel" section of the <i>Catalyst4500</i> h CiscoIOS Software Configuration Guide.			
Examples	This example	e shows how to select LACP to manage channeling on the interface:			
	Switch(conf Switch(conf	ig-if)# channel-protocol lacp ig-if)#			
Related Commands	channel-gro show etherc	*			

class-map

L

To access the QoS class map configuration mode to configure QoS class maps, use the **class-map** command. To delete a class map, use the **no** form of this command.

class-map [match-all | match-any] name

no class-map [match-all | match-any] name

Syntax Description	match-all	(Optional) Specifies that all match criteria in the class map must be matched.
	match-any	(Optional) Specifies that an indeel effecting in the class map must be indefied.
	name	Name of the class map.
Defaults	Match all criter	ia.
Command Modes	Global configur	ation
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	The <i>name</i> and <i>a</i>	ccl_name arguments are case sensitive.
		hap command and its subcommands on individual interfaces to define packet narking, aggregate, and flow policing as part of a globally named service policy.
	These command	ls are available in QoS class map configuration mode:
	• exit—Exits	you from QoS class map configuration mode.
	• no—Remov	ves a match statement from a class map.
	• match—Co	onfigures classification criteria.
	These optio	onal subcommands are also available:
	- access-	group { acl_index name acl_name }
	– ip {dsc	p precedence} value1 value2 value8
	– any	
	The following s	ubcommands appear in the CLI help, but they are not supported on LAN interfaces:
	• input-inter	face {interface interface_number null number vlan vlan_id}
	• protocol lin	nktype
	• destination	a-address mac mac_address
	 source-add 	ress mac mac_address
	• qos-group	

• mpls

• no

After you have configured the class map name and are in class map configuration mode, you can enter the **match** subcommands. The syntax for these subcommands is as follows:

match {[access-group {*acl_index* | **name** *acl_name*}] | [**ip** {**dscp** | **precedence**} *value1 value2... value8*]}

See Table2-1 for a syntax description of the match subcommands.

Table2-1	Syntax Desc	ription for the	match Command
----------	-------------	-----------------	---------------

Optional Subcommand	Description
access-group acl_index acl_name	Specifies the access list index or access list names; valid access list index values are from 1 to2699.
access-group acl_name	Specifies the named access list.
ip dscp value1 value2 value8	Specifies the IP DSCP values to match; valid values are from 0 to 63. Enter up to eight DSCP values separated by white spaces.
ip precedence <i>value1 value2 value8</i>	Specifies the IP precedence values to match; valid values are from 0 to 7. Enter up to eight precedence values separated by white spaces.

Examples

This example shows how to access the **class-map** commands and subcommands and to configure a class map named ipp5 and enter a match statement for ip precedence 5:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map ipp5
Switch(config-cmap)# match ip precedence 5
Switch(config-cmap)#
```

This example shows how to configure the class map to match an already configured access list:

```
Switch(config-cmap)# match access-group IPacll
Switch(config-cmap)#
```

clear counters

L

To clear the interface counters, use the clear counters command.

clear counters [{**FastEthernet** *interface_number*} | {**GigabitEthernet** *interface_number*} | {**null** *interface_number*} | {**port-channel** *number*} | {**vlan** *vlan_id*}]

Syntax Description	FastEthernet in	iterface_number	(Optional) Specifies the Fast Ethernet interface; valid values are from 1 to 9.
	GigabitEthern	et interface_number	(Optional) Specifies the Gigabit Ethernet interface; valid values are from 1 to 9.
	null interface_m	umber	(Optional) Specifies the null interface; the valid value is 0.
	port-channel na	umber	(Optional) Specifies the channel interface; valid values are from 1 to 64.
	vlan vlan_id		(Optional) Specifies the VLAN; valid values are from 1 to 4096.
Defaults	This command h	as no default settings	
Command Modes	Privileged EXEC	C	
Command History	Release	Modification	
	12.1(8a)EW	Support for this c	ommand was introduced on the Catalyst 4500 series switch.
	12.1(12c)EW	Support for exten	ded VLAN addresses was added.
Usage Guidelines	This command c interface.	lears all the current i	nterface counters from all the interfaces unless you specify an
 Note		oes not clear the coun nterface counters co	nters that are retrieved using SNMP, but only those seen when you ommand.
Examples	This example sh	ows how to clear all	the interface counters:
	Switch# clear d Clear "show int Switch#		on all interfaces [confirm] y

This example shows how to clear the counters on a specific interface:

Switch# **clear counters vlan 200** Clear "show interface" counters on this interface [confirm]**y** Switch#

 Modification

 12.1(8a)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Examples This example shows how to clear all the active MFIB routes and global counters: Switch# clear ip mfib counters Switch#

Related Commands show ip mfib

clear ip mfib fastdrop

To clear all the MFIB fast-drop entries, use the clear ip mfib fastdrop command.

clear ip mfib fastdrop

Syntax Description	This command has no arguments or keywords.	
Defaults	This command has no default settings.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
command mistory	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	If new fast-droppe	ed packets arrive, the new fast-drop entries are created.
Examples	This example shows how to clear all the fast-drop entries:	
	Switch# clear ig Switch#	p mfib fastdrop
Related Commands	ip mfib fastdrop show ip mfib fast	

clear lacp counters

To clear the statistics for all the interfaces belonging to a specific channel group, use the **clear lacp counters** command.

clear lacp [channel-group] counters

Syntax Description	channel-group	(Optional) Channel-group number; valid values are from 1 to 64.	
Defaults	This command has no default settings.		
Command Modes	Privileged EXEC mode		
Command History	Release	Modification	
	12.1(13)EW	Support for this command was introduced on the Catalyst4500 series switches.	
Usage Guidelines	This command is not supported on systems that are configured with a Supervisor Engine I. If you do not specify a channel group, all channel groups are cleared. If you enter this command for a channel group that contains members in PAgP mode, the command		
Examples	This example shows how to clear the statistics for a specific group: Switch# clear lacp 1 counters Switch#		
Related Commands	show lacp

clear mac-address-table dynamic

To clear the dynamic address entries from the Layer2 MAC address table, use the **clear mac-address-table dynamic** command.

clear mac-address-table dynamic [{**address** *mac_addr*} | {**interface** *interface*}] [**vlan** *vlan_id*]

Syntax Description	address mac_addr	(Optional) Specifies the MAC address.	
	interface interface	(Optional) Specifies the interface and clears the entries associated with it; valid values are FastEthernet and GigabitEthernet .	
	vlan vlan_id	(Optional) Specifies the VLANs; valid values are from 1 to 4094.	
Defaults	This command has no	o default settings.	
Command Modes	Privileged EXEC		
Command History	Release M	odification	
	12.1(8a)EW Su	apport for this command was introduced on the Catalyst 4500 series switch.	
	12.1(12c)EW Su	pport for extended VLAN addresses added.	
Usage Guidelines	Enter the clear mac-address-table dynamic command with no arguments to remove all dynamic entries from the table.		
Examples	This example shows how to clear all the dynamic Layer2 entries for a specific interface (gi1/1):		
	Switch# clear mac-address-table dynamic interface gil/1 Switch#		
Related Commands	mac-address-table aging-time main-cpu show mac-address-table address		

clear pagp

To clear the port-channel information, use the **clear pagp** command.

clear pagp {group-number | counters}

Syntax Description	group-number	Channel-group number; valid values are from 1 to 64.	
	counters	Clears traffic filters.	
Defaults	This command has no default settings.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Examples	This example shows how to clear the port-channel information for a specific group:		
	Switch# clear pagp 32 Switch#		
	This example shows how to clear all the port-channel traffic filters:		
	Switch# clear pagp counters Switch#		
Related Commands	show pagp

clear port-security

L

To delete all configured secure addresses or a specific dynamic or sticky secure address on an interface from the MAC address table, use the **clear port-security** command.

clear port-security {all | dynamic } [address mac-addr [vlan vlan-id]] | [interface interface-id]

Syntax Description	all	Deletes all the secure MAC addresses.	
	dynamic	Deletes all the dynamic secure MAC addresses.	
	address mac-addr	(Optional) Deletes the specified secure MAC address.	
	vlan vlan-id	(Optional) Deletes the specified secure MAC address from the specified VLAN.	
	interface interface-id	(Optional) Deletes the secure MAC addresses on the specified physical port or port channel.	
Defaults	This command has no de	efault settings.	
Command Modes	Privileged EXEC		
Usage Guidelines	If you enter the clear port-security all command, the switch removes all the secure MAC addresses from the MAC address table.		
		prt-security dynamic interface <i>interface-id</i> command, the switch removes all	
	the dynamic secure MA	C addresses on an interface from the MAC address table.	
Command History	Release	C addresses on an interface from the MAC address table. Modification

clear qos

To clear the global and per-interface aggregate QoS counters, use the clear qos command.

clear qos [aggregate-policer [*name*] | **interface** { {**fastethernet** | **GigabitEthernet**} { *slot/interface* } } | **vlan** { *vlan_num*} | **port-channel** {*number*}]

Syntax Description	aggregate-policer name	(Optional) Specifies an aggregate policer.		
	interface	(Optional) Specifies an interface.		
	fastethernet	(Optional) Specifies the Fast Ethernet 802.3 interface.		
	GigabitEthernet	(Optional) Specifies the Gigabit Ethernet 802.3z interface.		
	slot/interface	(Optional) Number of the slot and interface.		
	vlan vlan_num	(Optional) Specifies a VLAN.		
	port-channel number	(Optional) Specifies the channel interface; valid values are from 1 to64.		
Defaults	This command has no def	ault settings.		
Command Modes	Privileged EXEC			
Command History	Release Modi	fication		
	12.1(8a)EW Supp	ort for this command was introduced on the Catalyst 4500 series switch.		
Usage Guidelines	is normally restricted cou The clear qos command r	qos command, the way that the counters work is affected and the traffic that Id be forwarded for a short period of time. esets the interface QoS policy counters. If no interface is specified, the clear QoS policy counters for all interfaces.		
Examples	This example shows how to clear the global and per-interface aggregate QoS counters for all protocols:			
	Switch# clear qos Switch#			
	This example shows how to clear the specific protocol aggregate QoS counters for all the interfaces:			
	Switch# clear qos aggre Switch#	egate-policer

clear vlan counters

L

To clear the software-cached counter values to start from zero again for a specified VLAN or all existing VLANs, use the **clear vlan counters** command.

clear vlan [vlan-id] counters

Syntax Description	<i>vlan-id</i> (Optional) VLAN number; see the "Usage Guidelines" section for valid values.		
Defaults	This command has no default settings.		
Command Modes	Privileged EXEC		
Command History	ReleaseModification12.1(13)EWSupport for this command was introduced on the Catalyst4500 series switches.		
Usage Guidelines	If you do not specify a <i>vlan-id</i> value; the software-cached counter values for all the existing VLANs are cleared.		
Examples	This example shows how to clear the software-cached counter values for a specific VLAN: Switch# clear vlan 10 counters Clear "show vlan" counters on this vlan [confirm]y Switch#		
Related Commands	show vlan counters		

clear vmps statistics

To clear the VMPS statistics, use the clear vmps statistics command.

clear vmps statistics

Syntax Description This command has no arguments or keywords.
--

- **Defaults** This command has no default settings.

debug interface

To abbreviate the entry of the **debug condition interface** command, use the **debug interface** command. To disable debugging output, use the **no** form of this command.

debug interface {**FastEthernet** *slot/port* | **GigabitEthernet** *slot/port* | **null** | **port-channel** *interface-num* | **vlan** *vlan_id*}

no debug interface {FastEthernet *slot/port* | **GigabitEthernet** *slot/port* | **null** | **port-channel** *interface-num* | **vlan** *vlan_id*}

Syntax Description	FastEthernet	Limits the debugging to Fast Ethernet interfaces.
	slot/port	Number of the slot and port.
	GigabitEthernet	Limits the debugging to Gigabit Ethernet interfaces.
	null	Limits the debugging to null interfaces; the only valid value is 0.
	port-channel interface-r	
	vlan vlan_id	Specifies the VLAN interface number; valid values are from 1 to 4094.
Defaults	This command has no def	fault settings.
Command Modes	Privileged EXEC	
Command History	Release Modifi	cation
	12.1(8a)EW Support	rt for this command was introduced on the Catalyst 4500 series switch.
	12.1(12c)EW Support	rt for extended VLAN addresses added.
Examples	This example shows how to limit the debugging to interface VLAN 1: Switch# debug interface vlan 1 Condition 1 set Switch#	
Related Commands	debug condition interface undebug interface (same as no debug interface)	

debug ipc

To debug the IPC activity, use the **debug ipc** command. To disable the debugging output, use the**no** form of this command.

debug ipc {all | errors | events | headers | packets | ports | seats}

no debug ipc {all | errors | events | headers | packets | ports | seats}

Syntax Description	all	Enables all IPC debugging.
	errors	Enables the IPC error debugging.
	events	Enables the IPC event debugging.
	headers	Enables the IPC header debugging.
	packets	Enables the IPC packet debugging.
	ports	Enables the debugging of the creation and deletion of ports.
	seats	Enables the debugging of the creation and deletion of nodes.
Defaults	This command	has no default settings.
Command Modes	Privileged EXE	C
Command History	Release	Modification
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Examples	This example sl	nows how to enable the debugging of the IPC events:
	Switch# debug Special Events Switch#	ipc events debugging is on
Related Commands	undebug ipc (s	ame as no debug ipc)

debug ip dhcp snooping event

To debug the DHCP snooping events, use the **debug ip dhcp snooping event** command. To disable debugging output, use the **no** form of this command.

debug ip dhcp snooping event

no debug ip dhcp snooping event

Syntax Description	This command has no arguments or keywords.
--------------------	--

Command Modes Privileged EXEC

 Command History
 Release
 Modification

 12.1(12c)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

ExamplesThis example shows how to enable the debugging for the DHCP snooping events:
Switch# debug ip dhcp snooping event
Switch#This example shows how to disable the debugging for the DHCP snooping events:
Switch# no debug ip dhcp snooping event
Switch#

Related Commands debug ip dhcp snooping packet

debug ip dhcp snooping packet

To debug the DHCP snooping messages, use the **debug ip dhcp snooping packet** command. To disable the debugging output, use the **no** form of this command.

debug ip dhcp snooping packet

no debug ip dhcp snooping packet

Syntax Description Th	his command has no argument	s or keywords.
-----------------------	-----------------------------	----------------

Defaults	Debugging of snooping packet is disabled.
----------	---

Command Modes Privileged EXEC

 Release
 Modification

 12.1(12c)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

 Examples
 This example shows how to enable the debugging for the DHCP snooping packets:

 Switch# debug ip dhcp snooping packet

 Switch#

 This example shows how to disable the debugging for the DHCP snooping packets:

 Switch# no debug ip dhcp snooping packet

 Switch#

Related Commands debug ip dhcp snooping event

debug ip verify source packet

To debug the IP source guard messages, use the **debug ip verify source packet** command. To disable the debugging output, use the **no** form of this command.

debug ip verify source packet

no debug ip verify source packet

Syntax Description	This command has no arguments or keywords.
--------------------	--

- **Defaults** Debugging of snooping security packets is disabled.
- Command Modes Privileged EXEC

 Release
 Modification

 12.1(12c)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Examples This example shows how to enable debugging for the IP source guard:

Switch# **debug ip verify source packet** Switch#

This example shows how to disable debugging for the IP source guard:

Switch# no debug ip verify source packet Switch#

Related Commands	undebug monit	or (same as no debug monitor)

debug nvram

To debug the NVRAM activity, use the **debug nvram** command. To disable the debugging output, use the **no** form of this command.

debug nvram

no debug nvram

Syntax Description	This command has no arguments or keywords.
--------------------	--

Defaults	This command has no default settings.
----------	---------------------------------------

Command Modes Privileged EXEC

 Release
 Modification

 12.1(8a)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Examples This example shows how to debug NVRAM: Switch# debug nvram NVRAM behavior debugging is on Switch#

Related Commands undebug nvram (same as no debug nvram)

debug pagp

To debug the PAgP activity, use the **debug pagp** command. To disable the debugging output, use the **no** form of this command.

debug pagp [all | event | fsm | misc | packet]

no debug pagp

Syntax Description	all	(Optional) Enables all PAgP debugging.
	event	(Optional) Enables the debugging of the PAgP events.
	fsm	(Optional) Enables the debugging of the PAgP finite state machine.
	misc	(Optional) Enables the miscellaneous PAgP debugging.
	packet	(Optional) Enables the PAgP packet debugging.
Defaults	This command	has no default settings.
Command Modes	Privileged EXE	c
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines		is supported only by the supervisor engine and can be entered only from the cries switch console.
Examples	This example sl	nows how to enable the PAgP miscellaneous debugging:
	Switch# *Sep 30 10:13:	<pre>pagp misc on Protocol Miscellaneous debugging is on 03: SP: PAgP: pagp_h(Fa5/6) expired 03: SP: PAgP: 135 bytes out Fa5/6</pre>
	*Sep 30 10:13:	03: SP: PAgP: Fa5/6 Transmitting information packet 03: SP: PAgP: timer pagp_h(Fa5/6) started with interval 30000
Related Commands	undebug pagp	(same as no debug pagp)

debug platform packet protocol lacp

To debug the LACP protocol packets, use the **debug platform packet protocol lacp** command. To disable the debugging output, use the **no** form of this command.

debug platform packet protocol lacp [receive | transmit | vlan]

no debug platform packet protocol lacp [receive | transmit | vlan]

Syntax Description	receive	(Optional) Enables the platform packet reception debugging functions.
	transmit	(Optional) Enables the platform packet transmission debugging functions.
	vlan	(Optional) Enables the platform packet VLAN debugging functions.
Defaults	This command	has no default settings.
Command Modes	Privileged EXE	C
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Examples	-	hows how to enable all PM debugging: platform packet protocol lacp

debug spanning-tree backbonefast

To enable debugging of the spanning-tree BackboneFast events, use the **debug spanning-tree backbonefast** command. To disable the debugging output, use the **no** form of this command.

debug spanning-tree backbonefast [detail | exceptions]

no debug spanning-tree backbonefast

Syntax Description	detail	(Optional) Displays the detailed BackboneFast debugging messages.
	exceptions	(Optional) Enables the debugging of spanning-tree BackboneFast exceptions.
Defaults	This command	has no default settings.
command Modes	Privileged EXE	C
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines		is supported only by the supervisor engine and can be entered only from the eries switch console.
Examples	-	hows how to enable the debugging and to display the detailed spanning-tree debugging information:
		spanning-tree backbonefast detail backbonefast detail debugging is on
Related Commands	undebug spanı	ning-tree backbonefast (same as no debug spanning-tree backbonefast)

console.

debug spanning-tree switch

To enable the switch shim debugging, use the **debug spanning-tree switch** command. To disable the debugging output, use the **no** form of this command.

no debug spanning-tree switch {all | errors | general | pm | rx {decode | errors | interrupt | process } | state | tx [decode] }

Suntay Decorintian						
Syntax Description	all	Displays all the spanning-tree switch shim debugging messages.				
	errors	Enables the debugging of switch shim errors or exceptions.				
	general	Enables the debugging of general events.				
	pm	Enables the debugging of port manager events.				
	rx	Displays the received BPDU-handling debugging messages.				
	decode	Enables the debugging of the decode-received packets of the spanning-tree switch shim.				
	errors	Enables the debugging of the receive errors of the spanning-tree switch shim.				
	interrupt	t Enables the shim ISR receive BPDU debugging on the spanning-tree switch.				
	process	Enables the process receive BPDU debugging on the spanning-tree switch.				
	state	Enables the debugging of the state changes on the spanning-tree port.				
	tx	Enables the transmit BPDU debugging on the spanning-tree switch shim.				
	decode	(Optional) Enables the decode-transmitted packets debugging on the spanning-tree switch shim.				
	This command has no default settings.					
Defaults	This command	has no default settings.				
Defaults Command Modes	This command Privileged EXE

Command Modes Privileged EXEC

Command History Release		Modification	
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.	

Usage Guidelines The following are four types of file read operations:

reading.

writing.

This command has no default settings.

- Operation 1—Reads the file header, which contains the header verification word and the file version number.
- Operation 2—Reads the main body of the file, which contains most of the domain and VLAN information.

To enable the VLAN manager Cisco IOS file system (IFS) error tests, use the debug sw-vlan ifs

Enables the VLAN manager IFS debugging of errors in an IFS file-open operation.

Debugs the errors that occurred when the IFS VLAN configuration file was open for

Debugs the errors that occurred when the IFS VLAN configuration file was open for

Determines the file-read operation. See the "Usage Guidelines" section for

Debugs the errors that occurred during an IFS file-write operation.

command. To disable the debugging output, use the **no** form of this command.

debug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write }

information about operation levels.

no debug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}

- Operation 3—Reads TLV descriptor structures.
- Operation 4—Reads TLV data.

Examples This example shows how to debug the TLV data errors during a file-read operation: Switch# debug sw-vlan ifs read 4 vlan manager ifs read # 4 errors debugging is on

Related Commands undebug sw-vlan ifs (same as no debug sw-vlan ifs)

debug sw-vlan ifs

Syntax Description

Defaults

debug sw-vlan notification

To enable the debugging of the messages that trace the activation and deactivation of the ISL VLAN IDs, use the **debug sw-vlan notification** command. To disable the debugging output, use the **no** form of this command.

debug sw-vlan notification {accfwdchange | allowedvlancfgchange | fwdchange | linkchange | modechange | pruningcfgchange | statechange }

no debug sw-vlan notification {accfwdchange | allowedvlancfgchange | fwdchange | linkchange | modechange | pruningcfgchange | statechange}

Syntax Description	accfwdchange	Enables the VLAN manager notification of aggregated access interface STP forward changes.
	allowedvlancfgch	ange Enables the VLAN manager notification of changes to allowed VLAN configuration.
	fwdchange	Enables the VLAN manager notification of STP forwarding changes.
	linkchange	Enables the VLAN manager notification of interface link state changes.
	modechange	Enables the VLAN manager notification of interface mode changes.
	pruningcfgchang	e Enables the VLAN manager notification of changes to pruning configuration.
	statechange	Enables the VLAN manager notification of interface state changes.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Examples	This example show	vs how to debug the software VLAN interface mode change notifications:

debug sw-vlan vtp

To enable the debugging of messages to be generated by the VTP protocol code, use the **debug sw-vlan vtp** command. To disable the debugging output, use the **no** form of this command.

debug sw-vlan vtp {events | packets | pruning [packets | xmit] | xmit }

no debug sw-vlan vtp $\{events \mid packets \mid pruning \ [packets \mid xmit] \mid xmit\}$

Syntax Description	events	Displays the general-purpose logic flow and detailed VTP debugging messages generated by the VTP_LOG_RUNTIME macro in the VTP code.
	packets	Displays the contents of all incoming VTP packets that have been passed into the VTP code from the Cisco IOS VTP platform-dependent layer, except for pruning packets.
	pruning	Enables the debugging message to be generated by the pruning segment of the VTP protocol code.
	packets	(Optional) Displays the contents of all incoming VTP pruning packets that have been passed into the VTP code from the Cisco IOS VTP platform-dependent layer.
	xmit	(Optional) Displays the contents of all outgoing VTP packets that the VTP code will request that the Cisco IOS VTP platform-dependent layer to send.
	xmit	Displays the contents of all outgoing VTP packets that the VTP code will request that the Cisco IOS VTP platform-dependent layer to send; does not include pruning packets.
Defaults	This command	d has no default settings.
Command Modes	Privileged EX	EC
Command History	Release	Modification
-	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	If you do not are displayed.	enter any more parameters after entering pruning , the VTP pruning debugging messages
Examples	-	shows how to debug the software VLAN outgoing VTP packets: g sw-vlan vtp xmit ugging is on
Related Commands	undebug sw-v	vlan vtp (same as no debug sw-vlan vtp)

debug udld

To enable the debugging of UDLD activity, use the **debug udld** command. To disable the debugging output, use the **no** form of this command.

debug udld {events | packets | registries }

no debug udld {events | packets | registries}

Syntax Description	events	Enables the debugging of UDLD process events as they occur.	
	packets	Enables the debugging of the UDLD process as it receives packets from the packet queue and attempts to transmit packets at the request of the UDLD protocol code.	
	registries	Enables the debugging of the UDLD process as it processes registry upcalls from the UDLD process-dependent module and other feature modules.	
Defaults	This comman	nd has no default settings.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
,	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Examples	This example shows how to debug the UDLD events:		
Examples	Switch# debug udld events UDLD events debugging is on Switch#		
	This example	e shows how to debug the UDLD packets:	
		ug udld packets s debugging is on	
	This example	e shows how to debug the UDLD registry events:

To create a macro of interfaces, use the **define interface-range** command.

define interface-range macro-name interface-range

Syntax Description	macro-name	Name of the interface range macro; up to 32 characters.	
	interface-range	List of valid ranges when specifying interfaces; see the "Usage Guidelines"	
		section.	
Defaults	This command ha	as no default settings.	
Command Modes	Global configurat	tion	
Command History	Release	Modification	
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Usage Guidelines	The macro name	is a character string of up to 32 characters.	
	A macro can contain up to five ranges. An interface range cannot span modules.		
	When entering the <i>interface-range</i> , use these formats:		
	 interface-type {mod}/{first-interface} - { last-interface} 		
	 interface-type {mod }/{first-interface} - { last-interface } 		
	The valid values for <i>interface-type</i> are as follows:		
	• FastEthernet		
	• GigabitEthernet		
	• Vlan vlan_id	!	
Examples	This example sho	ows how to create a multiple-interface macro:	
Examples	-	define interface-range macrol gigabitethernet 4/1-6, fastethernet 2/1-5	
	Switch(config)#	define interface-fange macrof gigabitethernet 4/1-0, fabtethernet 2/1-5	
Deleted Commende	1		
Related Commands	interface range		

Syntax Description

To deny an ARP packet based on matches against the DHCP bindings, use the **deny** command. To remove the specified ACEs from the access list, use the **no** form of this command.

- deny {[request] ip { any | host sender-ip | sender-ip sender-ip-mask} mac { any | host sender-mac | sender-mac sender-mac-mask} | response ip { any | host sender-ip | sender-ip sender-ip-mask} [{ any | host target-ip | target-ip target-ip-mask}] mac { any | host sender-mac | sender-mac sender-mac-mask } [{ any | host target-mac | target-mac target-mac-mask }] } [log]
- no deny {[request] ip {any | host sender-ip | sender-ip sender-ip-mask} mac {any | host sender-mac | sender-mac sender-mac-mask } | response ip {any | host sender-ip | sender-ip sender-ip-mask } [{any | host target-ip | target-ip target-ip-mask }] mac {any | host sender-mac | sender-mac sender-mac-mask } [{any | host target-mac | target-mac target-mac-mask }]}[log]

request	(Optional) Requests a match for the ARP request. When request is
request	not specified, matching is performed against all ARP packets.
ip	Specifies the sender IP address.
any	Specifies that any IP or MAC address will be accepted.
host sender-ip	Specifies that only a specific sender IP address will be accepted.
sender-ip sender-ip-mask	Specifies that a specific range of sender IP addresses will be accepted.
mac	Specifies the sender MAC address.
host sender-mac	Specifies that only a specific sender MAC address will be accepted
sender-mac sender-mac-mask	Specifies that a specific range of sender MAC addresses will be accepted.
response	Specifies a match for the ARP responses.
ip	Specifies the IP address values for the ARP responses.
host target-ip	(Optional) Specifies that only a specific target IP address will be accepted.
target-ip target-ip-mask	(Optional) Specifies that a specific range of target IP addresses wil be accepted.
mac	Specifies the MAC address values for the ARP responses.
host target-mac	(Optional) Specifies that only a specific target MAC address will be accepted.
target-mac target-mac-mask	(Optional) Specifies that a specific range of target MAC addresses will be accepted.
log	(Optional) Logs a packet when it matches the access control entry (ACE).

Defaults

At the end of the ARP access list, there is an implicit **deny ip any mac any** command.

Command Modes arp-nacl configuration

Command History	Release	Modification
	12.1(19)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	Deny clauses can b	be added to forward or drop ARP packets based on some matching criteria.
Examples	•	as a host with a MAC address of 0000.0000.abcd and an IP address of 1.1.1.1. This wto deny both requests and responses from this host:
	ARP access list s deny ip host Switch#	static-hosts 1.1.1.1 mac host 0000.0000.abcd
Related Commands	arp access-list ip arp inspection f permit	filter vlan

diagnostic monitor action

L

To direct the action of the switch when it detects a packet memory failure, use the **diagnostic monitor action** command.

diagnostic monitor action [conservative | normal | aggressive]

Syntax Description	conservative	(Optional) Specifies that the bootup SRAM diagnostics log all failures and remove all affected buffers from the hardware operation. The ongoing SRAM diagnostics will log events, but will take no other action.
	normal	(Optional) Specifies that the SRAM diagnostics operate as in conservative mode, except that an ongoing failure resets the supervisor engine; allows for the bootup tests to map out the affected memory.
	aggressive	(Optional) Specifies that the SRAM diagnostics operate as in normal mode, except that a bootup failure only logs failures and does not allow the supervisor engine to come online; allows for either a redundant supervisor engine or network-level redundancy to take over.
Defaults	normal mode	
Command Modes	Global configuration	on mode
Command History	Release	Modification
	12.2(18)EW	This command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	Use the conservati fixed.	ive keyword when you do not want the switch to reboot so that the problem can be
	Use the aggressive redundancy has bee	e keyword when you have redundant supervisor engines, or when network-level en provided.
Examples	This example show occurs:	vs how to configure the switch to initiate an RPR switchover when an ongoing failure
	Switch# configure Switch (config)#	e terminal diagnostic monitor action normal

dot1x guest-vlan

To enable a guest VLAN on a per-port basis, use the **dot1x guest-vlan** command. To return to the default setting, use the **no** form of this command.

dot1x guest-vlan vlan-id

no dot1x guest-vlan vlan-id

Syntax Description	vlan-id	Specifies a VLAN in the range of 1 to 4094.
Defaults	The default value	e for the guest VLAN is 0.
Command Modes	Interface configu	ration
Command History	Release	Modification
	12.1(19)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	-	n be configured only on switch ports that are statically configured as an access port. A guest me restrictions as a dot1x port that has no trunk port, dynamic port, EtherChannel port, tion port.
Examples	This example sho	ows how to enable a guest VLAN on Fast Ethernet interface 4/3:
	Switch# config Switch(config)# Switch(config-i	terminal interface fastethernet4/3 f)# dot1x port-control auto f)# dot1x guest-vlan 26 f)# end
Related Commands	dot1x max-reau show dot1x	th-req

dot1x initialize

To unauthorize an interface before reinitializing 802.1X, use the dot1x initialize command.

dot1x initialize interface

Syntax Description	interface	Number of the interface.
Defaults	This command h	as no default settings.
Command Modes	Privileged EXEC	C
Command History	Release	Modification
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	Use this comman	nd to initialize state machines and to set up the environment for fresh authentication.
Examples	This example sh	ows how to initialize the 802.1X state machines on an interface:
	Switch# dotlx i Switch#	
Related Commands	dot1x initialize show dot1x	

dot1x max-reauth-req

To set the maximum number of times that the switch will retransmit an EAP-Request/Identity frame to the client before restarting the authentication process, use the **dot1x max-reauth-req** command. To return to the default setting, use the **no** form of this command.

dot1x max-reauth-req count

no dot1x max-reauth-req

Syntax Description		Number of times that the switch retransmits EAP-Request/Identity frames before estarting the authentication process; valid values are from 1 to 10.	
Defaults	The switch send	ds a maximum of two retransmissions.	
Command Modes	Interface config	guration.	
Command History	Release	Modification	
	12.1(19)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Usage Guidelines	unreliable links	You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers. This setting impacts the wait before a non-dot1x-capable client is admitted to the guest VLAN, if one is configured.	
	You can verify	your settings by entering the show dot1x privileged EXEC command.	
Examples	-	hows how to set 5 as the number of times that the switch retransmits an dentity frame before restarting the authentication process:	
	Switch(config- Switch(config-	<pre>if)# dot1x max-reauth-req 5 if)#</pre>	
Related Commands	show dot1x		

dot1x max-req

To set the maximum number of times that the switch retransmits an Extensible Authentication Protocol (EAP)-Request frame of types other than EAP-Request/Identity to the client before restarting the authentication process, use the **dot1x max-req** command. To return to the default setting, use the **no** form of this command.

dot1x max-req count

no dot1x max-req

Syntax Description		per of times that the switch retransmits EAP-Request frames of types other than Request/Identity before restarting the authentication process; valid values are from 0.	
Defaults	The switch send	s a maximum of two retransmissions.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
	12.1(19)EW	This command was modified to control on EAP-Request/Identity retransmission limits.	
Usage Guidelines	unreliable links	nge the default value of this command only to adjust for unusual circumstances such as or specific behavioral problems with certain clients and authentication servers. your settings by entering the show dot1x privileged EXEC command.	
Examples	frame before res	ows how to set 5 as the number of times that the switch retransmits an EAP-Request tarting the authentication process: if)# dotlx max-req 5 if)#	
Related Commands	dot1x initialize dot1x max-reau show dot1x	th-req	

dot1x multiple-hosts

To allow multiple hosts (clients) on an 802.1X-authorized port that has the **dot1x port-control** interface configuration command set to **auto**, use the **dot1x multiple-hosts** command. To return to the default setting, use the **no** form of this command.

dot1x multiple-hosts

no dot1x multiple-hosts

- **Syntax Description** This command has no arguments or keywords.
- Defaults This command has no default settings.
- **Command Modes** Interface configuration

Command History	Release	Modification
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines This command enables you to attach multiple hosts to a single 802.1X-enabled port. In this mode, only one of the attached hosts must be successfully authorized for all hosts to be granted network access. If the port becomes unauthorized (reauthentication fails or an Extensible Authentication Protocol over LAN [EAPOL]-logoff message is received), all attached clients are denied access to the network.

Examples	This example shows how to enable 802.1X on Gigabit Ethernet 1/1 and to allow multiple hosts:
	Switch(config)# interface gigabitethernet1/1 Switch(config-if)# dot1x port-control auto
	Switch(config-if)# dot1x multiple-hosts
	You can verify your settings by entering the show dot1y [interface interface.id] privileged EXEC

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands show dot1x

dot1x port-control

To enable manual control of the authorization state on a port, use the **dot1x port-control** command. To return to the default setting, use the **no** form of this command.

dot1x port-control {auto | force-authorized | force-unauthorized }

no dot1x port-control {auto | force-authorized | force-unauthorized }

<u> </u>		
Syntax Description	auto	Enables 802.1X authentication on the interface and causes the port to transition to the authorized or unauthorized state based on the 802.1X authentication exchange between the switch and the client.
	force-authorized	Disables 802.1X authentication on the interface and causes the port to transition to the authorized state without any authentication exchange required. The port transmits and receives normal traffic without 802.1X-based authentication of the client.
	force-unauthorized	d Denies all access through the specified interface by forcing the port to transition to the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the interface.
Defaults	The port 802.1X aut	horization is disabled.
Command Modes	Interface configuration	ion
Command History	Release	Modification
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	The 802.1X protoco	I is supported on both the Layer 2 static-access ports and the Layer 3-routed ports
Usage Guidelines	-	I is supported on both the Layer 2 static-access ports and the Layer 3-routed ports to keyword only if the port is not configured as follows:
Usage Guidelines	You can use the aut • Trunk port—If	

	• EtherChannel port—Before enabling 802.1X on the port, you must first remove it from the EtherChannel. If you try to enable 802.1X on an EtherChannel or on an active port in an EtherChannel, an error message appears, and 802.1X is not enabled. If you enable 802.1X on an inactive port of an EtherChannel, the port does not join the EtherChannel.
	• Switch Port Analyzer (SPAN) destination port—You can enable 802.1X on a port that is a SPAN destination port; however, 802.1X is disabled until the port is removed as a SPAN destination. You can enable 802.1X on a SPAN source port.
	To globally disable 802.1X on the switch, you must disable it on each port. There is no global configuration command for this task.
Examples	This example shows how to enable 802.1X on Gigabit Ethernet 1/1:
	Switch(config)# interface gigabitethernet1/1 Switch(config-if)# dot1x port-control auto Switch#
	You can verify your settings by using the show dot1x all or show dot1x interface <i>int</i> commands to show the port-control status. An enabled status indicates that the port-control value is set either to auto or to force-unauthorized .

Related Commands show dot1x

dot1x re-authenticate

L

To manually initiate a reauthentication of all 802.1X-enabled ports or the specified 802.1X-enabled port, use the **dot1x re-authenticate** command.

dot1x re-authenticate [interface interface-id]

Syntax Description	interface <i>interface-id</i> (Optional) Slot and port number of the interface.
Defaults	This command has no default settings.
Command Modes	Privileged EXEC
Command History	Release Modification
	12.1(12c)EWSupport for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	You can use this command to reauthenticate a client without waiting for the configured number of seconds between reauthentication attempts (re-authperiod) and automatic reauthentication.
Examples	This example shows how to manually reauthenticate the device connected to Gigabit Ethernet interface1/1:
	Switch# dotlx re-authenticate interface gigabitethernet1/1 Starting reauthentication on gigabitethernet1/1 Switch#

dot1x re-authentication

To enable the periodic reauthentication of the client, use the **dot1x re-authentication** command. To return to the default setting, use the **no** form of this command.

dot1x re-authentication

no dot1x re-authentication

Syntax Description	This command has no arguments or keywords.
--------------------	--

- **Defaults** The periodic reauthentication is disabled.
- **Command Modes** Interface configuration

 Command History
 Release
 Modification

 12.1(12c)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines You configure the amount of time between the periodic reauthentication attempts by using the dot1x timeout re-authperiod global configuration command.

Examples This example shows how to disable the periodic reauthentication of the client:

Switch(config-if)# no dotlx re-authentication
Switch(config-if)#

This example shows how to enable the periodic reauthentication and set the number of seconds between the reauthentication attempts to 4000 seconds:

Switch(config-if)# dot1x re-authentication
Switch(config-if)# dot1x timeout re-authperiod 4000
Switch#

You can verify your settings by entering the **show dot1x** privileged EXEC command.

Related Commands

dot1x timeout show dot1x

dot1x system-auth-control

To enable 802.1X authentication on the switch, use the **dot1x system-auth-control** command. To disable 802.1X authentication on the system, use the **no** form of this command.

dot1x system-auth-control

no dot1x system-auth-control

Syntax Description	This command has no arguments or keywords.

Defaults	The 802.1X authentication is disabled.
----------	--

Command ModesGlobal configuration

Command HistoryReleaseModification12.1(12c)EWSupport for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines You must enable dot1x system-auth-control if you want to use the 802.1X access controls on any port on the switch. You can then use the dot1x port-control auto command on each specific port on which you want the 802.1X access controls to be used.

Examples This example shows how to enable 802.1X authentication: Switch(config)# dot1x system-auth-control Switch(config)#

Related Commands dot1x initialize show dot1x

2-91

dot1x timeout

To set the reauthentication timer, use the **dot1x timeout** command. To return to the default setting, use the **no** form of this command.

dot1x timeout {reauth-period seconds | quiet-period seconds | tx-period seconds | supp-timeout seconds | server-timeout seconds}

no dot1x timeout {reauth-period | quiet-period | tx-period | supp-timeout | server-timeout }

Syntax Description	reauth-period seconds	Number of seconds between reauthentication attempts; valid values are from 1 to 65535. See the "Usage Guidelines" section for more information.	
	quiet-period seconds	Number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client; valid values are from 0 to 65535 seconds.	
	tx-period seconds	Number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request; valid values are from 15 to 65535 seconds.	
	supp-timeout seconds	Number of seconds that the switch waits for the retransmission of EAP-Request packets; valid values are from 30 to 65535 seconds.	
	server-timeout seconds	Number of seconds that the switch waits for the retransmission of packets by the back-end authenticator to the authentication server; valid values are from 30to 65535 seconds.	

Defaults

The default settings are as follows:

- Reauthentication period is 3600 seconds.
- Quiet period is 60 seconds.
- Transmission period is 30 seconds.
- Supplicant timeout is 30 seconds.
- Server timeout is 30 seconds.

Command Modes Interface configuration

Command History	Release	Modification
	12.1(12)EW	Support for this command was introduced on the Catalyst4500 series switches.

Usage Guidelines The periodic reauthentication must be enabled before entering the **dot1x timeout re-authperiod** command. Enter the **dot1x re-authentication** command to enable periodic reauthentication.

This example shows how to set 60 as the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request:

Switch(config-if)# dotlx timeout tx-period 60
Switch(config-if)#

You can verify your settings by entering the show dot1x privileged EXEC command.

Related Commands

dot1x initialize show dot1x

duplex

To configure the duplex operation on an interface, use the **duplex** command. To return to the default setting, use the **no** form of this command.

duplex {auto | full | half}

no duplex

Syntax Description	auto	Specifies the autonegotiation operation.
	full	Specifies the full-duplex operation.
	half	Specifies the half-duplex operation.

DefaultsHalf-duplex operation

- Command ModesInterface configuration
- Command History
 Release
 Modification

 12.1(8a)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines Table2-2 lists the supported command options by interface.

Table2-2 Supported duplex Command Options

Interface Type	Supported Syntax	Default Setting	Guidelines
10/100-Mbps module	duplex[half full]	half	If the speed is set to auto , you will not be able to set the duplex mode.
			If the speed is set to 10 or 100 , and you do not configure the duplex setting, the duplex mode is set to half duplex.
100-Mbps fiber modules	duplex[half full]	half	
Gigabit Ethernet Interface	Not supported.	Not supported.	Gigabit Ethernet interfaces are set to full duplex.
10/100/1000	duplex[half full]		If the speed is set to auto or 1000 , you will not be able to set duplex .
			If the speed is set to 10 or 100 , and you do not configure the duplex setting, the duplex mode is set to half duplex.

If the transmission speed on a 16-port RJ-45 Gigabit Ethernet port is set to **1000**, the duplex mode is set to **full**. If the transmission speed is changed to **10** or **100**, the duplex mode stays at **full**. You must configure the correct duplex mode on the switch when the transmission speed changes to **10** or **100** from 1000 Mbps.

Note

Catalyst 4006 switches cannot automatically negotiate interface speed and duplex mode if either connecting interface is configured to a value other than **auto**.

Changing the interface speed and duplex mode configuration might shut down and reenable the interface during the reconfiguration.

Table2-3 describes the system performance for different combinations of the duplex and speed modes. The specified **duplex** command that is configured with the specified **speed** command produces the resulting action shown in the table.

duplex Command	speed Command	Resulting System Action
duplex half or duplex full	speed auto	Autonegotiates both speed and duplex modes
duplex half	speed 10	Forces 10 Mbps and half duplex
duplex full	speed 10	Forces 10 Mbps and full duplex
duplex half	speed 100	Forces 100 Mbps and half duplex
duplex full	speed 100	Forces 100 Mbps and full duplex
duplex full	speed 1000	Forces 1000 Mbps and full duplex

Table2-3	Relationship Between	duplex and s	peed Commands
----------	----------------------	--------------	---------------

Examples

This example shows how to configure the interface for full-duplex operation:

Switch(config-if)# duplex full
Switch(config-if)#

errdisable detect

To enable error-disable detection, use the **errdisable detect** command. To disable the error-disable detection feature, use the **no** form of this command.

errdisable detect cause {all | arp-inspection | dhcp-rate-limit | dtp-flap | gbic-invalid | l2ptguard | link-flap | pagp-flap}

no errdisable detect cause {all | arp-inspection | dhcp-rate-limit | dtp-flap | gbic-invalid | l2ptguard | link-flap | pagp-flap}

Syntax Description	cause	Specifies error-disable detection to detect from a specific cause.
	all	Specifies error-disable detection for all error-disable causes.
	arp-inspection	Specifies the detection for the ARP inspection error-disable cause.
	dhcp-rate-limit	Specifies the detection for the DHCP rate-limit error-disable cause.
	dtp-flap	Specifies the detection for the DTP flap error-disable cause.
	gbic-invalid	Specifies the detection for the GBIC invalid error-disable cause.
	l2ptguard	Specifies the detection for the Layer 2 protocol-tunnel error-disable cause.
	link-flap	Specifies the detection for the link flap error-disable cause.
	pagp-flap	Specifies the detection for the PAgP flap error-disable cause.
Defaults	All error-disable o	causes are detected.
Command Modes	Global configurat	ion
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	When a cause is d	, link-flap, pagp-flap) is defined as the reason why the error-disabled state occurred. letected on an interface, the interface is placed in error-disabled state (an operational ar to link-down state).
		e shutdown command and then the no shutdown command to recover an interface e error-disable state.
Examples	This example sho	ws how to enable error-disable detection for the link-flap error-disable cause:

This example shows how to disable error-disable detection for DAI:

Switch(config)# no errdisable detect cause arp-inspection Switch(config)# end Switch# show errdisable detect ErrDisable Reason Detection status _____ _____ udld Enabled bpduguard Enabled security-violatio Enabled channel-misconfig Disabled psecure-violation Enabled Enabled vmps pagp-flap Enabled dtp-flap Enabled link-flap Enabled 12ptguard Enabled gbic-invalid Enabled dhcp-rate-limit Enabled Enabled unicast-flood Enabled storm-control Enabled ilpower arp-inspection Disabled

Related Commands

errdisable recovery

To configure the recovery mechanism variables, use the **errdisable recovery** command. To return to the default setting, use the **no** form of this command.

- errdisable recovery [cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | l2ptguard | link-flap | pagp-flap | pesecure-violation | security-violation | storm-control | udld | unicastflood | vmps} [arp-inspection] [interval {*interval*}]]
- no errdisable recovery [cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | l2ptguard | link-flap | pagp-flap | pesecure-violation | security-violation | storm-control | udld | unicastflood | vmps} [arp-inspection] [interval {*interval*}]]

Syntax Description	cause	(Optional) Enables the error-disable recovery to recover from a specific cause.
	all	(Optional) Enables the recovery timers for all error-disable causes.
	arp-inspection	(Optional) Enables the recovery timer for the ARP inspection cause.
	bpduguard	(Optional) Enables the recovery timer for the BPDU guard error-disable cause.
	channel-misconfig	(Optional) Enables the recovery timer for the channel-misconfig error-disable cause.
	dhcp-rate-limit	(Optional) Enables the recovery timer for the DHCP rate limit error-disable cause.
	dtp-flap	(Optional) Enables the recovery timer for the DTP flap error-disable cause.
	gbic-invalid	(Optional) Enables the recovery timer for the GBIC invalid error-disable cause.
	l2ptguard	(Optional) Enables the recovery timer for the Layer 2 protocol-tunnel error-disable cause.
	link-flap	(Optional) Enables the recovery timer for the link flap error-disable cause.
	pagp-flap	(Optional) Enables the recovery timer for the PAgP flap error-disable cause.
	pesecure-violation	(Optional) Enables the recovery timer for the pesecure violation error-disable cause.
	security-violation	(Optional) Enables the automatic recovery of ports disabled due to 802.1X security violations.
	storm-control	(Optional) Enables the timer to recover from storm-control error-disable state.
	udld	(Optional) Enables the recovery timer for the UDLD error-disable cause.
	unicastflood	(Optional) Enables the recovery timer for the unicast flood error-disable cause.
	vmps	(Optional) Enables the recovery timer for the VMPS error-disable cause.
	arp-inspection	(Optional) Enables the ARP inspection cause and recovery timeout.
	interval interval	(Optional) Specifies the time to recover from a specified error-disable cause; valid values are from 30 to 86400 seconds.

Defaults	Error disable recover	ry is disabled.	
	The recovery interva	l is set to 300 seconds.	
Command Modes	Configuration		
Command History	Release N	lodification	
	12.1(8a)EW S	upport for this command was introduced on the Catalyst 4500 series switch.	
	12.1(19)EW S	upport for the storm-control feature.	
Usage Guidelines	state occurred. When (an operational state for the cause, the inter- you enable recovery	dtp-flap, link-flap, pagp-flap, udld) is defined as the reason why the error-disabled in a cause is detected on an interface, the interface is placed in error-disabled state that is similar to the link-down state). If you do not enable error-disable recovery erface stays in the error-disabled state until a shutdown and no shutdown occurs. If for a cause, the interface is brought out of the error-disabled state and allowed to nonce all the causes have timed out.	
	You must enter the s manually from error	hutdown command and then the no shutdown command to recover an interface disable.	
Examples	_	how to enable the recovery timer for the BPDU guard error disable cause: rdisable recovery cause bpduguard	
	This example shows how to set the timer to 300 seconds:		
	Switch(config)# errdisable recovery interval 300 Switch(config)#		
	This example shows how to enable the errdisable recovery for arp-inspection:

Timer interval: 300 seconds Interfaces that will be enabled at the next timeout: Switch#

Related Commands show errdisable recovery show interfaces status

flowcontrol

To configure a Gigabit Ethernet interface to send or receive pause frames, use the **flowcontrol** command. To disable the flow control setting, use the **no** form of this command.

 $flow control \ \{ receive \ | \ send \ \} \ \{ \ off \ | \ on \ | \ desired \ \}$

no flowcontrol {receive | send} { off | on | desired }

Syntax Description	receive	Specifies that the interface processes pause frames.
	send	Specifies that the interface sends pause frames.
	off	Prevents a local port from receiving and processing pause frames from remote ports or from sending pause frames to remote ports.
	on	Enables a local port to receive and process pause frames from remote ports or send pause frames to remote ports.
	desired	Obtains predictable results whether a remote port is set to on, off, or desired.

Defaults

The default settings for Gigabit Ethernet interfaces are as follows:

- Sending pause frames is desired—Gigabit Ethernet interfaces.
- Receiving pause frames is off—Gigabit Ethernet interfaces.
- Sending pause frames is on—Oversubscribed Gigabit Ethernet interfaces.
- Receiving pause frames is desired—Oversubscribed Gigabit Ethernet interfaces

Table2-4 shows the default settings for the modules.

Table2-4 Default Module Settings

Module	Ports	Send
All modules except WS-X4418-GB, WS-X4412-2GB-TX, and WS-X4416-2GB-TX	All ports except for the oversubscribed ports (1–18)	No
WS-X4418-GB	Uplink ports (1–2)	No
WS-X4418-GB	Oversubscribed ports (3–18)	Yes
WS-X4412-2GB-TX	Uplink ports (13–14)	No
WS-X4412-2GB-TX	Oversubscribed ports (1–12)	Yes
WS-X4416-2GB-TX	Uplink ports (17–18)	No

Command Modes Interface configuration

Command History	Release	Modification	
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.	

Usage Guidelines

The pause frames are special packets that signal a source to stop sending frames for a specific period of time because the buffers are full.

Table2-5 describes the guidelines for using the different configurations of the **send** and **receive** keywords with the **flowcontrol** command.

Configuration	Description
send on	Enables a local port to send pause frames to remote ports. To obtain predictable results, use send on only when remote ports are set to receive on or receive desired .
send off	Prevents a local port from sending pause frames to remote ports. To obtain predictable results, use send off only when remote ports are set to receive off or receive desired .
send desired	Obtains predictable results whether a remote port is set to receive on , receive off , or receive desired .
receive on	Enables a local port to process pause frames that a remote port sends. To obtain predictable results, use receive on only when remote ports are set to send on or send desired .
receive off	Prevents remote ports from sending pause frames to a local port. To obtain predictable results, use send off only when remote ports are set to receive off or receive desired .
receive desired	Obtains predictable results whether a remote port is set to send on , send off , or send desired .

Table2-5 Keyword Configurations for send and receive

Table2-6 identifies how the flow control will be forced or negotiated on the Gigabit Ethernet interfaces based on their speed settings.

Catalyst 4006 switches support flow control only on the gigabit interfaces.

Interface Type	Configured Speed	Advertised Flow Control
10/100/1000BASE-TX	Speed 1000	Configured flow control always
1000BASE-T	Negotiation always enabled	Configured flow control always negotiated
1000BASE-X	No speed nonegotiation	Configured flow control negotiated
1000BASE-X	Speed nonegotiation	Configured flow control forced

L

ExamplesThis example shows how to enable send flow control:
Switch(config-if)# flowcontrol receive on
Switch(config-if)#This example shows how to disable send flow control:
Switch(config-if)# flowcontrol send off
Switch(config-if)#This example shows how to set receive flow control to desired:
Switch(config-if)# flowcontrol receive desired
Switch(config-if)#

hw-module power

To turn the power off on a slot or line module, use the**no hw-module power** command. To turn the power back on, use the **hw-module power** command.

hw-module [slot | module] number power

no hw-module [slot | module] number power

Syntax Description	slot	(Optional) Specifies a slot on a chassis.
	module	(Optional) Specifies a line module.
	number	(Optional) Slot or module number.
Defaults	After a boot up	, the power is on.
Command Modes	Global configu	ration
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
	12.2(18)EW	Add slot and module keywords.
Examples	This example sl	hows how to shut off power to a module in slot 5:
	Switch# no hw- Switch#	-module slot 5 power

hw-module uplink select

To select the 10-Gigabit Ethernet or Gigabit Ethernet uplinks on the Supervisor Engine V-10GE, use the **hw-module uplink select** command.

hw-module uplink select {tengigabitethernet | gigabitethernet}

Syntax Description	tengigabitethe	ernet (Optional) Specifies the 10-Gigabit Ethernet uplinks.
	gigabitetherne	et (Optional) Specifies the Gigabit Ethernet uplinks.
Defaults	tengigabitetheri	net
Command Modes	Global configu	ration
Command History	Release	Modification
	12.2(25)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	requires saving t the system respo appropriate com	ink selection is programmed into hardware during initialization, changing the active uplinks the configuration and reloading the switch. When you are configuring a change to the uplinks, onds with a message informing you that the switch must be reloaded, and suggests the mand (depending on redundancy mode) to reload the switch. his command does not exist. To undo the configuration, you must configure the uplinks.
Examples	Switch(config)	hows how to select the Gigabit Ethernet uplinks:)# hw-module uplink select gigabitethernet he active supervisor is required to apply the new configuration.)#
Note	The Gigabit Eth	hernet uplinks will be active after the next reload.
	Switch(config)	
Note	The Gigabit Eth	hernet uplinks will be active after the next reload of the chassis/shelf. Use the

redundancy reload shelf command to reload the chassis/shelf. Use the

This example shows how to select the Gigabit Ethernet uplinks in a redundant system in RPR mode:

Switch(config)# hw-module uplink select gigabitethernet
A reload of the active supervisor is required to apply the new configuration.
Switch(config)#

The Gigabit Ethernet uplinks will be active on a switchover or reload of the active supervisor engine.

Related Commands show hw-module uplink

instance

L

To map a VLAN or a set of VLANs to an MST instance, use the **instance** command. To return the VLANs to the common instance default, use the **no** form of this command.

instance instance-id {vlans vlan-range}

no instance *instance-id*

Syntax Description	instance-id	MST instance to which the specified VLANs are mapped; valid values are from 0 to 15.	
	vlans vlan-range	Specifies the number of the VLANs to be mapped to the specified instance. The number is entered as a single value or a range; valid values are from 1 to 4094.	
Defaults	Mapping is disabled.		
Command Modes	MST configuration		
Command History	Release	Modification	
·····,	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
	Any unmapped VLA	N is mapped to the CIST instance.	
Examples	This example shows	how to map a range of VLANs to instance 2:	
	Switch(config-mst) Switch(config-mst)	# instance 2 vlans 1-100 #	
	This example shows how to map a VLAN to instance 5:		
	Switch(config-mst) Switch(config-mst)	# instance 5 vlans 1100 #	
	This example shows how to move a range of VLANs from instance 2 to the CIST instance:		
	Switch(config-mst)# no instance 2 vlans 40-60 Switch(config-mst)#		
	This example shows how to move all the VLANs mapped to instance 2 back to the CIST instance:		
	Switch(config-mst) Switch(config-mst)		

Related Commands

name revision show spanning-tree mst spanning-tree mst configuration L

To select an interface to configure and to enter interface configuration mode, use the **interface** command.

interface type number

Syntax Description	type	Type of interface to be configured; see Table2-7 for valid values.
	number	Module and port number.
Defaults	No interface ty	pes are configured.
Command Modes	Global configu	ration
Command History	Release	Modification
	12.2(25)EW	Extended to include the 10-Gigabit Ethernet interface.

Usage Guidelines Table2-7 lists the valid values for *type*.

Table2-7 Valid type Values

Keyword	Definition	
ethernet	Ethernet IEEE 802.3 interface.	
fastethernet	100-Mbps Ethernet interface.	
gigabitethernet	Gigabit Ethernet IEEE 802.3z interface.	
tengigabitethernet	10-Gigabit Ethernet IEEE 802.3ae interface.	
ge-wan	Gigabit Ethernet WAN IEEE 802.3z interface; supported on Catalyst4500 series switches that are configured with a Supervisor EngineII only.	
pos	Packet OC-3 interface on the Packet over SONET Interface Processor; supported on Catalyst4500 series switches that are configured with a Supervisor EngineII only.	
atm	ATM interface; supported on Catalyst4500 series switches that are configured with a Supervisor EngineII only.	
vlan	VLAN interface; see the interface vlan command.	
port-channel	Port channel interface; see the interface port-channel command.	
null	Null interface; the valid value is 0 .	
tunnel	Tunnel interface.	

Examples This example shows how to enter the interface configuration mode on the Fast Ethernet interface 2/4: Switch(config)# interface fastethernet2/4 Switch(config)#

Related Commands show interfaces

interface port-channel

L

To access or create a port-channel interface, use the interface port-channel command.

interface port-channel channel-group

Syntax Description	<i>channel-group</i> Port-channel group number; valid values are from 1 to 64.
Defaults	This command has no default settings.
Command Modes	Global configuration
Command History	ReleaseModification12.1(8a)EWSupport for this command was introduced on the Catalyst 4500 series switch
	12.1(6a)Ew Support for this command was infoldeded on the Catalyst 4500 series switch
Usage Guidelines	You do not have to create a port-channel interface before assigning a physical interface to a channel group. A port-channel interface is created automatically when the channel group gets its first physical interface, if it is not already created.
	You can also create the port channels by entering the interface port-channel command. This will create a Layer 3 port channel. To change the Layer 3 port channel into a Layer 2 port channel, use the switchport command before you assign the physical interfaces to the channel group. A port channel cannot be changed from Layer 3 to Layer 2 or vice versa when it contains member ports.
	Only one port channel in a channel group is allowed.
<u> </u>	The Layer 3 port-channel interface is the routed interface. Do not enable Layer 3 addresses on the physical Fast Ethernet interfaces.
	If you want to use CDP, you must configure it only on the physical Fast Ethernet interface and not on the port-channel interface.
Examples	This example creates a port-channel interface with a channel-group number of 64: Switch(config)# interface port-channel 64 Switch(config)#
Related Commands	channel-group show etherchannel

interface range

To run a command on multiple ports at the same time, use the **interface range** command.

interface range {vlan vlan_id - vlan_id} {port-range | macro name}

Syntax Description	vlan vlan_id - vlan_id	Specifies a VLAN range; valid values are from 1 to4094.	
	port-range	Port range; for a list of valid values for <i>port-range</i> , see the "Usage Guidelines" section.	
	macro name	Specifies the name of a macro.	
Defaults	This command has no	default settings.

To display the VLAN unning config command. The VLANs that are not displayed cannot be used in mmand. ered with the interface range command are applied to all the existing VLAN accro, you must define a range using the define interface-range command. ges that are made to a port range are saved to NVRAM, but the port ranges tha erface range command do not get saved to NVRAM. range in two ways: ve port ranges ously defined macro the ports or the name of a port-range macro. A port range must consist of the sam s within a range cannot span the modules.	

Use these formats when entering the *port-range*:

- *interface-type* {*mod*}/{*first-port*} {*last-port*}
- *interface-type* {*mod*}/{*first-port*} {*last-port*}

Valid values for *interface-type* are as follows:

- FastEthernet
- GigabitEthernet
- Vlan vlan_id

You cannot specify both a macro and an interface range in the same command. After creating a macro, you can enter additional ranges. If you have already entered an interface range, the CLI does not allow you to enter a macro.

You can specify a single interface in the *port-range* value. This makes the command similar to the **interface** *interface-number* command.

This example shows how to use the **interface range** command to interface to FE 5/18 - 20:

Switch(config)# interface range fastethernet 5/18 - 20
Switch(config-if)#

This command shows how to run a port-range macro:

Switch(config)# interface range macro macrol
Switch(config-if)#

interface vlan

To create or access a Layer 3 switch virtual interface (SVI), use the **interface vlan** command. To delete an SVI, use the **no** form of this command.

interface vlan vlan_id

no interface vlan *vlan_id*

Syntax Description	<i>vlan_id</i> Number of the VLAN; valid values are from 1 to 4094.			
Defaults	Fast EtherChannel is not specified.			
Command Modes	Global configuration			
Command History	Release	Modification		
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch		
	12.1(12c)EW	Support for extended addressing was added.		
	displayed whenever a VLAN interface is newly created, so you can check that you entered the correct VLAN number.			
	If you delete an SVI by entering the no interface vlan <i>vlan_id</i> command, the associated interface is forced into an administrative down state and marked as deleted. The deleted interface will no longer be visible in a show interface command.			
		te a deleted SVI by entering the interface vlan <i>vlan_id</i> command for the deleted nterface comes back up, but much of the previous configuration will be gone.		
Examples	This example sl number:	hows the output when you enter the interface vlan <i>vlan_id</i> command for a new VLAN		

ip arp inspection filter vlan

To permit ARPs from hosts that are configured for static IP when DAI is enabled and to define an ARP access list and apply it to a VLAN, use the **ip arp inspection filter vlan** command. To disable this application, use the **no** form of this command.

ip arp inspection filter arp-acl-name **vlan** vlan-range [static]

no ip arp inspection *filter arp-acl-name* **vlan** *vlan-range* [*static*]

Syntax Description	arp-acl-name	Access control list name.	
	vlan-range	VLAN number or range; valid values are from 1to 4094.	
	static	(Optional) Specifies that the access control list should be applied statically.	
Defaults	No defined ARP	ACLs are applied to any VLAN.	
Command Modes	Configuration		
Command History	Release	Modification	
	12.1(19)EW	Support for this command was introduced on the Catalyst 4500 series switch	
Usage Guidelines	containing only th are bridged in the	cess control list is applied to a VLAN for dynamic ARP inspection, the ARP packets ne IP-to-Ethernet MAC bindings are compared against the ACLs. All other packet types incoming VLAN without validation. Decifies that the incoming ARP packets are compared against the ARP access control	
	list, and the packets are permitted only if the access control list permits them. If the access control lists deny the packets because of explicit denies, the packets are dropped. If the packets are denied because of an implicit deny, they are then matched against the list of DHCP bindings if the ACL is not applied statically.		
Examples	This example sho	ows how to apply the ARP ACL "static-hosts" to VLAN 1 for DAI:	
	Switch# config terminal Enter configuration commands, one per line. End with CNTL/Z. Switch(config)# ip arp inspection filter static-hosts vlan 1 Switch(config)# end Switch# Switch# show ip arp inspection vlan 1 Source Mac Validation : Enabled Destination Mac Validation : Disabled IP Address Validation : Disabled		

Vlan 	Configuration	Operation	ACL Match	Static ACL
1	Enabled	Active	static-hosts	No
Vlan	ACL Logging	DHCP Loggin	ng 	
1	Acl-Match	Deny		
Switch#

ip arp inspection log-buffer

To configure the parameters that are associated with the logging buffer, use the **ip arp inspection log-buffer** command. To disable the parameters, use the **no** form of this command.

ip arp inspection log-buffer {**entries** *number* | **logs** *number* **interval** *seconds*}

no ip arp inspection log-buffer {entries | logs}

Syntax Description	entries number	Number of entries from the logging buffer; the range is from 0 to 1024.
	logs number	Number of entries to be logged in an interval; the range is from 0 to 1024. A
		Ovalue indicates that entries should not be logged out of this buffer.
	interval seconds	Logging rate; the range is from 0 to 86400 (1 day). A 0 value indicates an immediate log.
Defaults	When dynamic ARP	P inspection is enabled, denied, or dropped, the ARP packets are logged.
	The number of entri	es is set to 32.
	The number of logg	ing entries is limited to 5 per second.
	The interval is set to	o 1.
Command Modes	Configuration	
Command History	Release	Modification
	12.1(19)EW	Support for this command was introduced on the Catalyst 4500 series switch
Usage Guidelines	flow are registered b	acket of a given flow is logged immediately. The subsequent packets for the same but are not logged immediately. Registering these packets is done in a log buffer that VLANs. Entries from this buffer are logged on a rate-controlled basis.
Examples	This example shows	s how to configure the logging buffer to hold up to 45 entries:
	Switch(config)# ig Switch(config)# er Switch# show ip ar Total Log Buffer S	on commands, one per line. End with CNTL/Z. p arp inspection log-buffer entries 45 nd rp inspection log Size : 45 htries per 1 seconds.

This example shows how to configure the logging rate to 10 logs per 3 seconds:

```
Switch(config)# ip arp inspection log-buffer logs 10 interval 3
Switch(config)# end
Switch# show ip arp inspection log
Total Log Buffer Size : 45
Syslog rate : 10 entries per 3 seconds.
No entries in log buffer.
Switch#

no ip arp inspection vlan vlan-rang	e logging {acl-match	dhcp-bindings}
-------------------------------------	----------------------	----------------

Syntax Descriptionvlan-rangeNumber of the VLANs to be mapped to the specified instance. The number is entered as a single value or a range; valid values are from 1to 4094.acl-matchSpecifies the logging criteria for packets that are dropped or permitted based on ACL matches.matchlogSpecifies that logging of packets matched against ACLs is controlled by the matchlog keyword in the permit and deny access control entries of the ACL.NoteBy default, the matchlog keyword is not available on the ACEs. When the keyword is used, denied packets are not logged. Packets are logged only when they match against an ACE that has the matchlog keyword.noneSpecifies that ACL-matched packets are not logged.MoteSpecifies that ACL-matched packets are not logged.
ACL matches. matchlog Specifies that logging of packets matched against ACLs is controlled by the matchlog keyword in the permit and deny access control entries of the ACL. Note By default, the matchlog keyword is not available on the ACEs. When the keyword is used, denied packets are not logged. Packets are logged only when they match against an ACE that has the matchlog keyword. none Specifies that ACL-matched packets are not logged.
matchlog keyword in the permit and deny access control entries of the ACL. Note By default, the matchlog keyword is not available on the ACEs. When the keyword is used, denied packets are not logged. Packets are logged only when they match against an ACE that has the matchlog keyword. none Specifies that ACL-matched packets are not logged.
keyword is used, denied packets are not logged. Packets are logged only when they match against an ACE that has the matchlog keyword. none Specifies that ACL-matched packets are not logged.
dhcp-bindings Specifies the logging criteria for packets dropped or permitted based on matches
against the DHCP bindings.
permit Specifies logging when permitted by DHCP bindings.
all Specifies logging when permitted or denied by DHCP bindings.
none Prevents all logging of packets permitted or denied by DHCP bindings.
Defaults All denied or dropped packets are logged. Command Modes Configuration Command History Release Modification
12.1(19)EW Support for this command was introduced on the Catalyst 4500 series switch
Usage Guidelines The acl-match and dhcp-bindings keywords merge with each other. When you set an ACL match configuration, the DHCP bindings configuration is not disabled. You can use the no form of this command to reset some of the logging criteria to their defaults. If you do not specify either option, a the logging types are reset to log on when the ARP packets are denied. The two options that are availab to you are as follows:
• acl-match—Logging on ACL matches is reset to log on deny

- acl-match-Logging on ACL matches is reset to log on deny
- dhcp-bindings-Logging on DHCP binding compared is reset to log on deny

Examples

This example shows how to configure an ARP inspection on VLAN 1 to add packets to a log on matching against the ACLs with the **logging** keyword:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip arp inspection vlan 1 logging acl-match matchlog
Switch(config)# end
Switch# show ip arp inspection vlan 1

ip cef load-sharing algorithm

To configure the load-sharing hash function so that the source TCP/UDP port, the destination TCP/UDP port, or both ports can be included in the hash in addition to the source and destination IP addresses, use the **ip cef load-sharing algorithm** command. To revert back to the default, which does not include the ports, use the **no** form of this command.

ip cef load-sharing algorithm {include-ports {source | destination dest} | original |
 tunnel | universal }

no ip cef load-sharing algorithm {**include-ports** {**source** | **destination** *dest*} | **original** | **tunnel** | **universal**}

Syntax Description	include-ports	Specifies the algorithm that includes the Layer 4 ports.				
	source source	Specifies the source port in the load-balancing hash functions.				
	destination dest	Specifies the destination port in the load-balancing hash. Uses the source and destination in hash functions.				
	original	Specifies the original algorithm; not recommended.				
	tunnel	Specifies the algorithm for use in tunnel-only environments.				
	universal	Specifies the default Cisco IOS load-sharing algorithm.				
Defaults	Default load-shari	ng algorithm is disabled.				
 Note	This option does n	ot include the source or destination port in the load-balancing hash.				
Command History	Release	Modification				
Command History	Release 12.1(12c)EW	Modification Support for this command was introduced on the Catalyst 4500 series switch				
Usage Guidelines	software-routed pa	ithm, tunnel algorithm, and universal algorithm are routed through the hardware. For ackets, the algorithms are handled by the software. The include-ports option does not are-switched traffic.				
Examples	This example show	ws how to configure the IP CEF load-sharing algorithm that includes Layer 4 ports:				
	Switch(config)# Switch(config)#	ip cef load-sharing algorithm include-ports

ip dhcp snooping

To enable DHCP snooping globally, use the **ip dhcp snooping** command. To disable DHCP snooping, use the **no** form of this command.

ip dhcp snooping

no ip dhcp snooping

- Syntax Description This command has no arguments or keywords.
- **Defaults** DHCP snooping is disabled.
- **Command Modes** Global configuration

 Release
 Modification

 12.1(12c)EW
 Support for this command was introduced on the Catalyst 4500 series switch

Usage Guidelines You must enable DHCP snooping globally before you can use DHCP snooping on a VLAN.

Examples This example shows how to enable DHCP snooping: Switch(config)# ip dhcp snooping

Switch(config)#

This example shows how to disable DHCP snooping:

Switch(config)# no ip dhcp snooping
Switch(config)#

Related Commands ip dhcp snooping information option ip dhcp snooping limit rate ip dhcp snooping trust ip dhcp snooping vlan show ip dhcp snooping show ip dhcp snooping binding

ip dhcp snooping binding

To set up and generate a DHCP binding configuration to restore bindings across reboots, use the **ip dhcp snooping binding** command. To disable the binding configuration, use the **no** form of this command.

ip dhcp snooping binding mac-address vlan vlan-# ip-address interface interface expiry seconds

no ip dhcp snooping binding mac-address **vlan** vlan-# ip-address **interface** interface

Syntax Description	mac-address	Specifies a MAC address.
	vlan vlan-#	Specifies a valid VLAN number.
	ip-address	Specifies an IP address.
	interface interface	Specifies an interface type and number.
	expiry seconds	Specifies the interval (in seconds) after which binding is no longer valid.
Defaults	This command has no	o default settings.
Command Modes	Privileged EXEC	
Command History	Release M	odification
	12.1(19)EW Su	apport for this command was introduced on the Catalyst 4500 series switch
		apport for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 ries switch.
Usage Guidelines	Whenever a binding changed and a write	is added or removed using this command, the binding database is marked as is initiated.
Examples	This example shows how to generate a DHCP binding configuration on interface gigabitethernet1/1 ir VLAN 1 with an expiration time of 1000 seconds:	
Switch# ip dhcp sn Switch#	nooping binding 0001.	1234.1234 vlan 1 172.20.50.5 interface gil/1 expiry 1000

show ip dhcp snooping

show ip dhcp snooping binding

ip dhcp snooping database

To store the bindings that are generated by DHCP snooping, use the **ip dhcp snooping database** command. To either reset the timeout, reset the write-delay, or delete the agent specified by the URL, use the **no** form of this command.

ip dhcp snooping database {*url* | **timeout** *seconds* | **write-delay** *seconds*}

no ip dhcp snooping database {timeout | write-delay}

Syntax Description	url	Specifies the URL in one of the following forms:
		 tftp://<host>/<filename></filename></host>
		<pre>• ftp://<user>:<password>@<host>/<filename></filename></host></password></user></pre>
		rcp:// <user>@<host>/<filename></filename></host></user>
		 nvram:/<filename></filename>
		 bootflash:/<filename></filename>
	timeout seconds	Specifies when to abort the database transfer process after a change to the binding database.
		The minimum value of the delay is 15 seconds. 0 is defined as an infinite duration.
	write-delay seconds	Specifies the duration for which the transfer should be delayed after a change to the binding database.
Command Modes	Interface configura	lue is set to 300 seconds.
Command History	Release	Modification
	12.1(19)EW	Support for this command was introduced on the Catalyst 4500 series switch
Usage Guidelines	on an TFTP server redundant supervis You need to create	AM and bootflash have limited storage capacity, we recommend that you store a file . When a file is stored in a remote location that is accessible through TFTP, an RPR sor engine can take over the binding list when a switchover occurs. an empty file at the configured URL on network-based URLs (such as TFTP and FTP) can write the set of bindings for the first time at the URL.

```
Examples
                   This example shows how to store a database file with the IP address 10.1.1.1 within a directory called
                   directory. A file named file must be present on the TFTP server.
                   Switch# config terminal
                   Switch(config)# ip dhcp snooping database tftp://10.1.1.1/directory/file
                   Switch(config)# end
                   Switch# show ip dhcp snooping database
                   Agent URL : tftp://10.1.1.1/directory/file
                   Write delay Timer : 300 seconds
                   Abort Timer : 300 seconds

ip igmp filter

To control whether all hosts on a Layer2 interface can join one or more IP multicast groups by applying an IGMP profile to the interface, use the **ip igmp filter** command. To remove a profile from the interface, use the **no** form of this command.

ip igmp filter *profile number*

no ip igmp filter

Syntax Description	profile number	IGMP profile number to be applied; valid values are from 1 to 429496795.
Defaults	Profiles are not ap	plied.
Command Modes	Interface configura	ition
Command History	Release	Modification
	12.1(11b)EW	Support for this command was introduced on the Catalyst 4500 series switch
Usage Guidelines	ports, switch virtua	AP filters only to Layer 2 physical interfaces; you cannot apply IGMP filters to routed al interfaces (SVIs), or ports that belong to an EtherChannel group. can be applied to one or more switch port interfaces, but one port can have only one t.
Examples	Switch(config)#	vs how to apply IGMP profile 22 to an interface. interface gigabitethernet1/1)# ip igmp filter 22)#
Related Commands	ip igmp profile show ip igmp pro	file

ip igmp max-groups

To set the maximum number of IGMP groups that a Layer 2 interface can join, use the **ip igmp max-groups** command. To set the maximum back to the default, use the **no** form of this command.

ip igmp max-groups number

no ip igmp max-groups

Syntax Description		Maximum number of IGMP groups that an interface can join; valid values are from0 to 4294967294.
Defaults	No maximum lin	nit.
Command Modes	Interface configu	iration
Command History	Release 12.1(11b)EW	Modification Support for this command was introduced on the Catalyst 4500 series switch
Usage Guidelines		ip igmp max-groups command only on Layer 2 physical interfaces; you cannot set the groups for the routed ports, the switch virtual interfaces (SVIs), or the ports that belong nel group.
Examples	Switch(config)#	ows how to limit the number of IGMP groups that an interface can join to 25: interface gigabitethernet1/1 f)# ip igmp max-groups 25

ip igmp profile

L

To create an IGMP profile, use the **ip igmp profile** command. To delete the IGMP profile, use the **no** form of this command.

ip igmp profile profile number

no ip igmp profile profile number

Syntax Description	profile number	IGMP profile number being configured; valid values are from 1 to 4294967295.
Defaults	No profile created	
Command Modes	Global configurat IGMP profile con	
Command History	Release	Modification
	12.1(11b)EW	Support for this command was introduced on the Catalyst 4500 series switch
Usage Guidelines	-	ange, enter the low IP multicast address, a space, and the high IP multicast address. IGMP profile to one or more Layer 2 interfaces, but each interface can have only one it.
Examples	addresses: Switch # config Switch(config)# Switch(config-ig	ip igmp profile 40 mp-profile)# permit mp-profile)# range 233.1.1.1 233.255.255.255

ip igmp query-interval

To configure the frequency that the switch sends the IGMP host-query messages, use the **ip igmp query-interval** command. To return to the default frequency, use the **no** form of this command.

ip igmp query-interval seconds

no ip igmp query-interval

Syntax Description	seconds	Frequency, in seconds, at which the IGMP host-query messages are transmitted; valid values depend on the IGMP snooping mode. See the "Usage Guidelines" section for more
		information.
Defaults	The query i	nterval is set to 60 seconds.
Command Modes	Interface co	nfiguration
Command History	Release	Modification
	12.1(8a)EV	Support for this command was introduced on the Catalyst 4500 series switch
Usage Guidelines	If you use the default IGMP snooping configuration, the valid query interval values are from 1 to 65535 seconds. If you have changed the default configuration to support CGMP as the IGMP snooping	
	learning method, the valid query interval values are from 1 to 300 seconds. The designated switch for a LAN is the only switch that sends the IGMP host-query messages. For IGMP version 1, the designated switch is elected according to the multicast routing protocol that runs on the LAN. For IGMP version 2, the designated querier is the lowest IP-addressed multicast switch on the subnet.	
	If no queries are heard for the timeout period (controlled by the ip igmp query-timeout command), the switch becomes the querier.	
<u>Note</u>	Changing tl	ne timeout period may severely impact multicast forwarding.
Examples	This examp host-query	le shows how to change the frequency at which the designated switch sends the IGMP messages:

Switch(config-if)# ip igmp query-interval 120
Switch(config-if)#

L

ip igmp snooping

To enable IGMP snooping, use the **ip igmp snooping** command. To disable IGMP snooping, use the **no** form of this command.

ip igmp snooping [tcn {flood query count count | query solicit}]

no ip igmp snooping [tcn {flood query count *count* | **query solicit**}]

Syntax Description	tcn	(Optional) Specifies the topology change configurations.
	flood	(Optional) Specifies to flood the spanning-tree table to the network when a topology
		change occurs.
	query	(Optional) Specifies the TCN query configurations.
	count count	(Optional) Specifies how often the spanning-tree table is flooded; valid values are from 1 to 10.
	solicit	(Optional) Specifies an IGMP general query.
Defaults	IGMP snooping	g is enabled.
Command Modes	Global configu	ration
	Interface config	guration
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch
	12.1(11)EW	Support for flooding the spanning-tree table was added.
Usage Guidelines	ports, VLAN in	option applies only to Layer 2 switch ports and EtherChannels; it does not apply to routed nterfaces, or Layer 3 channels. nooping command is disabled by default on multicast routers.
	<u>.</u>	
Note	You can use the	e ten flood option in interface configuration mode.
Examples	This example s	hows how to enable IGMP snooping:
	Switch(config)# ip igmp snooping Switch(config)#	
	This example s	hows how to disable IGMP snooping:
	Switch(config)# no ip igmp snooping Switch(config)#	

This example shows how to enable the flooding of the spanning-tree table to the network after nine topology changes have occurred:

Switch(config)# ip igmp snooping tcn flood query count 9
Switch(config)#

This example shows how to disable the flooding of the spanning-tree table to the network:

Switch(config)# no ip igmp snooping tcn flood
Switch(config)#

This example shows how to enable an IGMP general query:

Switch(config)# ip igmp snooping tcn query solicit
Switch(config)#

This example shows how to disable an IGMP general query:

Switch(config)# no ip igmp snooping tcn query solicit
Switch(config)#

ip route-cache flow

To enable NetFlow statistics for IP routing, use the **ip route-cache flow** command. To disable NetFlow statistics, use the **no** form of this command.

ip route-cache flow [infer-fields]

no ip route-cache flow [infer-fields]

Syntax Description	infer-fields	(Optional) Includes the NetFlow fields as inferred by the software: Input identifier, Output identifier, and Routing information.
Defaults	NetFlow statisti	cs is disabled.
	Inferred informa	ation is excluded.
Command Modes	Configuration	
Command History	Release	Modification
	12.1(13)EW	Support for this command was introduced on the Catalyst4500 series switches.
	12.1(19)EW	Command enhanced to support infer fields.
Usage Guidelines	The NetFlow sta IP address, dest	mmands, you need to install the SupervisorEngineIV and the NetFlow Service Card. tistics feature captures a set of traffic statistics. These traffic statistics include the source ination IP address, Layer 4 port information, protocol, input and output identifiers, and formation that can be used for network analysis, planning, accounting, billing and attacks.
	NetFlow switch	ing is supported on IP and IP-encapsulated traffic over all interface types.
	will purge the ex	ip route-cache flow infer-fields command after the ip route-cache flow command, you xisting cache, and vice versa. This action is done to avoid having flows with and without n the cache simultaneously.
•	For additional in <i>Software Config</i>	nformation on NetFlow switching, refer to the <i>Catalyst4500 Series Switch CiscoIOS</i> guration Guide.
<u>Note</u>		nes additional memory and CPU resources compared to other switching modes. You the resources required on your switch before enabling NetFlow.

Examples

L

This example shows how to enable NetFlow switching on the switch:

```
Switch# config terminal
Switch(config)# ip route-cache flow
Switch(config)# exit
Switch#
```

This command does not work on a per-interface basis.

ip source binding

To add or delete a static IP source binding entry, use the **ip source binding** command. To delete the corresponding IP source binding entry, use the **no** form of this command.

ip source binding ip-address mac-address vlan vlan-id interface interface-name

no ip source binding ip-address mac-address vlan vlan-id interface interface-name

Syntax Description	ip-address	Binding IP address.			
	mac-address	Binding MAC address.			
	vlan vlan-id	VLAN number.			
	interface interface-name	e Binding interface.			
Defaults	This command has no de	fault settings.			
Command Modes	Global configuration				
	choose contigeration				
Command History	Release	Modification			
	12.1(19)EW	This command was first introduced.			
Usage Guidelines	The ip source binding command is used to add a static IP source binding entry only.				
	The no form of this command deletes the corresponding IP source binding entry. For the deletion to succeed, all required parameters must match.				
	•	try is keyed by a MAC address and VLAN number. If the CLI contains an , the existing binding entry will be updated with the new parameters; a separate created.			
Examples	This example shows how	to configure the static IP source binding:			
	Switch# config terminal Switch(config)# ip source binding 11.0.0.1 0000.000A.000B vlan 10 interface fastethernet6/10 Switch(config)#

ip sticky-arp

To enable sticky ARP, use the **ip sticky-arp** command. Use the **no** form of this command to disable sticky ARP.

ip sticky-arp

no ip sticky-arp

Syntax Description	This command has no	o arguments or	keywords.
--------------------	---------------------	----------------	-----------

Defaults Enabled

Command Modes Global configuration

 Release
 Modification

 12.1(12c)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines This command is supported on PVLANs only.

ARP entries that are learned on Layer3 PVLAN interfaces are sticky ARP entries. (You should display and verify ARP entries on the PVLAN interface using the **show arp** command).

For security reasons, sticky ARP entries on the PVLAN interface do not age out. Connecting new equipment with the same IP address generates a message and the ARP entry is not created.

Because the ARP entries on the PVLAN interface do not age out, you must manually remove ARP entries on the PVLAN interface if a MAC address changes.

Unlike static entries, sticky-ARP entries are not stored and restored when you enter the **reboot** and **restart** commands.

Examples

This example shows how to enable sticky ARP:

Switch# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Switch(config) ip sticky-arp Switch(config)# end Switch#

This example shows how to disable sticky ARP:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config) no ip sticky-arp
Switch(config)# end
Switch#
```

ip verify header vlan all

To enable IP header validation for Layer 2-switched IPv4 packets, use the **ip verify header vlan all** command. To disable the IP header validation, use the **no** form of this command.

ip verify header vlan all

no ip verify header vlan all

Syntax Description	This command has no default settings.			
Defaults	The IP header is validated for bridged and routed IPv4 packets.			
Command Modes	Configuration			
Command History	Release Modification			
	12.1(20)EWSupport for this command was introduced on the Catalyst 4500 series switch			
Usage Guidelines	 This command does not apply to Layer 3-switched (routed) packets. The Catalyst 4500 series switch checks the validity of the following fields in the IPv4 header for all switched IPv4 packets: The version must be 4. The header length must be greater than or equal to 20 bytes. The total length must be greater than or equal to four times the header length and greater than the Layer 2 packet size minus the Layer 2 encapsulation size. If an IPv4 packet fails the IP header validation, the packet is dropped. If you disable the header validation, the packets with the invalid IP headers are bridged but are not routed even if routing was 			
Examples	<pre>intended. The IPv4 access lists also are not applied to the IP headers. This example shows how to disable the IP header validation for the Layer 2-switched IPv4 packets: Switch# config terminal Switch(config)# no ip verify header vlan all Switch(config)# end Switch#</pre>			

ip verify source vlan dhcp-snooping

To enable IP source guard on DHCP snooping on untrusted Layer 2 interfaces, use the **ip verify source vlan dhcp-snooping** command. To disable IP source guard on DHCP snooping on untrusted Layer 2 interfaces, use the **no** form of this command.

ip verify source vlan dhcp-snooping [port-security]

l2protocol-tunnel

To enable protocol tunneling on an interface, use the **l2protocol-tunnel** command. You can enable tunneling for the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. To disable tunneling on the interface, use the **no** form of this command.

l2protocol-tunnel [cdp | stp | vtp]

no l2protocol-tunnel [cdp | stp | vtp]

Syntax Description	cdp	(Optional) Enables tunneling of CDP.			
	stp	(Optional) Enables tunneling of STP.			
	vtp	(Optional) Enables tunneling of VTP.			
Defaults	The default is no Layer 2 protocol packets are tunneled.				
Command Modes	Interface configuration				
Command History	Release	Modification			
	12.2(18)EW	Support for this command was introduced on the Catalyst 4500 series switch			
Usage Guidelines	You must enter this command, with or without protocol types, to tunnel Layer 2 packets.				
	propagated across packets are encapsu	inneling across a service-provider network ensures that Layer 2 information is the network to all customer locations. When protocol tunneling is enabled, protocol alated with a well known Cisco multicast address for transmission across the network. reach their destination, the well-known MAC address is replaced by the Layer 2 ress.			
	You can enable La protocols.	yer 2 protocol tunneling for CDP, STP, and VTP individually or for all three			
Examples	This example show	as how to enable protocol tunneling for the CDP packets:			
	Switch(config-if) Switch(config-if))# l2protocol-tunnel cdp)#			
Related Commands	l2protocol-tunnel				
	12protocol-tunnel	drop-threshold shutdown-threshold			

l2protocol-tunnel cos

To configure the class of service (CoS) value for all tunneled Layer 2 protocol packets, use the **l2protocol-tunnel cos** command. To return to the default value of zero, use the **no** form of this command.

l2protocol-tunnel cos value

no l2protocol-tunnel cos

Syntax Description	<i>value</i> Specifies the CoS priority value for tunneled Layer 2 protocol packets. The range is 0 to 7, with 7 being the highest priority.
Defaults	The default is to use the CoS value that is configured for data on the interface. If no CoS value is configured, the default is 5 for all tunneled Layer 2 protocol packets.
	configured, the default is 5 for all tunneled Eayer 2 protocol packets.
Command Modes	Global configuration
Command History	Release Modification
	12.2(18)EWThis command was first introduced on the Catalyst 4500 series switch.
Usage Guidelines	When enabled, the tunneled Layer 2 protocol packets use this CoS value.
	The value is saved in NVRAM.
Examples	This example shows how to configure a Layer-2 protocol tunnel CoS value of 7:
	Switch(config)# 12protocol-tunnel cos 7 Switch(config)#
Related Commands	l2protocol-tunnel
	l2protocol-tunnel drop-threshold l2protocol-tunnel shutdown-threshold

I2protocol-tunnel drop-threshold

To set a drop threshold for the maximum rate of Layer2 protocol packets per second to be received before an interface drops packets, use the **I2protocol-tunnel drop-threshold** command. You can set the drop threshold for the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. To disable the drop threshold on the interface, use the **no** form of this command.

l2protocol-tunnel drop-threshold [cdp | stp | vtp] value

no l2protocol-tunnel drop-threshold [cdp | stp | vtp] value

Syntax Description		
	cdp	(Optional) Specifies a drop threshold for CDP.
	stp	(Optional) Specifies a drop threshold for STP.
	vtp	(Optional) Specifies a drop threshold for VTP.
	value	Specifies a threshold in packets per second to be received for encapsulation before the interface shuts down, or specifies the threshold before the interface drops packets. The range is 1 to4096. The default is no threshold.
Defaults	The defaul	t is no drop threshold for the number of the Layer 2 protocol packets.
Command Modes	Interface c	onfiguration
Command History	Release	Modification
	12.2(18)E	W Support for this command was introduced on the Catalyst 4500 series switch
Usage Guidelines	that are rec keyword, t shutdown t	cocol-tunnel drop-threshold command controls the number of protocol packets per second veived on an interface before it drops packets. When no protocol option is specified with a he threshold is applied to each of the tunneled Layer 2 protocol types. mac access-list extended

To define the extended MAC access lists, use the **mac access-list extended** command. To remove the MAC access lists, use the **no** form of this command.

mac access-list extended name

no mac access-list extended name

Syntax Description	name A	ACL to which the entry belongs.
Defaults	MAC access lists	s are not defined.
Command Modes	Global configura	ition
Command History	Release	Modification
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch
Usage Guidelines	When you enter	the ACL name, follow these naming conventions:
		f 31 characters long and can include a-z, A-Z, 0-9, the dash character (-), the underscore), and the period character (.)
	• Must start w	ith an alpha character and must be unique across all ACLs of all types
	• Case sensitiv	ve
	• Cannot be a	number
	• Must not be	a keyword; keywords to avoid are all, default-action, map, help, and editbuffer
	{{src-mac mask	the mac access-list extended <i>name</i> command, you use the [no] {permit deny} any } [dest-mac mask]} [protocol-family {appletalk arp-non-ipv4 decnet ipx rarp-non-ipv4 vines xns}] subset to create or delete entries in a MAC layer access
	Table2-8 descri	bes the syntax of the mac access-list extended subcommands.
	Table2-8 mac	access-list extended Subcommands
	Subcommand	Description
	deny	Prevents access if the conditions are matched.
	no	(Optional) Deletes a statement from an access list.
	permit	Allows access if the conditions are matched.
	src-mac mask	Source MAC address in the form: source-mac-address source-mac-address-mask.
	any	Specifies any protocol type.

Subcommand	Description
dest-mac mask	(Optional) D estination MAC address in the form: dest-mac-address dest-mac-address-mask.
protocol-family	(Optional) Name of the protocol family. Table2-9 lists which packets are mapped to a particular protocol family.

Table2-8 mac access-list extended Subcommands (continued)

Table2-9 describes mapping an Ethernet packet to a protocol family.

Table2-9Mapping an Ethernet Packet to a Protocol Family

Protocol Family	Ethertype in Packet Header
Appletalk	0x809B, 0x80F3
Arp-Non-Ipv4	0x0806 and protocol header of Arp is a non-Ip protocol family
Decnet	0x6000-0x6009, 0x8038-0x8042
Ipx	0x8137-0x8138
Ірvб	0x86DD
Rarp-Ipv4	0x8035 and protocol header of Rarp is Ipv4
Rarp-Non-Ipv4	0x8035 and protocol header of Rarp is a non-Ipv4 protocol family
Vines	0x0BAD, 0x0BAE, 0x0BAF
Xns	0x0600, 0x0807

When you enter the src-mac mask or dest-mac mask value, follow these guidelines:

- Enter the MAC addresses as three 4-byte values in dotted hexadecimal format such as 0030.9629.9f84.
- Enter the MAC address masks as three 4-byte values in dotted hexadecimal format. Use 1 bit as a wildcard. For example, to match an address exactly, use 0000.0000.0000 (can be entered as 0.0.0).
- For the optional *protocol* parameter, you can enter either the EtherType or the keyword.
- Entries without a *protocol* parameter match any protocol.
- The access list entries are scanned in the order that you enter them. The first matching entry is used. To improve performance, place the most commonly used entries near the beginning of the access list.
- An implicit **deny any any** entry exists at the end of an access list unless you include an explicit **permit any any** entry at the end of the list.
- All new entries to an existing list are placed at the end of the list. You cannot add entries to the middle of a list.

Examples This example shows how to create a MAC layer access list named mac_layer that denies traffic from 0000.4700.0001, which is going to 0000.4700.0009, and permits all other traffic:

Switch(config)# mac access-list extended mac_layer Switch(config-ext-macl)# deny 0000.4700.0001 0.0.0 0000.4700.0009 0.0.0 protocol-family appletalk Switch(config-ext-macl)# permit any any

mac-address-table aging-time

To configure the aging time for the entries in the Layer 2 table, use the **mac-address-table aging-time** command. To reset the *seconds* value to the default setting, use the **no** form of this command.

mac-address-table aging-time seconds [vlan vlan_id]

no mac-address-table aging-time *seconds* [**vlan** *vlan_id*]

Syntax Description	seconds	Aging time in seconds; valid values are 0 and from 10 to 1000000 seconds.
	vlan vlan_id	(Optional) Single VLAN number or a range of VLANs; valid values are from 1 to4094.
Defaults	Aging time is se	et to 300 seconds.
Command Modes	Global configur	ation
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch
	12.1(12c)EW	Support for extended addressing was added.
Usage Guidelines	If you do not er	nter a VLAN, the change is applied to all routed-port VLANs.
	Enter 0 seconds	s to disable aging.
Examples	This example sl	hows how to configure the aging time to 400 seconds:
	Switch(config) Switch(config))# mac-address-table aging-time 400)#
	This example sl	hows how to disable aging:
	Switch(config) Switch(config))# mac-address-table aging-time 0

mac-address-table static

To configure the static MAC addresses for a VLAN interface or drop unicast traffic for a MAC address for a VLAN interface, use the **mac-address-table static** command. To remove the static MAC address configurations, use the **no** form of this command.

mac-address-table static *mac-addr* {**vlan** *vlan-id*} {**interface** *type* | **drop**}

no mac-address-table static mac-addr {**vlan** vlan-id} {**interface** type} {**drop**}

Current Deserviced		
Syntax Description	mac-addr	MAC address; optional when using the no form of this command.
	vlan vlan-id	VLAN and valid VLAN number; valid values are from 1 to 4094.
	interface type	Interface type and number; valid options are FastEthernet and GigabitEthernet .
	drop	Drops all traffic received from and going to the configured MAC address in the specified VLAN.
Defaults	This command h	as no default settings.
Command Modes	Global configura	tion
Command History	Release	Modification
	Release	Woullication
	12.1(13)EW	Support for this command was introduced on the Catalyst4500 series switches.
Usage Guidelines	12.1(13)EW

main-cpu

To enter the main CPU submode and manually synchronize the configurations on the two supervisor engines, use the **main-cpu** command.

main-cpu

Syntax Description This command has no arguments or keywords.

Defaults This command has no default settings.

Command Modes Redundancy

 Release
 Modification

 12.1(12c)EW
 Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).

Usage Guidelines The main CPU submode is used to manually synchronize the configurations on the two supervisor engines.

From the main CPU submode, use the **auto-sync** command to enable automatic synchronization of the configuration files in NVRAM.

```
Note
```

After you enter the main CPU submode, you can use the **auto-sync** command to automatically synchronize the configuration between the primary and secondary route processors based on the primary configuration. In addition, you can use all of the redundancy commands that are applicable to the main CPU.

Examples

This example shows how to reenable the default automatic synchronization feature using the auto-sync standard command to synchronize the startup-config and config-register configuration of the active supervisor engine with the standby supervisor engine. The updates for the boot variables are automatic and cannot be disabled.

```
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# auto-sync standard
Switch(config-r-mc)# end
Switch# copy running-config startup-config
Switch#
```

Related Commands auto-sync

match

To specify a match clause by selecting one or more ACLs for a VLAN access-map sequence, use the **match** subcommand. To remove the match clause, use the **no** form of this command.

match {**ip** address {*acl-number* | *acl-name* }} | {**mac** address *acl-name*}

no match {**ip address** {*acl-number* | *acl-name*}} | {**mac address** *acl-name*}

	No.
1	Note

If a match clause is not specified, the action for the VLAN access-map sequence is applied to all packets. All packets are matched against that sequence in the access map.

Syntax Description	ip address acl-number	Selects one or more IP ACLs for a VLAN access-map sequence; valid values are from 1 to 199 and from 1300 to 2699.
	ip address acl-name	Selects an IP ACL by name.
	mac address acl-name	Selects one or more MAC ACLs for a VLAN access-map sequence.

- **Defaults** This command has no default settings.
- Command Modes VLAN access-map

 Release
 Modification

 12.1(12c)EW
 Support for this command was introduced on the Catalyst 4500 series switch

Usage Guidelines The match clause specifies the IP or MAC ACL for traffic filtering. The MAC sequence is not effective for IP packets. IP packets should be access controlled by IP match clauses. Refer to the Catalyst4500 Series Switch CiscoIOS Software Configuration Guide for additional configuration guidelines and restrictions.

Refer to the Cisco IOS Command Reference publication for additional match command information.

Examples This example shows how to define a match clause for a VLAN access map:

Switch(config)# vlan access-map ganymede 10
Switch(config-access-map)# match ip address 13
Switch(config-access-map)#

Related Commands show vlan access-map vlan access-map

Catalyst4500 Series SwitchCiscolOS Command Reference—Release 12.2(25)EW

To specify match criteria to treat flows with a unique source or destination address as a new flow, use the match flow ip command. To disable this function, use the no form of this command.

match flow ip {source-address | destination-address }

no match flow ip {source-address | destination-address }

Syntax Description	source-address Establishes a new flow from a flow with a unique IP source address.
	destination-address Establishes a new flow from a flow with a unique IP destination address.
Defaults	None.
Command Modes	class-map configuration submode
Command History	Release Modification
	12.2(25)EW Support for this command was introduced on the Catalyst 4500 series switch
Usage Guidelines	When you specify the source-address keyword, each flow with a unique source address is treated as a new flow. When you specify the destination-address keyword, each flow with a unique destination address is treated as a new flow.
•	A policy map is called a <i>flow-based</i> policy map when you configure the flow keywords on the class map that it uses. To attach a flow-based policy map as a child to an aggregate policy map, use the service-policy command.
<u>Note</u>	The match flow command is available on the Catalyst 4500 series switch only when Supervisor Engine VI (WS-X4516-10GE) is present.
Examples	This example shows how to create a flow-based class map associated with a source address: Switch(config)# class-map match-all cl Switch(config-cmap)# match flow ip source-address Switch(config-cmap)# end Switch# Switch# show class-map cl Class Map match-all cl (id 2) Match flow ip source-address Switch#
	This example shows how to create a flow-based class map associated with a destination address: Switch(config)# class-map match-all cl Switch(config-cmap)# match flow ip destination-address Switch(config-cmap)# end

Switch#

```
Switch# show class-map c1
Class Map match-all c1 (id 2)
Match flow ip destination-address
Switch#
```

Assume there are two active flows on the Fast Ethernet interface 6/1 with source addresses 192.168.10.20 and 192.168.10.21. The following example shows how to maintain each flow to 1 Mbps with an allowed burst value of 9000 byte:

```
Switch# configure terminal
Enter configuration commands, one per line. End with \ensuremath{\texttt{CNTL}}\xspace/\ensuremath{\texttt{Z}}\xspace.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip source-address
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police 1000000 9000
Switch(config-pmap-c)# exit

media-type

To select the connector for a dual-mode capable port, use the **media-type** command.

media-type {rj45 | sfp} Uses the RJ-45 connector. Syntax Description rj45 Uses the SFP connector. sfp Defaults sfp **Command Modes** Interface configuration Modification **Command History** Release 12.2(20)EWA Support for this command was introduced for the WS-X4306-GB-T module and the WS-X4948 chassis. **Usage Guidelines** This command is supported on all ports on the WS-X4306-GB-T module and ports 1/45-48 on the WS-X4948 chassis. Entering the show interface capabilities command provides the Multiple Media Types field, which displays the value **no** if a port is not dual-mode capable and lists the media types (**sfp** and **rj45**) for dual-mode capable ports. Examples This example shows how to configure port 5/45 on a WS-X4948 chassis to use the RJ-45 connector: Switch(config)# interface gigabitethernet 5/45 Switch(config-if)# media-type rj45

mode

To set the redundancy mode, use the **mode** command.

mode {rpr | sso}

Syntax Description	rpr	Specifies RPR mode.	
	SSO	Specifies SSO mode.	
Defaults) series switches that are c onfigured with Supervisor Engine II+, Supervisor Engine IV, Engine V, the defaults are as follows:	
	• SSO, if the s	supervisor engine is using Cisco IOS Release 12.2(20)EWA.	
		supervisor engine is using Cisco IOS Release $12.1(12c)EW$ through (18)EW, as well as Release $12.1(xx)E$.	
	release to both sup	re upgrading the current supervisor engine from Release 12.2(18)EW or an earlier o Release 12.2(20)EWA, and the RPR mode has been saved to the startup configuration, ervisor engines will continue to operate in RPR mode after the software upgrade. To use de, you must manually change the redundancy mode to SSO.	
Command History	Release	Modification	
	12.2(20)EWA	Support for this command was introduced on the Catalyst 4500 series switch.	
Usage Guidelines	RPR and SSO m Supervisor Engi	ode are not supported on Catalyst4500 series switches that are configured with neII.	
	The mode comm	nand can be entered only from within redundancy configuration mode.	
	Follow these guidelines when configuring your system to RPR or SSO mode:		
	• You must use identical Cisco IOS images and supervisor engines to support RPR and SSO mode. Redundancy may not work due to differences between the Cisco IOS release and supervisor engine capabilities.		
	• Any modules that are not online at the time of a switchover are reset and reloaded on a switchover.		
	• •	rm an OIR of the module within 60 seconds before a stateful switchover, the module g the stateful switchover and the port states are restarted.	
	• The FIB tab reconverge.	les are cleared on a switchover. Routed traffic is interrupted until route tables	
	The redundant s	upervisor engine reloads on any mode change and begins to work in the current mode.	

 Examples
 This example shows how to set the redundancy mode to SSO:

 Switch(config)# redundancy
 Switch(config-red)# mode sso

 Switch(config-red)#
 Switch(config-red)#

Related Commands	redundancy
	redundancy force-switchover

	show running-config

monitor session

To enable the SPAN sessions on interfaces or VLANs, use the **monitor session** command. To remove one or more source or destination interfaces from a SPAN session, or a source VLAN from a SPAN session, use the **no** form of this command.

monitor session session {destination interface {FastEthernet interface-number |

GigabitEthernet *interface-number* } [encapsulation {isl | dot1q}] [ingress [vlan vlan_id] [learning]]} | {remote vlan vlan_id} | {source {interface {FastEthernet *interface-number* | GigabitEthernet *interface-number* | Port-channel *interface-number*} | [vlan vlan_id] |{remote vlan vlan_id} | {cpu [queue queue_id]} [, | - | rx | tx | both]} | {filter {ip access-group [name | id]} {vlan vlan_id [, | -]} | {packet-type {good | bad}} | {address-type {unicast | multicast | broadcast } [rx | tx | both]}

no monitor session session {destination interface {FastEthernet interface-number | GigabitEthernet interface-number } [encapsulation {isl | dot1q }] [ingress [vlan vlan_id] [learning]]} | {remote vlan vlan_id} | {source {interface {FastEthernet interface-number | GigabitEthernet interface-number | Port-channel interface-number}} | [vlan vlan_id] |{remote vlan vlan_id} | {cpu [queue queue_id]} [, | - | rx | tx | both]} | {filter {ip access-group [name | id]} {vlan vlan_id [, | -]} | {packet-type {good | bad}} | {address-type {unicast | multicast | broadcast } [rx | tx | both]}

Syntax Description	session	Number of a SPAN session; valid values are from 1 to 6.
	destination	Specifies a SPAN destination.
	interface	Specifies an interface.
	FastEthernet interface-number	Specifies a Fast Ethernet module and port number; valid values are from 1 to 6.
	GigabitEthernet interface-number	Specifies a Gigabit Ethernet module and port number; valid values are from 1 to 6.
	encapsulation	(Optional) Specifies the encapsulation type of the destination port.
	isl	(Optional) Specifies ISL encapsulation.
	dot1q	(Optional) Specifies dot1q encapsulation.
	ingress	(Optional) Indicates whether the ingress option is enabled.
	vlan vlan_id	(Optional) Specifies the VLAN; valid values are from 1 to 4094.
	learning	(Optional) Enables host learning on ingress-enabled destination ports.
	remote vlan vlan_id	Specifies an RSPAN source or destination session on a switch.
	source	Specifies a SPAN source.
	Port-channel interface-number	Specifies a port-channel interface; valid values are from 1 to 64.
	сри	Causes traffic received or sent from the CPU to be copied to the destination of the session.
		destination of the session.

queue <i>queue_id</i>	(Optional) Specifies that only traffic received on the specific CPU subqueue should be copied to the destination of the session. Valid values are from 1 to 32, or by the following names: all, control-packet, rpf-failure, adj-same-if, nfl, mtu-exceeded, unknown-sa, span, acl input, acl input log, acl input error, acl input forward, acl input punt, acl output, acl output log, acl output error, acl output forward, acl output, acl output log, acl output error, acl output forward, acl output punt, bridged, bridged 1, bridged 2, bridged 3, bridged 4, routed received, routed received 1, routed received 2, routed received 3, routed received 4, routed forward, routed forward 1, routed forward 2, routed forward 3, and routed forward 4.
,	(Optional) Symbol to specify another range of SPAN VLANs; valid values are from 1 to 4094.
-	(Optional) Symbol to specify a range of SPAN VLANs.
both	(Optional) Monitors and filters received and transmitted traffic.
rx	(Optional) Monitors and filters received traffic only.
tx	(Optional) Monitors and filters transmitted traffic only.
filter	Limits SPAN source traffic to specific VLANs.
ip access-group	(Optional) Specifies an IP access group filter, either a name or a number.
name	(Optional) Specifies an IP access list name.
id	(Optional) Specifies an IP access list number. Valid values are 1 to 199 for an IP access list and 1300 to 2699 for an IP expanded access list.
vlan vlan_id	(Optional) Specifies the VLAN to be filtered. The number is entered as a single value or a range; valid values are from 1to 4094.
packet-type	Limits SPAN source traffic to packets of a specified type.
good	Specifies a good packet type
bad	Specifies a bad packet type.
address-type unicast multicast broadcast	Limits SPAN source traffic to packets of a specified address type. Valid types are unicast, multicast, and broadcast.

Defaults

s Received and transmitted traffic, as well as all VLANs, packet types, and address types are monitored on a trunking interface.

Packets are transmitted untagged out the destination port; ingress and learning are disabled.

All packets are permitted and forwarded "as is" on the destination port.

Command Modes Global configuration

Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch
	12.1(11b)EW	Support for differing directions within a single-user session and extended VLAN addressing was added.
	12.1(19)EW	Support for ingress packets, encapsulation specification, packet and address type filtering, and CPU source sniffing enhancements was added.
	12.1(20)EW	Support for remote SPAN and host learning on ingress-enabled destination ports was added.
	12.2(20)EW	Support for an IP access group filter was added.

Usage Guidelines

Only one SPAN destination for a SPAN session is supported. If you attempt to add another destination interface to a session that already has a destination interface that is configured, you will get an error. You must first remove a SPAN destination interface before changing the SPAN destination to a different interface.

Beginning in Cisco IOS Release 12.1(12c)EW, you can configure sources from different directions within a single user session.

Beginning in Cisco IOS Release 12.1(12c)EW, SPAN is limited to two sessions containing ingress sources and four sessions containing egress sources. Bidirectional sources support both ingress and egress sources.

A particular SPAN session can either monitor VLANs or monitor individual interfaces: you cannot have a SPAN session that monitors both specific interfaces and specific VLANs. If you first configure a SPAN session with a source interface, and then try to add a source VLAN to the same SPAN session, you will receive an error. You will also receive an error message if you configure a SPAN session with a source VLAN, and then try to add a source interface to that session. You must first clear any sources for a SPAN session before switching to another type of source. CPU sources may be combined with source interfaces and source VLANs.

When configuring the **ingress** option on a destination port, you must specify an ingress VLAN if the configured encapsulation type is untagged (the default) or is 802.1 Q. If the encapsulation type is ISL, then no ingress VLAN specification is necessary.

By default, when you enable ingress, no host learning is performed on destination ports. When you enter the **learning** keyword, host learning is performed on the destination port, and traffic to learned hosts is forwarded out the destination port.

If you enter the **filter** keyword on a monitored trunking interface, only traffic on the set of specified VLANs is monitored. Port-channel interfaces are displayed in the list of **interface** options if you have them configured. VLAN interfaces are not supported. However, you can span a particular VLAN by entering the **monitor session** source vlan vlan-id command.

The packet-type filters are supported only in the Rx direction. You can specify both Rx- and Tx-type filters and multiple-type filters at the same time (for example, you can use **good** and **unicast** to only sniff nonerror unicast frames). As with VLAN filters, if you do not specify the type, the session will sniff all packet types.

The **queue** identifier allows sniffing for only traffic that is sent or received on the specified CPU queues. The queues may be identified either by number or by name. The queue names may contain multiple numbered queues for convenience.

Examples This example shows how to configure IP access group 100 on a SPAN session:

Switch(config)# monitor session 1 filter ip access-group 100
Switch(config)#

This example shows how to add a source interface to a SPAN session:

Switch(config)# monitor session 1 source interface fa2/3
Switch(config)#

This example shows how to configure the sources with different directions within a SPAN session:

```
Switch(config)# monitor session 1 source interface fa2/3 rx
Switch(config)# monitor session 1 source interface fa2/2 tx
Switch(config)#
```

This example shows how to remove a source interface from a SPAN session:

Switch(config)# no monitor session 1 source interface fa2/3
Switch(config)#

This example shows how to limit SPAN traffic to VLANs 100 through 304:

```
Switch(config)# monitor session 1 filter vlan 100 - 304
Switch(config)#
```

This example shows how to configure RSPAN VLAN 20 as the destination:

```
Switch(config)# monitor session 2 destination remote vlan 20
Switch(config)#
```

Related Commands show monitor

mtu

L

To enable jumbo frames on an interface by adjusting the maximum size of a packet or maximum transmission unit (MTU), use the **mtu** command. To return to the default setting, use the **no** form of this command.

mtu bytes

no mtu

Syntax Description	<i>bytes</i> Byte size; valid values are from 1500 to 9198.		
Defaults	The default settings are as follows:		
	• Jumbo frames are disabled		
	• 1500 bytes for all ports		
Command Modes	Interface configuration mode		
Command History	Release Modification		
	12.1(13)EWSupport for this command was introduced on the Catalyst4500 series switches.		
Usage Guidelines	Jumbo frames are supported on nonblocking Gigabit Ethernet ports, switch virtual interfaces (SVI), and EtherChannels. Jumbo frames are not available for stub-based ports.		
	The baby giants feature uses the global system mtu <i>size</i> command to set the global baby giant MT allows all stub-based port interfaces to support an Ethernet payload size of up to 1552 bytes.		
	Both the system mtu command and the per-interface mtu command work on interfaces that can support jumbo frames, but the per-interface mtu command takes precedence.		
Examples	This example shows how to specify an MTU of 1800 bytes:		
	Switch(config)# interface GigabitEthernet 1/1 Switch(config-if)# mtu 1800		
Delated Commande

name

To set the MST region name, use the **name** command. To return to the default name, use the **no** form of this command.

name name

no name name

Syntax Description	name	Specifies the name of the MST region. The name can be any string with a maximum length of 32 characters.	
Defaults	The MST region name is not set.		
Command Modes	MST configuration		
Command History	Release	Modification	
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch	
Usage Guidelines	Two or more Catalyst 4500 series switches with the same VLAN mapping and configuration version number are considered to be in different MST regions if the region names are different.		
Examples	This example shows how to name a region:		
	Switch(config-mst)# name Cisco Switch(config-mst)#		
Related Commands	instance revision show spanning- spanning-tree n	tree mst ast configuration	

pagp learn-method

To learn the input interface of the incoming packets, use the **pagp learn-method** command. To return to the default value, use the **no** form of this command.

pagp learn-method {aggregation-port | physical-port}

no pagp learn-method

Syntax Description	aggregation-port	Specifies learning the address on the port channel.	
	physical-port	Specifies learning the address on the physical port within the bundle.	
Defaults	Aggregation port is enabled.		
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch	
Examples		ys how to enable port channel address learning:	
	Switch(config-if)# pagp learn-method physical-port Switch(config-if)# pagp learn-method physical-port Switch(config-if)# pagp learn-method physical-port		
	This example shows how to enable aggregation port address learning within the bundle:		
	Switch(config-if)# pagp learn-method aggregation-port Switch(config-if)#		
Related Commands	pagp learn-metho show pagp	d	

pagp port-priority

To select a port in hot standby mode, use the **pagp port-priority** command. To return to the default value, use the **no** form of this command.

pagp port-priority priority

no pagp port-priority

Syntax Description	priority	Port priority number; valid values are from 1 to 255.
Defaults	Port priority is s	et to 128.
Command Modes	Interface configu	uration
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch
Usage Guidelines	The higher the p	riority, the better the chances are that the port will be selected in the hot standby mode.
Examples	This example sh	ows how to set the port priority:
	-	if)# pagp port-priority 45
Related Commands	pagp learn-met show pagp	hod

permit

permit

To permit an ARP packet based on matches against the DHCP bindings, use the **permit** command. To remove a specified ACE from an access list, use the **no** form of this command

- permit {[request] ip {any | host sender-ip | sender-ip sender-ip-mask} mac {any | host sender-mac | sender-mac sender-mac-mask} | response ip {any | host sender-ip | sender-ip sender-ip-mask} [{any | host target-ip | target-ip target-ip-mask}] mac {any | host sender-mac | sender-mac sender-mac-mask} [{any | host target-mac | target-mac target-mac-mask}]}[log]
- no permit {[request] ip {any | host sender-ip | sender-ip sender-ip-mask} mac {any | host sender-mac | sender-mac sender-mac-mask} | response ip {any | host sender-ip | sender-ip sender-ip-mask} [{any | host target-ip | target-ip target-ip-mask}] mac {any | host sender-mac | sender-mac sender-mac-mask} [{any | host target-mac | target-mac target-mac-mask}]}[log]

Syntax Description	request	(Optional) Requests a match for the ARP request. When request is not specified, matching is performed against all ARP packets.
	ip	Specifies the sender IP address.
	any	Specifies that any IP or MAC address will be accepted.
	host sender-ip	Specifies that only a specific sender IP address will be accepted.
	sender-ip sender-ip-mask	Specifies that a specific range of sender IP addresses will be accepted.
	mac	Specifies the sender MAC address.
	host sender-mac	Specifies that only a specific sender MAC address will be accepted.
	sender-mac sender-mac-mask	Specifies that a specific range of sender MAC addresses will be accepted.
	response	Specifies a match for the ARP responses.
	ip	Specifies the IP address values for the ARP responses.
	host target-ip	(Optional) Specifies that only a specific target IP address will be accepted.
	target-ip target-ip-mask	(Optional) Specifies that a specific range of target IP addresses will be accepted.
	mac	Specifies the MAC address values for the ARP responses.
	host target-mac	(Optional) Specifies that only a specific target MAC address will be accepted.
	target-mac target-mac-mask	(Optional) Specifies that a specific range of target MAC addresses will be accepted.
	log	(Optional) Logs a packet when it matches the access control entry (ACE).

Defaults

This command has no default settings.

Command Modes arp-nacl configuration

Command History	Release	Modification	
	12.1(19)EW	Support for this command was introduced on the Catalyst 4500 series switch	
Usage Guidelines	Permit clauses can	be added to forward or drop ARP packets based on some matching criteria.	
Examples	•	vs a host with a MAC address of 0000.0000.abcd and an IP address of 1.1.1.1. This w to permit both requests and responses from this host:	
	Switch(config)# arp access-list static-hosts Switch(config-arp-nacl)# permit ip host 1.1.1.1 mac host 0000.0000.abcd Switch(config-arp-nacl)# end Switch# show arp access-list		
	<pre>ARP access list static-hosts permit ip host 1.1.1.1 mac host 0000.0000.abcd Switch#</pre>		
Related Commands	arp access-list deny ip arp inspection f	filter vlan	

policy-map

To access the QoS policy map configuration mode to configure the QoS policy map, use the **policy-map** command. To delete a policy map, use the **no** form of this command.

policy-map policy-map-name

no policy-map *policy-map-name*

Syntax Description	policy-map-name	Specifies the name of the policy map.		
Defaults	This command has	no default settings.		
Command Modes	Global configurati	on		
Command History	Release	Modification		
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch		
Usage Guidelines	In QoS policy-map	o configuration mode, these configuration commands are available:		
	• exit exits QoS class map configuration mode.			
	• no removes an existing defined policy map.			
	created class 1	<i>up-name</i> accesses the QoS class map configuration mode to specify a previously nap to be included in the policy map or to create a class map. (See the class-map additional information.)		
		gate name] rate burst [conform-action {drop transmit}] [{exceed-action {drop transmit transmit }]] defines a microflow or aggregate policer.		
		scp } sets the specified class trust values. Trust values that are set in this command t values that are set on specific interfaces.		
Examples	_	vs how to create a policy map named ipp5-policy that uses the class-map named ipp5 to rewrite the packet precedence to 6 and to aggregate police the traffic that matches value of 5:		
	Switch(config)# Switch(config-pm Switch(config-pm	ion commands, one per line. End with CNTL/Z. policy-map ipp5-policy ap)# class ipp5 ap-c)# set ip precedence 6 ap-c)# police 2000000000 2000000 conform-action transmit exceed-action nsmit		

Related Commands

port-channel load-balance

To set the load-distribution method among the ports in the bundle, use the **port-channel load-balance** command. To reset the load distribution to the default, use the **no** form of this command.

port-channel load-balance method

no port-channel load-balance

Syntax Description	<i>method</i> Specifies the load distribution method. See the "Usage Guidelines" section for more information.				
Defaults	Load distribution on the source XOR destination IP address is enabled.				
Command Modes	Global configuration				
Command History	Release	Modification			
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch			
Usage Guidelines	The following	values are valid for the load-distribution method:			
	• dst-ip —Load distribution on the destination IP address				
	• dst-mac —Load distribution on the destination MAC address				
	• dst-port–	-Load distribution on the destination TCP/UDP port

power dc input

To configure the power DC input parameters on the switch, use the **power dc input** command. To return to the default power settings, use the **no** form of this command.

power dc input watts

no power dc input

Syntax Description	dc input	Specifies the external DC source for both power supply slots.
	watts	Sets the total capacity of the external DC source in watts; valid values are from 300 to 8500.
Defaults	DC power input	t is 2500 W.
Command Modes	Global configur	ation
Command History	Release	Modification
	12.1(11)EW	Support for this command was introduced on the Catalyst 4500 series switch
	12.1(13)EW	Support for dc input was added.
Usage Guidelines	•	e is not capable of supporting Power over Ethernet, you will receive this message:
Examples	-	nows how to set the total capacity of the external DC power source to 5000 W: # power dc input 5000 #
Related Commands	show power	

power inline

To set the inline-power state for the inline-power-capable interfaces, use the **power inline** command. To return to the default values, use the **no** form of this command.

power inline {auto [max milliwatt] | never | static [max milliwatt] | consumption milliwatt }

no power inline

Syntax Description	auto	Sets the Power over Ethernet state to auto mode for inline-power-capable interfaces.		
	max milliwatt	(Optional) Maximum power that the equipment can consume; valid range is from 2000 to 15400 mW.Disables both the detection and power for the inline-power capable interfaces.		
	never			
	static	Allocates power statically.		
	consumption milliwatt	Sets power allocation per interface; valid range is from 4000 to 15400. Any non-default value disables automatic adjustment of power allocation.		
Defaults	The default settings are	as follows:		
Delaults	The default settings are as follows:Auto mode for Power over Ethernet is set.Maximum milliwatt mode is set to 15400.			
	• Default allocation is	s set to 15400.		
Command Modes	Interface configuration			
Command History	Release Modi	fication		
	12.1(11)EW Supp	ort for this command was introduced on the Catalyst 4500 series switch		
	12.1(19)EW Supp	ort added for static power allocation.		
	12.1(20)EW Supp	ort added for Power over Ethernet.		
Usage Guidelines	If your interface is not c	apable of supporting Power over Ethernet, you will receive this message:		
usage Guidelines	•	apable of supporting Power over Ethernet, you will rece ot supported on interface Admin		

ø

Examples

This example shows how to set the inline-power detection and power for the inline-power-capable interfaces:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 4/1
Switch(config-if)# power inline auto
Switch(config-if)# end
Switch#
```

This example shows how to disable the inline-power detection and power for the inline-power-capable interfaces:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 4/1
Switch(config-if)# power inline never
Switch(config-if)# end
Switch#
```

This example shows how to set the permanent Power over Ethernet allocation to 8000 mW for Fast Ethernet interface 4/1 regardless what is mandated either by the 802.3af class of the discovered device or by any CDP packet that is received from the powered device:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 4/1
Switch(config-if)# power inline consumption 8000
Switch(config-if)# end
Switch#
```

Related Commands power inline consumption show power

power inline consumption

To set the default power that is allocated to an interface for all the inline-power-capable interfaces on the switch, use the **power inline consumption** command. To return to the default values, use the **no** form of this command.

power inline consumption default milliwatts

no power inline consumption default

Syntax Description	default	Specifies the switch to use the default allocation.
	milliwatts	Sets the default power allocation in milliwatts; the valid range is from 4000to15400. Any non-default value disables automatic adjustment of power allocation.
Defaults	Milliwatt mode i	is set to 15400.

private-vlan

		vate VLANs and the association between a private VLAN and a secondary VLAN, use command. To return to the default value, use the no form of this command.	
	private-vlan	{isolated community primary}	
	-	association secondary-vlan-list [{ add secondary-vlan-list} e secondary-vlan-list}]	
	no private-v	lan {isolated community primary}	
	no private-v	lan association	
Syntax Description	isolated	Designates the VLAN as an isolated private VLAN.	
	communi ty	Designates the VLAN as the community private VLAN.	
	primary	Designates the VLAN as the primary private VLAN.	
	association	Creates an association between a secondary VLAN and a primary VLAN.	
	secondary-vlan-l	<i>ist</i> Specifies the number of the secondary VLAN.	
	add	(Optional) Associates a secondary VLAN to a primary VLAN.	
	remove	(Optional) Clears the association between a secondary VLAN and a primary VLAN.	
Defaults	Private VLANs a	re not configured.	
Command Modes	VLAN configura	tion	
Command History	Release	Modification	
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch	
	12.1(12c)EW	Support for extended addressing was added.	
	12.2(20)EW	Support for community VLAN was added.	
Usage Guidelines	You cannot confi	gure VLAN 1 or VLANs 1001 to 1005 as private VLANs.	
	VTP does not support private VLANs. You must configure private VLANs on each device where you want private VLAN ports.		
		<i>lan_list</i> parameter cannot contain spaces; it can contain multiple comma-separated can be a single private VLAN ID or a range of private VLAN IDs separated by hyphens.	
	The secondary_v	lan_list parameter can contain multiple community VLAN IDs.	

The *secondary_vlan_list* parameter can contain only one isolated VLAN ID. A private VLAN is defined as a set of private ports characterized by a common set of VLAN number pairs: each pair is made up of at least two special unidirectional VLANs and is used by isolated ports or by a community of ports to communicate with the switches.

An isolated VLAN is a VLAN that is used by the isolated ports to communicate with the promiscuous ports. The isolated VLAN traffic is blocked on all other private ports in the same VLAN and can be received only by the standard trunking ports and the promiscuous ports that are assigned to the corresponding primary VLAN.

A community VLAN is the VLAN that carries the traffic among the community ports and from the community ports to the promiscuous ports on the corresponding primary VLAN. A community VLAN is not allowed on a private VLAN trunk.

A promiscuous port is a private port that is assigned to a primary VLAN.

A primary VLAN is a VLAN that is used to convey the traffic from the switches to the customer end stations on the private ports.

You can specify only one isolated *vlan-id* value, while multiple community VLANs are allowed. You can only associate isolated and community VLANs to one VLAN. The associated VLAN list may not contain primary VLANs. Similarly, a VLAN that is already associated to a primary VLAN cannot be configured as a primary VLAN.

The private-vlan commands do not take effect until you exit the config-VLAN submode.

If you delete either the primary or secondary VLAN, the ports that are associated with the VLAN become inactive.

Refer to the *Catalyst4500 Series Switch CiscoIOS Software Configuration Guide* for additional configuration guidelines.

Examples

This example shows how to create a private VLAN relationship among the primary VLAN 14, the isolated VLAN 19, and community VLANs 20 and 21:

```
Switch(config)# vlan 19
Switch(config-vlan) # private-vlan isolated
Switch(config)# vlan 14
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# private-vlan association 19
```

This example shows how to remove an isolated VLAN from the private VLAN association:

```
Switch(config)# vlan 14
Switch(config-vlan)# private-vlan association remove 18
Switch(config-vlan)#
```

This example shows how to remove a private VLAN relationship and delete the primary VLAN. The associated secondary VLANs are not deleted.

```
Switch(config-vlan)# no private-vlan 14
Switch(config-vlan)#
```

private-vlan mapping

To create a mapping between the primary and the secondary VLANs so that both share the same primary VLAN SVI, use the **private-vlan mapping** command. To remove all PVLAN mappings from an SVI, use the **no** form of this command.

private-vlan mapping primary-vlan-id {[secondary-vlan-list] { **add** secondary-vlan-list}] { **remove** secondary-vlan-list}]}

no private-vlan mapping

Syntax Description	primary-vlan-id	VLAN ID of the primary VLAN of the PVLAN relationship.	
	secondary-vlan-list	(Optional) VLAN ID of the secondary VLANs to map to the primary VLAN.	
	add	(Optional) Maps the secondary VLAN to the primary VLAN.	
	remove	(Optional) Removes the mapping between the secondary VLAN and the primary VLAN.	
Defaults	All PVLAN mapping	s are removed.	
Command Modes	Interface configuration		
Command History	Release M	odification	
	12.1(8a)EW Su	pport for this command was introduced on the Catalyst 4500 series switch	
Usage Guidelines	2	<i>list</i> parameter cannot contain spaces. It can contain multiple, comma-separated be a single PVLAN ID or a range of PVLAN IDs separated by hyphens.	
	This command is valid in the interface configuration mode of the primary VLAN.		
	The SVI of the primary VLAN is created at Layer 3.		
	The traffic that is received on the secondary VLAN is routed by the SVI of the primary VLAN.		
	The SVIs of the existi is entered.	ing secondary VLANs do not function and are considered down after this command	
	A secondary SVI can be mapped to only one primary SVI. If the configured PVLANs association is different from what is specified in this command (if the specified <i>primary-vlan-id</i> is configured as a secondary VLAN), all the SVIs that are specified in this command are brought down.		
	secondary vLAN), al	in the 5 vis that are specified in this command are brought down.	

Examples

This example shows how to map the interface of VLAN 20 to the SVI of VLAN 18:

```
Switch(config)# interface vlan 18
Switch(config-if)# private-vlan mapping 18 20
Switch(config-if)#
```

This example shows how to permit the routing of the secondary VLAN ingress traffic from PVLANs 303 through 307, 309, and 440 and how to verify the configuration:

```
Switch# config terminal
Switch(config)# interface vlan 202
Switch(config-if)# private-vlan mapping add 303-307,309,440
Switch(config-if)# end
Switch# show interfaces private-vlan mapping
Interface Secondary VLAN Type
_____ ____
vlan202 303
                      isolated
vlan202 304
                      isolated
vlan202
                       isolated
         305

vlan202 307
                      isolated
vlan202 309
                      isolated
vlan202 440
                      isolated
Switch#
```

This example shows the displayed message that you will see if the VLAN that you are adding is already mapped to the SVI of VLAN 18. You must delete the mapping from the SVI of VLAN 18 first.

```
Switch(config)# interface vlan 19
Switch(config-if)# private-vlan mapping 19 add 21
Command rejected: The interface for VLAN 21 is already mapped as s secondary.
Switch(config-if)#
```

This example shows how to remove all PVLAN mappings from the SVI of VLAN 19:

```
Switch(config)# interface vlan 19
Switch(config-if)# no private-vlan mapping
Switch(config-if)#
```

Related Commands show interfaces private-vlan mapping show vlan show vlan private-vlan

private-vlan synchronize

To map the secondary VLANs to the same instance as the primary VLAN, use the **private-vlan** synchronize command.

private-vlan synchronize

- **Defaults** This command has no default settings.
- Command Modes MST configuration

 Release
 Modification

 12.1(12c)EW
 Support for this command was introduced on the Catalyst 4500 series switch

Usage Guidelines If you do not map the VLANs to the same instance as the associated primary VLAN when you exit the MST configuration submode, a warning message displays and lists the secondary VLANs that are not mapped to the same instance as the associated primary VLAN. The **private-vlan synchronize** command automatically maps all secondary VLANs to the same instance as the associated primary VLANs.

Examples This example shows how to initialize PVLAN synchronization:

Switch(config-mst)# private-vlan synchronize
Switch(config-mst)#

This example assumes that a primary VLAN 2 and a secondary VLAN 3 are associated to VLAN 2, and that all VLANs are mapped to the CIST instance 1. This example also shows the output if you try to change the mapping for the primary VLAN 2 only:

```
Switch(config)# spanning-tree mst configuration
Switch(config-mst)# instance 1 vlan 2
Switch(config-mst)# exit
These secondary vlans are not mapped to the same instance as their primary:
->3
Switch(config)#
```

Related Commands show spanning-tree mst

qos (global configuration mode)

To globally enable QoS functionality on the switch, use the **qos** command. To globally disable QoS functionality, use the **no** form of this command. qos no qos Syntax Description This command has no arguments or keywords. Defaults QoS functionality is disabled. **Command Modes** Global configuration **Command History** Modification Release 12.1(8a)EW Support for this command was introduced on the Catalyst 4500 series switch **Usage Guidelines** If QoS functionality is globally enabled, it is enabled on all interfaces, except on the interfaces where QoS has been disabled. If QoS functionality is globally disabled, all traffic is passed in QoS pass-through mode. Examples This example shows how to enable QoS functionality globally on the switch: Switch(config)# gos Switch(config)# **Related Commands** qos (interface configuration mode) show qos

qos account layer2 encapsulation

To include additional bytes to be accounted by the QoS features, use the **qos account layer2 encapsulation** command. To disable the use of additional bytes, use the **no** form of this command.

qos account layer2 encapsulation {arpa | dot1q | isl | length len}

no qos account layer2 encapsulation {arpa | dot1q | isl | length len}

Syntax Description	arpa	Specifies the account length of the Ethernet ARPA-encapsulated packet (18bytes).
	dot1q	Specifies the account length of the 802.1Q-encapsulated packet (22 bytes).
	isl	Specifies the account length of the ISL-encapsulated packet (48 bytes).
	length len	Specifies the a dditional packet length to account for; the valid range is from 0 to 64 bytes.
Defaults		the length that is specified in the IP header for the IP packets and the length that is Ethernet header for non-IP packets is included.
Command Modes	Global configu	ration
Command History	Release	Modification
	12.1(19)EW	This command was first introduced.
Usage Guidelines		4500 series switch, the qos account layer2 encapsulation command indicates that the should consider the configured length in addition to the IP length of the packet when packets.
	Sharing and sha	ping always use the Ethernet ARPA length.
Note	it was received.	h is included when policing all IP packets irrespective of the encapsulation with which When qos account layer2 encapsulation isl is configured, a fixed length of 48 bytes is policing all IP packets, not only those IP packets that are received with ISL
	Sharing and sha	ping use the length that is specified in the Layer 2 headers.
Examples	This example sl	nows how to include an additional 18 bytes when policing IP packets:
	Switch# config Switch(conf)# Switch (conf)‡	qos account layer2 encapsulation length 18

This example shows how to disable the consistent accounting of the Layer 2 encapsulation by the QoS features:

Switch# config terminal
Switch(conf)# no qos account layer2 encapsulation
Switch (conf)#

Command History	ReleaseModifie12.1(8a)EWSupportThis policer can be sharedThe Catalyst 4006 switchThe qos aggregate-policethat aggregate. When youto 32 Gbps, and the range	t for this command was introduced on the Catalyst 4500 series switch d by different policy map classes and on different interfaces. supports up to 1000 aggregate input policers and 1000 output policers. er command allows you to configure an aggregate flow and a policing rule fo enter your rate and burst parameters, the range for the average rate is 32 Kbps

Suffix	Description
k	1000 bps
m	1,000,000 bps
g	1,000,000,000 bps

Bursts can be entered in bytes without a suffix. In addition, the suffixes shown in Table2-12 are allowed.

Table2-12 Burst Suffix

Suffix	Description
k	1000 bytes
m	1,000,000 bytes
g	1,000,000,000 bytes

Note

Due to hardware granularity, the rate value is limited, so the burst that you configure might not be the value that is used.

Modifying an existing aggregate rate limit modifies that entry in NVRAM and in the switch if it is currently being used.

When you enter the aggregate policer name, follow these naming conventions:

- Maximum of 31 characters long and may include a-z, A-Z, 0-9, the dash (-), the underscore (_), and the period (.).
- Must start with an alphabetic character and must be unique across all ACLs of all types.
- Aggregate policer names are case sensitive.
- Cannot be a number.
- Must not be a keyword; keywords to avoid are all, default-action, map, help, and editbuffer.

An aggregate policer can be applied to one or more interfaces. However, if you apply the same policer to the input direction on one interface and to the output direction on a different interface, then you have created the equivalent of two different aggregate policers in the switching engine. Each policer has the same policing parameters, with one policing the ingress traffic on one interface and the other policing the egress traffic on another interface. If you apply an aggregate policer to multiple interfaces in the same direction, only one instance of the policer is created in the switching engine.

You can apply an aggregate policer to a physical interface or to a VLAN. If you apply the same aggregate policer to a physical interface and to a VLAN, then you have created the equivalent of two different aggregate policers in the switching engine. Each policer has the same policing parameters, with one policing the traffic on the configured physical interface and the other policing the traffic on the configured VLAN. If you apply an aggregate policer to only ports or only VLANs, then only one instance of the policer is created in the switching engine.

If you apply a single aggregate policer to the ports and the VLANs in different directions, then you have created the equivalent of four aggregate policers; one for all ports sharing the policer in the input direction, one for all ports sharing the policer in the output direction, one for all VLANs sharing the policer in the input direction.

Examples This example shows how to configure a QoS aggregate policer to allow a maximum of 100,000 bits per second with a normal burst size of 10,000 bytes, to transmit when these rates are not exceeded, and to drop packets when these rates are exceeded:

Switch(config)# qos aggregate-policer micro-one 100000 10000 conform-action transmit exceed action drop Switch(config)#

qos map cos

To define the ingress CoS-to-DSCP mapping for the trusted interfaces, use the **qos map cos** command. To remove a prior entry, use the **no** form of this command.

qos map cos cos_values to dscp dscp1

no qos map cos to dscp

Syntax Description	cos_values	CoS values; list up to eight CoS values separated by spaces.									
	to dscp	Defines mapping and specifies DSCP value.									
	dscp1	DSCP value to map to the CoS values; valid values are from 0 to 63.									
Defaults	The default Co	S-to-DSCP configuration settings are shown in the following table:									
	CoS 0 1	2 3 4 5 6 7									
	DSCP 0 8	16 24 32 40 48 56									
Command Modes	Global config	uration									
Command History	Release	Modification									
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch									
Usage Guidelines	to the internal	SCP map is used to map the packet CoS (on the interfaces that are configured to trust CoS) DSCP value. This map is a table of eight CoS values (0 through 7) and their corresponding 'he switch has one map.									
Examples	This example	shows how to configure the ingress CoS-to-DSCP mapping for cos 0:									
	Switch(config Switch(config	()# qos map cos 0 to dscp 20 ()#									
	This example	shows how to disable the ingress CoS-to-DSCP mapping for cos 0:									
	Switch(config Switch(config)# no gos map cos 0 to dscp 20)#

qos map dscp policed

To set the mapping of the policed DSCP values to the marked-down DSCP values, use the **qos map dscp policed** command. To remove a prior entry, use the **no** form of this command.

qos map dscp policed *dscp_list* **to dscp** *policed_dscp*

no qos map dscp policed

Syntax Description	dscp_list	DSCP values; valid values are from 0 to 63.	
Syntax Description	to dscp	Defines mapping.	
	Marked-down DSCP values; valid values are from 0 to 63.		
	policed_dscp		
Defaults	Mapping of DS	CP values is disabled.	
Command Modes	Global configura	ation	
Command History	Release	Modification	
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch	
Usage Guidelines	The DSCP-to-policed-DSCP map determines the marked-down DSCP value that is applied to the		
	out-of-profile flows. The switch has one map.		
	You can enter up to eight DSCP values, separated by spaces.		
•	You can enter of	nly one policed DSCP value.	
<u>Note</u>	To avoid out-of-	-sequence packets, configure the DSCP-to-policed-DSCP map so that marked-down	
Note		in the same queue as in-profile traffic.	
Examples	This example sh	nows how to map multiple DSCPs to a single policed-DSCP value:	
	Switch(config) Switch(config)	# qos map dscp policed 20 25 43 to dscp 4 #	
Related Commands	qos map cos qos map dscp show qos

qos rewrite ip dscp

To enable DSCP rewrite for IP packets, use the **qos rewrite ip dscp** command. To disable IP DSCP rewrite, use the **no** form of this command.

qos rewrite ip dscp

no qos rewrite ip dscp

Syntax Description	This command has no arg	guments or keywords.
--------------------	-------------------------	----------------------

- Defaults IP DSCP rewrite is enabled.
- Command Modes Global configuration

 Release
 Modification

 12.2(18)EW
 Support for this command was introduced on the Catalyst 4500 series switch

Usage Guidelines If you disable IP DSCP rewrite and enable QoS globally, the following events occur:

- The ToS byte on the IP packet is not modified.
- Marked and marked-down DSCP values are used for queueing.
- The internally derived DSCP (as per the trust configuration on the interface or VLAN policy) is used for transmit queue and Layer 2 CoS determination. The DSCP is not rewritten on the IP packet header.

If you disable QoS, the CoS and DSCP of the incoming packet are preserved and are not rewritten.

 Examples
 This example shows how to disable IP DSCP rewrite:

 Switch(config)# no gos rewrite ip dscp

 Switch(config)#

Related Commands qos (global configuration mode) show qos

qos trust

To set the trusted state of an interface (for example, whether the packets arriving at an interface are trusted to carry the correct CoS, ToS, and DSCP classifications), use the **qos trust** command. To set an interface to the untrusted state, use the **no** form of this command.

qos trust {**cos** / *device cisco-phone* | **dscp** | **extend** [**cos** *priority*]}

no qos trust {**cos** / *device cisco-phone* | **dscp** | **extend** [**cos** *priority*]}

Syntax Description	cos	Specifies that the CoS bits in incoming frames are trusted and derives the internal DSCP value from the CoS bits.		
	device cisco-phone	<i>phone</i> Specifies the Cisco IP phone as the trust device for a port.		
	dscp	Specifies that the ToS bits in the incoming packets contain a DSCP value.		
	extend	Specifies to extend the trust to Port VLAN ID (PVID) packets coming from the PC.		
	cos priority	(Optional) Specifies that the CoS priority value is set to PVID packets; valid values are from 0 to 7.		
Defaults	The default settings	s are as follows:		
	• If global QoS is	s enabled, trust is disabled on the port.		
	• If global QoS is	s disabled, trust DSCP is enabled on the port.		
	• The CoS priority level is 0.			
Command Modes	Interface configurat	tion Modification		
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch		
	12.1(11)EW	Support for extending trust for voice was added.		
	12.1(19)EW	Support for trust device Cisco IP phone was added.		
Usage Guidelines	You can only configure the trusted state on physical LAN interfaces. By default, the trust state of an interface when QoS is enabled is untrusted; when QoS is disabled on the interface, the trust state is reset to trust DSCP.			
	When the interface trust state is qos trust cos , the transmit CoS is always the incoming packet CoS (or the default CoS for the interface, if the packet is not tagged).			
	When the interface	trust state is not qos trust dscp , the security and QoS ACL classification will always SCP and not the incoming packet DSCP.		
	Trusted boundary should not be configured on the ports that are part of an EtherChannel (that is, a port channel).			

Examples

This example shows how to set the trusted state of an interface to CoS:

Switch(config-if)# qos trust cos
Switch(config-if)#

This example shows how to set the trusted state of an interface to DSCP:

Switch(config-if)# qos trust dscp
Switch(config-if)#

This example shows how to set the PVID CoS level to 6:

Switch(config-if)# qos trust extend cos 6
Switch(config-if)#

This example shows how to set the Cisco phone as the trust device:

Switch(config-if)# qos trust device cisco-phone
Switch(config-if)#

Related Commands

qos cos qos vlan-based show qos interface

qos vlan-based

To enable per-VLAN QoS for a Layer 2 interface, use the **qos vlan-based** command. To disable per-VLAN QoS for a Layer 2 interface, use the **no** form of this command.

qos vlan-based

no qos vlan-based

Syntax Description	This command has no arguments of	r keywords.
--------------------	----------------------------------	-------------

- **Defaults** Per-VLAN QoS is disabled.
- Command Modes Interface configuration

Command History	Release	Modification	
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch	

Usage Guidelines In VLAN-based mode, the policy map that is attached to the Layer 2 interface is ignored, and QoS is driven by the policy map that is attached to the corresponding VLAN interface.

Per-VLAN QoS can be configured only on the Layer 2 interfaces.

If no input QoS policy is attached to a Layer 2 interface, then the input QoS policy that is attached to the VLAN (on which the packet is received), if any, is used even if the port is not configured as VLAN based.

If you do not want this default, attach a placeholder input QoS policy to the Layer 2 interface.

Similarly, if no output QoS policy is attached to a Layer 2 interface, then the output QoS policy that is attached to the VLAN (on which the packet is transmitted), if any, is used even if the port is not configured as VLAN based.

If you do not want this default, attach a placeholder output QoS policy to the Layer 2 interface.

Layer 3 interfaces are always in interface-based mode. Layer 3 VLAN interfaces are always in VLAN-based mode.

Examples	This example shows how to enable per-VLAN QoS for a Layer 2 interface:		
	Switch(config-if)# qos vlan-based		
	Switch(config-if)#

redundancy

To enter the redundancy configuration mode, use the **redundancy** command in the global configuration mode.

redundancy

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** This command has no default settings.
- Command Modes Global configuration

 Release
 Modification

 12.1(12c)EW
 Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).

Usage Guidelines The redundancy configuration mode is used to enter the main CPU submode.

To enter the main CPU submode, use the **main-cpu** command in the redundancy configuration mode.

The main CPU submode is used to manually synchronize the configurations on the two supervisor engines.

From the main CPU submode, use the **auto-sync** command to enable automatic synchronization of the configuration files in NVRAM.

Use the **no** command to disable redundancy. If you disable redundancy, then reenable redundancy, the switch returns to default redundancy settings.

Use the exit command to exit the redundancy configuration mode.

Examples This example shows how to enter redundancy mode:

Switch(config)# redundancy
Switch(config-r)#

This example shows how to enter the main CPU submode:

Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)#

- MAC address of the adjacent router.
- Time left before the adjacency rolls out of the adjacency table. After it rolls out, a packet must use the same next hop to the destination.

Examples

This example shows how to display adjacency information:

```
Switch# show adjacency

Protocol Interface Address

IP FastEthernet2/3 172.20.52.1(3045)

IP FastEthernet2/3 172.20.52.22(11)

Switch#
```

This example shows how to display a summary of adjacency information:

```
Switch# show adjacency summary
Adjacency Table has 2 adjacencies
Interface Adjacency Count
FastEthernet2/3 2
Switch#
```

This example shows how to display protocol detail and timer information:

```
Switch# show adjacency detail
Protocol Interface
                             Address
ΙP
       FastEthernet2/3

Switch#

This example shows how to display adjacency information for a specific interface:

```
Switch# show adjacency fastethernet2/3
Protocol Interface Address
IP FastEthernet2/3 172.20.52.1(3045)
IP FastEthernet2/3 172.20.52.22(11)
Switch#
```

Related Commands debug adjacency

show arp access-list

To display detailed information on an ARP access list, use the show arp command.

show arp access-list Syntax Description This command has no arguments or keywords. Defaults This command has no default settings. **Command Modes** EXEC Modification **Command History** Release 12.1(19)EW Support for this command was introduced on the Catalyst 4500 series switch. Examples This example shows how to display the ARP ACL information for a switch: Switch# show arp access-list ARP access list rose permit ip 10.101.1.1 0.0.0.255 mac any permit ip 20.3.1.0 0.0.0.255 mac any **Related Commands** access-group mode arp access-list ip arp inspection filter vlan

show auto install status

To display the status of an automatic installation, use the show auto install status command.

show auto install status Syntax Description This command has no arguments or keywords. Defaults This command has no default settings. **Command Modes** Privileged EXEC Modification **Command History** Release 12.2(20)EW Support for this command was introduced on the Catalyst 4500 series switch. **Examples** This example shows how to display the IP address of the TFTP server and to display whether or not the switch is currently acquiring the configuration file on the TFTP server: Switch# show auto install status : Downloading config file Status DHCP Server : 20.0.0.1 TFTP Server : 30.0.0.3 Config File Fetched : Undetermined The first IP address in the display indicates the server that is used for the automatic installation. The

second IP address indicates the TFTP server that provided the configuration file.

show auto qos

To display the automatic quality of service (auto-QoS) configuration that is applied, use the **show auto qos** user EXEC command.

show auto qos [interface [interface-id]] [{begin | exclude | include} expression]

Syntax Description	interface interface-id	(Optional) Displays auto-QoS information for the specified interface or for all interfaces. Valid interfaces include physical ports.
	begin	(Optional) Begins with the line that matches the expression.
	exclude	(Optional) Excludes lines that match the expression.
	include	(Optional) Includes lines that match the specified expression.
	expression	(Optional) Expression in the output to use as a reference point.

Examples

This example shows output from the **show auto qos** command when auto-QoS is enabled:

```
Switch# show auto qos
00:00:55:qos
00:00:56:qos map cos 3 to dscp 26
00:00:57:gos map cos 5 to dscp 46
00:00:58:qos map dscp 16 to tx-queue 1
00:00:58:qos map dscp 32 to tx-queue 1
00:00:58:qos dbl
00:00:59:policy-map autoqos-voip-policy
00:00:59: class class-default
00:00:59:
          dbl
00:00:59:interface GigabitEthernet1/1
00:00:59: qos trust device cisco-phone
00:00:59: gos trust cos
00:00:59: tx-queue 3
00:00:59: priority high
00:00:59: shape percent 70
00:00:59: service-policy output autoqos-voip-policyend
```

This example shows output from the **show auto qos interface** command when the **auto qos voip cisco-phone** interface configuration command is entered:

```
Switch# show auto qos interface
Initial configuration applied by AutoQoS:
1
interface GigabitEthernet1/1
gos trust device cisco-phone
qos trust cos
tx-queue 3
priority high
shape percent 70
service-policy output autogos-voip-policy
interface GigabitEthernet1/2
qos trust device cisco-phone
qos trust cos
tx-queue 3
priority high
shape percent 70
service-policy output autoqos-voip-policy
```

This example shows output from the **show auto qos interface gigabitethernet1/1** command when the **auto qos voip cisco-phone** interface configuration command is entered:

```
Switch# show auto qos interface gigabitethernet1/1
Initial configuration applied by AutoQoS:
!
interface GigabitEthernet1/1
qos trust device cisco-phone
qos trust cos
tx-queue 3
priority high
shape percent 70
service-policy output autoqos-voip-policy
```

This example shows output from the **show auto qos** command when auto-QoS is disabled:

```
Switch# show auto qos
AutoQoS is disabled
```

Table2-13 describes the fields that are shown in the example.

Field	Definition	
Device ID	Configured ID (name), MAC address, or serial number of the neighbor device.	
Local Intrfce	(Local Interface) The protocol that is used by the connectivity media.	
Holdtme	(Holdtime) Remaining amount of time, in seconds, that the current device holds the CDP advertisement from a transmitting router before discarding it.	
Capability	Capability code that is discovered on the device. This device type is listed in the CDP Neighbors table. Possible values are as follows:	
	R—Router	
	T—Transparent bridge	
	B—Source-routing bridge	
	S—Switch	
	H—Host	
	I—IGMP device	
	r—Repeater	
	P—Phone	
Platform	Product number of the device.	
Port ID	Protocol and port number of the device.	

Table2-13 show cdp neighbors Field Descriptions

Table2-14 describes the fields that are shown in the example.

Field	Definition		
Device ID	Name of the neighbor device and either the MAC address or the serial number of this device.		
Entry address(es)	List of network addresses of neighbor devices.		
[network protocol] address	Network address of the neighbor device. The address can be in IP, IPX, AppleTalk, DECnet, or CLNS protocol conventions.		
Platform	Product name and number of the neighbor device.		
Capabilities	Device type of the neighbor. This device can be a router, a bridge, a transparent bridge, a source-routing bridge, a switch, a host, an IGMP device, or a repeater.		
Interface	Protocol and port number of the port on the current device.		
Holdtime	Remaining amount of time, in seconds, that the current device holds the CDP advertisement from a transmitting router before discarding it.		
Version:	Software version running on the neighbor device.		
advertisement version:	Version of CDP that is being used for CDP advertisements.		
Duplex:	Duplex state of connection between the current device and the neighbor device.

Re-authentication	=	Disabled
ReAuthPeriod	=	3600 Seconds
ServerTimeout	=	30 Seconds
SuppTimeout	=	30 Seconds
TxPeriod	=	30 Seconds
Guest-Vlan	=	91
Switch#		

Table2-15 provides a partial list of the displayed fields. The remaining fields in the display show internal state information. For a detailed description of these state machines and their settings, refer to the 802.1X specification.

Table2-15	show dot1x interface Field Description	n
-----------	--	---

Field	Description
PortStatus	Status of the port (authorized or unauthorized). The status of a port is displayed as authorized if the dot1x port-control interface configuration command is set to auto and has successfully completed authentication.
Port Control	Setting of the dot1x port-control interface configuration command.
MultiHosts	Setting of the dot1x multiple-hosts interface configuration command (allowed or disallowed).

This is an example of output from the **show dot1x statistics interface gigabitethernet1/1** command. Table2-16 describes the fields in the display.

```
Switch# show dot1x statistics interface gigabitethernet1/1
```

Table2-16 show dot1x statistics Field Descriptions

Field	Description
TxReq/TxReqId	Number of EAP-request/identity frames that have been sent.
TxTotal	Number of EAPOL frames of any type that have been sent.
RxStart	Number of valid EAPOL-start frames that have been received.
RxLogoff	Number of EAPOL-logoff frames that have been received.

Field	Description
RxRespId	Number of EAP-response/identity frames that have been received.
RxResp	Number of valid EAP-response frames (other than response/identity frames) that have been received.
RxInvalid	Number of EAPOL frames that have been received and have an unrecognized frame type.
RxLenError	Number of EAPOL frames that have been received in which the packet body length field is invalid.
RxTotal	Number of valid EAPOL frames of any type that have been received.
RxVersion	Protocol version number carried in the most recently received EAPOL frame.
LastRxSrcMac	Source MAC address carried in the most recently received EAPOL frame.

show flowcontrol

To display the per-interface status and statistics related to flow control, use the **show flowcontrol** command.

show flowcontrol [module slot | interface interface]

Syntax Description	module <i>slot</i>	(Optional) Limits the display to interfaces on a specific module.
	interface interface	(Optional) Displays the status on a specific interface.
Defaults	This command has	s no default settings.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
	12.2(25)EW	Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.

Usage Guidelines Table 2-17 describes the fields in the **show flowcontrol** command output.

Table2-17 show flowcontrol Command Output

Field	Description
Port	Module and port number.
Send-Flowcontrol-Admin	Flow-control administration. Possible settings: on indicates the local port sends flow control to the far end; off indicates the local port does not send flow control to the far end; desired indicates the local end sends flow control to the far end if the far end supports it.
Send-Flowcontrol-Oper	Flow-control operation. Possible setting: disagree indicates the two ports could not agree on a link protocol.
Receive-Flowcontrol-Admin	Flow-control administration. Possible settings: on indicates the local port requires the far end to send flow control; off indicates the local port does not allow the far end to send flow control; desired indicates the local end allows the far end to send flow control.
Receive-Flowcontrol-Oper	Flow-control operation. Possible setting: disagree indicates the two ports could not agree on a link protocol.
RxPause	Number of pause frames received.
TxPause	Number of pause frames transmitted.

show interfaces

To display traffic on a specific interface, use the show interfaces command.

show interfaces [{{fastethernet mod/interface-number} | {gigabitethernet mod/interface-number} | {tengigabitethernet mod/interface-number} | {null interface-number} | vlan vlan_id} | status}]

Syntax Description	fastethernet mod/interface-number	(Optional) Specifies the Fast Ethernet module and interface.
	gigabitethernet mod/interface-number	(Optional) Specifies the Gigabit Ethernet module and interface.
	tengigabitethernet mod/interface-number	(Optional) Specifies the 10-Gigabit Ethernet module and interface.
	null interface-number	(Optional) Specifies the null interface; the valid value is 0.
	vlan vlan_id	(Optional) Specifies the VLAN; valid values are from 1 to 4094.
	status	(Optional) Displays status information.

Defaults

This command has no default settings.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
	12.1(12c)EW	Support for extended VLAN addresses was added.
	12.2(25)EW	Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.

Usage Guidelines The statistics are collected on a per-VLAN basis for Layer 2-switched packets and Layer 3-switched packets. The statistics are available for both unicast and multicast. The Layer 3-switched packet counts are available for both the ingress and egress directions. The per-VLAN statistics are updated every 5seconds.

In some cases, you might see a difference in the duplex mode that is displayed between the **show interfaces** command and the **show running-config** commands. The duplex mode that is displayed in the **show interfaces** command is the actual duplex mode that the interface is running. The **show interfaces** command shows the operating mode for an interface, while the **show running-config** command shows the configured mode for an interface.

If you do not enter any keywords, all counters for all modules are displayed.

```
Examples
                    This example shows how to display traffic for a Gigabit Ethernet interface 2/5:
                    Switch# show interfaces gigabitethernet2/5
                   GigabitEthernet9/5 is up, line protocol is up

     0 runts, 0 giants, 0 throttles
     0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
     0 input packets with dribble condition detected
     0 packets output, 0 bytes, 0 underruns
     0 output errors, 0 collisions, 0 interface resets
     0 babbles, 0 late collision, 0 deferred
     0 lost carrier, 0 no carrier
     0 output buffer failures, 0 output buffers swapped out
Switch#
```

This example shows how to display status information for Gigabit Ethernet interface 1/2:

Switch#	show interfa	ces gigabiteth	ernet1/2	status		
Port	Name	Status	Vlan	Duplex	Speed	Туре
Gil/2		notconnect	1	auto	1000	1000-XWDM-RXONLY
Switch#						

This example shows how to display status information for the interfaces on the supervisor engine:

Switch# show interfaces status

Port	Name	Status	Vlan	Duplex	Speed Type
Tel/1		connected	1	full	10G 10GBase-LR
Tel/2		connected	1	full	10G 10GBase-LR
Switch#					

show interfaces capabilities

To display the interface capabilities for an interface or for all the interfaces on a switch, use the **show interfaces capabilities** command.

show interfaces capabilities [{module mod}]

show interfaces [interface interface-number] capabilities

Syntax Description	module mod	(Optional) Display information for the specified module only.		
	interface	(Optional) Interface type; valid values are fastethernet , gigabitethernet , tengigabitethernet , and port-channel .		
	interface-number	(Optional) Port number.		
Defaults	This command has no c	default settings.		
Command Modes	Privileged EXEC			
Command History	Release	Modification		
-	12.1(19)EW	Support for this command was introduced on the Catalyst 4500 series switch.		
	12.2(25)EW	Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.		
Usage Guidelines	interface-number dependent dependent interface-number dependent de	argument designates the module and port number. Valid values for nd on the chassis and module used. For example, if you have a 48-port ernet RJ-21 (telco connector) switching module installed in a Catalyst 4507 r the slot number are from 2 to 13 and valid values for the port number are 1 to 48

Related Commands show interfaces counters

show interfaces counters

To display the traffic on the physical interface, use the **show interfaces counters** command.

show interfaces counters [all | detail | errors | storm-control | trunk] [module mod]

Syntax Description	all	(Optional) Displays all the interface counters including errors, trunk, and detail.				
	detail	(Optional) Displays the detailed interface counters.				
	errors	(Optional) Displays the interface error counters.				
	storm-control	(Optional) Displays the number of packets discarded due to suppression on the interface.				
	trunk	(Optional) Displays the interface trunk counters.				
	module mod	(Optional) Limits the display to interfaces on a specific module.				
Defaults	This command has	s no default settings.				
Command Modes	Privileged EXEC					
Command History	Release	Modification				
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.				
	12.1(19)EWSupport for storm control.					
	12.2(18)EWSupport for the display of total suppression discards.					
Usage Guidelines	-	r any keywords, all the counters for all modules are displayed. e storm-control keyword includes the suppressed multicast bytes.				
Examples	This example show	ws how to display the error counters for a specific module:				
•	*	erfaces counters errors module 1				
	Port Alig	n-Err FCS-Err Xmit-Err Rcv-Err UnderSize				
	Gi1/1	0 0 0 0 0				
	Gi1/2	0 0 0 0 0				
	Port Single	-Col Multi-Col Late-Col Excess-Col Carri-Sen Runts Giants				
	Gil/l	0 0 0 0 0 0				
	Gil/2	0 0 0 0 0 0 0				
	Switch#					

This example shows how to display the traffic that is seen by a specific module:

Port	InOctets	InUcastPkts	InMcastPkts	InBcastPkts
Gi1/1	0	0	0	0
Gil/2	0	0	0	0

Port OutOctets OutUcastPkts OutMcastPkts OutBcastPkts Gi1/1 0 0 0 0 Gi1/2 0 0 0 0 Switch#

This example shows how to display the trunk counters for a specific module:

Switch# show interfaces counters trunk module 1

Switch# show interfaces counters module 1

Port	TrunkFramesTx	TrunkFramesRx	WrongEncap
Gi1/1	0	0	0
Gil/2	0	0	0
Switch#			

This example shows how to display the number of packets that are discarded due to suppression :

Switch# show interfaces counters storm-control

Multicast Suppression : Enabled

Port	BcastSuppLevel	TotalSuppressionDiscards
Fa5/35	10.00%	6278550
Switch#

show interfaces link

L

To display how long a cable has been disconnected from an interface, use the **show interfaces link** command:

show interfaces link [module mod_num]

Syntax Description	module mod_nu	(Optional) Limits the display to interfaces on a module.
Defaults	This command h	nas no default settings.
Command Modes	Privileged EXE	С
Command History	Release	Modification
	12.2(18)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines		tate is up, the command displays 0:00. If the interface state is down, the time (in hours, conds) is displayed.
Examples	This example sh Switch# show i :	ows how to display active link-level information:
	Port Name Gil/1 Gil/2 Gi3/1 Gi3/2 Fa4/1 Fa4/2 Fa4/3 Fa4/4	Down Time 00:00:00 00:00:00 00:00:00 00:00:00 00:00:00 00:00:00 00:00:00 00:00:00 00:00:00
	This example sh	ows how to display inactive link-level information:
	Switch# show i	nterfaces link
	Port Name Gi3/4 Gi3/5 Gi3/6	Down Time 1 minute 28 secs 1 minute 28 secs 1 minute 28 secs

show interfaces mtu

To display the maximum transmission unit (MTU) size of all the physical interfaces and SVIs on the switch, use the **show interfaces mtu** command.

show interfaces mtu [module mod]

Syntax Description	module mod	(Optional) Limits the display to interfaces on a specific module.
Defaults	This command	has no default settings.
Command Modes	EXEC	
Command History	Release	Modification
	12.1(13)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Examples	-	shows how to display the MTU size for all interfaces on module 1:
	Port Name	MTU
	Gi1/1 Gi1/2 Switch>	1500 1500
Related Commands	mtu	

show interfaces private-vlan mapping

To display PVLAN mapping information for VLAN SVIs, use the **show interfaces private-vlan mapping** command.

show interfaces private-vlan mapping [active]

Syntax Description	active (O	active (Optional) Displays active interfaces only.						
Defaults	This command h	as no default settings.						
Command Modes	Privileged EXE	C						
Command History	Release	Modification						
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.						
Usage Guidelines	This command d	lisplays SVI information only.						
Examples	This example sh	ows how to display PVLAN mapping information:						
	Interface Secon	nterfaces private-vlan mapping ndary VLAN Type						
	vlan2 301 vlan2 302 Switch#	isolated isolated						
Related Commands	private-vlan private-vlan ma	ipping						

show interfaces status

To display the interface status or a list of interfaces in error-disabled state, use the **show interfaces status** command.

show interfaces status [err-disabled]

Syntax Description	err-disabled	(Optional) Displays interfaces in error-disabled state.			
Defaults	This command	has no default settings.			
Command Modes	Privileged EXE	C			
Command History	Release	Modification			
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.			
Examples	This example sl	hows how to display the status of all interfaces:			
	Switch# show i	interfaces status			
	Port Name	Status Vlan Duplex Speed Type			
	Gil/1	disabled routed full 1000 missing			
	Gil/2	notconnect 1 full 1000 unknown (4)			
	Fa5/1	disabled routed auto auto 10/100BaseTX			
	Fa5/2	disabled routed auto auto 10/100BaseTX			
	Fa5/3	disabled routed auto auto 10/100BaseTX			
	Fa5/4	disabled routed auto auto 10/100BaseTX			
	Fa5/15	disabled routed auto auto 10/100BaseTX			
	Fa5/16	disabled routed auto auto 10/100BaseTX			
	Fa5/17 Switch#	disabled routed auto auto 10/100BaseTX			
	This example shows how to display the status of interfaces in an error-disabled state:				
	Switch# show i	interfaces status err-disabled			
	Port Name	Status Reason			
	Fa9/4	notconnect link-flap			
	informational error message when the timer expires on a cause				
	5d04h:%PM-SP-4 Switch#	4-ERR_RECOVER:Attempting to recover from link-flap err-disable state on Fa9/4			
Related Commands	errdisable dete	ect			

show errdisable recovery

Administrative private-vlan trunk private VLANs: none
Administrative private-vlan trunk Native VLAN tagging: Disabled
Operational private-vlan: none
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
Capture VLANs Allowed: ALL
Unknown unicast blocked: disabled
Unknown multicast blocked: disabled
```

Related Commands show interfaces capabilities show interfaces counters

show interfaces transceiver

To display diagnostic-monitoring data for all interfaces that have transceivers installed, use the **show** interfaces transceiver command.

show interfaces {{[int_name] transceiver {[detail]} | {transceiver[module mod] | detail
[module mod]}}

Syntax Description	int_name	(Optional) Interface.					
	detail	(Optional) Displays the calibrated values and the A2D readouts if the readout values differ from the calibrated values. Also displays the high-alarm, high-warning, low-warning, and low-alarm thresholds.					
	module mod	(Optional) Limits the display to interfaces on a specific module.					
Defaults	The noninterfac	e-specific versions of the show interfaces transceiver command are enabled by default.					
	a transceiver (G	becific versions of these commands are enabled by default if the specified interface has BIC or SFP) that is configured for diagnostic monitoring, and the transceiver is in a sports diagnostic monitoring.					
Command Modes	Privileged EXE	C					
Command History	Release	Modification					
-	12.1(20)EW Support for this command was introduced on the Catalyst 4500 series switch.						
	12.2(18)EW	Support for the calibration keyword was withdrawn.					
Usage Guidelines		faces transceiver command provides useful information under the following conditions: e transceiver is installed on a chassis that is configured for diagnostic monitoring.					
	• The transceiver is in a module that supports diagnostic monitoring.						
	If you notice that the alarm and warning flags have been set on a transceiver, reenter the command to confirm.						
Examples	This example sl installed on the	nows how to display diagnostic monitoring data for all interfaces with transceivers switch:					
	If device ++ : high NA or N/A:	<pre>nterfaces transceiver is externally calibrated, only calibrated values are printed. alarm, + : high warning, - : low warning, : low alarm. not applicable, Tx: transmit, Rx: receive. mperes, dBm: decibels (milliwatts).</pre>					
		Optical Optical Temperature Voltage Current Tx Power Rx Power Celsius) (Volts) (mA) (dBm) (dBm)					

Gi1/1	48.1	3.30	0.0	8.1 ++	N/A
Gil/2	33.0	3.30	1.8	-10.0	-36.9
Gi2/1	43.7	5.03	50.6 +	-16.7	N/A
Gi2/2	39.2	5.02	25.7	0.8	N/A
Switch#					

```
Note
```

The value for the Optical Tx Power (in dBm) equals ten times log (Tx Power in mW). If the Tx Power value is 3 mW, then the Optical Tx Power value equals 10 * log (3), which equals 10 * .477 or 4.77 dBm. The Optical Rx Power value behaves similarly. If the Tx Power or the Rx Power is zero, then its dBm value is undefined and is shown as N/A (not applicable).

This example shows how to display detailed diagnostic monitoring data, including calibrated values, alarm and warning thresholds, A2D readouts, and alarm and warning flags. The A2D readouts are reported separately in parentheses only if they differ from the calibrated values:

```
Switch# show interfaces transceiver detail
```

```
mA: milliamperes, dBm: decibels (milliwatts), NA or N/A: not applicable.
++ : high alarm, + : high warning, - : low warning, -- : low alarm.
A2D readouts (if they differ), are reported in parentheses.
The threshold values are calibrated.
```

show ip igmp snooping membership

To display host membership information, use the show ip igmp snooping membership command.

show ip igmp snooping membership [interface interface_num] [vlan vlan_id]
[reporter a.b.c.d] [source a.b.c.d group a.b.c.d]

Syntax Description	interface <i>interface_num</i>	(Optional) Displays IP address and version information of an interface.						
	vlan vlan_id	(Optional) Displays VLAN members sorted by group IP address of a VLAN; valid values are from 1 to 1001 and from 1006 to 4094.						
	reporter a.b.c.d	(Optional) Displays membership information for a specified reporter.						
	source a.b.c.d	(Optional) Specifies a reporter, source, or group IP address.						
	group a.b.c.d	(Optional) Displays all members of a channel (source, group), sorted by interface or VLAN.						
Defaults	This command has no defa	ault settings.						
Command Modes	Privileged EXEC							
Command History	Release Modific	cation						
	12.1(20)EW Suppor	t for this command was introduced on the Catalyst 4500 series switch.						
	12.2(25)EW Added	support for the 10-Gigabit Ethernet interface.						
Usage Guidelines	This command is valid onl	ly if explicit host tracking is enabled on the switch.						
Examples	This example shows how t	to display host membership for the Gigabit Ethernet interface 4/1:						
	Switch# show ip igmp snooping membership interface gigabitethernet4/1 #channels: 5 #hosts : 1 Source/Group Interface Reporter Uptime Last-Join Last-Leave							
	40.40.40.2/224.10.10.10 Gi4/1 20.20.20.20 00:23:37 00:06:50 00:20:30 40.40.40.4/224.10.10.10Gi4/1 20.20.20.20 00:39:42 00:09:17 - Switch#							
	This example shows how to display host membership for VLAN 20 and group 224.10.10.10:							
	Switch# show ip igmp snooping membership vlan 20 source 40.40.40.2 group 224.10.10.10 #channels: 5 #hosts : 1 Source/Group Interface Reporter Uptime Last-Join Last-Leave

show ip igmp snooping mrouter

To display information on the dynamically learned and manually configured multicast switch interfaces, use the **show ip igmp snooping mrouter** command.

show ip igmp snooping mrouter [{vlan vlan-id}]

Syntax Description	vlan vlan-id (0	Optional) Specifies a VLAN; valid values are from 1 to 1001 and from 1006 to 4094.
Defaults	This command h	as no default settings.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
	12.1(19)EW	Added support for extended VLAN addresses.
	You can display	a VLAN that has IGMP snooping enabled. IGMP snooping information for the VLAN interfaces by entering the show ip igmp <i>lan-num</i> command.
Examples	This example sho	ows how to display snooping information for a specific VLAN:
	Switch# show ig vlan	p igmp snooping mrouter vlan 1 ports
	+Gi J Gi Switch#	.1/1,Gi2/1,Fa3/48,Switch
Related Commands	ip igmp snoopin show ip igmp in	

show mac-address-table multicast

show ip igmp snooping vlan

To display information on the dynamically learned and manually configured VLAN switch interfaces, use the **show ip igmp snooping vlan** command.

show ip igmp snooping vlan vlan_num

Syntax Description	<i>vlan_num</i> Number of the VLAN; valid values are from 1 to 1001 and from 1006 to 4094.
Defaults	This command has no default settings.
Command Modes	Privileged EXEC
Command History	Release Modification
	12.1(8a)EWSupport for this command was introduced on the Catalyst 4500 series switch.12.1(12c)EWSupport for extended addressing was added.
Usage Guidelines	You can also use the show mac-address-table multicast command to display the entries in the MAC address table for a VLAN that has IGMP snooping enabled.
Examples	This example shows how to display snooping information for a specific VLAN:
	Switch# show ip igmp snooping vlan 2 vlan 2
	IGMP snooping is globally enabled IGMP snooping TCN solicit query is globally enabled IGMP snooping global TCN flood query count is 2 IGMP snooping is enabled on this Vlan IGMP snooping immediate-leave is disabled on this Vlan IGMP snooping mrouter learn mode is pim-dvmrp on this Vlan IGMP snooping is running in IGMP_ONLY mode on this Vlan Switch#

show ip interface

To display the usability status of interfaces that are configured for IP, use the **show ip interface** command.

show ip interface [type number]

Syntax Description	type	(Optional) Interface type.			
	number	(Optional) Interface number.			
Defaults	This command	has no default settings.			
Command Modes	EXEC				
Command History	Release	Modification			
	12.2(25)EW	Extended to include the 10-Gigabit Ethernet interface.			
Usage Guidelines	The Cisco IOS software automatically enters a directly connected route in the routing table if the interface is usable. A usable interface is one through which the software can send and receive packets. If the software determines that an interface is not usable, it removes the directly connected routing entry from the routing table. Removing the entry allows the software to use dynamic routing protocols to determine backup routes to the network, if any.				
	If the interface can provide two-way communication, the line protocol is marked "up." If the interface hardware is usable, the interface is marked "up."				
	If you specify an optional interface type, you see information only on that specific interface.				
	If you specify no optional arguments, you see information on all the interfaces.				
	fast switching	chronous interface is encapsulated with PPP or Serial Line Internet Protocol (SLIP), IP is enabled. The show ip interface command on an asynchronous interface that is with PPP or SLIP displays a message indicating that IP fast switching is enabled.			
Examples	This example s	shows how to display the usability status for a specific VLAN:			
	Vlan1 is up, Internet ad Broadcast a Address det MTU is 1500 Helper addr Directed br Outgoing ac	ress is not set roadcast forwarding is disabled cress list is not set cress list is not set			

```
Local Proxy ARP is disabled
  Security level is default
  Split horizon is enabled
  ICMP redirects are always sent
  ICMP unreachables are always sent
  ICMP mask replies are never sent
  IP fast switching is enabled
  IP fast switching on the same interface is disabled
  IP Flow switching is disabled
  IP CEF switching is enabled
  IP Fast switching turbo vector
  IP Normal CEF switching turbo vector
  IP multicast fast switching is enabled
  IP multicast distributed fast switching is disabled
  IP route-cache flags are Fast, CEF
 Router Discovery is disabled
  IP output packet accounting is disabled
  IP access violation accounting is disabled
  TCP/IP header compression is disabled
  RTP/IP header compression is disabled
  Probe proxy name replies are disabled
  Policy routing is disabled
  Network address translation is disabled
  WCCP Redirect outbound is disabled
  WCCP Redirect inbound is disabled
  WCCP Redirect exclude is disabled
  BGP Policy Mapping is disabled
  Sampled Netflow is disabled
  IP multicast multilayer switching is disabled
  Netflow Data Export (hardware) is enabled
Switch#
```

Table2-19 describes the fields that are shown in the example.

Field	Description
Ethernet0 is up	If the interface hardware is usable, the interface is marked "up." For an interface to be usable, both the interface hardware and line protocol must be up.
line protocol is up	If the interface can provide two-way communication, the line protocol is marked "up." For an interface to be usable, both the interface hardware and line protocol must be up.
Internet address and subnet mask	IP address and subnet mask of the interface.
Broadcast address	Broadcast address.
Address determined by	Status of how the IP address of the interface was determined.
MTU	MTU value that is set on the interface.
Helper address	Helper address, if one has been set.
Secondary address	Secondary address, if one has been set.
Directed broadcast forwarding	Status of directed broadcast forwarding.
Multicast groups joined	Multicast groups to which this interface belongs.
Outgoing access list	Status of whether the interface has an outgoing access list set.
Inbound access list	Status of whether the interface has an incoming access list set.

Table2-19 show ip interface Field Descriptions

Field	Description			
Proxy ARP	Status of whether Proxy Address Resolution Protocol (ARP) is enabled for the interface.			
Security level	IP Security Option (IPSO) security level set for this interface.			
Split horizon	Status of split horizon.			
ICMP redirects	Status of the redirect messages on this interface.			
ICMP unreachables	Status of the unreachable messages on this interface.			
ICMP mask replies	Status of the mask replies on this interface.			
IP fast switching	Status of whether fast switching has been enabled for this interface. Fast switching is typically enabled on serial interfaces, such as this one.			
IP SSE switching	Status of the IP silicon switching engine (SSE).			
Router Discovery	Status of the discovery process for this interface. It is typically disabled on serial interfaces.			
IP output packet accounting	Status of IP accounting for this interface and the threshold (maximum number of entries).			
TCP/IP header compression	Status of compression.			
Probe proxy name	Status of whether the HP Probe proxy name replies are generated.			
WCCP Redirect outbound is enabled	Status of whether packets that are received on an interface are redirected to a cache engine.			
WCCP Redirect exclude is disabled	Status of whether packets that are targeted for an interface are excluded from being redirected to a cache engine.			
Netflow Data Export (hardware) is enabled	NDE hardware flow status on the interface.			

Table2-19 show ip interface Field Descriptions (continued)

show ip mfib

L

To display all active Multicast Forwarding Information Base (MFIB) routes, use the **show ip mfib** command.

show ip mfib [all | counters | log [n]]

Syntax Description	all	(Optional) Specifies all routes in the MFIB, including those routes that are used to accelerate fast switching but that are not necessarily in the upper-layer routing protocol table.					
	counters	(Optional) Specifies the counts of MFIB-related events. Only nonzero counters are shown.					
	log	(Optional) Specifies a log of the most recent number of MFIB-related events. The most recent event is first.					
	n	(Optional) Number of events.					
Defaults	This command has no default settings.						
Command Modes	Privileged E	XEC					
Command History	Release 12.1(8a)EW	Modification Support for this command was introduced on the Catalyst 4500 series switch.					
	1211(04)211						
Usage Guidelines	The MFIB table contains a set of IP multicast routes; each route in the MFIB table contains several flags that associate to the route.						
	The route flags indicate how a packet that matches a route is forwarded. For example, the IC flag on an MFIB route indicates that some process on the switch needs to receive a copy of the packet. The se flags are associated with MFIB routes:						
		Copy (IC) flag—Set on a route when a process on the switch needs to receive a copy of all matching the specified route.					
	the route	g (S) flag—Set on a route when a switch process needs notification that a packet matching is received. In the expected behavior, the protocol code updates the MFIB state in response g received a packet on a signaling interface.					
	the C fla	ed (C) flag—When set on a route, the C flag has the same meaning as the S flag, except that g indicates that only packets sent by directly connected hosts to the route should be signaled ocol process.					

A route can also have a set of flags associated with one or more interfaces. For an (S,G) route, the flags on interface 1 indicate how the ingress packets should be treated and whether packets matching the route should be forwarded onto interface 1. These per-interface flags are associated with the MFIB routes:

- Accepting (A)—Set on the RPF interface when a packet that arrives on the interface and that is marked as Accepting (A) is forwarded to all Forwarding (F) interfaces.
- Forwarding (F)—Used with the A flag as described above. The set of forwarding interfaces together form a multicast olist or output interface list.
- Signaling (S)—Set on an interface when a multicast routing protocol process in Cisco IOS needs to be notified of ingress packets on that interface.
- Not Platform (NP) fast-switched—Used with the F flag. A forwarding interface is also marked as Not Platform fast-switched whenever that output interface cannot be fast-switched by the platform hardware and requires software forwarding.

For example, the Catalyst 4006 switch with Supervisor EngineIII cannot switch tunnel interfaces in hardware so these interfaces are marked with the NP flag. When an NP interface is associated with a route, a copy of every ingress packet arriving on an Accepting interface is sent to the switch software forwarding path for software replication and then forwarded to the NP interface.

Examples

This example shows how to display all active MFIB routes:

```
Switch# show ip mfib
IP Multicast Forwarding Information Base
Entry Flags: C - Directly Connected, S - Signal,
             IC - Internal Copy
Interface Flags: A - Accept, F - Forward, NS - Signal,
             NP - Not platform switched
Packets: Fast/Partial/Slow Bytes: Fast/Partial/Slow:
(171.69.10.13, 224.0.1.40), flags (IC)
  Packets: 2292/2292/0, Bytes: 518803/0/518803
  Vlan7 (A)
  Vlan100 (F NS)
  Vlan105 (F NS)
(*, 224.0.1.60), flags ()
  Packets: 2292/0/0, Bytes: 518803/0/0

  Packets: 1/0/0, 1500/0/0 bytes
  Vlan7 (A)
Switch#
```

Related Commands clear ip mfib counters

show ip mfib fastdrop

To show all currently active fast-drop entries and to show whether fast drop is enabled, use the **show ip mfib fastdrop** command.

show ip mfib fastdrop

Syntax Description This command has no arguments or keywords.

Defaults This command has no default settings.

Command Modes Privileged EXEC

 Command History
 Release
 Modification

 12.1(8a)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Examples This example shows how to display all currently active fast-drop entries and whether fast drop is enabled.

Switch# show ip mfib fasttdrop
MFIB fastdrop is enabled.
MFIB fast-dropped flows:
(10.0.0.1, 224.1.2.3, Vlan9) 00:01:32
(10.1.0.2, 224.1.2.3, Vlan9) 00:02:30
(1.2.3.4, 225.6.7.8, Vlan3) 00:01:50
Switch#

Related Commands clear ip mfib fastdrop

show ip mroute

To display IP multicast routing table information, use the show ip mroute command.

show ip mroute [interface_type slot/port | host_name | host_address [source] | active [kbps |
interface_type num] | count | pruned | static | summary]

Syntax Description	interface_type slot/port	(Optional) Interface type and number of the slot and port; valid values for <i>interface type</i> are fastethernet , gigabitethernet , tengigabitethernet , null , and vlan .			
	host_name	(Optional) Name or IP address as defined in the DNS hosts table.			
	host_address source	(Optional) IP address or name of a multicast source.			
	active	(Optional) Displays the rate that active sources are sending to multicast groups.			
	kbps interface_type num	(Optional) Minimum rate at which active sources are sending to multicast groups; active sources sending at this rate or greater will be displayed. Valid values are from 1 to 4294967295 kbps.			
	count	(Optional) Displays the route and packet count information.			
	pruned	(Optional) Displays the pruned routes.			
	static	(Optional) Displays the static multicast routes.			
	summary	(Optional) Displays a one-line, abbreviated summary of each entry in the IP multicast routing table.			
Command Modes	Privileged EXEC				
Command History	Release N	Aodification			
	12.1(8a)EW S	upport for this command was introduced on the Catalyst 4500 series switch.			
	12.2(25)EW A	Added support for the 10-Gigabit Ethernet interface.			
Usage Guidelines	If you omit all the o entries in the IP mul	ptional arguments and keywords, the show ip mroute command displays all the lticast routing table.			
	The show ip mroute active <i>kbps</i> command displays all the sources sending at a rate greater than or equal to <i>kbps</i> .				
	entries. The star reference of the star reference of the destinat	g table is populated by creating source, group (S,G) entries from star, group $(*,G)$ ers to all source addresses, the "S" refers to a single source address, and the "G" ion multicast group address. In creating (S,G) entries, the software uses the best path roup found in the unicast routing table (through Reverse Path Forwarding (RPF).			

Examples	This example shows how to display all the entries in the IP multicast routing table:					
	Switch# show ip mroute					
	<pre>IP Multicast Routing Table Flags:D - Dense, S - Sparse, s - SSM Group, C - Connected, L - Local, P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set, J - Join SPT, M - MSDP created entry, X - Proxy Join Timer Running A - Advertised via MSDP, U - URD, I - Received Source Specific Host Report</pre>					
	Outgoing interface flags:H - Hardware switched					
	Timers:Uptime/Expires Interface state:Interface, Next-Hop or VCD, State/Mode					
	<pre>(*, 230.13.13.1), 00:16:41/00:00:00, RP 10.15.1.20, flags:SJC Incoming interface:GigabitEthernet4/8, RPF nbr 10.15.1.20 Outgoing interface list:</pre>					
	GigabitEthernet4/9, Forward/Sparse-Dense, 00:16:41/00:00:00, H					
	(*, 230.13.13.2), 00:16:41/00:00:00, RP 10.15.1.20, flags:SJC					
	Incoming interface:GigabitEthernet4/8, RPF nbr 10.15.1.20, RPF-MFD Outgoing interface list: GigabitEthernet4/9, Forward/Sparse-Dense, 00:16:41/00:00:00, H					
	(10.20.1.15, 230.13.13.1), 00:14:31/00:01:40, flags:CJT					
	<pre>Incoming interface:GigabitEthernet4/8, RPF nbr 10.15.1.20, RPF-MFD Outgoing interface list: GigabitEthernet4/9, Forward/Sparse-Dense, 00:14:31/00:00:00, H</pre>					
	(132.206.72.28, 224.2.136.89), 00:14:31/00:01:40, flags:CJT Incoming interface:GigabitEthernet4/8, RPF nbr 10.15.1.20, RPF-MFD					
	Outgoing interface list:Null Switch#					

This example shows how to display the rate that the active sources are sending to the multicast groups and to display only the active sources that are sending at greater than the default rate:

```
Switch# show ip mroute active
Active IP Multicast Sources - sending > = 4 kbps
Group: 224.2.127.254, (sdr.cisco.com)
   Source: 146.137.28.69 (mbone.ipd.anl.gov)
     Rate: 1 pps/4 kbps(lsec), 4 kbps(last 1 secs), 4 kbps(life avg)
Group: 224.2.201.241, ACM 97
   Source: 130.129.52.160 (webcast3-el.acm97.interop.net)
    Rate: 9 pps/93 kbps(lsec), 145 kbps(last 20 secs), 85 kbps(life avg)
Group: 224.2.207.215, ACM 97
   Source: 130.129.52.160 (webcast3-e1.acm97.interop.net)
     Rate: 3 pps/31 kbps(1sec), 63 kbps(last 19 secs), 65 kbps(life avg)
Switch#
```

This example shows how to display route and packet count information:

```
Switch# show ip mroute count
IP Multicast Statistics
56 routes using 28552 bytes of memory
13 groups, 3.30 average sources per group
Forwarding Counts:Pkt Count/Pkts per second/Avg Pkt Size/Kilobits per second
Other counts:Total/RPF failed/Other drops(OIF-null, rate-limit etc)
Group:224.2.136.89, Source count:1, Group pkt count:29051
    source:132.206.72.28/32, Forwarding:29051/-278/1186/0, Other:85724/8/56665
Switch#
```

This example shows how to display summary information:

```
Switch# show ip mroute summary
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, s - SSM Group, C - Connected, L - Local,
        P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set,
        J - Join SPT, M - MSDP created entry, X - Proxy Join Timer Running
        A - Advertised via MSDP, U - URD, I - Received Source Specific Host
        Report
Outgoing interface flags: H - Hardware switched
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode
```

Switch#

Table2-20 describes the fields shown in the output.

Field	Description			
Flags:	Information about the entry.			
D - Dense Entry is operating in dense mode.				
S - Sparse	Entry is operating in sparse mode.			
s - SSM Group	Entry is a member of an SSM group.			
C - Connected	Member of the multicast group is present on the directly connected interface.			
L - Local	Switch is a member of the multicast group.			
P - Pruned	Route has been pruned. This information is retained in case a downstream member wants to join the source.			
R - Rp-bit set	Status of the (S,G) entry; is the (S,G) entry pointing toward the RP. The R - Rp-bit set is typically a prune state along the shared tree for a particular source.			
F - Register flag	Status of the software; indicates if the software is registered for a multicast source.			
T - SPT-bit set	Status of the packets; indicates if the packets been received on the shortest path source tree.			

Table2-20 show ip mroute Field Descriptions

Field	Description
J - Join SPT	For (*, G) entries, indicates that the rate of traffic flowing down the shared tree is exceeding the SPT-Threshold set for the group. (The default SPT-Threshold setting is 0kbps.) When the J - Join SPT flag is set, the next (S,G) packet received down the shared tree triggers an (S,G) join in the direction of the source causing the switch to join the source tree.
	For (S, G) entries, indicates that the entry was created because the SPT-Threshold for the group was exceeded. When the J - Join SPT flag is set for (S,G) entries, the switch monitors the traffic rate on the source tree and attempts to switch back to the shared tree for this source if the traffic rate on the source tree falls below the group's SPT-Threshold for more than one minute.
	The switch measures the traffic rate on the shared tree and compares the measured rate to the group's SPT-Threshold once every second. If the traffic rate exceeds the SPT-Threshold, the J-Join SPT flag is set on the (*, G) entry until the next measurement of the traffic rate. The flag is cleared when the next packet arrives on the shared tree and a new measurement interval is started.
	If the default SPT-Threshold value of 0 Kbps is used for the group, the J- Join SPT flag is always set on (*, G) entries and is never cleared. When the default SPT-Threshold value is used, the switch immediately switches to the shortest-path tree when traffic from a new source is received.
Outgoing interface flag:	Information about the outgoing entry.
H - Hardware switched	Entry is hardware switched.
Timer:	Uptime/Expires.
Interface state:	Interface, Next-Hop or VCD, State/Mode.
(*, 224.0.255.1) (198.92.37.100/32, 224.0.255.1)	Entry in the IP multicast routing table. The entry consists of the IP address of the source switch followed by the IP address of the multicast group. An asterisk (*) in place of the source switch indicates all sources.
	Entries in the first format are referred to as (*,G) or "star comma G" entries. Entries in the second format are referred to as (S,G) or "ScommaG" entries. (*,G) entries are used to build (S,G) entries.
uptime	How long (in hours, minutes, and seconds) the entry has been in the IP multicast routing table.
expires	How long (in hours, minutes, and seconds) until the entry is removed from the IP multicast routing table on the outgoing interface.

Table2-20 show ip mroute Field Descriptions (continued)

Field	Description				
RP	Address of the RP switch. For switches and access servers operating in sparse mode, this address is always 0.0.0.0.				
flags:	Information about the entry.				
Incoming interface	Expected interface for a multicast packet from the source. If t packet is not received on this interface, it is discarded.				
RPF neighbor	IP address of the upstream switch to the source. "Tunneling" indicates that this switch is sending data to the RP encapsulated in Register packets. The hexadecimal number in parentheses indicates to which RP it is registering. Each bit indicates a different RP if multiple RPs per group are used.				
DVMRP or Mroute	Status of whether the RPF information is obtained from the DVMRP routing table or the static mroutes configuration.				
Outgoing interface list	Interfaces through which packets are forwarded. When the ip pim nbma-mode command is enabled on the interface, the IP address of the PIM neighbor is also displayed.				
Ethernet0	Name and number of the outgoing interface.				
Next hop or VCD	Next hop specifies downstream neighbor's IP address. VCD specifies the virtual circuit descriptor number. VCD0 indicates that the group is using the static-map virtual circuit.				
Forward/Dense	Status of the packets; indicates if they are they forwarded on the interface if there are no restrictions due to access lists or the TTL threshold. Following the slash (/), mode in which the interface is operating (dense or sparse).				
Forward/Sparse	Sparse mode interface is in forward mode.				
time/time (uptime/expiration time)	Per interface, how long (in hours, minutes, and seconds) the entry has been in the IP multicast routing table. Following the slash (/), how long (in hours, minutes, and seconds) until the entry is removed from the IP multicast routing table.

Related Commands ip source binding

show ip verify source

To display the IP source guard configuration and filters on a particular interface, use the **show ip verify source** command.

show ip verify source [interface interface_num]

Syntax Description	interface inter	face_num (C	Optional) Speci	fies an interface.		
Defaults	This command	has no default	settings.			
Command Modes	Privileged EXE	EC				
Command History	Release	Modificatio				
	12.1(19)EW	Support for	this command	was introduced	on the Catalyst 4500	U series switch.
Examples				ource guard cont rface command:	figuration and filter	s on a particular
					VLANs 10–20, inter ng IP address bindin	
	Interface	Filter-type		IP-address	Mac-address	Vlan
	fa6/1 fa6/1	ip	active active	10.0.0.1 deny-all		10 11-20
	• This output snooping is	nooping-enable t appears when s enabled on VI	d VLANs that you enter the sh LANs 10–20, ir	do not have a val now ip verify sou aterface fa6/1 has	id IP source binding rce interface fa6/2 IP source filter mo	alled on the port for g. command and DHCl de that is configured
		Filter-type	-	binding 10.0.0.1	Mac-address	Vlan
	 fa6/2		inactive-tru			
	• This outpu	t appears when	you enter the s	-		/ 3 command and the
	Interface	Filter-type			Mac-address	Vlan

• This output appears when you enter the **show ip verify source interface fa6/4** command and the interface fa6/4 has an IP source filter mode that is configured as IP MAC and the existing IP MAC that binds 10.0.0.2/aaaa.bbbb.cccc on VLAN 10 and 11.0.0.1/aaaa.bbbb.cccd on VLAN 11:

Interface	Filter-type	Filter-mode	IP-address	Mac-address	Vlan
fa6/4	ip-mac	active	10.0.2	aaaa.bbbb.cccc	10
fa6/4	ip-mac	active	11.0.0.1	aaaa.bbbb.cccd	11
fa6/4	ip-mac	active	deny-all	deny-all	12-20

• This output appears when you enter the **show ip verify source interface fa6/5** command and the interface fa6/5 has IP source filter mode that is configured as IP MAC and existing IP MAC binding 10.0.0.3/aaaa.bbbb.ccce on VLAN 10, but port security is not enabled on fa6/5:

Interface	Filter-type	Filter-mode	IP-address	Mac-address	Vlan
fa6/5	ip-mac	active	10.0.3	permit-all	10
fa6/5	ip-mac	active	deny-all	permit-all	11-20

Enable port security first because the DHCP security MAC filter cannot apply to the port or VLAN.

• This output appears when you enter the **show ip verify source interface fa6/6** command and the interface fa6/6 does not have IP source filter mode that is configured:

DHCP security is not configured on the interface fa6/6.

This example shows how to display all the interfaces on the switch that have DHCP snooping security enabled with the **show ip verify source** command.

The output is an accumulation of per-interface show CLIs:

Interface	Filter-type	Filter-mode	IP-address	Mac-address	Vlan
fa6/1	ip	active	10.0.0.1		10
fa6/1	ip	active	deny-all		11-20
fa6/2	ip	inactive-tru	st-port		
fa6/3	ip	inactive-no-	snooping-vlan		
fa6/4	ip-mac	active	10.0.2	aaaa.bbbb.cccc	10
fa6/4	ip-mac	active	11.0.0.1	aaaa.bbbb.cccd	11
fa6/4	ip-mac	active	deny-all	deny-all	12-20
fa6/5	ip-mac	active	10.0.3	permit-all	10
fa6/5	ip-mac	active	deny-all	permit-all	11-20

show I2protocol-tunnel

To display information about the Layer 2 protocol tunnel ports, use the **show l2protocol-tunnel** command. This command displays information for the interfaces with protocol tunneling enabled.

show l2protocol-tunnel [interface interface-id] [[summary] | {begin | exclude | include}
expression]

Syntax Description	interface <i>interface-id</i>	(Optional) Specifies the interface for which protocol tunneling information appears. Valid interfaces are physical ports and port channels; the port channel range is 1 to 64.
	summary	(Optional) Displays only Layer 2 protocol summary information.
	begin	(Optional) Displays information beginning with the line that matches the <i>expression</i> .
	exclude	(Optional) Displays information that excludes lines that match the <i>expression</i> .
	include	(Optional) Displays the lines that match the specified <i>expression</i> .
	expression	(Optional) Expression in the output to use as a reference point.

Command Modes User EXEC

Command History	Release	Modification
	12.2(18)EW	This command was first introduced on the Catalyst 4500 series switch.
	12.2(25)EW	Added support for the 10-Gigabit Ethernet interface.

Usage Guidelines After enabling Layer 2 protocol tunneling on an access or 802.1Q tunnel port with the l2protocol-tunnel command, you can configure some or all of these parameters:

- Protocol type to be tunneled
- Shutdown threshold
- Drop threshold

If you enter the **show l2protocol-tunnel** [**interface** *interface-id*] command, only information about the active ports on which all the parameters are configured appears.

If you enter the **show l2protocol-tunnel summary** command, only information about the active ports on which some or all of the parameters are configured appears.

Expressions are case sensitive. For example, if you enter | **exclude output**, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

Examples

L

This is an example of output from the **show l2protocol-tunnel** command:

Switch> show l2protocol-tunnel

Switch#
```

Table2-21 lists the output field definitions.

Field	Description			
State	State of the specific port at the current moment is displayed; allowed values are as follows:			
	• <i>bndl</i> —Port is attached to an aggregator and bundled with other ports.			
	• <i>susp</i> —Port is in a suspended state; it is not attached to any aggregator.			
	• <i>indep</i> —Port is in an independent state (not bundled but able to switch data traffic. In this case, LACP is not running on the partner port).			
	• <i>hot-sby</i> —Port is in a Hot-standby state.			
	• down—Port is down.			
LACPDUs Interval	Interval setting.			
LACP Port Priority	Port priority setting.			
Admin Key	Administrative key.			
Oper Key	Operator key.			
Port Number	Port number.			
Port State	State variables for the port encoded as individual bits within a single octet with the following meaning [1]:			
	• bit0 : <i>LACP_Activity</i>			
	• bit1: LACP_Timeout			
	• bit2: Aggregation			
	• bit3 : Synchronization			
	• bit4 : Collecting			
	• bit5 : <i>Distributing</i>			
	• bit6 : Defaulted			
	• bit7: Expired			

Table2-21 show lacp internal Command Output Fields

This example shows how to display LACP neighbors information for a specific port channel:

```
Switch# show lacp 1 neighbor
Flags: S - Device sends PDUs at slow rate. F - Device sends PDUs at fast rate.
        A - Device is in Active mode.
                                             P - Device is in Passive mode.

Switch#
```

In the case where no PDUs have been received, the default administrative information is displayed in braces.

This example shows how to display the LACP system identification:

```
Switch> show lacp sys-id
8000,AC-12-34-56-78-90
Switch>
```

The system identification is made up of the system priority and the system MAC address. The first two bytes are the system priority, and the last six bytes are the globally administered individual MAC address associated to the system.

Related Commands lacp port-priority lacp system-priority

show mac access-group interface

To display the ACL configuration on a Layer 2 interface, use the **show mac access-group interface** command.

show mac access-group interface [interface interface-number]

interface	(Optional) Specifies the interface type; valid values are ethernet , fastethernet , gigabitethernet , tengigabitethernet , pos , atm , port-channel , and ge-wan .
interface-number	(Optional) Specifies the port number.
This command has i	no default settings.
Privileged EXEC	
Release	Modification
12.1(19)EW	Support for this command was introduced on the Catalyst 4500 series switch.
The valid values for	r the port number depend on the chassis used.
This example shows	s how to display the ACL configuration on interface fast 6/1:
Interface FastEthe	access-group interface fast 6/1 ernet6/1: -list is simple-mac-acl
	interface-number This command has Privileged EXEC Release 12.1(19)EW The valid values fo This example show Switch# show mac

Related Commands access-group mode

show mac-address-table address

To display MAC address table information for a specific MAC address, use the **show mac-address-table address** command.

show mac-address-table address mac_addr [interface type slot/port | protocol protocol | vlan vlan_id]

Syntax Description	mac_addr	48-bit MAC address; the valid format is H.H.H.			
	interface type slo	<i>type</i> are fastethernet , gigabitethernet , and tengigabitethernet .			
	protocol protoco	<i>l</i> (Optional) Specifies a protocol. See the "Usage Guidelines" section for more information.			
	vlan vlan_id	(Optional) Displays entries for the specific VLAN only; valid values are from 1 to 4094.			
Defaults	This commond ha				
Defaults	This command ha	s no default settings.			
Command Modes	Privileged EXEC				
Command History	Release	Modification			
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.			
	12.1(12c)EW	Added support for extended VLAN addresses.			
	12.2(25)EW	Added support for the 10-Gigabit Ethernet interface.			
Usage Guidelines	For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the "vlan" column not the internal VLAN number.				
	The keyword definitions for the <i>protocol</i> variable are as follows:				
	• ip specifies the IP protocol.				
	• ipx specifies the IPX protocols.				
		cifies the assigned protocol entries.			
	• other specifie	es the other protocol entries.			

Examples	This example shows how to display MAC address table information for a specific MAC address:								
	Unicast Ent	ries		dress 0030.94fc.0dff	nont				
				protocols	port				
	1 003	30.94fc.0dff	static	ip, ipx, assigned, other	Switch				
	Fa6/1 003	30.94fc.0dff	static	ip, ipx, assigned, other	Switch				
	Fa6/2 003	30.94fc.0dff	static	ip, ipx, assigned, other	Switch				
	Switch#

	show mac-a	ddress-table	protocol						
	show mac-a	ddress-table	static						

show mac-address-table vlan

show mac-address-table aging-time

To display the MAC address aging time, use the **show mac-address-table aging-time** command.

show mac-address-table aging-time [vlan vlan_id]

Syntax Description	vlan vlan_id	(Optional) Specifies a VLAN; valid values are from 1to 4094.
Defaults	This command h	as no default settings.
Command Modes	Privileged EXE	C
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
	12.1(12c)EW	Support for extended addressing was added.
Examples	This example sh	ows how to display the currently configured aging time for all VLANs:
	Switch# show m Vlan Aging 7	
	100 300 200 1000	
	Switch#	
	This example sh	ows how to display the currently configured aging time for a specific VLAN:
	Vlan Aging 2	
	100 300	
	Switch#

show mac-address-table count

To display the number of entries currently in the MAC address table, use the **show mac-address-table count** command.

show mac-address-table count [vlan vlan_id]

Syntax Description	vlan vlan_id	(Optional) Specifies a VLAN; valid values are from 1 to 4094.
Defaults	This command h	nas no default settings.
Command Modes	Privileged EXEC	2
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
	12.1(12c)EW	Added support for extended VLAN addresses.
Examples	Switch# show ma MAC Entries for Dynamic Unicast Static Unicast Static Unicast Total Unicast M Total Unicast M	t Address Count:0Address (User-defined) Count:0Address (System-defined) Count:1MAC Addresses In Use:1MAC Addresses Available:32768
Related Commands	show mac-addr show mac-addr show mac-addr show mac-addr	

show mac-address-table dynamic

To display the dynamic MAC address table entries only, use the **show mac-address-table dynamic** command.

show mac-address-table dynamic [address mac_addr | interface type slot/port |
protocol protocol | vlan vlan_id]

Syntax Description	address mac_add	dr (Optional) Specifies a 48-bit MAC address; the valid format is H.H.H.
	interface type sla	<i>ot/port</i> (Optional) Specifies an interface to match; valid values for <i>type</i> are fastethernet , gigabitethernet , and tengigabitethernet .
	protocol protoco	<i>l</i> (Optional) Specifies a protocol. See the "Usage Guidelines" section for more information.
	vlan vlan_id	(Optional) Displays entries for a specific VLAN; valid values are from 1 to 4094.
Defaults	This command ha	s no default settings.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
	12.1(12c)EW	Added support for extended VLAN addresses.
	12.2(25)EW	Added support for the 10-Gigabit Ethernet interface.
Usage Guidelines	The keyword defi	nitions for the <i>protocol</i> argument are as follows:
	• assigned spe	cifies assigned protocol entries.
	• ip specifies I	P protocol.
	• ipx specifies	IPX protocols.
	• other specifi	es other protocol entries.
	The show mac-ad	Idress-table dynamic command output for an EtherChannel interface changes the port on (for example, 5/7) to a port group number (for example, Po80).
		ress table entries that are used by the routed ports, the routed port name is displayed in n not the internal VLAN number.

Examples

This example shows how to display all the dynamic MAC address entries:

Switch# show mac-address-table dynamic

Unicast	Entries	-		
vlan	mac address	type	protocols	port
				+
1	0000.0000.0201	dynamic	ip	FastEthernet6/15
1	0000.0000.0202	dynamic	ip	FastEthernet6/15
1	0000.0000.0203	dynamic	ip,assigned	FastEthernet6/15

show policy-map

L

To display information about the policy map, use the **show policy-map** command.

show policy-map [policy_map_name]

Syntax Description	policy_map_name	(Optional) Name of the policy map.
Defaults	This command has	no default settings.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Examples	Switch# show pol : Policy Map ipp5-p class ipp5 set ip precede Switch#	ence 6
	This example show Switch# show pol: Policy Map ipp5-r class ipp5 set ip precede Switch#	policy
Related Commands	class-map policy-map show class-map show policy-map i	nterface

show policy-map interface

To display the statistics and configurations of the input and output policies that are attached to an interface, use the **show policy-map interface** command.

show policy-map interface [{fastethernet interface-number} | {gigabitethernet interface-number} | {port-channel number} | {vlan vlan_id}] [input | output]

Syntax Description	fastethernet interface-number	(Optional) Specifies the Fast Ethernet 802.3 interface.			
	gigabitethernet interface-number	(Optional) Specifies the Gigabit Ethernet 802.3z interface.			
	port-channel number	(Optional) Specifies the port channel.			
	vlan vlan_id	(Optional) Specifies the VLAN ID; valid values are from 1 to 4094.			
	input	(Optional) Specifies input policies only.			
	output	(Optional) Specifies output policies only.			
Defaults	This command has no default settings				
Command Modes	Privileged EXEC				
Command History	Release Modification				
	12.1(8a)EW Support for this command was introduced on the Catalyst 4500 series switch.				
	12.1(12c)EW Added support for	extended VLAN addresses.			
Examples	This example shows how to display th attached to an interface:	ne statistics and configurations of all input and output policies			
	Switch# show policy-map interface				
	FastEthernet6/1				
	service-policy input:ipp5-polic	У			
	class-map:ipp5 (match-all) O packets				
	<pre>match:ip precedence 5 set:</pre>				
	ip precedence 6				
	class-map:class-default (matc 0 packets	h-any)			
	match:any 0 packets				
	service-policy output:ipp5-poli	су			

```
class-map:ipp5 (match-all)
    0 packets
    match:ip precedence 5
    set:
        ip precedence 6
    class-map:class-default (match-any)
        0 packets
        match:any
        0 packets
Switch#
```

This example shows how to display the input policy statistics and configurations for a specific interface:

```
Switch# show policy-map interface fastethernet 5/36 input
service-policy input:ipp5-policy
class-map:ipp5 (match-all)
    0 packets
    match:ip precedence 5
    set:
        ip precedence 6
class-map:class-default (match-any)
    0 packets
    match:any
        0 packets
Switch#
```

Switch#

This example shows how to display redundancy facility client information:

```
Switch# show redundancy clients

clientID = 0 clientSeq = 0 RF_INTERNAL_MSG

clientID = 30 clientSeq = 135 Redundancy Mode RF

clientID = 28 clientSeq = 330 GALIOS_CONFIG_SYNC

clientID = 65000 clientSeq = 65000 RF_LAST_CLIENT Switch
```

The output displays the following information:

- clientID displays the client's ID number.
- clientSeq displays the client's notification sequence number.
- Current redundancy facility state.

This example shows how to display the redundancy facility counter information:

```
Switch# show redundancy counters
Redundancy Facility OMs
               comm link up = 1
        comm link down down = 0
          invalid client tx = 0
          null tx by client = 0
               tx failures = 0
      tx msg length invalid = 0
      client not rxing msgs = 0
rx peer msg routing errors = 0
           null peer msg rx = 0
        errored peer msg rx = 0
                 buffers tx = 1535
     tx buffers unavailable = 0
                 buffers rx = 1530
     buffer release errors = 0
 duplicate client registers = 0
  failed to register client = 0
       Invalid client syncs = 0
```

This example shows how to display redundancy facility history information:

```
Switch# show redundancy history

show running-config

L

To display the module status and configuration, use the show running-config command.

show running-config [module slot]

Syntax Description	module <i>slot</i>	(Optional) Specifies the module slot number; valid values are from 1 to 6.
Defaults	This command h	as no default settings.
Command Modes	Privileged EXEC	C
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	interfaces comm mode displayed i The show interfa	ou might see a difference in the duplex mode displayed when you enter the show nand and the show running-config command. If you do see a difference, the duplex in the show interfaces command is the actual duplex mode that the interface is running. aces command shows the operating mode for an interface, while the show command shows the configured mode for an interface.
	but no configura interface speed is once the speed is	ng-config command output for an interface may display a duplex mode configuration tion for the speed. When no speed is displayed in the output, it indicates that the s configured to be auto and that the duplex mode shown becomes the operational setting configured to something other than auto. With this configuration, it is possible that the mode for that interface does not match the duplex mode shown with the show command.
Examples	Switch# show ru	5-CONFIG_I:Configured from console by consolesh runn
	! version 12.1 no service pad service timesta service timesta	

```
!
!
interface FastEthernet1
no ip address
shutdown
duplex auto
speed auto
Switch#
```

This example shows the output for the **show running-config** command when you have enabled the **switchport voice vlan** command:

```
Switch# show running-config int fastethernet 6/1
Building configuration...
Current configuration:133 bytes
!
interface FastEthernet6/1
switchport voice vlan 2
no snmp trap link-status
spanning-tree portfast
channel-group 1 mode on
end
```

Switch#

show slavebootflash:

To display information about the standby bootflash file system, use the **show slavebootflash:** command.

show slavebootflash: [all | chips | filesys]

Syntax Description	all	(Optional) Displays all possible Flash information.
	chips	(Optional) Displays Flash chip information.

show slot0:

L

To display information about the slot0: file system, use the show slot0: command.

show slot0: [all | chips | filesys]

Syntax Description	all	(Optional) Displays all Flash information including the output from the show slot0: chips and show slot0: filesys commands.
	chips	(Optional) Displays Flash chip register information.
	filesys	(Optional) Displays file system status information.
Defaults	This command	has no default settings.
Command Modes	EXEC	
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.

show spanning-tree

To display spanning-tree state information, use the show spanning-tree command.

show spanning-tree [bridge_group | active | backbonefast | bridge [id] | inconsistentports | interface type | root | summary [total] | uplinkfast | vlan vlan_id | pathcost method | detail]

bridge_group	(Optional) Specifies the bridge group number; valid values are from 1 to 255.
active	(Optional) Displays the spanning-tree information on active interfaces only.
backbonefast	(Optional) Displays the spanning-tree BackboneFast status.
bridge	(Optional) Displays the bridge status and configuration information.
id	(Optional) Name of the bridge.
inconsistentports	(Optional) Displays the root inconsistency state.
interface type	(Optional) Specifies the interface type and number; valid values are fastethernet , gigabitethernet , tengigabitethernet , port-channel (1 to 64), and vlan (1 to 4094).
root	(Optional) Displays the root bridge status and configuration.
summary	(Optional) Specifies a summary of port states.
total	(Optional) Displays the total lines of the spanning-tree state section.
uplinkfast	(Optional) Displays the spanning-tree UplinkFast status.
vlan vlan_id	(Optional) Specifies the VLAN ID; valid values are from 1 to 4094.
pathcost method	(Optional) Displays the default path cost calculation method used.
detail	(Optional) Displays a summary of interface information.
Privileged EXEC	
Release	Modification
12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
12.1(12c)EW	Support for extended addressing was added.
12.2(25)EW	Added support for the 10-Gigabit Ethernet interface.
	active backbonefast bridge id inconsistentports interface type root summary total uplinkfast vlan vlan_id pathcost method detail Interface informati Privileged EXEC Release 12.1(8a)EW 12.1(12c)EW

```
VLAN1 is executing the ieee compatible Spanning Tree protocol
Bridge Identifier has priority 32768, address 0050.3e8d.6401
Configured hello time 2, max age 20, forward delay 15
Current root has priority 16384, address 0060.704c.7000
Root port is 265 (FastEthernet5/9), cost of root path is 38
Topology change flag not set, detected flag not set
Number of topology changes 0 last change occurred 18:13:54 ago
Times: hold 1, topology change 24, notification 2
hello 2, max age 14, forward delay 10
Timers: hello 0, topology change 0, notification 0
Port 265 (FastEthernet5/9) of VLAN1 is forwarding
```

```
Port path cost 19, Port priority 128, Port Identifier 129.9.
Designated root has priority 16384, address 0060.704c.7000
Designated bridge has priority 32768, address 00e0.4fac.b000
Designated port id is 128.2, designated path cost 19
Timers: message age 3, forward delay 0, hold 0
Number of transitions to forwarding state: 1
BPDU: sent 3, received 32852
Switch#
```

This example shows how to display the spanning-tree BackboneFast status:

```
Switch# show spanning-tree backbonefast
BackboneFast is enabled
BackboneFast statistics
-----
Number of transition via backboneFast (all VLANs) : 0
Number of inferior BPDUs received (all VLANs) : 0
Number of RLQ request PDUs received (all VLANs) : 0
```

```
Number of RLQ response PDUs received (all VLANs) : 0
Number of RLQ request PDUs sent (all VLANs) : 0
Number of RLQ response PDUs sent (all VLANs) : 0
Switch#
```

This example shows how to display spanning-tree information for the bridge:

```
Switch# show spanning-tree bridge

Switch#
```

This example shows how to display spanning-tree information for Fast Ethernet interface 5/9:

```
Switch# show spanning-tree interface fastethernet5/9
Interface Fa0/10 (port 23) in Spanning tree 1 is ROOT-INCONSISTENT
Port path cost 100, Port priority 128
Designated root has priority 8192, address 0090.0c71.a400
Designated bridge has priority 32768, address 00e0.1e9f.8940
Designated port is 23, path cost 115
Timers: message age 0, forward delay 0, hold 0
BPDU: sent 0, received 0
The port is in the portfast mode
Switch#
```

This example shows how to display spanning-tree information for a specific VLAN:

```
Switch# show spanning-tree vlan 1
VLAN1 is executing the ieee compatible Spanning Tree protocol
Bridge Identifier has priority 32768, address 0030.94fc.0a00
Configured hello time 2, max age 20, forward delay 15
We are the root of the spanning tree
Topology change flag not set, detected flag not set
Number of topology changes 5 last change occurred 01:50:47 ago
            from FastEthernet6/16
Times: hold 1, topology change 35, notification 2
            hello 2, max age 20, forward delay 15
Timers:hello 0, topology change 0, notification 0, aging 300
Port 335 (FastEthernet6/15) of VLAN1 is forwarding
    Port path cost 19, Port priority 128, Port Identifier 129.79.
    Designated root has priority 32768, address 0030.94fc.0a00
```

Designated port id is 129.79, designated path cost $\ensuremath{\mathsf{0}}$

```
Timers:message age 0, forward delay 0, hold 0
Number of transitions to forwarding state:1
BPDU:sent 6127, received 0
Switch#
```

This example shows how to display spanning-tree information for a specific bridge group:

```
Switch# show spanning-tree vlan 1
UplinkFast is disabled
BackboneFast is disabled
Switch#
```

This example shows how to display a summary of port states:

```
Switch# show spanning-tree summary
Root bridge for:VLAN1, VLAN2.
PortFast BPDU Guard is disabled
EtherChannel misconfiguration guard is enabled
UplinkFast is disabled
BackboneFast is disabled
Default pathcost method used is short
```

Name		Blocking	g Listenir	ng Learnin	ng Forwardi	ng STP Active
VLAN1		0	0	0	1	1
VLAN2		0	0	0	1	1
	2 VLANs	0 0		0	2	2
Switch#						

This example shows how to display the total lines of the spanning-tree state section:

```
Switch# show spanning-tree summary totals

Root bridge for:VLAN1, VLAN2.

PortFast BPDU Guard is disabled

EtherChannel misconfiguration guard is enabled

UplinkFast is disabled

BackboneFast is disabled

Default pathcost method used is short

Name Blocking Listening Learning Forwarding STP Active

Table2-22 describes the fields in the **show storm-control** display.

Table2-22 show storm-control Field Descriptions

Field	Description					
Interface	Displays the ID of the interface.					
Filter State	Displays the status of the filter:					
	• Blocking—Storm control is enabled, and a storm has occurred.					
	• Forwarding—Storm control is enabled, and no storms have occurred.					
	• Inactive—Storm control is disabled.					
Level	Displays the threshold level set on the interface for broadcast traffic.					
Current	Displays the bandwidth utilization of broadcast traffic as a percentage of total available bandwidth. This field is valid only when storm control is enabled.					
	Note N/A is displayed for interfaces that do storm control in the hardware.

snmp ifindex clear

To clear any previously configured **snmp ifindex** commands that were entered for a specific interface, use the **snmp ifindex clear** command.

snmp ifindex clear

Syntax Description This command has no arguments or keywords.

- **Defaults** This command has no default settings.
- Command Modes Interface configuration mode

 Command History
 Release
 Modification

 12.1(19)EW
 Support for this command was introduced on the Catalyst4500 series switches.

Usage Guidelines Interface index persistence occurs when ifIndex values in the interface MIB (IF-MIB) persist across reboots and allow for consistent identification of specific interfaces using SNMP.

Use the **snmp ifindex clear** command on a specific interface when you want that interface to use the global configuration setting for ifIndex persistence. This command clears any ifIndex configuration commands previously entered for that specific interface.

Examples This example shows how to enable ifIndex persistence for all interfaces:

Router(config)# **snmp-server ifindex persist**

This example shows how to disable IfIndex persistence for FastEthernet 1/1 only:

Router(config)# interface fastethernet 1/1
Router(config-if)# no snmp ifindex persist
Router(config-if)# exit

This example shows how to clear the ifIndex configuration from the FastEthernet 1/1 configuration:

Router(config)# interface fastethernet 1/1
Router(config-if)# snmp ifindex clear
Router(config-if)# exit

As a result of this sequence of commands, ifIndex persistence is enabled for all interfaces that are specified by the **snmp-server ifindex persist** global configuration command.

Related Commands

snmp ifindex persist snmp-server ifindex persist

snmp ifindex persist

To enable ifIndex values in the Interfaces MIB (IF-MIB) that persist across reboots (ifIndex persistence) on a specific interface, use the **snmp ifindex persist** command. To disable ifIndex persistence only on a specific interface, use the **no** form of this command.

snmp ifindex persist

no snmp ifindex persist

- Syntax Description This command has no arguments or keywords.
- Defaults Disabled.
- **Command Modes** Interface configuration mode

Command History	Release	Modification
	12.1(19)EW	Support for this command was introduced on the Catalyst4500 series switches.

Usage Guidelines Interface index persistence occurs when ifIndex values in the IF-MIB persist across reboots and allow for consistent identification of specific interfaces using SNMP.

The **snmp ifindex persist** interface configuration command enables and disables ifIndex persistence for individual entries (that correspond to individual interfaces) in the ifIndex table of the IF-MIB.

The **snmp-server ifindex persist** global configuration command enables and disables ifIndex persistence for all interfaces on the routing device. This action applies only to interfaces that have ifDescr and ifIndex entries in the ifIndex table of the IF-MIB.

Examples This example shows how to enable ifIndex persistence for interface FastEthernet 1/1 only:

Router(config)# interface fastethernet 1/1
Router(config-if)# snmp ifindex persist
Router(config-if)# exit

This example shows how to enable ifIndex persistence for all interfaces, and then disable ifIndex persistence for interface FastEthernet 1/1 only:

```
Router(config)# snmp-server ifindex persist
Router(config)# interface fastethernet 1/1
Router(config-if)# no snmp ifindex persist
Router(config-if)# exit
```

Related Commands snmp ifindex clear snmp-server ifindex persist

snmp-server enable traps

To enable SNMP notifications (traps or informs), use the **snmp-server enable traps** command. To disable all SNMP notifications, use the **no** form of this command.

```
snmp-server enable traps [flash [insertion | removal ] | fru-ctrl |
port-security [trap-rate trap-rate] | removal | stpx | vlancreate | vlandelete | vtp]
```

no snmp-server enable traps flash [insertion | removal] | fru-ctrl | port-security [trap-rate trap-rate] | removal | stpx | vlancreate | vlandelete | vtp]

Syntax Description	flash	(Optional) Controls the SNMP FLASH trap notifications.
	insertion	(Optional) Controls the SNMP Flash insertion trap notifications.
	removal	(Optional) Controls the SNMP Flash removal trap notifications.
	fru-ctrl	(Optional) Controls the SNMP entity FRU control trap notifications.
	port-security	(Optional) Controls the SNMP trap generation.
	trap-rate trap-rate	(Optional) Sets the number of traps per second.
	stpx	(Optional) Controls all the traps defined in CISCO-STP-EXTENSIONS-MIB notifications.
	vlancreate	(Optional) Controls the SNMP VLAN created trap notifications.
	vlandelete	(Optional) Controls the SNMP VLAN deleted trap notifications.
	vtp	(Optional) Controls the SNMP VTP trap notifications.
Command History	Release M	Nodification
· · · · · · · · · · · · · · · · · · ·		upport for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	enabled. SNMP notifications ca requests for the specifi or informs, use the sm The snmp-server ena	and without an option, all notification types controlled by this command are n be sent as traps or inform requests. This command enables both traps and inform ded notification types. To specify whether the notifications should be sent as traps mp-server host [traps informs] command. ble traps command is used in conjunction with the snmp-server host command.
	-	nost command to specify which host or hosts receive SNMP notifications. To send t configure at least one snmp-server host command.

- insertion—Controls the SNMP Flash insertion trap notifications. - removal—Controls the SNMP Flash removal trap notifications. fru-ctrl—Controls the FRU control traps from the CISCO-ENTITY-FRU-CONTROL-MIB. ٠ port-security—Controls the port-security traps from the CISCO-PORT-SECURITY-MIB. stpx—Controls all the traps from the CISCO-STP-EXTENSIONS-MIB. • vlancreate—Controls SNMP VLAN created trap notifications. vlandelete—Controls SNMP VLAN deleted trap notifications. vtp—Controls the VTP traps from the CISCO-VTP-MIB. **Examples** This example shows how to send all traps to the host is specified by the name myhost.cisco.com using the community string defined as public: Switch(config)# snmp-server enable traps Switch(config)# snmp-server host myhost.cisco.com public Switch(config)#

• flash—Controls SNMP FLASH traps from the CISCO-FLASH-MIB.

Related Commands Refer to Cisco IOS documentation for additional **snmp-server enable traps** commands.

This list of the MIBs is used for the traps:

snmp-server ifindex persist

To globally enable ifIndex values that will remain constant across reboots for use by SNMP, use the **snmp-server ifindex persist** command. To globally disable inIndex persistence, use the **no** form of this command.

snmp-server ifindex persist

no snmp-server ifindex persist

- **Syntax Description** This command has no arguments or keywords.
- Defaults Disabled.
- **Command Modes** Global configuration mode

Command History	Release	Modification
	12.1(19)EW	Support for this command was introduced on the Catalyst4500 series
		switches.

Usage Guidelines Interface index persistence occurs when ifIndex values in the IF-MIB persist across reboots and allow for consistent identification of specific interfaces using SNMP.

The **snmp-server ifindex persist** global configuration command does not override the interface-specific configuration. To override the interface-specific configuration of ifIndex persistence, enter the **no snmp ifindex persist** and **snmp ifindex clear** interface configuration commands.

Entering the **no snmp-server ifindex persist** global configuration command enables and disables ifIndex persistence for all interfaces on the routing device using ifDescr and ifIndex entries in the ifIndex table of the IF-MIB.

Examples This example shows how to enable ifIndex persistence for all interfaces:

Router(config)# snmp-server ifindex persist

Related Commands snmp ifindex clear snmp ifindex persist

snmp-server ifindex persist compress

To configure the format of the ifIndex table in a compressed format, use the **snmp-server ifindex persist compress** command. To place the table in a decompressed format, use the **no** form of this command.

snmp-server ifindex persist compress

no snmp-server ifindex persist compress

- Syntax Description This command has no arguments or keywords.
- Defaults Disabled

Command Modes Global configuration mode.

 Release
 Modification

 12.2(20)EWA
 Support for this command was introduced on the Catalyst4500 series switches.

Usage Guidelines This command is hidden on Supervisor Engine V and later supervisor engines because the ifIndex table is always in a compressed format on those supervisor engines.

At bootup, if the nvram:ifIndex-table.gz file (the ifIndex table ina compressed format) is present on a Supervisor Engine II+, Supervisor Engine III, or Supervisor Engine IV, the **snmp-server ifindex persist compress** command is automatically run even if the startup-config file does not have this configuration.

ExamplesThis example shows how to enable compression of the ifIndex table:
Router(config)# snmp-server ifindex persist compressThis example shows how to disable compression of the ifIndex table:
Router(config)# no snmp-server ifindex persist compress

Related Commands snmp ifindex clear snmp ifindex persist snmp-server ifindex persist

2-449

spanning-tree backbonefast

To enable BackboneFast on a spanning-tree VLAN, use the **spanning-tree backbonefast** command. To disable BackboneFast, use the **no** form of this command.

spanning-tree backbonefast

no spanning-tree backbonefast

Syntax Description	This command has no arguments or keywords.
Defaults	BackboneFast is disabled.
Command Modes	Global configuration
Command History	Release Modification
	12.1(8a)EWSupport for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	BackboneFast should be enabled on all Catalyst 4006 family switches to allow the detection of indirect link failures. Enabling BackboneFast starts the spanning-tree reconfiguration more quickly.
Examples	This example shows how to enable BackboneFast on all VLANs:
	Switch(config)# spanning-tree backbonefast Switch(config)#
Related Commands	spanning-tree cost spanning-tree port-priority spanning-tree portfast default spanning-tree portfast (interface configuration mode) spanning-tree uplinkfast spanning-tree vlan show spanning-tree

spanning-tree bpdufilter

To enable BPDU filtering on an interface, use the **spanning-tree bpdufilter** command. To return to the default settings, use the **no** form of this command.

spanning-tree bpdufilter {enable | disable }

no spanning-tree bpdufilter

Syntax Description	enable	Enables BPDU filtering on this interface.
	disable	Disables BPDU filtering on this interface.
Defaults	Disabled	
Command Modes	Interface config	puration
Command History	Release	Modification
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines		
\wedge		
Caution	interface is app	entering the spanning-tree bpdufilter enable command. Enabling BPDU filtering on an roximately equivalent to disabling the spanning tree for this interface. It is possible to loops if this command is not correctly used.
		ng Layer 2 protocol tunneling on all the service provider edge switches, you must enable PDU filtering on the 802.1Q tunnel ports by entering the spanning-tree bpdufilter nd.
	-	allows you to prevent a port from sending and receiving BPDUs. The configuration is e whole interface, whether it is trunking or not. This command has three states:
	• spanning-t the interfac	tree bpdufilter enable—This state unconditionally enables the BPDU filter feature on se.
	• spanning-t the interfac	tree bpdufilter disable —This state unconditionally disables the BPDU filter feature on the set.
	interface is	ng-tree bpdufilter —This state enables the BPDU filter feature on the interface if the in operational PortFast state and if the spanning-tree portfast bpdufilter default s configured.

L

Examples This example shows how to enable the BPDU filter feature on this interface:

Switch(config-if)# **spanning-tree bpdufilter enable** Switch(config-if)#

Related Commands show spanning-tree spanning-tree portfast bpdufilter default

spanning-tree bpduguard

To enable BPDU guard on an interface, use the **spanning-tree bpduguard** command. To return to the default settings, use the **no** form of this command.

spanning-tree bpduguard {enable | disable}

no spanning-tree bpduguard

Syntax Description	enable	Enables BPDU guard on this interface.		
	disable	Disables BPDU guard on this interface.		
Defaults	BPDU guard is	disabled.		
Command Modes	Interface configuration			
Command History	Release	Modification		
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.		
Usage Guidelines	BPDU guard is a feature that prevents a port from receiving BPDUs. This feature is typically used in a service provider environment where the administrator wants to prevent an access port from participating in the spanning tree. If the port still receives a BPDU, it is put in the ErrDisable state as a protective measure. This command has three states:			
	• spanning - interface.	tree bpduguard enable—This state unconditionally enables BPDU guard on the		
	• spanning - interface.	tree bpduguard disable—This state unconditionally disables BPDU guard on the		
	 no spanning-tree bpduguard—This state enables BPDU guard on the interface if it is in the operational PortFast state and if the spanning-tree portfast bpduguard default command is configured. 			
Examples	This example s	hows how to enable BPDU guard on this interface:		
	Switch(config Switch(config	-if)# spanning-tree bpduguard enable -if)#		
Related Commands	show spanning spanning-tree	-tree portfast bpduguard default		

Chapter2

L

spanning-tree cost

To calculate the path cost of STP on an interface, use the **spanning-tree cost** command. To revert to the default, use the **no** form of this command.

spanning-tree cost cost

Cisco IOS Commands for the Catalyst 4500 Series Switches

no spanning-tree cost cost

Syntax Description	<i>cost</i> Path cost; valid values are from 1 to 200,000,000.
Defaults	The default settings are as follows:
	• FastEthernet—19
	• GigabitEthernet—1
Command Modes	Interface configuration
Command History	Release Modification
	12.1(8a)EWSupport for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	When you configure the cost, the higher values indicate higher costs. The range applies regardless of the protocol type that is specified. The path cost is calculated, based on the interface bandwidth.
Examples	This example shows how to access an interface and set a path cost value of 250 for the spanning-tree VLAN that is associated with that interface:
	Switch(config)# interface fastethernet 2/1 Switch(config-if)# spanning-tree cost 250 Switch(config-if)#
Related Commands	spanning-tree port-priority spanning-tree portfast default
	spanning-tree portfast (interface configuration mode)
	spanning-tree uplinkfast spanning-tree vlan
	show spanning-tree

spanning-tree etherchannel guard misconfig

To display an error message when a loop due to a channel misconfiguration is detected, use the **spanning-tree etherchannel guard misconfig** command. To disable the feature, use the **no** form of this command. **spanning-tree etherchannel guard misconfig**

no spanning-tree etherchannel guard misconfig

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** Spanning-tree EtherChannel guard is enabled.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines When an EtherChannel guard misconfiguration is detected, this message is displayed:

%SPANTREE-2-CHNL_MISCFG:Detected loop due to etherchannel misconfig of interface Port-Channel1

To determine which local ports are involved in the misconfiguration, enter the **show interfaces status err-disabled** command. To check the EtherChannel configuration on the remote device, enter the **show etherchannel summary** command on the remote device.

After you correct the configuration, enter the **shutdown** and the **no shutdown** commands on the associated port-channel interface.

Examples This example shows how to enable the EtherChannel guard misconfiguration feature:

Switch(config)# spanning-tree etherchannel guard misconfig
Switch(config)#

Related Commands show etherchannel show interfaces status shutdown (refer to Cisco IOS documentation)

spanning-tree extend system-id

To enable the extended system ID feature on a chassis that supports 1024 MAC addresses, use the **spanning-tree extend system-id** command. To disable the feature, use the **no** form of this command.

spanning-tree extend system-id

no spanning-tree extend system-id

Syntax Description	This command has no arguments or keywords.		
Defaults	Enabled on systems that do not provide 1024 MAC addresses.		
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Usage Guidelines	Releases 12.1(13)E and later support chassis with 64 or 1024 MAC addresses. For chassis with 64 MAC addresses, STP uses the extended system ID plus a MAC address to make the bridge ID unique for each VLAN.		
	You cannot disable the extended system ID on chassis that support 64 MAC addresses.		
	Enabling or disabling the extended system ID updates the bridge IDs of all active STP instances, which might change the spanning-tree topology.		
Examples	This example show	s how to enable the extended system ID:	
	Switch(config)# s Switch(config)#	spanning-tree extend system-id	
Related Commands	show spanning-tre	e	

spanning-tree guard

To enable root guard, use the **spanning-tree guard** command. To disable root guard, use the **no** form of this command.

spanning-tree guard {loop | root | none}

no spanning-tree guard

Syntax Description	loop Ena	ables the loop guard mode on the interface.	
	root Ena	ables root guard mode on the interface.	
	none Set	s the guard mode to none.	
Defaults	Root guard is di	sabled.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
	12.1(12c)EW	Loop guard support was added.	
Examples	This example sh	nows how to enable root guard:	
	Switch(config-if)# spanning-tree guard root Switch(config-if)#		
Related Commands	show spanning-tree		

spanning-tree link-type

To configure a link type for a port, use the **spanning-tree link-type** command. To return to the default settings, use the **no** form of this command.

spanning-tree link-type {point-to-point | shared}

no spanning-tree link-type

Syntax Description	point-to-point	Specifies that the interface is a point-to-point link.	
	shared	Specifies that the interface is a shared medium.	
Defaults	Link type is derive	ed from the duplex mode.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Usage Guidelines	RSTP+ fast transiti	on works only on point-to-point links between two bridges.	
	By default, the switch derives the link type of a port from the duplex mode. A full-duplex port is considered as a point-to-point link while a half-duplex configuration is assumed to be on a shared link.		
	If you designate a p	port as a shared link, RSTP+ fast transition is forbidden, regardless of the duplex setting.	
Examples	This example shows how to configure the port as a shared link:		
	Switch(config-if Switch(config-if)# spanning-tree link-type shared)#	
Related Commands	show spanning-tr	ee interface	

spanning-tree loopguard default

To enable loop guard as the default on all ports of a specific bridge, use the **spanning-tree loopguard default** command. To disable loop guard, use the **no** form of this command.

spanning-tree loopguard default

no spanning-tree loopguard default

Syntax Description This command has no keywords or a	arguments.
--	------------

- Defaults Loop guard is disabled.
- **Command Modes** Global configuration

 Release
 Modification

 12.1(12c)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines Loop guard provides an additional security in the bridge network. Loop guard prevents alternate or root ports from becoming the designated port because of a failure leading to a unidirectional link.

Loop guard operates only on ports that are considered point-to-point by the spanning tree.

Individual loop-guard port configuration overrides this global default.

 Examples
 This example shows how to enable loop guard:

 Switch(config)# spanning-tree loopguard default

 Switch(config)#

Related Commands show spanning-tree spanning-tree guard

spanning-tree mode

To switch between PVST+ and MST modes, use the **spanning-tree mode** command. To return to the default settings, use the **no** form of this command.

spanning-tree mode {pvst | mst | rapid-pvst}

no spanning-tree mode {pvst | mst | rapid-pvst}

Syntax Description	pvst	Specifies PVST+ mode.	
	mst	Specifies MST mode.	
	rapid-pvst	Specifies Rapid PVST mode.	
Defaults	PVST+ mode		
Command Modes	Configuration		
Command History	Release	Modification	
-	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
	12.1(19)EW	Support for the rapid-pvst keyword.	
Usage Guidelines	Be careful when using the spanning-tree mode command to switch between PVST+ and MST modes. When you enter the command, all spanning-tree instances are stopped for the previous mode and restarted in the new mode. Using this command may cause disruption of user traffic.		
Examples	This example shows how to switch to MST mode: Switch(config)# spanning-tree mode mst		
	Switch(config)#		
	This example shows how to return to the default mode (PVST):		
	Switch(config)# no spanning-tree mode Switch(config)#		
Related Commands	show spanning-tree mst		

spanning-tree mst

To set the path cost and port-priority parameters for any MST instance (including the CIST with instance ID0), use the **spanning-tree mst** command. To return to the default settings, use the **no** form of this command.

spanning-tree mst instance-id [cost cost] | [port-priority prio]

no spanning-tree mst *instance-id* {**cost** | **port-priority**}

Syntax Description	instance-id	Instance ID number; valid values are from 0 to 15.		
	cost cost	(Optional) Specifies the path cost for an instance; valid values are from 1 to200000000.		
	port-priority prio	(Optional) Specifies the port priority for an instance; valid values are from 0 to 240 in increments of 16.		
Defaults	Port priority is 128			
Command Modes	Interface configura	tion		
Command History	Release	Modification		
-	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.		
Usage Guidelines	The higher cost <i>cost</i> values indicate higher costs. When entering the <i>cost</i> value, do not include a comma in the entry; for example, enter 1000 , not 1,000 .			
	The higher port-priority prio values indicate smaller priorities.			
	By default, the cost depends on the port speed; faster interface speeds indicate smaller costs. MST always uses long path costs.			
Examples	This example shows how to set the interface path cost:			
	Switch(config-if)# spanning-tree mst 0 cost 17031970 Switch(config-if)#			
	This example shows how to set the interface priority:			
	Switch(config-if) Switch(config-if)	# spanning-tree mst 0 port-priority 64 #		
Related Commands	show spanning-tre spanning-tree por			

spanning-tree mst configuration

To enter the MST configuration submode, use the **spanning-tree mst configuration** command. To return to the default MST configuration, use the **no** form of this command.

spanning-tree mst configuration

no spanning-tree mst configuration

Syntax Description	This command has no arguments or keywords.			
Defaults	The default settings are as follows:			
	• No VLANs are mapped to any MST instance.			
	• All VLANs are mapped to the CIST instance.			
	• The region name is an empty string.			
	• The revision number is 0.			
Command Modes	Global configuration			
Command History	Release Modification			
	12.1(12c)EWSupport for this command was introduced on the Catalyst 4500 series switted	ch.		
Usage Guidelines	 The MST configuration consists of three main parameters: Instance VLAN mapping (see the instance command) Region name (see the name command) Configuration revision number (see the revision command) 			
	By default, the value for the MST configuration is the default value for all its parameters.			
	The abort and exit commands allow you to exit the MST configuration submode. The difference between the two commands depends on whether you want to save your changes or not.			
	The exit command commits all the changes before leaving MST configuration submode. If you do not map the secondary VLANs to the same instance as the associated primary VLAN, when you exit the MST configuration submode, a message displays and lists the secondary VLANs that are not mapped to the same instance as the associated primary VLAN. The message is as follows:			
	These secondary vlans are not mapped to the same instance as their primary: ->3			
	The abort command leaves the MST configuration submode without committing any changes.			

Whenever you change an MST configuration submode parameter, it can cause a loss of connectivity. To reduce the number of service disruptions, when you enter the MST configuration submode, you are changing a copy of the current MST configuration. When you are done editing the configuration, you can apply all the changes at once by using the **exit** keyword, or you can exit the submode without committing any change to the configuration by using the **abort** keyword.

In the unlikely event that two users enter a new configuration at exactly at the same time, this message is displayed:

Switch(config-mst)# exit
% MST CFG:Configuration change lost because of concurrent access
Switch(config-mst)#

Examples This example shows how to enter the MST configuration submode: Switch(config)# spanning-tree mst configuration Switch(config-mst)# This example shows how to reset the MST configuration to the default settings:

Switch(config)# no spanning-tree mst configuration
Switch(config)#

Related Commands instance name revision show spanning-tree mst

spanning-tree mst forward-time

To set the forward delay timer for all the instances, use the **spanning-tree mst forward-time** command. To return to the default settings, use the **no** form of this command.

spanning-tree mst forward-time seconds

no spanning-tree mst forward-time

Syntax Description	seconds	Number of seconds to set the forward delay timer for all the instances on the Catalyst4500 series switch; valid values are from 4 to 30 seconds.	
Defaults	The forward del	ay timer is set for 15 seconds.	
Command Modes	Global configuration		
Command History	Release 12.1(12c)EW	Modification Support for this command was introduced on the Catalyst 4500 series switch.	
Examples	This example shows how to set the forward-delay timer: Switch(config)# spanning-tree mst forward-time 20 Switch(config)#		
Related Commands	show spanning-tree mst		

spanning-tree mst hello-time

To set the hello-time delay timer for all the instances, use the **spanning-tree mst hello-time** command. To return to the default settings, use the **no** form of this command.

spanning-tree mst hello-time seconds

no spanning-tree mst hello-time

Syntax Description		seconds to set the hello-time delay timer for all the instances on the 00 series switch; valid values are from 1 to 10 seconds.
Defaults	The hello-time delay timer is	set for 2 seconds.
Command Modes	Global configuration	
Command History	ReleaseModifica12.1(12c)EWSupport f	tion for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	If you do not specify the held	o-time value, the value is calculated from the network diameter.
Examples	This example shows how to set the hello-time delay timer: Switch(config)# spanning-tree mst hello-time 3	
Related Commands	<pre>Switch(config)# show spanning-tree mst</pre>	

spanning-tree mst max-age

To set the max-age timer for all the instances, use the **spanning-tree mst max-age** command. To return to the default settings, use the **no** form of this command.

spanning-tree mst max-age seconds

no spanning-tree mst max-age

Syntax Description	seconds	Number of seconds to set the max-age timer for all the instances on the Catalyst4500 series switch; valid values are from 6 to 40 seconds.	
Defaults	The max-age tin	ner is set for 20 seconds.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Examples	This example shows how to set the max-age timer:		
	Switch(config) Switch(config)	# spanning-tree mst max-age 40 #	
Related Commands	show spanning-tree mst		

spanning-tree mst max-hops

To specify the number of possible hops in the region before a BPDU is discarded, use the **spanning-tree mst max-hops** command. To return to the default settings, use the **no** form of this command.

spanning-tree mst max-hops hopnumber

no spanning-tree mst max-hops

Syntax Description	hopnumber	Number of possible hops in the region before a BPDU is discarded; valid values are from 1 to 40 hops.
Defaults	Number of hop	s i s 20.
Command Modes	Global configu	ration
Command History	Release 12.1(12c)EW	Modification Support for this command was introduced on the Catalyst 4500 series switch.
Examples	This example shows how to set the number of possible hops in the region before a BPDU is discarded to 25 Switch(config)# spanning-tree mst max-hops 25 Switch(config)#	
Related Commands	show spanning	z-tree mst

spanning-tree mst root

spanning-tree mst root

To designate the primary root, secondary root, bridge priority, and timer value for an instance, use the **spanning-tree mst root** command. To return to the default settings, use the **no** form of this command.

spanning-tree mst instance-id root {primary | secondary} | { priority prio} [diameter dia
[hello-timehello]]

no spanning-tree mst root

Syntax Description	instance-id	Instance identification number; valid values are from 1 to 15.	
	root	Configures switch as the root switch.	
	primary	Sets a high enough priority (low value) to make the bridge root of the spanning-tree instance.	
	secondary	Designates this switch as a secondary root if the primary root fails.	
	priority prio	Sets the bridge priority; see the "Usage Guidelines" section for valid values and additional information.	
	diameter dia	(Optional) Sets the timer values for the bridge based on the network diameter; valid values are from 2 to 7.	
	hello-time hello	(Optional) Specifies the duration between the generation of configuration messages by the root switch.	
Defaults	Bridge priority is 32768.		
Command Modes	Global configuration

Switch(config)# spanning-tree mst 5 root primary
Switch(config)#
```

Related Commands show spanning-tree mst

OL-6661-01

spanning-tree pathcost method

To set the path cost calculation method, use the **spanning-tree pathcost method** command. To revert to the default setting, use the **no** form of this command.

 $spanning-tree \ path cost \ method \ \{long \ | \ short\}$

no spanning-tree pathcost method

Syntax Description	long Specifies 32-bit-based values for port path costs.			
	short Specifies 16-bit-based values for port path costs.			
Defaults	Port path cost has 32-bit-based values.			
Command Modes	Global configuration			
Command History	Release Modification			
	12.1(8a)EWSupport for this command was introduced on the Catalyst 4500 series switch.			
Usage Guidelines	This command applies to all the spanning-tree instances on the switch. The long path cost calculation method uses all the 32 bits for path cost calculation and yields values in the range of 1 through 200,000,000.			
	The short path cost calculation method (16 bits) yields values in the range of 1 through 65,535.			
Examples	This example shows how to set the path cost calculation method to long:			
	Switch(config) spanning-tree pathcost method long Switch(config)			
	This example shows how to set the path cost calculation method to short:			
	Switch(config) spanning-tree pathcost method short Switch(config)			
Related Commands	show spanning-tree			

spanning-tree portfast (interface configuration mode)

To enable PortFast mode, where the interface is immediately put into the forwarding state upon linkup without waiting for the timer to expire, use the **spanning-tree portfast** command. To return to the default setting, use the **no** form of this command.

spanning-tree portfast {disable | trunk}

no spanning-tree portfast

Syntax Description	disable	Disables PortFast on the interface.	
	trunk	Enables PortFast on the interface even while in the trunk mode.	
Defaults	PortFast mode is disabled.		
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
	12.1(12c)EW	The disable and trunk options were added.	
Usage Guidelines	You should use this feature only with interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt the Catalyst4500 series switch and network operation.		
	An interface with PortFast mode enabled is moved directly to the spanning-tree forwarding state when linkup occurs without waiting for the standard forward-time delay.		
	Be careful when using the no spanning-tree portfast command. This command does not disable PortFast if the spanning-tree portfast default command is enabled.		
	This command has four states:		
	• spanning-tree portfast—This command enables PortFast unconditionally on the given port.		
	• spanning-tree portfast disable —This command explicitly disables PortFast for the given port. The configuration line shows up in the running-configuration as it is not the default.		
	• spanning-tree portfast trunk—This command allows you to configure PortFast on trunk ports.		
	•	enter the spanning-tree portfast trunk command, the port is configured for PortFast when in the access mode.	

• **no spanning-tree portfast**—This command implicitly enables PortFast if the **spanning-tree portfast default** command is defined in global configuration and if the port is not a trunk port. If you do not configure PortFast globally, the **no spanning-tree portfast** command is equivalent to the **spanning-tree portfast disable** command.

Examples This example shows how to enable PortFast mode: Switch(config-if)# spanning-tree portfast Switch(config-if)

spanning-tree portfast bpdufilter default

To enable the BPDU filtering by default on all PortFast ports, use the **spanning-tree portfast bpdufilter default** command. To return to the default settings, use the **no** form of this command.

spanning-tree portfast bpdufilter default

no spanning-tree portfast bpdufilter default

- Syntax Description This command has no keywords or arguments.
- **Defaults** BPDU filtering is disabled.
- **Command Modes** Global configuration

 Release
 Modification

 12.1(12c)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines

The **spanning-tree portfast bpdufilter default** command enables BPDU filtering globally on the Catalyst4500 series switch. BPDU filtering prevents a port from sending or receiving any BPDUs.

You can override the effects of the **spanning-tree portfast bpdufilter default** command by configuring BPDU filtering at the interface level.

```
Note
```

Be careful when enabling BPDU filtering. Functionality is different when enabling on a per-port basis or globally. When enabled globally, BPDU filtering is applied only on ports that are in an operational PortFast state. Ports still send a few BPDUs at linkup before they effectively filter outbound BPDUs. If a BPDU is received on an edge port, it immediately loses its operational PortFast status and BPDU filtering is disabled.

When enabled locally on a port, BPDU filtering prevents the Catalyst4500 series switch from receiving or sending BPDUs on this port.

Caution

Be careful when using this command. This command can cause bridging loops if not used correctly.

Examples

This example shows how to enable BPDU filtering by default:

Switch(config)# spanning-tree portfast bpdufilter default
Switch(config)#

Related Commands show spanning-tree mst spanning-tree bpdufilter

spanning-tree portfast bpduguard default

To enable BPDU guard by default on all the PortFast ports, use the **spanning-tree portfast bpduguard default** command. To return to the default settings, use the **no** form of this command.

spanning-tree portfast bpduguard default

no spanning-tree portfast bpduguard default

Syntax Description	This command has	no keywords	or arguments.
--------------------	------------------	-------------	---------------

- Defaults BPDU guard is disabled.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines

/

Caution Be careful when using this command. You should use this command only with the interfaces that connect to the end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt the Catalyst4500 series switch and network operation.

BPDU guard disables a port if it receives a BPDU. BPDU guard is applied only on ports that are PortFast enabled and are in an operational PortFast state.

Examples This example shows how to enable BPDU guard by default: Switch(config)# spanning-tree portfast bpduguard default Switch(config)#

Related Commands show spanning-tree mst spanning-tree bpduguard

spanning-tree portfast default

To globally enable PortFast by default on all access ports, use the **spanning-tree portfast default** command. To disable PortFast as default on all access ports, use the **no** form of this command.

spanning-tree portfast default			
	no spanning-	tree portfast default	
Syntax Description	This command has no arguments or keywords.		
Defaults	PortFast is disabled.		
Command Modes	Global configurat	ion	
Command History	Release	Modification	
2	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Usage Guidelines	Be careful when using this command. You should use this command only with the interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt the Catalyst4500 series switch and network operation.		
	An interface with PortFast mode enabled is moved directly to the spanning-tree forwarding state when linkup occurs without waiting for the standard forward-time delay.

spanning-tree uplinkfast

To enable the UplinkFast feature, use the **spanning-tree uplinkfast** command. To disable UplinkFast, use the **no** form of this command.

spanning-tree uplinkfast [max-update-rate packets-per-second]

no spanning-tree uplinkfast [max-update-rate]

Syntax Description	max-update-rate packets_per_second	(Optional) Specifies the maximum rate (in packets per second) at which update packets are sent; valid values are from 0 to 65535.
Defaults	The default settings an	e as follows:
	• Disabled.	
	• Maximum update	rate is 150.
Command Modes	Global configuration	
Command History	Release Mo	dification
	12.1(8a)EW Sup	oport for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	When UplinkFast is co selected as root. All ir	be used only on access switches. onfigured, the bridge priority is changed to 49,152 so that this switch will not be atterface path costs of all spanning-tree interfaces belonging to the specified as are also increased by 3000.
	switchover to an altern state. During this time topology change, a mu	tects that the root interface has failed, the UplinkFast feature causes an immediate nate root interface, transitioning the new root interface directly to the forwarding , a topology change notification is sent. To minimize the disruption caused by the nlticast packet is sent to 01-00-0C-CD-CD for each station address in the ept for those associated with the old root interface.
	enabled) and change the	e uplinkfast max-update-rate command to enable UplinkFast (if not already he rate at which the update packets are sent. Use the no form of this command to of 150 packets per second.
Examples	Switch(config)# spa	ow to enable UplinkFast and set the maximum rate to 200 packets per second: nning-tree uplinkfast nning-tree uplinkfast max-update-rate 200
	Switch(config)# span	ming-ties upilmklast mak-update-late 200

 Related Commands
 spanning-tree cost

 spanning-tree port-priority
 spanning-tree portfast default

 spanning-tree portfast (interface configuration mode)
 spanning-tree vlan

spanning-tree vlan

To configure STP on a per-VLAN basis, use the **spanning-tree vlan** command. To return to the default value, use the **no** form of this command.

spanning-tree vlan vlan_id [forward-time seconds | hello-time seconds | max-age seconds |
priority priority | protocol protocol | root {primary | secondary} [diameter net-diameter
[hello-time seconds]]]

no spanning-tree vlan *vlan_id* [**forward-time** | **hello-time** | **max-age** | **priority** | **root**]

Syntax Description	vlan_id	VLAN identification number; valid values are from 1 to 4094.		
	forward-time second	(Optional) Sets the STP forward delay time; valid values are from 4 to 30seconds.		
	hello-time seconds	(Optional) Specifies, in seconds, the time between configuration messages generated by the root switch; valid values are from 1 to 10 seconds.		
	max-age seconds	(Optional) Sets the maximum time, in seconds, that the information in a BPDU is valid; valid values are from 6 to 40 seconds.		
	priority priority	(Optional) Sets the STP bridge priority; valid values are from 0 to 65535.		
	protocol protocol	(Optional) Specifies the protocol.		
	root primary (Optional) Forces this switch to be the root bridge.			
	root secondary	(Optional) Specifies this switch act as the root switch should the primary root fail.		
	diameter net-diame	<i>eter</i> (Optional) Specifies the maximum number of bridges between two end stations; valid values are from 2 to 7.		
Defaults	The default acttines			
Delaults	The default settings are as follows:			
	• Forward-time—			
	• Hello-time—2 seconds			
	• Max-age—20 seconds			
	• Priority—32768 with STP enabled; 128 with MST enabled			
	Root—No STP root			
Command Modes	Global configuration			
Command Modes	Global configuration	n		
Command Modes		n Modification		
	Release N			

Usage Guidelines	When you are setting the max-age <i>seconds</i> value, if a bridge does not hear BPDUs from the root bridge within the specified interval, it assumes that the network has changed and recomputes the spanning-tree topology.
	The spanning-tree root primary command alters the switch bridge priority to 8192. If you enter the spanning-tree root primary command and the switch does not become root, then the bridge priority is changed to 100 less than the bridge priority of the current bridge. If the switch does not become root, an error will result.
	The spanning-tree root secondary command alters the switch bridge priority to 16384. If the root switch fails, this switch becomes the next root switch.
	Use the spanning-tree root commands on backbone switches only.
Examples	This example shows how to enable spanning tree on VLAN 200:
	Switch(config)# spanning-tree vlan 200 Switch(config)#
	This example shows how to configure the switch as the root switch for VLAN 10 with a network diameter of 4:
	Switch(config)# spanning-tree vlan 10 root primary diameter 4 Switch(config)#
	This example shows how to configure the switch as the secondary root switch for VLAN 10 with a network diameter of 4:
	Switch(config)# spanning-tree vlan 10 root secondary diameter 4 Switch(config)#

speed

To configure the interface speed, use the **speed** command. To disable a speed setting, use the **no** form of this command.

speed {10 | 100 | 1000 | auto [10 | 100 | 1000] | nonegotiate}

no speed

Syntax Description	10	(Optional) Configures the interface to transmit at 10 Mbps.	
	100	(Optional) Configures the interface to transmit at 100 Mbps.	
	1000	(Optional) Configures the interface to transmit at 1000 Mbps.	
	auto [10 100	(Optional) Enables the interface to autonegotiate the speed and specify the exact	
	1000]	values to advertise when autonegotiating.	
	nonegotiate	(Optional) Enables the interface to not negotiate the speed.	

Defaults

The default values are shown in the following table:

Interface Type	Supported Syntax	Default Setting
10/100-Mbps module	speed [10 100 auto [10 100]]	Auto
100-Mbps fiber modules	Not applicable	Not applicable
Gigabit Ethernet Interface	speed nonegotiate	Nonegotiate
10/100/1000	speed [10 100 1000 auto [10 100 1000]]	Auto
1000	Not applicable	Not applicable

Command Modes Interface configuration

Command History

Release	Modification
12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
12.2(20)EWA	Support for auto negotiating specific speeds added.

Usage GuidelinesTable2-26 lists the supported command options by interface.

Interface Type	Supported Syntax	Default Setting	Guidelines
10/100-Mbps module	speed [10 100 auto]	auto	If the speed is set to 10 or 100 and you do not configure the duplex setting, the duplex is set to half.
100-Mbps fiber modules	Not applicable.	Not applicable.	Not applicable.
Gigabit Ethernet Interface	speed nonegotiate	nonegotiate is enabled.	This is only applicable to Gigabit Ethernet ports.
10/100/1000	speed [10 100 1000 auto]	auto	If the speed is set to 10 or 100 and you do not configure the duplex setting, the duplex is set to half.
			If the speed is set to 1000 or auto with any subset containing 1000 (e.g. speed auto 10 1000 or speed auto on a 10/100/1000 port), you will not able to set half duplex.
1000	Not applicable.	Not applicable.	The speed is always 1000. The duplex is half.

Table2-26 Supported speed Command Options

If you configure the interface speed and duplex commands manually and enter a value other than **speed auto** (for example, 10 or 100 Mbps), make sure that you configure the connecting interface speed command to a matching speed but do not use the auto parameter.

When manually configuring the interface speed to either 10 or 100 Mbps, the switch prompts you to also configure duplex mode on the interface.

Catalyst 4006 switches cannot automatically negotiate the interface speed and the duplex mode if either connecting interface is configured to a value other than **auto**.

Changing the interface speed and the duplex mode configuration might shut down and reenable the interface during the reconfiguration.

Table2-27 describes the system's performance for different combinations of the duplex and speed modes. The specified **duplex** command that is configured with the specified **speed** command produces the resulting system action.

Table2-27 System Action Using duplex and speed Commands

duplex Command	speed Command	Resulting System Action
duplex auto	-	Autonegotiates both speed and duplex modes
duplex half	speed 10	Forces 10 Mbps and half duplex

duplex Command	speed Command	Resulting System Action
duplex full	speed 10	Forces 10 Mbps and full duplex
duplex half	speed 100	Forces 100 Mbps and half duplex
duplex full	speed 100	Forces 100 Mbps and full duplex
duplex full	speed 1000	Forces 1000 Mbps and full duplex

Table2-27 System Action Using duplex and speed Commands (continued)

Examples

This example shows how to set the interface speed to 100 Mbps on the Fast Ethernet interface5/4:

```
Switch(config)# interface fastethernet 5/4
Switch(config-if)# speed 100
```

This example shows how to allow Fast Ethernet interface5/4 to autonegotiate the speed and duplex mode:

Switch(config)# interface fastethernet 5/4
Switch(config-if)# speed auto

Note

The speed auto 10 100 command is similar to the speed auto command on a Fast Ethernet interface.

This example shows how to limit the interface speed to 10 and 100 Mbps on the Gigabit Ethernet interface1/1 in auto-negotiation mode:

```
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# speed auto 10 100
```

This example shows how to limit the speed negotiation to 100 Mbps on the Gigabit Ethernet interface1/1:

```
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# speed auto 100
```

storm-control

To enable broadcast storm control on a port and to specify what to do when a storm occurs on a port, use the **storm-control** interface configuration command. To disable storm control for the broadcast traffic and to disable a specified storm-control action, use the **no** form of this command.

storm-control {broadcast level high level [lower level]} | action {shutdown | trap}}

no storm-control {broadcast level level [lower level]} | action {shutdown | trap}}

Syntax Description	broadcast	Enables the broadcast storm control on the port.	
	level high-level lower-level	Defines the rising and falling suppression levels:	
		• <i>high-level</i> —Rising suppression level as a percent of total bandwidth, up to two decimal places; valid values are from 0 to 100 percent. Blocks the flooding of storm packets when the value specified for <i>level</i> is reached.	
		• <i>lower-level</i> —(Optional) Falling suppression level as a percent of total bandwidth, up to two decimal places; valid values are from 0 to 100. This value must be less than the rising supression value.	
	action	Directs the switch to take action when a storm occurs on a port.	
	shutdown	Disables the port during a storm.	
	trap	Sends an SNMP trap when a storm occurs. This keyword is available but not supported in 12.1(19)EW.	
Defaults Command Modes	Broadcast storm control is disal	bled. All packets are passed.	
Command Modes	Interface configuration

Enter the **show running-config** command to display the enabled suppression mode and level setting.

To turn off suppression for the specified traffic type, you can do one of the following:

- Set the *high-level* value to 100 percent for the specified traffic type.
- Use the **no** form of this command.

The lower level is ignored for the interfaces that perform storm control in the hardware.

ExamplesThis example shows how to enable broadcast storm control on a port with a 75.67 percent rising
suppression level:
Switch(config-if)# storm-control broadcast level 75.67This example shows how to disable the port during a storm:
Switch(config-if)# storm-control action shutdown
This example shows how to disable storm control on a port:
Switch(config-if)# no storm-control broadcast level
This example shows how to disable storm control by setting the high level to 200 percent:
Switch(config-if)# storm-control broadcast level 200

storm-control broadcast include multicast

To enable multicast storm control on a port, use the **storm-control broadcast include multicast** command. To disable multicast storm control, use the **no** form of this command.

storm-control broadcast include multicast

no storm-control broadcast include multicast

Syntax Description	This command has no arguments or keywords.
--------------------	--

- Defaults Multicast storm control is disabled.
- Command Modes Global configuration

 Command History
 Release
 Modification

 12.2(18)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines This command prompts the hardware to filter multicast packets if it is already filtering broadcast packets.

Examples This example shows how to enable multicast storm control globally: Switch(config)# storm-control broadcast include multicast Switch(config)#

Related Commands storm-control

switchport

To modify the switching characteristics of a Layer 2 switch interface, use the **switchport** command. To return the interface to the routed-interface status and cause all further Layer 2 configuration to be erased, use the **no** form of this command without parameters.

switchport [access vlan vlan_num] | [nonegotiate] | [voice vlan {vlan_id | dot1p | none | untagged }]

no switchport [access | nonegotiate | voice vlan]

Syntax Description	access vlan vlan_num	 (Optional) Sets the VLAN when the interface is in access mode; valid values are from 1 to 1005. 		
	nonegotiate	(Optional) Specifies that the DISL/DTP negotiation packets will not be sent on the interface.		
	voice vlan <i>vlan_id</i>	(Optional) Specifies the number of the VLAN; valid values are from 1 to 1005.		
	dot1p	(Optional) Specifies that the PVID packets are tagged as priority.		
	none	(Optional) Specifies that the telephone and voice VLAN do not communicate.		
	untagged	(Optional) Specifies the untagged PVID packets.		
Defaults	The default settings are as follows:			
	• Switchport trunking mode is enabled.			
	• Dynamic negotiation parameter is set to auto.			
	• Access VLANs and trunk interface native VLANs are a default VLAN corresponding to the platform or interface hardware.			
	• All VLAN lists include all VLANs.			
	• No voice VLAN i	s enabled.		
Command Modes	Interface configuration	1		
Command History	Release Mo	dification		
	12.1(8a)EW Sup	oport for this command was introduced on the Catalyst 4500 series switch.		
	12.1(11)EW Sup	pport for voice VLAN was added.		
Usage Guidelines	The no switchport co	mmand shuts the port down and then reenables it, which may generate messages		
5	-	n the port is connected.		

The **no** form of the **switchport access** command resets the access mode VLAN to the appropriate default VLAN for the device. The **no** form of the **switchport nonegotiate** command removes the **nonegotiate** status.

When you are using the **nonegotiate** keyword, DISL/DTP negotiation packets will not be sent on the interface. The device will trunk or not trunk according to the **mode** parameter given: **access** or **trunk**. This command will return an error if you attempt to execute it in **dynamic** (**auto** or **desirable**) mode.

The voice VLAN is automatically set to VLAN 1 unless you use one of the optional keywords.

If you use the **switch port voice vlan** command for an interface, the interface cannot join a port channel.

When you use the **switchport voice vlan** command, the output for the **show running-config** command changes to show the voice VLAN set.

Examples

This example shows how to cause the port interface to stop operating as a Cisco-routed port and convert to a Layer 2-switched interface:

```
Switch(config-if)# switchport
Switch(config-if)#
```

This example shows how to cause a port interface in access mode, which is configured as a switched interface, to operate in VLAN 2:

```
Switch(config-if)# switchport access vlan 2
Switch(config-if)#
```

This example shows how to cause a port interface, which is configured as a switched interface, to refrain from negotiating in trunking mode and act as a trunk or access port (depending on the **mode** set):

```
Switch(config-if)# switchport nonegotiate
Switch(config-if)#
```

This example shows how to set the voice VLAN for the interface to VLAN 2:

```
Switch(config-if)# switchport voice vlan 2
switchport voice vlan 2
Switch(config-if)#
```

Related Commands show interfaces switchport

switchport access vlan

To set the VLAN when an interface is in access mode, use the **switchport access vlan** command. To reset the access mode VLAN to the appropriate default VLAN for the device, use the **no** form of this command.

switchport access [vlan {vlan-id | dynamic }]

no switchport access vlan

Syntax Description	vlan-id	(Optional) Number of the VLAN on the interface in access mode; valid values are from 1 to 4094.	
	dynamic	(Optional) Enables VMPS control of the VLAN.	
Defaults	The default set	tings are as follows:	
	• The access VLAN and trunk interface native VLAN are default VLANs that correspond to the platform or the interface hardware.		
	All VLAN	lists include all VLANs.	
Command Modes	Interface config	guration	
Command History	Release	Modification	
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
	12.1(13)EW	Support for VPMS was added.	
Usage Guidelines	Layer 2 interfac	r the switchport command without any keywords to configure the LAN interface as a ce before you can enter the switchport access vlan command. This action is required only a lready entered the switchport command for the interface.	
	-	b switchport command shuts the port down and then reenables it, which could generate the device to which the port is connected.	
	The no form of the switchport access vlan command resets the access mode VLAN to the appropriate default VLAN for the device.		
	your system is	is configured with a Supervisor Engine I, valid values for <i>vlan-id</i> are from 1 to 1005. If configured with a Supervisor Engine II, valid values for <i>vlan-id</i> are from 1 to 4094. e VLANs are not supported on systems configured with a Supervisor Engine I.	
Examples	-	hows how to cause the port interface to stop operating as a Cisco-routed port and convert	
	to a Layer 2-sw	vitched interface:	

Note

This command is not used on platforms that do not support Cisco-routed ports. All physical ports on such platforms are assumed to be Layer 2-switched interfaces.

This example shows how to cause a port interface that has already been configured as a switched interface to operate in VLAN 2 instead of the platform's default VLAN when in access mode:

Switch(config-if)# switchport access vlan 2
Switch(config-if)#

Related Commands show interfaces switchport

switchport block

To prevent the unknown multicast or unicast packets from being forwarded, use the **switchport block** interface configuration command. To allow the unknown multicast or unicast packets to be forwarded, use the **no** form of this command.

switchport block {multicast | unicast}

no switchport block {multicast | unicast}

Syntax Description	multicast	Specifies that the unknown multicast traffic should be blocked.
-,	unicast	Specifies that the unknown unicast traffic should be blocked.
		· · · · · · · · · · · · · · · · · · ·
Defaults	Unknown multicast a	and unicast traffic are not blocked.
2012010		own MAC addresses is sent to all ports.
	An traffic with unknown	own where addresses is sent to an ports.
Command Modes	Interface configuration	on
Command History	Release	Modification
J	12.1(19)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	You can block the un	known multicast or unicast traffic on the switch ports.
-	Blocking the unknow must explicitly confi	on multicast or unicast traffic is not automatically enabled on the switch ports; you gure it.
Note	For more information release.	about blocking the packets, refer to the software configuration guide for this
Examples	This example shows	how to block the unknown multicast traffic on an interface:
	Switch(config-if)#	switchport block multicast
	You can verify your command.	setting by entering the show interfaces interface-id switchport privileged EXEC
Related Commands	show interfaces swit	tchport

switchport mode

To set the interface type, use the **switchport mode** command. To reset the mode to the appropriate default mode for the device, use the **no** form of this command.

switchport mode {access | dot1q-tunnel | trunk | dynamic {auto | desirable}}

switchport mode private-vlan {host | promiscuous | trunk}

no switchport mode dot1q-tunnel

no switchport mode private-vlan

Syntax Description	access	Specifies a nontrunking, nontagged single VLAN Layer 2 interface.
	dot1q-tunnel	Specifies an 802.1Q tunnel port.
	trunk	Specifies a trunking VLAN Layer 2 interface.
	dynamic auto	Specifies that the interface convert the link to a trunk link.
	dynamic desiral	ble Specifies that the interface actively attempt to convert the link to a trunk link.
	private-vlan hos	st Specifies that the ports with a valid PVLAN trunk association become active host private VLAN trunk ports.
	private-vlan promiscuous	Specifies that the ports with a valid PVLAN mapping become active promiscuous ports.
	private-vlan tru	Ink Specifies that the ports with a valid PVLAN trunk association become active host private VLAN trunk ports.
Command Modes	dot1q tunnel ports are disabled.	
Command History	Release	Modification
-	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
	12.2(18)EW	Support was added for configuring dot1q tunnel ports.
Usage Guidelines	If you enter access mode, the interface goes into permanent nontrunking mode and negotiates to convert the link into a nontrunk link even if the neighboring interface does not approve the change.	
		k mode, the interface goes into permanent trunking mode and negotiates to convert the link even if the neighboring interface does not approve the change.
	If you enter dyna	mic auto mode, the interface converts the link to a trunk link if the neighboring

If you enter **dynamic desirable** mode, the interface becomes a trunk interface if the neighboring interface is set to **trunk**, **desirable**, or **auto** mode.

If you specify the **dot1q-tunnel** keyword, the port is set unconditionally as an 802.1Q tunnel port.

The port becomes inactive if you configure it as a private VLAN trunk port and one of the following applies:

- The port does not have a valid PVLAN association.
- The port does not have valid allowed normal VLANs.

If a private port PVLAN association or mapping is deleted, or if a private port is configured as a SPAN destination, it becomes inactive.

Examples This example shows how to set the interface to dynamic desirable mode:

Switch(config-if)# switchport mode dynamic desirable
Switch(config-if)#

This example shows how to set a port to PVLAN host mode:

Switch(config-if)# switchport mode private-vlan host
Switch(config-if)#

This example shows how to set a port to private VLAN trunk:

Switch(config-if)# switchport mode private-vlan trunk
Switch(config-if)#

This example shows how to configure a port for an 802.1Q tunnel port:

Switch(config-if)# switchport mode dotlq-tunnel Switch(config-if)#

You can verify your settings by entering the **show interfaces switchport** command and examining information in the Administrative Mode and Operational Mode rows.

Related Commands show interfaces switchport switchport switchport private-vlan host-association switchport private-vlan mapping

switchport port-security

To enable port security on an interface, use the **switchport port-security** command. To disable port security and set parameters to their default states, use the **no** form of this command.

switchport port-security [aging {static | time time | type { absolute | inactivity } } | limit rate invalid-source-mac [N | none] | mac-address mac-address | mac-address sticky [mac-address] | maximum value | violation {restrict | shutdown}]

no switchport port-security [aging {static | time time | type {absolute | inactivity}} | limit rate invalid-source-mac [N | none] | mac-address mac-address | mac-address sticky [mac-address] | maximum value | violation {restrict | shutdown}]

Syntax Description	aging	(Optional) Specifies aging for port security.
	static	(Optional) Enables aging for statically configured secure addresses on this port.
	time time	(Optional) Specifies the aging time for this port. The valid values are from 0 to 1440 minutes. If the time is 0, aging is disabled for this port.
	type absolute	(Optional) Sets the aging type as absolute aging. All the secure addresses on this port age out exactly after the time (minutes) specified and are removed from the secure address list.
	type inactivity	(Optional) Sets the aging type as inactivity aging. The secure addresses on this port age out only if there is no data traffic from the secure source address for the specified time period.
	limit rate invalid-source-mac	(Optional) Sets the rate limit for bad packets. This rate limit also applies to the port where DHCP snooping security mode is enabled as filtering the IP and MAC address.
	N none	(Optional) Supplies a rate limit (N) or indicates none (none).
	mac-address mac-address	(Optional) Specifies a secure MAC address for the interface; a 48-bit MAC address. You can add additional secure MAC addresses up to the maximum value that is configured.
	sticky	(Optional) Configures the dynamic addresses as sticky on the interface.
	maximum value	(Optional) Sets the maximum number of secure MAC addresses for the interface. Valid values are from 1 to 3072. The default setting is 1.
	violation	(Optional) Sets the security violation mode and action to be taken if port security is violated.
	restrict	(Optional) Sets the security violation restrict mode. In this mode, a port security violation restricts data and causes the security violation counter to increment.
	shutdown	(Optional) Sets the security violation shutdown mode. In this mode, a port security violation causes the interface to immediately become error disabled.

Defaults	 The default settings are as follows: Port security is disabled. When port security is enabled and no keywords are entered, the default maximum number of secure MAC addresses is 1. 		
	Aging is disable		
	 Aging is disable Aging time is 0 		
		resses on this port age out immediately after they are removed from the secure address	
	list.	esses on this port age out miniculately after they are removed from the secure address	
Command Modes	Interface configurat	tion	
Command History	Release	Modification	
	12.1(13)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
	12.1(19)EW	Extended to include DHCP snooping security enhancement.	
	12.2(18)EW	Add support for sticky interfaces.	
	configured. The packets are dro the address table an the interface. If you enable port s	by configuring some MAC addresses and allowing the rest to be dynamically opped into the hardware when the maximum number of secure MAC addresses are in ad a station that does not have a MAC address in the address table attempts to access ecurity on a voice VLAN port and if there is a PC connected to the IP phone, you set wed secure addresses on the port to more than 1.	
	You cannot configu	are static secure MAC addresses in the voice VLAN.	
	A secure port has the	ne following limitations:	
	• A secure port c	cannot be a dynamic access port or a trunk port.	
	• A secure port c	cannot be a routed port.	
	• A secure port c	cannot be a protected port.	
	• A secure port c	cannot be a destination port for Switched Port Analyzer (SPAN).	
	• A secure port cannot belong to a Fast EtherChannel or Gigabit EtherChannel port group.		
	• A secure port cannot be an 802.1X port.		
	• If you try to enable 802.1X on a secure port, an error message appears, and 802.1X is not enabled. If you try to change an 802.1X-enabled port to a secure port, an error message appears, and the security settings are not changed.		
	errdisable recover	is in the error-disabled state, you can remove it from this state by entering the y cause <i>psecure-violation</i> global configuration command, or you can manually ing the shutdown and no shut down interface configuration commands.	

To enable secure address aging for a particular port, set the aging time to a value other than 0 for that port.

To allow limited time access to particular secure addresses, set the aging type as **absolute**. When the aging time lapses, the secure addresses are deleted.

To allow continuous access to a limited number of secure addresses, set the aging type as**inactivity**. This action removes the secure address when it becomes inactive, and other addresses can become secure.

To allow unlimited access to a secure address, configure it as a secure address, and disable aging for the statically configured secure address by using the **no switchport port-security aging static** interface configuration command.

If the sticky command is executed without a MAC address specified, all MAC addresses that are learned on that port will be made sticky. You can also specify a specific MAC address to be a sticky address by entering the **sticky** keyword next to it.

You can configure the sticky feature even when port security is not enabled on the interface. The feature becomes operational when you enable port security on the interface.

You can use the **no** form of the **sticky** command only if the sticky feature is already enabled on the interface.

This example shows how to enable port security on Fast Ethernet port 12 and to set the maximum number of secure addresses to 5. The violation mode is the default, and no secure MAC addresses are configured.

```
Switch(config)# interface fastethernet 2/12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 5
Switch(config-if)#
```

You can verify the settings for all secure ports or the specified port by using the **show port-security** privileged EXEC command.

This example shows how to make all MAC addresses learned on Fast Ethernet port 12 sticky:

```
Switch(config)# interface fastethernet 2/12
SSwitch(config-if)# switchport port-security mac-address sticky
Switch(config-if)
```

This example shows how to make MAC address 1000.2000.3000 sticky on Fast Ethernet port 12:

```
Switch(config)# interface fastethernet 2/12
SSwitch(config-if)# switchport port-security mac-address sticky 1000.2000.3000
Switch(config-if)
```

This example shows how to disable the sticky feature on Fast Ethernet port 12:

```
Switch(config)# interface fastethernet 2/12
Switch(config-if)# no switchport port-security mac-address sticky
Switch(config-if)
```

This command makes all sticky addresses on this interface normal learned entries. It does not delete the entries from the secure MAC address table.

This example shows how to remove all sticky and static addresses that are configured on the interface:

```
Switch(config)# interface fastethernet 2/12
Switch(config-if)# no switchport port-security mac-address
Switch(config-if)
```

Examples

This example shows how to configure a secure MAC address on Fast Ethernet port 12:

Switch(config)# interface fastethernet 0/12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address 1000.2000.3000
Switch(config-if)

You can verify your settings by using the show port-security address privileged EXEC command.

switchport private-vlan mapping

To define private VLAN mapping for a promiscuous port, use the **switchport private-vlan mapping** command. To clear all mapping from the primary VLAN, use the **no** form of this command.

switchport private-vlan mapping {primary-vlan-id} {secondary-vlan-list} |
{add secondary-vlan-list} | {remove secondary-vlan-list}

no switchport private-vlan mapping

Syntax Description	primary-vlan-id	Number of the primary VLAN of the private VLAN relationship; valid values are from 2 to 4094 (excluding 1002 to 1005).
	secondary-vlan-lis	<i>t</i> Number of the secondary VLANs to map to the primary VLAN; valid values are from 2 to 4094.
	add	Maps the secondary VLANs to the primary VLAN.
	remove	Clears mapping between the secondary VLANs and the primary VLAN.
Defaults	Private VLAN map	pping is disabled.
Command Modes	Interface configuration	
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
	12.1(12c)EW	Support for extended addressing was added.
	12.2(20)EW	Support for community VLAN was added.
Usage Guidelines	There is no run-time effect on the port unless it is in private VLAN promiscuous mode. If the private VLAN promiscuous mode but the VLANs do not exist, the command is allowed, but made inactive.	
	The secondary VL	AN may be an isolated or community VLAN.
Examples	This example shows how to configure the mapping of primary VLAN 18 to the secondary isolated VLAN20 on a port:	
	Switch(config-if)# switchport private-vlan mapping 18 20 Switch(config-if)#	
	This example show	vs how to add a VLAN to the mapping:
	-	# switchport private-vlan mapping 18 add 21

This example shows how to add a range of secondary VLANs to the mapping:

Switch(config-if)# switchport private-vlan mapping 18 add 22-24
Switch(config-if)#

switchport private-vlan trunk allowed vlan

To configure a list of the allowed normal VLANs on a private VLAN trunk port, use the **switchport private-vlan trunk allowed vlan** command. To remove all the allowed normal VLANs from a private VLAN trunk port, use the **no** form of this command.

switchport private-vlan trunk allowed vlan {vlan-list} all | none | [add | remove | except]
 vlan_atom [,vlan_atom...]

no switchport private-vlan trunk allowed vlan

Syntax Description	vlan_list	Sets the list of allowed VLANs; see the "Usage Guidelines" section for formatting guidelines for <i>vlan_list</i> .	
	all	Specifies all VLANs from 1 to 4094. This keyword is not supported on commands that do not permit all VLANs in the list to be set at the same time.	
	none	Indicates an empty list. This keyword is not supported on commands that require certain VLANs to be set or at least one VLAN to be set.	
	add	(Optional) Adds the defined list of VLANs to those currently set instead of replacing the list.	
	remove	(Optional) Removes the defined list of VLANs from those currently set instead of replacing the list.	
	except	(Optional) Lists the VLANs that should be calculated by inverting the defined list of VLANs.	
	vlan_atom	Either a single VLAN number from 1 to 4094 or a continuous range of VLANs described by two VLAN numbers, the lesser one first, separated by a hyphen.	
Defaults	All allowed normal VLANs are removed from a private VLAN trunk port.		
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.1(12c)EW		
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Usage Guidelines		ormal VLANs are allowed unless you explicitly configure the VLANs to be allowed.	
Usage Guidelines	By default, no n		

ExamplesThis example shows how to configure the private VLAN trunk port that carries normal VLANs 1 to10:
Switch(config-if)# switchport private-vlan trunk allowed vlan 1-10
Switch(config-if)#This example shows how to remove all the allowed normal VLANs from a private VLAN trunk port:
Switch(config-if)# no switchport private-vlan trunk allowed vlan
Switch(config-if)#Switch(config-if)#

switchport private-vlan trunk native vlan tag

To control the tagging of the native VLAN traffic on 802.1Q private VLAN trunks, use the **switchport private-vlan trunk native vlan tag** command. To remove the control of tagging (and default to the global setting), use the **no** form of this command.

switchport private-vlan trunk native vlan tag

no switchport private-vlan trunk native vlan tag

Syntax Description	This command has no	arguments or keywords.
--------------------	---------------------	------------------------

Defaults The default setting is global; the settings on the port are determined by the global setting.

Command Modes Interface configuration

Command History	Release	Modification
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.
	12.2(18)EW	Removed vlan-id keyword.

Usage Guidelines The configuration created with this command only applies to ports that are configured as private VLAN trunks.

Examples	This example shows how to enable 802.1Q native VLAN tagging on a PVLAN trunk:			
	Switch(config-if)# switchport private-vlan trunk native vlan tag Switch(config-if)#			

Related Commands show interfaces switchport switchport mode

switchport trunk

To set the trunk characteristics when an interface is in trunking mode, use the **switchport trunk** command. To reset all of the trunking characteristics back to the original defaults, use the **no** form of this command.

switchport trunk encapsulation {isl | dot1q | negotiate}

no switchport trunk encapsulation

switchport trunk native vlan { tag | vlan_id }

no switchport trunk native vlan {**tag** | *vlan_id*}

switchport trunk allowed vlan vlan_list

no switchport trunk allowed vlan vlan_list

switchport trunk pruning vlan vlan_list

no switchport trunk pruning vlan vlan_list

Syntax Description	encapsulation isl	Sets the trunk encapsulation format to ISL.
	encapsulation dot1q	Sets the trunk encapsulation format to 802.1Q.
	encapsulation negotiate	Specifies that if DISL and DTP negotiation do not resolve the encapsulation format, ISL will be the selected format.
	native vlan tag	Specifies the tagging of native VLAN traffic on 802.1Q trunks.
	native vlan vlan_id	Sets the native VLAN for the trunk in 802.1Q trunking mode.
	allowed vlan vlan_list	Sets the list of allowed VLANs that transmit this interface in tagged format when in trunking mode. See the "Usage Guidelines" section for formatting guidelines for <i>vlan_list</i> .
	pruning vlan vlan_list	Sets the list of VLANs that are enabled for VTP pruning when the switch is in trunking mode. See the "Usage Guidelines" section for formatting guidelines for <i>vlan_list</i> .

Defaults

The default settings are as follows:

- The encapsulation type is dependent on the platform or interface hardware.
- The access VLANs and trunk interface native VLANs are a default VLAN that corresponds to the platform or the interface hardware.
- All VLAN lists include all VLANs.
- Native VLAN tagging is enabled on the port if enabled globally.

Command Modes Interface configuration

Command History	Release	Modification	
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
	12.1(12c)EW	Support for extended addressing was added.	
	12.2(18)EW	Support for native VLAN tagging was added.	
Usage Guidelines	The <i>vlan_list</i> for	rmat is all none [add remove except] <i>vlan_atom</i> [, <i>vlan_atom</i>], where:	
	• all specifies all VLANs from 1 to 4094. This keyword is not supported on commands that do not permit all VLANs in the list to be set at the same time.		
		tes an empty list. This keyword is not supported on commands that require certain be set or at least one VLAN to be set.	
	• add adds th	e defined list of VLANs to those currently set, instead of replacing the list.	
	• remove rem	noves the defined list of VLANs from those currently set, instead of replacing the list.	
	• except lists	the VLANs that should be calculated by inverting the defined list of VLANs.	
		is either a single VLAN number from 1 to 4094 or a continuous range of VLANs y two VLAN numbers (the lesser one first, separated by a hyphen).	
	-	trunk encapsulation command is supported only for platforms and interface hardware both ISL and 802.1Q formats.	
	•	negotiate keywords, and DISL and DTP negotiation do not resolve the encapsulation ne selected format. The no form of this command resets the trunk encapsulation format ult.	
	The no form of t for the device.	he native vlan command resets the native mode VLAN to the appropriate default VLAN	
	The no form of	the allowed vlan command resets the list to the default list, which allows all VLANs.	
	The no form of for VTP pruning	the pruning vlan command resets the list to the default list, which enables all VLANs g.	
	0	tion guidelines and restrictions apply when using 802.1Q trunks and impose some ne trunking strategy for a network:	
	802.1Q trun	ecting Cisco switches through an 802.1Q trunk, make sure that the native VLAN for an k is the same on both ends of the trunk link. If the native VLAN on one end of the trunk from the native VLAN on the other end, spanning-tree loops might result.	
	every VLAN tree enabled on every VI	panning tree on the native VLAN of an 802.1Q trunk without disabling spanning tree on N in the network can cause spanning-tree loops. We recommend that you leave spanning d on the native VLAN of an 802.1Q trunk. If this is not possible, disable spanning tree LAN in the network. Make sure that your network is free of physical loops before banning tree.	
	BPDUs on e are sent unta (01-80-C2-0	connect two Cisco switches through 802.1Q trunks, the switches exchange spanning-tree each VLAN that is allowed on the trunks. The BPDUs on the native VLAN of the trunk agged to the reserved 802.1d spanning-tree multicast MAC address 00-00-00). The BPDUs on all other VLANs on the trunk are sent tagged to the reserved cast MAC address (01-00-0c-cc-cc-cd).	

- Non-Cisco 802.1Q switches maintain only a single instance of spanning tree (MST) that defines the spanning-tree topology for all VLANs. When you connect a Cisco switch to a non-Cisco switch through an 802.1Q trunk, the MST of the non-Cisco switch and the native VLAN spanning tree of the Cisco switch combine to form a single spanning-tree topology known as the CST.
- Because Cisco switches transmit BPDUs to the SSTP multicast MAC address on the VLANs other than the native VLAN of the trunk, non-Cisco switches do not recognize these frames as BPDUs and flood them on all ports in the corresponding VLAN. Cisco switches connected to the non-Cisco 802.1Q network receive these flooded BPDUs. Because Cisco switches receive the flooded BPDUs, the switches can maintain a per-VLAN spanning-tree topology across a network of non-Cisco 802.1Q switches. The non-Cisco 802.1Q network separating the Cisco switches is treated as a single broadcast segment between all switches that are connected to the non-Cisco 802.1Q network through the 802.1Q trunks.
- Ensure that the native VLAN is the same on *all* of the 802.1Q trunks connecting the Cisco switches to the non-Cisco 802.1Q network.
- If you are connecting multiple Cisco switches to a non-Cisco 802.1Q network, all of the connections must be through the 802.1Q trunks. You cannot connect Cisco switches to a non-Cisco 802.1Q network through the ISL trunks or through the access ports. This action causes the switch to place the ISL trunk port or access port into the spanning-tree "port inconsistent" state and no traffic will pass through the port.

Follow these guidelines for native VLAN tagging:

- The **no switchport trunk native vlan tag** command disables the native VLAN tagging operation on a port. This overrides the global tagging configuration.
- The switchport trunk native vlan tag command can be used to reenable tagging on a disabled port.
- The **no** option is saved to NVRAM so that the user does not have to manually select the ports to disable the tagging operation each time that the switch reboots.
- When the **switchport trunk native vlan tag** command is enabled and active, all packets on the native VLAN are tagged, and incoming untagged data packets are dropped. Untagged control packets are accepted.

Examples This example shows how to cause a port interface that is configured as a switched interface to encapsulate in 802.1Q trunking format regardless of its default trunking format in trunking mode:

Switch(config-if)# switchport trunk encapsulation dotlq Switch(config-if)#

This example shows how to enable 802.1Q tagging on a port:

Switch(config-if)# switchport trunk native vlan tag Switch(config-if)#

Related Commands show interfaces switchport

system mtu

L

To set the maximum Layer 2 or Layer 3 payload size, use the **system mtu** command. To revert to the default MTU setting, use the **no** form of this command.

system mtu datagram-size

no system mtu

Syntax Description	datagram-size	Layer 2 payload size; valid values from 1500 to 1552 bytes.			
Defaults	The default MTU setting is 1500 bytes.				
Command Modes	Global configuration				
Command History	Release	Modification			
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.			
Usage Guidelines	•	<i>ze</i> parameter specifies the Ethernet payload size, not the total Ethernet frame size, and J is changed as a result of changing the system mtu command.			
	For ports from 3 to18 on model WS-X4418-GB and ports from 1 to 12 on model WS-X4412-2GB-TX, only the standard IEEE Ethernet payload size of 1500 bytes is supported.				
	For other modules, an Ethernet payload size of up to 1552 bytes is supported with a total Ethernet frame size of up to 1600 bytes.				
Examples	This example sho	ows how to set the MTU size to 1550 bytes:			
		tion commands, one per line. End with CNTL/Z. system mtu 1550			
	This example shows how to revert to the default MTU setting:				
	Switch# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Switch(config)# no system mtu Switch(config)# end Switch#

traceroute mac

To display the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address, use the **traceroute mac** command.

traceroute mac [interface interface-id] {source-mac-address} [**interface** interface-id] {destination-mac-address} [**vlan** vlan-id] [**detail**]

Syntax Description	interface <i>interface-id</i>	(Optional) Specifies the source or destination switch interface.			
Syntax Description	· · · · · · · · · · · · · · · · · · ·	 (Optional) Specifies the source of destination switch interface. MAC address of the source switch in hexadecimal format. (Optional) Specifies the VLAN on which to trace the Layer 2 path that the packets take from the source switch to the destination switch; valid VLAN IDs are from 1 to 4094. Do not enter leading zeros. 			
	source-mac-address destination-mac-address				
	vlan vlan-id				
	vian viun-iu				
	detail	(Optional) Displays detail information.			
Defaults	This command has no defa	ault settings.			
Command Modes	Privileged EXEC				
Command History	Release Modifica	tion			
	12.1(15)EW Support for this command was introduced on the Catalyst 4500 series switch.				
Usage Guidelines	Do not use leading zeros v The Laver 2 traceroute fea	vhen entering a VLAN ID. ture is available on these switches:			
	 Catalyst 2950 switches running Release 12.1(12c)EA1 or later Catalyst 3550 switches running Release 12.1(12c)EA1 or later 				
		vitches running Catalyst operating system Release 6.2 or later for the			
	• Catalyst4500 series sv	vitches running Release 12.1(15)EW or later			
	• Catalyst 5000 family s supervisor engine	switches running Catalyst operating system Release 6.1 or later for the			
	• Catalyst 6500 series switches running Catalyst operating system Release 6.1 or later for the supervisor engine				
	For Layer 2 traceroute to f of the switches in the netw	functional properly, Cisco Discovery Protocol (CDP) must be enabled on all york. Do not disable CDP.			
		device in the Layer 2 path that does not support Layer 2 traceroute, the switch trace queries and lets them time out.			
	The maximum number of l	hops identified in the path is ten.			

Layer 2 traceroute supports only unicast traffic. If you specify a multicast source or destination MAC address, the physical path is not identified, and a message appears.

The **traceroute mac** command output shows the Layer 2 path when the specified source and destination addresses belong to the same VLAN. If you specify source and destination addresses that belong to different VLANs, the Layer 2 path is not identified, and a message appears.

If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and a message appears.

Layer 2 traceroute is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port). When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and a message appears.

This feature is not supported in Token Ring VLANs.

Examples

This example shows how to display the Layer 2 path by specifying the source and destination MAC addresses:

Switch# traceroute mac 0000.0201.0601 0000.0201.0201

Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6) con6 (2.2.6.6) :Fa0/1 =>Fa0/3 con5 (2.2.5.5)) : Fa0/3 =>Gi0/1) : Gi0/1 =>Gi0/2 con1 (2.2.1.1)con2 (2.2.2.2)) : Gi0/2 =>Fa0/1 Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2) Layer 2 trace completed Switch#

This example shows how to display the detailed Layer 2 path:

```
Switch# traceroute mac 0000.0201.0601 0000.0201.0201 detail
Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
con6 / WS-C2950G-24-EI / 2.2.6.6 :
        Fa0/1 [auto, auto] =>Fa0/3 [auto, auto]
con5 / WS-C2950G-24-EI / 2.2.5.5 :
        Fa0/3 [auto, auto] =>Gi0/1 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
        Gi0/1 [auto, auto] =>Gi0/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
        Gi0/2 [auto, auto] =>Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
Switch#
```

This example shows the Layer 2 path when the switch is not connected to the source switch:

```
Switch# traceroute mac 0000.0201.0501 0000.0201.0201 detail
Source not directly connected, tracing source .....
Source 0000.0201.0501 found on con5[WS-C2950G-24-EI] (2.2.5.5)
con5 / WS-C2950G-24-EI / 2.2.5.5 :
        Fa0/1 [auto, auto] =>Gi0/1 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
        Gi0/1 [auto, auto] =>Gi0/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
        Gi0/2 [auto, auto] =>Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
Switch#
```

This example shows the Layer 2 path when the switch cannot find the destination port for the source MAC address:

```
Switch# traceroute mac 0000.0011.1111 0000.0201.0201
Error:Source Mac address not found.
Layer2 trace aborted.
Switch#
```

This example shows the Layer 2 path when the source and destination devices are in different VLANs:

```
Switch# traceroute mac 0000.0201.0601 0000.0301.0201
Error:Source and destination macs are on different vlans.
Layer2 trace aborted.
Switch#
```

This example shows the Layer 2 path when the destination MAC address is a multicast address:

```
Switch# traceroute mac 0000.0201.0601 0100.0201.0201
Invalid destination mac address
Switch#
```

This example shows the Layer 2 path when the source and destination switches belong to multiple VLANs:

```
Switch# traceroute mac 0000.0201.0601 0000.0201.0201
Error:Mac found on multiple vlans.
Layer2 trace aborted.
Switch#
```

This example shows how to display the Layer 2 path by specifying the interfaces on the source and destination switches:

Switch# traceroute mac interface fastethernet0/1 0000.0201.0601 interface fastethernet0/3 0000.0201.0201 Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6) con6 (2.2.6.6) :Fa0/1 =>Fa0/3 (2.2.5.5 Fa0/3 =>Gi0/1 con5) : conl (2.2.1.1) : Gi0/1 =>Gi0/2 (2.2.2.2 Gi0/2 =>Fa0/1 con2) : Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2) Layer 2 trace completed Switch#

Related Commands traceroute mac ip

traceroute mac ip

To display the Layer 2 path that is taken by the packets from the specified source IP address or hostname to the specified destination IP address or hostname, use the **traceroute mac** command.

traceroute mac ip {source-ip-address | source-hostname} { destination-ip-address |
 destination-hostname } [detail]

Cuntax Decorintian					
Syntax Description	source-ip-address	IP address of the source switch as a 32-bit quantity in dotted-decimal format.			
	destination-ip-address	IP address of the destination switch as a 32-bit quantity in dotted-decimal format.			
	source-hostname	IP hostname of the source switch.			
	destination-hostname	IP hostname of the destination switch.			
	detail	(Optional) Displays detailed traceroute MAC IP information.			
Defaults	This command has no default settings.				
Command Modes	Privileged EXEC				
Command History	Release Modifi	cation			
	12.1(13)EWSupport for this command was introduced on the Catalyst 4500 series switch.				
Usage Guidelines	The Layer 2 traceroute fea	ature is available on these switches:

The **traceroute mac ip** command output shows the Layer 2 path when the specified source and destination IP addresses are in the same subnet. When you specify the IP addresses, the switch uses Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.

- If an ARP entry exists for the specified IP address, the switch uses the associated MAC address and identifies the physical path.
- If an ARP entry does not exist, the switch sends an ARP query and tries to resolve the IP address. The IP addresses must be in the same subnet. If the IP address is not resolved, the path is not identified, and a message appears.

Layer 2 traceroute is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port). When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

This feature is not supported in Token Ring VLANs.

Examples

This example shows how to display the Layer 2 path by specifying the source and destination IP addresses and by using the **detail** keyword:

```
Switch# traceroute mac ip 2.2.66.66 2.2.22.22 detail
Translating IP to mac....
2.2.66.66 => 0000.0201.0601
2.2.22.22 =>0000.0201.0201
Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)

udld (global configuration mode)

To enable aggressive or normal mode in the UDLD protocol and to set the configurable message timer time, use the **udld** command. Use the **no** form of this command to do the following:

- Disable normal mode UDLD on all the fiber ports by default
- Disable aggressive mode UDLD on all the fiber ports by default
- Disable the message timer

udld enable | aggressive

no udld enable | aggressive

udld message time message-timer-time

no udld message time

Syntax Description	enable		Enables UDLD in normal mode by default on all the fiber interfaces.
	aggressive		Enables UDLD in aggressive mode by default on all the fiber interfaces.
	message time m	essage-timer-time	Sets the period of time between the UDLD probe messages on the ports that are in advertisement mode and are currently determined to be bidirectional; valid values are from 7 to 90seconds.
Defaults	All fiber interfac	es are disabled and	the message timer time equals 15 seconds.
Command Modes	Global configura	tion	
Command History	Release	Modification	
	12.1(8a)EW	Support for this co	ommand was introduced on the Catalyst 4500 series switch.
Usage Guidelines	or in the detection	n phase, UDLD resta	all the neighbors of a port have aged out either in the advertisement arts the linkup sequence to try to resynchronize with any potentially the port if the message train from the link is still undetermined.
		fects the fiber interfaction on the other interfaction	aces only. Use the udld (interface configuration mode) command ce types.
Examples	This example sho	ows how to enable U	UDLD on all the fiber interfaces:
	Switch (config)		

L

Related Commandsshow udldudld (interface configuration mode)

udld (interface configuration mode)

To enable UDLD on an individual interface or to prevent a fiber interface from being enabled by the **udld** (global configuration mode) command, use the **udld** command. To return to the **udld** (global configuration mode) command setting, or if the port is a nonfiber port to disable UDLD, use the **no** form of this command.

udld {enable | aggressive | disable }

no udld {enable | aggressive | disable}

Suntay Decorintion	anahla	Enables UDLD on this interface.		
Syntax Description	enable			
	aggressive	Enables UDLD in aggressive mode on this interface.		
	disable	Disables UDLD on this interface.		
Defaults		erfaces are enabled per the state of the global udld (enable or aggressive) command, and nterfaces are enabled with UDLD disabled.		
Command Modes	Interface conf	figuration		
Command History	Release	Modification		
2	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.		
	or in the detection phase, UDLD restarts the linkup sequence to try to resynchronize with any potentially out-of-sync neighbor and shuts down the port if the message train from the link is still undetermined. Use the no udld enable command on the fiber ports to return control of UDLD to the global udld enable command or to disable UDLD on the nonfiber ports.			
	Use the udld aggressive command on the fiber ports to override the setting of the global udld (enable or aggressive) command. Use the no form on the fiber ports to remove this setting, return control of UDLD enabling back to the global udld command or to disable UDLD on the nonfiber ports.			
	The disable keyword is supported on the fiber ports only. Use the no form of this command to remove this setting and return control of UDLD to the udld (global configuration mode) command.			
	If the port changes from fiber to nonfiber or vice versa, all configurations will be maintained because of a change of module or a GBIC change detected by the platform software.			
Examples	-	shows how to cause any port interface to enable UDLD, despite the current global udld guration mode) setting:		
	Switch (conf Switch (conf	ig-if)# udld enable ig-if)#		

This example shows how to cause any port interface to enable UDLD in aggressive mode, despite the current global **udld** (enable or aggressive) setting:

Switch (config-if)# udld aggressive
Switch (config-if)#

This example shows how to cause a fiber port interface to disable UDLD, despite the current global **udld** (global configuration mode) setting:

Switch (config-if)# udld disable Switch (config-if)#

Related Commands show udld udld (global configuration mode)

udld reset

To reset all the UDLD ports in the shutdown state, use the **udld reset** command.

udld reset

- **Syntax Description** This command has no keywords or variables.
- **Defaults** This command has no default settings.
- Command Modes Privileged EXEC

 Release
 Modification

 12.1(8a)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines If the interface configuration is still enabled for UDLD, these ports will begin to run UDLD again and may shut down if the reason for the shutdown has not been corrected.

The **udld reset** command permits the traffic to flow on the ports again; other features, such as spanning tree, PAgP, and DTP, operate normally if enabled.

Examples This example shows how to reset all the ports that are shut down by UDLD: Switch# udld reset Switch#

Related Commands show udld

unidirectional

To configure the nonblocking Gigabit Ethernet ports to unidirectionally send or receive traffic on an interface, use the **unidirectional** command. To disable unidirectional communication, use the **no** form of this command.

unidirectional {receive-only | send-only }

no unidirectional {receive-only | send-only }

Syntax Description	receive-only	Specifies the unidirectional reception.		
Syntax Description				
	send-only	Specifies the unidirectional transmission.		
Defaults	Disabled			
Dolaano	Distored			
Command Modes	Interface config	guration		
O	Delesse			
Command History	Release	Modification		
	12.1(13)EW	Support for this command was introduced on the Catalyst 4500 series switch.

verify

To verify the checksum of a file on a Flash memory file system, use the verify command.

verify [/md5] [flash-filesystem:] [filename] [expected-md5-signature]

Syntax Description	/md5	(Optional) Verifies the MD5 signatures.		
	flash-filesystem	: (Optional) Device where the Flash resides; valid values are bootflash :, slot0: , flash: , or sup-bootflash: .		
	filename	(Optional) Name of the Cisco IOS image.		
	expected-md5-s	<i>ignature</i> (Optional) MD5 signature.		
Defaults	The current wor	king device is specified.		
Command Modes	Privileged EXE	2		
Command History	Release	Modification		
-	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.		
	of the image. Re you can verify th Use the verify / validates the int that is computed original file.	e, which is included with the image on the disk, lists the name, file size, and checksum view the contents of the Readme file before loading or duplicating the new image so that he checksum when you copy it into the Flash memory or on to a server. md5 command to verify the MD5 signature of a file before using it. This command egrity of a copied file by comparing a precomputed MD5 signature with the signature by this command. If the two MD5 signatures match, the copied file is identical to the		
	You can find the MD5 signature posted on the Cisco.com page with the image.			
		verify /md5 command in one of the following ways:		
	• Verify the MD5 signatures manually by entering the verify / md5 <i>filename</i> command.			
	 Check the displayed signature against the MD5 signature posted on the Cisco.com page. Allow the system to compare the MD5 signatures by entering the verify /md5 {flash-filesystem:filename} {expected-md5-signature} command. 			
	After completing the comparison, the system returns with a verified message. If an error is detected, the output is similar to the following:			
	Switch# verify /md5 slot0:c4-jsv-mz 0f			
		· · · · · · · · · · · · · · · · · · ·		

Submitted signature = 0f To display the contents of the Flash memory, enter the show flash command. The Flash contents listing does not include the checksum of the individual files. To recompute and verify the image checksum after the image has been copied into the Flash memory, enter the verify command.
A colon (:) is required after the specified device.
This example shows how to use the verify command:
Switch# verify cat6k_r47_1.cbi
File cat6k_r47_1.cbi verified OK. Switch#
This example shows how to manually check the MD5 signature:
Switch# verify /md5 c4-jsv-mz
Done!
verify /md5 (slot0:c4-jsv-mz) = 0f369ed9e98756f179d4f29d6e7755d3 Switch#
This example shows how to allow the system to compare the MD5 signatures:
Switch# verify /md5 slot0:c4-jsv-mz 0f369ed9e98756f179d4f29d6e7755d3
Done! verified /md5 (slot0:c6sup12-jsv-mz) = 0f369ed9e98756f179d4f29d6e7755d3 Switch#

vlan (VLAN Database mode)

To configure a specific VLAN, use the **vlan** command. To delete a VLAN, use the **no** form of this command.

vlan vlan_id [are hops] [backupcrfmode] [bridge type | bridge-num] [media type] [mtu mtu-size]
[name vlan-name] [parent parent-vlan-id] [ring ring-number] [said said-value] [state
{suspend | active}] [stp type type] [tb-vlan1 tb-vlan1-id] [tb-vlan2 tb-vlan2-id]

no vlan vlan

Syntax Description	vlan_id	Number of the VLAN; valid values are from 1 to 4094.
	are hops	(Optional) Specifies the maximum number of All Route Explorer hops for this VLAN; valid values are from 0 to 13. Zero is assumed if no value is specified.
	backupcrf mode	(Optional) Enables or disables the backup CRF mode of the VLAN; valid values are enable and disable .
	bridge type	(Optional) Specifies the bridging characteristics of the VLAN or identification number of the bridge; valid <i>type</i> values are srb and srt .
	bridge_num	(Optional) Valid bridge_num values are from 0 to 15.
	media type	(Optional) Specifies the media type of the VLAN; valid values are fast ethernet, fd-net, fddi, trcrf, and trbrf.
	mtu mtu-size	(Optional) Specifies the maximum transmission unit (packet size, in bytes) that the VLAN can use; valid values are from 576 to 18190.
	name vlan-name	(Optional) Defines a text string used as the name of the VLAN (1to32characters).
	parent parent-vlan-id	(Optional) Specifies the ID number of the parent VLAN of FDDI or Token Ring-type VLANs; valid values are from 2 to 1001.
	ring ring-number	(Optional) Specifies the ring number of FDDI or Token Ring-type VLANs; valid values are from 2 to 1001.
	said said-value	(Optional) Specifies the security association identifier; valid values are from 1 to 4294967294.
	state	(Optional) Specifies the state of the VLAN.
	suspend	Specifies that the state of the VLAN is suspended. VLANs in the suspended state do not pass packets.
	active	Specifies that the state of the VLAN is active.
	stp type type	(Optional) Specifies the STP type; valid values are ieee, ibm, and auto.
	tb-vlan1 tb-vlan1-id	(Optional) Specifies the ID number of the first translational VLAN for this VLAN; valid values are from 2 to 1001. Zero is assumed if no value is specified.
	tb-vlan2 tb-vlan2-id	(Optional) Specifies the ID number of the second translational VLAN for this VLAN; valid values are from 2 to 1001. Zero is assumed if no value is specified.

Defaults	The defaults are as follows:			
	• The vlan-name is "VLANxxxx" where "xxxx" represents four numeric digits (including leading zeroes) equal to the VLAN ID number.			
	• The media type is Fast Ethernet.			
	• The state is active.			
	• The said-value is 100,000 plus the VLAN ID number.			
	• The mtu-size default is dependent upon the VLAN type:			
	- fddi—1500			
	 trcrf—1500 if V2 is not enabled; 4472 if it is enabled fd-net—1500 			
	- trbrf—1500 if V2 is not enabled; 4472 if it is enabled			
	• No ring number is specified.			
	• No bridge number is specified.			
	• No parent VLAN is specified.			
	• No STP type is specified.			
	• No translational bridge VLAN is specified.			
Command History	Release Modification			
2	12.1(8a)EW Support for this command was introduced on the Catalyst 4500 series switch.			
Usage Guidelines	VLAN 1 parameters are factory configured and cannot be changed.			
	When you define <i>vlan-name</i> , the name must be unique within the administrative domain.			
	The SAID is documented in 802.10. When the no form is used, the VLANs SAID is returned to the default.			
	When you define the said-value, the name must be unique within the administrative domain.			
	The bridge <i>bridge-number</i> argument is used only for Token Ring-net and FDDI-net VLANs and is ignored in other types of VLANs. When the no form is used, the VLANs source-route bridging number returns to the default.			
	The parent VLAN resets to the default if the parent VLAN is deleted or the media keyword changes the VLAN type or the VLAN type of the parent VLAN.			
	The <i>tb-vlan1</i> and <i>tb-vlan2</i> are used to configure translational bridge VLANs of a specified type of VLAN and are not allowed in other types of VLANs. The translational bridge VLANs must be a different VLAN type than the affected VLAN; if two VLANs are specified, the two must be different VLAN types.			
	A translational bridge VLAN will reset to the default if the translational bridge VLAN is deleted or the media keyword changes the VLAN type or the VLAN type of the corresponding translational bridge VLAN.			

Examples

This example shows how to add a new VLAN with all the default parameters to the new VLAN database: Switch(vlan)# vlan 2

If the VLAN already exists, no action occurs.

This example shows how to cause the device to add a new VLAN, specify the media type and parent VLAN ID number 3, and set all the other parameters to the defaults:

Switch(vlan)# vlan 2 media fastethernet parent 3 VLAN 2 modified: Media type FASTETHERNET Parent VLAN 3

This example shows how to delete VLAN 2:

Switch(vlan)# **no vlan 2** Switch(vlan)#

This example shows how to return the MTU to the default for its type and the translational bridging VLANs to the default:

Switch(vlan)# no vlan 2 mtu tb-vlan1 tb-vlan2
Switch(vlan)#

Related Commands show vlan

vlan access-map

To enter VLAN access-map command mode to create a VLAN access map, use the **vlan access-map** command. To remove a mapping sequence or the entire map, use the **no** form of this command.

vlan access-map name [seq#]

no vlan access-map name [seq#]

Syntax Description	name	VLAN access-map tag.	
, i	seq#	(Optional) Map sequence number; valid values are from 0 to 65535.	
Defaults	This command I	has no default settings.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Usage Guidelines	you do not spec clause and one a command witho	sequence number of an existing map sequence, you enter VLAN access-map mode. If ify a sequence number, a number is automatically assigned. You can enter one match action clause per map sequence. If you enter the no vlan access-map name [<i>seq#</i>] out entering a sequence number, the whole map is removed. Once you enter VLAN de, the following commands are available:	
	• action—Se	ts the action to be taken (forward or drop).	
	• default—R	eturns a command to its default settings.	
	• end—Exits	from configuration mode.	
	• exit —Exits	from VLAN access-map configuration mode.	
	• match—Se	ts the values to match (IP address or MAC address).	
	• no —Negate	es a command or reset its defaults.	
Examples	This example sh	nows how to enter VLAN access-map mode:	
	Switch(config) Switch(config-	# vlan access-map cisco access-map)#	
Related Commands	match show vlan acce	ss-map	

vlan database

To enter VLAN configuration mode, use the vlan database command.

	vlan databa	ase
Syntax Description	This command l	nas no arguments or keywords.
Defaults	This command has no default settings.	
Command Modes	Privileged EXE	c
Command History	Release	Modification
Command History	Release 12.1(8a)EW	ModificationSupport for this command was introduced on the Catalyst 4500 series switch.
Command History Usage Guidelines	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.

	12.1(8a)EW From VLAN co commands, incl • abort—Exi	Support for this command was introduced on the Catalyst 4500 series switch. nfiguration mode, you can access the VLAN database editing buffer manipulation uding:
	 12.1(8a)EW From VLAN co commands, incl abort—Exi apply—App 	Support for this command was introduced on the Catalyst 4500 series switch. nfiguration mode, you can access the VLAN database editing buffer manipulation uding: ts mode without applying the changes.
	 12.1(8a)EW From VLAN co commands, incl abort—Exi apply—Appl exit—Appli 	Support for this command was introduced on the Catalyst 4500 series switch. nfiguration mode, you can access the VLAN database editing buffer manipulation uding: ts mode without applying the changes. plies the current changes and bumps the revision number.

- **show**—Displays the database information.
- **vlan**—Accesses the subcommands to add, delete, or modify values that are associated with a single VLAN. For information about the **vlan** subcommands, see the **vlan** (**VLAN Database mode**) command.
- **vtp**—Accesses the subcommands to perform VTP administrative functions. For information about the **vtp** subcommands, see the **vtp** client command.

Examples This example shows how to enter VLAN configuration mode: Switch# vlan database Switch(vlan)#

This example shows how to exit VLAN configuration mode without applying changes after you are in VLAN configuration mode:

Switch(vlan)# **abort** Aborting.... Switch# This example shows how to delete a VLAN after you are in VLAN configuration mode:

Switch(vlan)# **no vlan 100** Deleting VLAN 100... Switch(vlan)#

This example shows how to turn off pruning after you are in VLAN configuration mode:

Switch(vlan)# no vtp pruning
Pruning switched OFF
Switch(vlan)#

Related Commands show vlan

OL-6661-01

Defaults	802.1Q native VLAN tagging is disabled.		
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(18)EW	This command was first introduced on the Catalyst 4500 series switch.	
Usage Guidelines		native VLAN packets exiting all 802.1Q trunk ports are tagged unless the port is ed to disable native VLAN tagging.	
	When disabled, the native VLAN packets exiting all 802.1Q trunk ports are not tagged.		
	service-provider ne tagging the tagged service-provider ne might also be carrie VLAN of a tunneli	bommand with 802.1Q tunneling. This feature operates on an edge switch of a etwork and expands VLAN space by using a VLAN-in-VLAN hierarchy and by packets. You must use the 802.1Q trunk ports for sending out the packets to the etwork. However, the packets going through the core of the service-provider network ed on the 802.1Q trunks. If the native VLANs of an 802.1Q trunk match the native ng port on the same switch, the traffic on the native VLAN is not tagged on the This command ensures that the native VLAN packets on all 802.1Q trunk ports are	
Examples	This example show configuration:	as how to enable 802.1Q tagging on the native VLAN frames and verify the	
	Switch# config te Switch (config)# Switch (config)# Switch# show vlar	vlan dotlq tag native	
Related Commands	switchport private switchport trunk	e-vlan trunk native vlan tag	

Syntax Description

To enable tagging of the native VLAN frames on all 802.1Q trunk ports, use the vlan dot1q tag native command. To disable tagging of native VLAN frames, use the no form of this command.

vlan dot1q tag native

no vlan dot1q tag native

This command has no arguments or keywords.

vlan dot1q tag native

vlan filter

To apply a VLAN access map, use the **vlan filter** command. To clear the VLAN access maps from VLANs or interfaces, use the **no** form of this command.

vlan filter map-name {vlan-list vlan-list}

no vlan filter *map-name* {**vlan-list** [*vlan-list*]}

Syntax Description	map-name	VLAN access-map tag.	
	vlan-list vlan-list	Specifies the VLAN list; see the "Usage Guidelines" section for valid values.	
Defaults	This command has	s no default settings.	
Command Modes	Global configurati	on	
Command History	Release	Modification	
	12.1(12c)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Usage Guidelines	You can applyThe <i>vlan-list</i> p	an action clause in a VLAN access map, note the following: the VLAN access map to one or more VLANs. barameter can be a single VLAN ID, a list of VLAN IDs, or VLAN ID ranges <i>id</i>). Multiple entries are separated by (-), (hyphen), or (,) (comma).	
	 You can apply only one VLAN access map to each VLAN. 		
	When entering the no form of this command, the <i>vlan-list</i> parameter is optional (but the keyword vlan-list is required). If you do not enter the <i>vlan-list</i> parameter, the VACL is removed from all the VLANs where the <i>map-name</i> is applied.		
Examples	This example show	ws how to apply a VLAN access map on VLANs 7 through 9:	
	Switch(config)# Switch(config)#	vlan filter ganymede vlan-list 7-9	

vlan internal allocation policy

Use the **vlan internal allocation policy** command to configure the internal VLAN allocation scheme. To return to the default setting, use the **no** form of this command.

vlan internal allocation policy {ascending | descending }

no vlan internal allocation policy

Syntax Description	ascending	Specifies to allocate internal VLANs from 1006 to 4094.
	descending	Specifies to allocate internal VLANs from 4094 to 1006.
Defaults	The default is t	he ascending allocation scheme.
Command Modes	Global configu	ration mode
Command History	Release	Modification
	12.1(19)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	You can config	gure internal VLAN allocation to be from 1006 and up or from 4094 and down.
	The internal VLANs and user-configured VLANs share the 1006 to 4094 VLAN spaces. A "first come, first served" policy is used in allocating these spaces.	
	The vlan inter internal VLAN	nal allocation policy command allows you to configure the allocation direction of the .
	allocated first. configure a VL	bootup, the internal VLANs that are required for features in the startup-config file are The user-configured VLANs in the startup-config file are configured next. If you AN that conflicts with an existing internal VLAN, the VLAN that you configured is put ational status until the internal VLAN is freed and becomes available.
	After you enter used by the por	the write mem command and the system reloads, the reconfigured allocation scheme is "t manager.
Examples	This example sl policy:	hows how to configure the VLANs in a descending order as the internal VLAN allocation
	Switch(config Switch(config)# vlan internal allocation policy descending)#
Related Commands	show vlan inte	rnal usage

vmps reconfirm (global configuration)

To change the reconfirmation interval for the VLAN Query Protocol (VQP) client, use the **vmps reconfirm** command. To return to the default setting, use the **no** form of this command.

vmps reconfirm *interval*

no vmps reconfirm

Cuntary Decerimtian	1	$O_{1} = (1 + 1) + (1 + 1$
Syntax Description	interval	Queries to the VLAN Membership Policy Server (VMPS) to reconfirm dynamic
		VLAN assignments; valid values are from 1 to 120 minutes.
Defaults	The reconfirma	tion interval is 60 minutes.
Command Modes	Global configu	ration
Command History	Release	Modification
	12.1(13)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Examples	-	hows how to set the VQP client to reconfirm dynamic VLAN entries every 20 minutes:
	You can verify Reconfirm Inte	your setting by entering the show vmps command and examining information in the rval row.
Related Commands	show vmps vmps reconfir	m (privileged EXEC)

vmps reconfirm (privileged EXEC)

To immediately send VLAN Query Protocol (VQP) queries to reconfirm all the dynamic VLAN assignments with the VLAN Membership Policy Server (VMPS), use the **vmps reconfirm** command.

vmps reconfirm

Syntax Description	This command has no arguments or keywords.	
Defaults	This command has no default settings.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(13)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	You can verify your setting by entering the show vmps command and examining the VMPS Action row of the Reconfirmation Status section. The show vmps command shows the result of the last time that the assignments were reconfirmed either because the reconfirmation timer expired or because the vmps reconfirm command was entered.	
Examples	This example shows how to immediately send VQP queries to the VMPS: Switch# vmps reconfirm Switch#	
Related Commands	show vmps vmps reconfirm	(global configuration)

vmps retry

To configure the per-server retry count for the VLAN Query Protocol (VQP) client, use the **vmps retry** command. To return to the default setting, use the **no** form of this command.

vmps retry count

no vmps retry

Syntax Description	count	Number of attempts to contact the VLAN Membership Policy Server (VMPS) by the client before querying the next server in the list; valid values are from 1 to 10.
Defaults	The retry count	a is 3.
Command Modes	Global configu	ration
Command History	Release 12.1(13)EW	ModificationSupport for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	You can verify Server Retry C	your setting by entering the show vmps command and examining information in the ount row.
Examples	This example shows how to set the retry count to 7: Switch(config)# vmps retry 7	
Related Commands	show vmps	

vmps server

L

To configure the primary VLAN Membership Policy Server (VMPS) and up to three secondary servers, use the **vmps server** command. To remove a VMPS server, use the **no** form of this command.

vmps server ipaddress [primary]

no vmps server *ipaddress*

Syntax Description	ipaddress	IP address or host name of the primary or secondary VMPS servers. If you specify a hostname, the Domain Name System (DNS) server must be configured.
	primary	(Optional) Determines whether primary or secondary VMPS servers are being configured.
Defaults	No primary or	secondary VMPS servers are defined.
Command Modes	Global configu	iration
Command History	Release	Modification
	12.1(4)EA1	This command was first introduced.
Usage Guidelines		r that you entered is automatically selected as the primary server whether or not primary a can override the first server address by using primary in a subsequent command.
	If a member switch in a cluster configuration does not have an IP address, the cluster does not use the VMPS server that is configured for that member switch. Instead, the cluster uses the VMPS server on the command switch, and the command switch proxies the VMPS requests. The VMPS server treats the cluster as a single switch and uses the IP address of the command switch to respond to requests.	
	delete all serve	e no form without specifying the <i>ipaddress</i> , all configured servers are deleted. If you ers when dynamic-access ports are present, the switch cannot forward the packets from the n these ports because it cannot query the VMPS.
	You can verify VMPS Domair	your setting by entering the show vmps command and examining information in the a Server row.

Examples This example shows how to configure the server with IP address 191.10.49.20 as the primary VMPS server. The servers with IP addresses 191.10.49.21 and 191.10.49.22 are configured as secondary servers:

```
Switch(config)# vmps server 191.10.49.20 primary
Switch(config)# vmps server 191.10.49.21
Switch(config)# vmps server 191.10.49.22
Switch(config)#
```

This example shows how to delete the server with IP address 191.10.49.21:

Switch(config)# no vmps server 191.10.49.21
Switch(config)#

Related Commands show vmps

vtp (global configuration mode)

To modify the name of a VTP configuration storage file, use the **vtp** command. To clear a filename, use the **no** form of this command.

vtp {{file filename} | {if-id name}}

no vtp { {**file** *filename* } | { **if-id** *name* }}

Syntax Description	file filename	Specifies the IFS file where VTP configuration will be stored.	
	if-id name	Specifies the name of the interface providing the VTP updater ID for this device, where the if-id <i>name</i> is an ASCII string limited to 255 characters.	
Defaults	Disabled		
Command Modes	Global configu	ration	
Command History	Release	Modification	
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Usage Guidelines	You cannot use the vtp file command to load a new database. You can use it only to rename the file in which the existing database is stored.		
	for this device.	e vtp if-id command to specify the name of the interface providing the VTP updater ID The VTP updater is the device that adds, deletes, or modifies VLANs to a network, and updater to inform the rest of the system of the changes.	
Examples	This example s	hows how to specify the IFS file system file where VTP configuration is stored:	
	Switch(config)# vtp file vtpconfig Setting device to store VLAN database at filename vtpconfig. Switch(config)#		
	This example shows how to specify the name of the interface providing the VTP updater ID:		
	Switch(config Switch(config)# vtp if-id fastethernet)#	
Related Commands	show vtp		

vtp client

To place a device in VTP client mode, use the **vtp client** command. To return to VTP server mode, use the **no** form of this command.

vtp client

no vtp client

- **Syntax Description** This command has no arguments or keywords.
- Defaults Disabled
- **Command Modes** VLAN configuration

 Release
 Modification

 12.1(8a)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines If the receiving switch is in client mode, the client switch changes its configuration to duplicate the configuration of the server. If you have switches in client mode, make sure to make all VTP or VLAN configuration changes on a switch in server mode.

The **vtp server** command is the functional equivalent of **no vtp client** except that it does not return an error if the device is not in client mode.

Examples This example shows how to place the device in VTP client mode:

Switch(vlan-config)# vtp client Switch(vlan-config)#

Related Commands show vtp vtp (global configuration mode)

vtp domain

L

To configure the administrative domain name for a device, use the vtp domain command.

vtp domain domain-name

Syntax Description	domain-name	Name of the domain.	
Defaults	This command h	as no default settings.	
Command Modes	VLAN configuration		
Command History	Release	Modification	
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Usage Guidelines	When you define	the downin waves the domain name is asso consitive and can be from 1 to 20 characters	
Usage Guidennes	When you define the <i>domain-name</i> , the domain name is case sensitive and can be from 1 to 32 characters.		
	You must set a d	omain name before you can transmit any VTP advertisements.	
	•	ot set a domain name, the device will leave the no-management-domain state upon st VTP summary packet on any port that is currently trunking.	
		eives its domain from a summary packet, it resets its configuration revision number to	
		evice leaves the no-management-domain state, it can never be configured to reenter the y cleaning NVRAM and reloading.	
Examples	This example sho	ows how to set the devices administrative domain:	
	Switch(vlan-cor Switch(vlan-cor	nfig)# vtp domain DomainChandon nfig)#	
Related Commands	show vtp		
		iguration mode)	

vtp (global configuration mode)

vtp password

To create a VTP domain password, use the **vtp password** command. To delete the password, use the **no** form of this command.

vtp password password-value

no vtp password

Syntax Description	password-value	An ASCII string, from 1 to 32 characters, identifying the administrative domain for the device.	
Defaults	Disabled		
Command Modes	VLAN configurati	on	
Command History	Release	Modification	
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.	
Examples	This example show	ws how to create a VTP domain password:	
	Switch(vlan-config)# vtp password DomainChandon Switch(vlan-config)#		
	This example shows how to delete the VTP domain password:		
	Switch(vlan-config)# no vtp password Clearing device VLAN database password. Switch(vlan-config)#		
Related Commands	show vtp		

vtp (global configuration mode)

vtp pruning

To enable pruning in the VLAN database, use the **vtp pruning** command. To disable pruning in the VLAN database, use the **no** form of this command.

vtp pruning

no vtp pruning

Syntax Description	This command h	nas no arguments or keywords.
Defaults	Disabled	
Command Modes	VLAN configur	ation
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines		uses information about each pruning-eligible VLAN to be removed from VTP updates tations belonging to that VLAN.
Examples	This example sh	nows how to enable pruning in the VLAN database:
	Switch(vlan-co Pruning switch	nfig)# vtp pruning ed ON
	Switch(vlan-co	
	This example sh	nows how to disable pruning in the VLAN database:
	Switch(vlan-co Pruning switch	nfig)# no vtp pruning
	Switch(vlan-co	
Related Commands	show vtp	

vtp (global configuration mode)

vtp server

To place the device in VTP server mode, use the **vtp server** command.

vtp server

- **Syntax Description** This command has no arguments or keywords.
- Defaults Enabled
- Command Modes VLAN configuration

 Release
 Modification

 12.1(8a)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines If you make a change to the VTP or VLAN configuration on a switch in server mode, that change is propagated to all the switches in the same VTP domain.

You can set VTP to either server or client mode only when you disable dynamic VLAN creation.

If the receiving switch is in server mode, the configuration is not changed.

The **vtp server** command is the functional equivalent of **no vtp client**, except that it does not return an error if the device is not in client mode.

Examples This example shows how to place the device in VTP server mode:

Switch(vlan-config)# **vtp server** Switch(vlan-config)#

Related Commands show vtp vtp (global configuration mode)

vtp transparent

To place a device in VTP transparent mode, use the **vtp transparent** command. To return to VTP server mode, use the **no** form of this command.

vtp transparent

no vtp transparent

Syntax Description	This command l	has no arguments or keywords.
Defaults	Disabled	
Command Modes	VLAN configur	ration
Command History	Release	Modification
	12.1(8a)EW	Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines	The vtp transparent command disables VTP from the domain but does not remove the domain from the switch.	
transparent mode do not participate in VTP. If you make VTP or		switch is in transparent mode, the configuration is not changed. The switches in de do not participate in VTP. If you make VTP or VLAN configuration changes on a parent mode, the changes are not propagated to the other switches in the network.
		command is similar to the no vtp transparent command, except that it does not return evice is not in transparent mode.
Examples	This example sh	hows how to place the device in VTP transparent mode:
	Switch(vlan-co Switch(vlan-co	onfig)# vtp transparent onfig)#
	This example sh	hows how to return the device to VTP server mode:
	Switch(vlan-co Switch(vlan-co	onfig)# no vtp transparent onfig)#
Related Commands	show vtp vtp (global con	figuration mode)

vtp v2-mode

To enable version 2 mode, use the **vtp v2-mode** command. To disable version 2 mode, use the **no** form of this command.

vtp v2-mode

no vtp v2-mode

- **Syntax Description** This command has no arguments or keywords.
- Defaults Disabled
- Command Modes VLAN configuration

 Command History
 Release
 Modification

 12.1(8a)EW
 Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines All switches in a VTP domain must run the same version of VTP. VTP version 1 and VTP version2 do not operate on switches in the same VTP domain.

If all switches in a domain are VTP version 2-capable, you only need to enable VTP version 2 on one switch; the version number is then propagated to the other version 2-capable switches in the VTP domain.

If you toggle the version 2 mode, the parameters of certain default VLANs will be modified.

Examples This example shows how to enable version 2 mode in the VLAN database:

Switch(vlan-config)# **vtp v2-mode** Switch(vlan-config)#

This example shows how to disable version 2 mode in the VLAN database:

Switch(vlan-config)# no vtp v2-mode
Switch(vlan-config)#

Related Commands show vtp vtp (global configuration mode)

deny ARP packet based on matches 2-79 permit ARP packet based on matches 2-203 DHCP snooping clearing database 2-29 displaying 2-325 displaying binding table 2-326 displaying status of DHCP database 2-329 displaying status of error detection 2-283 enabling DHCP globally 2-128 enabling IP source guard 2-160 enabling on a VLAN 2-135 enabling option 82 2-132 enabling rate limiting on an interface 2-133 enabling trust on an interface 2-134 establishing binding configuration 2-129 renew binding database 2-245 store generated bindings 2-130 diagnostic test displaying attributes 2-267 display module-based results 2-269 displaying error disable recovery 2-284 displaying inline power status 2-392 displaying monitoring activity 2-58 displaying SEEPROM information GBIC 2-292 displaying SPAN session information 2-422, 2-485 document conventions xvi document organization xv DOS attack protecting system's resources 2-117 drop threshold, Layer 2 protocol tunneling 2-164 DSCP rewrite for IP packets enable 2-236 dual-capable port selecting a connector 2-192 duplex mode configuring autonegotiation on an interface 2-94 configuring full duplex on an interface 2-94 configuring half duplex on an interface 2-94

dynamic ARP inspection preventing 2-117 Dynamic Buffer Limiting See DBL Dynamic Host Configuration Protocol See DHCP

E

EAP restarting authentication process 2-85 enabling debugging for UDLD 2-76 voice VLANs 2-487 environmental alarms 2-280 displaying information 2-280 status 2-280 temperature 2-280 error disable detection enabling error disable detection 2-96 error-disabled state displaying 2-310 error disable recovery configuring recovery mechanism variables 2-98 displaying recovery timer information 2-284 enabling ARP inspection timeout 2-98 specifying recovery cause 2-98 EtherChannel assigning interfaces to EtherChannel groups 2-16 debugging EtherChannel 2-50 debugging PAgP shim 2-50 debugging spanning tree activities 2-67 displaying information for a channel 2-285 removing interfaces from EtherChannel groups 2-16 EtherChannel guard detecting STP misconfiguration 2-454 **Explicit Host Tracking** clearing the database 2-33

enabling per-VLAN 2-147 expressions matching multiple expression occurrences 1-9 multiple-character patterns 1-8 multiplying pattern occurrence 1-10 single-character patterns 1-7 Extensible Authentication Protocol See EAP

F

field replaceable unit (FRU)
displaying status information 2-280
Flash memory file system
displaying file system information 2-260
verifying checksum 2-525
flow control
configuring a gigabit interface for pause frames 2-101
displaying per-interface statistics for flow control 2-289

G

GBIC displaying SEEPROM information 2-292 Gigabit Ethernet interface clearing the hardware logic 2-24 Gigabit Ethernet uplink selecting 2-105 showing the mode 2-291 global configuration mode using 1-5

Η

hardware module resetting a module by toggling the power 2-104 hardware uplink selecting the mode 2-105 showing the mode 2-291 helper addresses, IP 2-343 hot standby protocol debugging 2-46 disabling debugging 2-46 limiting output 2-46

IDPROMs

displaying SEEPROM information chassis 2-292 clock module 2-292 fan trays 2-292 module 2-292 mux buffer 2-292 power supplies 2-292 supervisor engine 2-292 ifIndex persistence clearing SNMP ifIndex commands 2-443 compress SNMP ifIndex table format 2-448 disabling globally 2-447 disabling on an interface 2-444 enabling globally 2-447 enabling on an interface 2-444 IGMP applying filters for host joining on Layer 2 interfaces 2-137 clearing IGMP group cache entries 2-31 configuring frequency for IGMP host-query messages 2-140 creating an IGMP profile 2-139 displaying IGMP interface configuration information 2-331 displaying profiles 2-333 setting maximum group numbers 2-138 IGMP profiles displaying 2-333

IGMP snooping clearing the EHT database 2-33 configuring a Layer 2 interface as a group member 2-151 configuring a Layer 2 interface as a multicast router 2-149 configuring a static VLAN interface 2-151 displaying multicast information 2-340 displaying VLAN information 2-334, 2-338, 2-341 enabling 2-142 enabling immediate-leave processing 2-148 enabling on a VLAN 2-146 enabling per-VLAN Explicit Host Tracking 2-147 informs enabling 2-445 inline power displaying inline power status 2-392 inspection log clearing log buffer 2-27 interface displaying suppressed multicast bytes 2-304 interface capabilities displaying 2-301 interface configuration mode summary 1-5 interface link display cable disconnect time 2-307 interfaces configuring dot1q tunnel ports 2-492 creating an interface-range macro 2-78 debugging output of interface related activities 2-45 displaying description 2-306 displaying error-disabled state 2-310 displaying information when tunneling is enabled 2-358 displaying status 2-306 displaying traffic for a specific interface 2-298 entering interface configuration mode 2-109 executing a command on multiple ports in a range 2-112 selecting an interface to configure 2-109

setting a CoS value for Layer 2 packets 2-163 setting drop threshold for Layer 2 packets 2-164 setting the interface type 2-492 interface speed configuring interface speed 2-481 interface transceiver displaying diagnostic data 2-313 internal VLAN allocation configuring 2-535 default setting 2-535 displaying allocation information 2-434 Internet Group Management Protocol See IGMP IP ARP applying ARP ACL to VLAN 2-115 clearing inspection statistics 2-28 clearing status of log buffer 2-27 controlling packet logging 2-125 enabling dynamic inspection 2-124 limit rate of incoming requests 2-117 set per-port config trust state 2-121 showing status of dynamic ARP inspection 2-320 showing status of log buffer 2-323 IPC debugging IPC activities 2-53 **IP DHCP Snooping** See DHCP snooping IP header validation disabling 2-159 enabling 2-159 **IP** interfaces displaying usability status 2-342 **IP** multicast displaying multicast routing table information 2-348 **IP** packets enable DSCP rewrite 2-236 IP phone and standard desktop enabling Cisco-recommended features 2-181

IP source binding adding or deleting 2-156 displaying bindingstagging 2-353 IP source guard debugging messages 2-56 displaying configuration and filters 2-354 enabling on DHCP snooping 2-160

J

Jumbo frames enabling jumbo frames 2-199

L

LACP deselecting channeling protocol 2-18 enabling LACP on an interface 2-18 setting channeling protocol 2-18 Layer 2 displaying ACL configuration 2-364 Layer 2 interface type specifying a nontrunking, nontagged single VLAN interface 2-492 specifying a trunking VLAN interface 2-492 Layer 2 protocol ports displaying 2-358 Layer 2 protocol tunneling error recovery 2-166 Layer 2 switching enabling voice VLANs 2-487 modifying switching characteristics 2-487 Laver 2 traceroute IP addresses 2-513 Layer 3 switching displaying information about an adjacency table 2-254 displaying port status 2-311 displaying status of native VLAN tagging 2-311 log buffer show status 2-323

logging

controlling IP ARP packets 2-125

Μ

MAC Access Control Lists See MAC ACLs MAC ACLs defining extended MAC access list 2-170 displaying MAC ACL information 2-431 naming an ACL 2-170 MAC address filtering configuring 2-177 disabling 2-177 enabling 2-177 MAC address table adding static entries 2-187 clearing dynamic entries 2-37 configuring aging time 2-173 displaying dynamic table entry information 2-369 displaying entry count 2-368 displaying information 2-365 displaying interface-based information 2-371 displaying multicast information 2-373 displaying protocol-based information 2-375 displaying static table entry information 2-377 displaying the MAC address aging time 2-367 displaying VLAN-based information 2-379 learning in the protocol buckets 2-174 removing static entries 2-187 MAC address tables adding static entries 2-177 deleting secure or specific addresses 2-39 disabling IGMP snooping on static MAC addresses 2-177 removing static entries 2-177 mac-address-table static 2-177 MAC address unicast filtering dropping unicast traffic 2-177

macro keywords help strings 2-2 mapping secondary VLANs to MST instance 2-220 mapping VLAN(s) to an MST instance 2-107 match subcommand accessing 2-19 maximum transmission unit (MTU) displaying the system MTU setting 2-423 setting the maximum Layer 2 payload size 2-509 MD5 verifying MD5 signature 2-525 message digest 5 See MD5 MFIB clearing ip mfib counters 2-34 clearing ip mfib fastdrop 2-35 displaying all active MFIB routes 2-345 displaying MFIB fastdrop table entries 2-347 enabling IP MFIB fastdrops 2-153 modes access-group 2-5 show access-group interface 2-253 switching between PVST+, MST, and Rapid PVST 2-459 See also command modes module password clearing 2-23 module reset resetting a module by toggling the power 2-104 --More-- prompt filter 1-6 search 1-7 MST designating the primary and secondary root 2-467 displaying MST protocol information 2-418 displaying region configuration information 2-418 displaying spanning tree information 2-418 entering MST configuration submode 2-461 setting configuration revision number 2-247 setting path cost and port priority for instances 2-460

setting the forward delay timer for all instances 2-463 setting the hello-time delay timer for all instances 2-464 setting the max-age timer for all instances 2-465 setting the MST region name 2-200 specifying the maximum number of hops 2-466 switching between PVST+ and Rapid PVST 2-459 using the MST configuration submode revision command 2-247 using the submode name command 2-200 MTU displaying global MTU settings 2-423 multicast enabling storm control 2-486 multicast/unicast packets prevent forwarding 2-491 Multicast Forwarding Information Base See MFIB multiple-character patterns 1-8 multiple hosts on authorized port 2-86 Multiple Spanning Tree See MST

Ν

native VLAN
controlling tagging of traffic 2-505
displaying ports eligible for native tagging 2-433
displaying ports eligible for tagging 2-433
enabling tagging on 802.1Q trunk ports 2-533
specifing the tagging of traffic 2-506
NetFlow
enabling NetFlow statistics 2-154
including infer fields in routing statistics 2-154
next-hop
displaying CEF VLAN information 2-324
no form of a command, using 1-6
NVRAM
debugging NVRAM activities 2-59

0

output pattern searches 1-7

packet forwarding prevent unknown packets 2-491 packet memory failure direct switch action upon detection 2-81 packet memory test bootup, displaying results 2-273 ongoing, displaying results 2-275 PACL access-group mode 2-5 paging prompt see -- More -- prompt PAgP clearing port channel information 2-38 debugging PAgP activity 2-60 deselecting channeling protocol 2-18 displaying port channel information 2-385 hot standby mode returning to defaults 2-202 selecting ports 2-202 input interface of incoming packets learning 2-201 returning to defaults 2-201 setting channeling protocol 2-18 parentheses 1-10 password clearing on an intelligent line module 2-23 establishing enhanced password security 2-524 setting username 2-524 PBR displaying route maps xvi redistributing route maps xvi

PM activities debugging 2-63 disabling debugging 2-63 Policy Based Routing See PBR port, dual-capable selecting the connector 2-192 Port Aggregation Protocol See PAgP port-based authentication displaying debug messages 2-49 displaying statistics and status 2-277 enabling 802.1X 2-87 manual control of authorization state 2-87 multiple hosts on authorized port 2-86 periodic re-authentication enabling 2-90 re-authenticating 802.1X-enabled ports 2-89 switch-to-client frame-retransmission number 2-85 port channel accessing 2-111 creating 2-111 displaying information 2-385 load distribution method resetting to defaults 2-207 setting 2-207 port range executing 2-112 port security debugging ports security 2-64 deleting secure or specific addresses 2-39 displaying settings for an interface or switch 2-390 enabling 2-494 filter source IP and MAC addresses 2-160 setting action upon security violation 2-494 setting the rate limit for bad packets 2-494 sticky port 2-494 Port Trust Device displaying 2-399

power status displaying inline power 2-392 displaying power status 2-392 power supply configuring combined and redundant power on the Catalyst 4507R 2-213 configuring inline power 2-210 configuring power consumption 2-212 configuring power redundancy on the Catalyst 4507R 2-215 displaying the SEEPROM 2-292 setting inline power state 2-209 Private VLAN See PVLANs privileged EXEC mode, summary 1-5 prompts system 1-5 protocol tunneling configuring encapsulation rate 2-166 disabling 2-162 displaying port information 2-358 enabling 2-162 setting a CoS value for Layer 2 packets 2-163 setting a drop threshold for Layer 2 packets 2-164 **PVLANs** configuring isolated, primary, and community PVLANs 2-216 controlling tagging of native VLAN traffic 2-505 disabling sticky-ARP 2-157 displaying map information for VLAN SVIs 2-309 displaying PVLAN information 2-436 enabling interface configuration mode 2-492 enabling sticky-ARP 2-157 mapping VLANs to the same SVI 2-218 specifying host ports 2-492 specifying promiscuous ports 2-492 PVST+ switching between PVST and MST 2-459

Q

QoS

account Layer 2 encapsulation 2-223 attaching a policy-map to an interface 2-248 automatic configuration 2-12 clearing aggregate counters 2-40 configuring a QoS policy map 2-205 configuring auto 2-12 defining a named aggregate policer 2-225 defining default CoS value 2-228 defining ingress CoS-to-DSCP mapping 2-232 displaying aggregate policer information 2-397 displaying auto configuration 2-258 displaying class maps information 2-266 displaying configuration information 2-258 displaying configurations of policies 2-388 displaying policy map information 2-387 displaying QoS information 2-396 displaying QoS map information 2-400 enabling global configuration mode 2-221 enabling per-VLAN QoS for a Layer 2 interface 2-239 enabling QoS on an interface 2-222 mapping DSCP values to transmit queues 2-233 mapping egress DSCP-to-CoS 2-233 mapping the DSCP-to-CoS value 2-233 setting the mapping of policed DSCP values 2-235 setting the trust state 2-237 specifying flow-based match criteria 2-189 QoS CoS configuring for tunneled Layer 2 protocol packets 2-163 defining default CoS value 2-228 gos dbl 2-229 question command 1-1 queueing information displaying 2-399

R

Rapid PVST switching between PVST and MST 2-459 re-authenticating 802.1X-enabled ports 2-89 re-authentication periodic 2-90 reboots restoring bindings across 2-129 redundancy accessing the main CPU 2-240 changing from active to standby supervisor engine 2-241 displaying information 2-402 displaying redundancy facility information 2-402 displaying RF client list 2-402 displaying RF operational counters 2-402 displaying RF states 2-402 enabling automatic synchronization 2-15 forcing switchover to standby supervisor engine 2 - 241set the mode 2-193 synchronizing the route processor configurations 2-187 related documentation xv remote SPAN See RSPAN renew commands ip dhcp snooping database 2-245 resetting PVLAN trunk setting switchport to trunk 2-492 rj45 connector, selecting the connector 2-192 ROM monitor mode summary 1-6 Route Processor Redundancy See redundancy RPR set the redundancy mode 2-193 **RSPAN** converting VLAN to RSPAN VLAN 2-244 displaying list 2-438

S

saving configuration changes 1-11 secure ports, limitations 2-495 set the redundancy mode 2-193 sfp connector, selecting the connector 2-192 show commands filtering parameters 1-7 searching and filtering 1-6 show platform commands 1-11 Simple Network Management Protocol See SNMP single-character patterns special characters 1-7 slaveslot0 displaying information on the standby supervisor 2-409 slot0 displaying information about the system 2-411 SMF debugging address insertions and deletions 2-66 **SNMP** debugging spanning tree activities 2-67 ifIndex persistence clearing SNMP ifIndex commands 2-443 compress SNMP ifIndex table format 2-448 disabling globally 2-447 disabling on an interface 2-444 enabling globally 2-447 enabling on an interface 2-444 informs disabling 2-445 enabling 2-445 traps configuring to send when storm occurs 2-484 disabling 2-445 enabling 2-445 software MAC filter See SMF

SPAN commands configuring a SPAN session to monitor 2-195 displaying SPAN session information 2-422, 2-485 SPAN enhancements displaying status 2-383 Spanning Tree Protocol See STP SPAN session displaying session information 2-383 filter ACLs 2-195 specify encap type 2-195 turn off host learning based on ingress packets 2-195 special characters anchoring, table 1-10 SSO 2-193 standard desktop enabling Cisco-recommended features 2-179 standard desktop and Cisco IP phone enabling Cisco-recommended features 2-181 sticky-ARP disabling on PVLANs 2-157 enabling on PVLANs 2-157 sticky port deleting 2-39 enabling security 2-494 storm control configuring for action when storm occurs 2-484 disabling suppression mode 2-283 displaying settings 2-421 enabling 2-484 enabling broadcast 2-484, 2-486 enabling multicast 2-484, 2-486 enabling suppression mode 2-283 enabling timer to recover from error disable 2-98 enabling unicast 2-484, 2-486 multicast, enabling 2-486 setting high and low levels 2-484 setting suppression level 2-283

STP

configuring link type for a port 2-457 configuring tunneling encapsulation rate 2-166 debugging all activities 2-67 debugging spanning tree activities 2-67 debugging spanning tree BackboneFast events 2-68 debugging spanning tree UplinkFast 2-71 detecting misconfiguration 2-454 displaying active interfaces only 2-413 displaying BackboneFast status 2-413 displaying bridge status and configuration 2-413 displaying spanning tree debug messages 2-67 displaying summary of interface information 2-413 enabling BPDU filtering by default on all PortFast ports 2-472 enabling BPDU filtering on an interface 2-450 enabling BPDU guard by default on all PortFast ports 2-474 enabling BPDU guard on an interface 2-452 enabling extended system ID 2-455 enabling loop guard as a default on all ports 2-458 enabling PortFast by default on all access ports 2-475 enabling PortFast mode 2-470 enabling protocol tunneling for 2-162 enabling root guard 2-456 enabling spanning tree BackboneFast 2-449 enabling spanning tree on a per VLAN basis 2-479 enabling spanning tree UplinkFast 2-477 setting an interface priority 2-476 setting drop threshold for 2-164 setting pathcost 2-453 setting the default pathcost calculation method 2-469 subinterface configuration mode, summary 1-6 SVI creating a Layer 3 interface on a VLAN 2-114 switchport 2-506 switchport interfaces displaying status of Layer 3 port 2-311 displaying status of native VLAN tagging 2-311

switch shim debugging 2-69 disabling debugging 2-69 switch to router connection enabling Cisco-recommended features 2-183 switch to switch connection enabling Cisco-recommended features 2-185 switch virtual interface See SVI sw-vlan 2-72 system prompts 1-5

Т

Tab key command completion 1-1 tables characters with special meaning 1-7 mac access-list extended subcommands 2-170 match syntax description 2-20 multipliers 1-9 relationship between duplex and speed commands 2-482 show cdp neighbors detail field descriptions 2-265 show cdp neighbors field descriptions 2-264 show ip interface field descriptions 2-343 show vlan command output fields 2-437 show vtp command output fields 2-441 special characters 1-9 special characters used for anchoring 1-10 speed command options 2-189, 2-482 valid interface types 2-109 TAC displaying information useful to TAC 2-424 TCAM debugging spanning tree activities 2-67 temperature readings displaying information 2-280 timer information 2-284

traffic shaping enable on an interface 2-250 traps, enabling 2-445 trunk encapsulation setting format 2-506 trunk interfaces displaying trunk interfaces information 2-318 trust state setting 2-121 tunnel ports displaying information about Layer 2 protocol 2-358 TX queues allocating bandwidth 2-516 returning to default values 2-516 setting priority to high 2-516 specifying burst size 2-516 specifying traffic rate 2-516

U

UDLD

displaying administrative and operational status 2-426 enabling by default on all fiber interfaces 2-518 enabling on an individual interface 2-520 preventing a fiber interface from being enabled 2-520 resetting all shutdown ports 2-522 setting the message timer 2-518 Unidirectional Link Detection See UDLD unknown multicast traffic, preventing 2-491 unknown unicast traffic, preventing 2-491 user EXEC mode, summary 1-5 username setting password and privilege level 2-524

V

VACLs

access-group mode 2-5 applying VLAN access maps 2-534 displaying VLAN access map information 2-431 specifying an action in a VLAN access map 2-8 specifying the match clause for a VLAN access-map sequence 2-188 using a VLAN filter 2-534 VLAN applying an ARP ACL 2-115 configuring 2-527 converting to RSPAN VLAN 2-244 displaying CEF information 2-324 displaying CEF next-hop information 2-324 displaying information on switch interfaces 2-334, 2-338 displaying information on VLAN switch interfaces 2-341 displaying information sorted by group IP address 2-334, 2-338 displaying IP address and version information 2-334, 2 - 338displaying Layer 2 VLAN information 2-428 displaying statistical information 2-381 displaying VLAN information 2-430 enabling dynamic ARP inspection 2-124 enabling Explicit Host Tracking 2-147 enabling guest per-port 2-82 entering VLAN configuration mode 2-531 native frames enabling tagging on all 802.1Q trunk ports 2-533 pruning the list for VTP 2-506 setting the list of allowed 2-506 VLAN Access Control Lists See VACLs VLAN access map See VACLs VLAN database resetting 2-246

VLAN debugging limiting output 2-48 VLAN manager debugging 2-72 disabling debugging 2-72 IOS file system error tests debugging 2-73 disabling debugging 2-73 VLAN Query Protocol See VQP VLAN query protocol (VQPC) debugging 2-77 **VLANs** clearing counters 2-41 clearing hardware logic 2-25 configuring internal allocation scheme 2-535 displaying internal VLAN allocation information 2-434 RSPAN VLANs 2-438 entering VLAN configuration mode 2-531 VMPS configuring servers 2-539 reconfirming dynamic VLAN assignments 2-537 voice VLANs enabling 2-487 VoIP configuring auto-QoS 2-12 VQP per-server retry count 2-538 reconfirming dynamic VLAN assignments 2-537 VTP configuring the administrative domain name 2-543 configuring the device in VTP client mode 2-542 configuring the device in VTP server mode 2-546 configuring the device in VTP transparent mode 2-547 configuring tunnel encapsulation rate 2-166 creating a VTP domain password 2-544

displaying domain information 2-440 displaying statistics information 2-440 enabling protocol tunneling for 2-162 enabling pruning in the VLAN database 2-545 enabling VTP version 2 mode 2-548 modifying the VTP configuration storage file name 2-541 set drop threshold for 2-164 VTP protocol code activating debug messages 2-75 deactivating debug messages 2-75 Index

Acronyms

Α

ACE	access control entry
ACL	access control list
AFI	authority and format identifier
Agport	aggregation port
AMP	Active Monitor Present
APaRT	Automated Packet Recognition and Translation
ARP	Address Resolution Protocol

В

BGP	Border Gateway Protocol
BPDU	bridge protocol data unit
BRF	bridge relay function
BSC	Bisync
BSTUN	Block Serial Tunnel
BUS	broadcast and unknown server
BVI	bridge-group virtual interface

C	-
САМ	content-addressable memory
CAR	committed access rate
CCA	circuit card assembly
CDP	Cisco Discovery Protocol
CEF	Cisco Express Forwarding
СНАР	Challenge Handshake Authentication Protocol
CIR	committed information rate
CLI	command-line interface
CLNS	Connection-Less Network Service
CMNS	Connection-Mode Network Service
COPS	Common Open Policy Server
COPS-DS	Common Open Policy Server Differentiated Services
CoS	class of service
CPLD	Complex Programmable Logic Device
CRC	cyclic redundancy check
CRF	concentrator relay function
CST	Common Spanning Tree

D

DAI	Dynamic ARP Inspection
DBL	Dynamic Buffer Limiting
DCC	Data Country Code
dCEF	distributed Cisco Express Forwarding
DDR	dial-on-demand routing
DE	discard eligibility

DEC	Digital Equipment Corporation
DFI	Domain-Specific Part Format Identifier
DFP	Dynamic Feedback Protocol
DISL	Dynamic Inter-Switch Link
DLC	Data Link Control
DLSw	Data Link Switching
DMP	data movement processor
DNS	Domain Name System
DoD	Department of Defense
DOS	denial of service
DRAM	dynamic RAM
DRiP	Dual Ring Protocol
DSAP	destination service access point
DSCP	differentiated services code point
DSPU	downstream SNA Physical Units
DTP	Dynamic Trunking Protocol
DTR	data terminal ready
DVMRP	Distance Vector Multicast Rotuing Protocol
DXI	data exchange interface

Ε

EAP	Extensible Authentication Protocol
EARL	Enhanced Address Recognition Logic
EEPROM	electrically erasable programmable read-only memory
EHSA	enhanced high system availability

EIA	Electronic Industries Association
ELAN	Emulated Local Area Network
EOBC	Ethernet out-of-band channel
ESI	end-system identifier

F

FECN	forward explicit congestion notification
FM	feature manager
FRU	field replaceable unit
FSM	feasible successor metrics

G

GARP	General Attribute Registration Protocol
GMRP	GARP Multicast Registration Protocol
GVRP	GARP VLAN Registration Protocol

I

ICC	Inter-card Communication
ICD	International Code Designator
ICMP	Internet Control Message Protocol
IDB	interface descriptor block
IDP	initial domain part or Internet Datagram Protocol
IDPROM	ID Programmable Read-Only Memory
IFS	IOS File System
IGMP	Internet Group Management Protocol
IGRP	Interior Gateway Routing Protocol

L

ILMI	Integrated Local Management Interface
IP	Internet Protocol
IPC	interprocessor communication
IPX	Internetwork Packet Exchange
IS-IS	Intermediate System-to-Intermediate System Intradomain Routing Protocol
ISL	Inter-Switch Link
ISO	International Organization of Standardization
ISR	Integrated SONET router

L L2 Layer 2 L3 Layer 3 L4 Layer 4 LAN local area network LANE LAN Emulation LAPB Link Access Procedure, Balanced LDA Local Director Acceleration LCP Link Control Protocol LEC LAN Emulation Client LECS LAN Emulation Configuration Server LEM link error monitor LER link error rate LES LAN Emulation Server LLC Logical Link Control LTL Local Target Logic

MAC	Media Access Control
MD5	Message Digest 5
MET	Multicast Expansion Table
MFIB	Multicast Forwarding Information Base
MIB	Management Information Base
MII	media-independent interface
MLS	Multilayer Switching
MLSE	maintenance loop signaling entity
MOP	Maintenance Operation Protocol
MOTD	message-of-the-day
MRM	multicast routing monitor
MRQ	Multicast Replication Queue
MSDP	Multicast Source Discovery Protocol
MST	Multiple Spanning Tree
MTU	maximum transmission unit
MVAP	multiple VLAN access port

Ν

Μ

NBP	Name Binding Protocol
NCIA	Native Client Interface Architecture
NDE	NetFlow Data Export
NET	network entity title
NetBIOS	Network Basic Input/Output System
NFFC	NetFlow Feature Card
NMP	Network Management Processor

NSAP	network service access point
NTP	Network Time Protocol
NVRAM	nonvolatile RAM

Ο

OAM	Operation, Administration, and Maintenance
OSI	Open System Interconnection
OSPF	open shortest path first

Ρ

PAE	port access entity
PAgP	Port Aggregation Protocol
PBD	packet buffer daughterboard
PC	Personal Computer (formerly PCMCIA)
РСМ	pulse code modulation
PCR	peak cell rate
PDP	policy decision point
PDU	protocol data unit
PEM	Power Entry Module
PEP	policy enforcement point
PGM	Pragmatic General Multicast
РНҮ	physical sublayer
PIB	policy information base
PIM	Protocol Independent Multicast
РМ	Port manager
PPP	Point-to-Point Protocol

PRID	Policy Rule Identifiers
PVLAN	Private VLAN

PVST+ Per VLAN Spanning Tree+

Q

QM	QoS manager
QoS	quality of service

R

RACL	router interface access control list
RADIUS	Remote Access Dial-In User Service
RAM	random-access memory
RCP	Remote Copy Protocol
RGMP	Router Group Management Protocol
RIF	Routing Information Field
RMON	remote network monitor
ROM	read-only memory
RP	route processor or rendezvous point
RPC	remote procedure call
RPF	reverse path forwarding
RPR	Router Processor Redundancy
RSPAN	remote SPAN
RST	reset
RSVP	ReSerVation Protocol
Rx	Receive

S

SAID	Security Association Identifier
SAP	service access point
SCM	service connection manager
SCP	Switch-Module Configuration Protocol
SDLC	Synchronous Data Link Control
SGBP	Stack Group Bidding Protocol
SIMM	single in-line memory module
SLB	server load balancing
SLCP	Supervisor Line-Card Processor
SLIP	Serial Line Internet Protocol
SMDS	Software Management and Delivery Systems
SMF	software MAC filter
SMP	Standby Monitor Present
SMRP	Simple Multicast Routing Protocol
SMT	Station Management
SNAP	Subnetwork Access Protocol
SNMP	Simple Network Management Protocol
SPAN	Switched Port Analyzer
SRB	source-route bridging
SRT	source-route transparent bridging
SSTP	Cisco Shared Spanning Tree
STP	Spanning Tree Protocol
SVC	switched virtual circuit
SVI	switched virtual interface

Т

TACACS+	Terminal Access Controller Access Control System Plus
TARP	Target Identifier Address Resolution Protocol
TCAM	Ternary Content Addressable Memory
TCL	table contention level
TCP/IP	Transmission Control Protocol/Internet Protocol
TFTP	Trivial File Transfer Protocol
TIA	Telecommunications Industry Association
TLV	type-length-value
TopN	Utility that allows the user to analyze port traffic by reports
TOS	type of service
TrBRF	Token Ring Bridge Relay Function
TrCRF	Token Ring Concentrator Relay Function
TTL	Time To Live
TVX	valid transmission
Tx	Transmit

U

UDLD UniDirectional Link Detection Protocol

- UDP User Datagram Protocol
- UNI User-Network Interface
- UTC Coordinated Universal Time

V

VACL VLAN access control list

VCC	virtual channel circuit
VCD	virtual circuit descriptor
VCI	virtual circuit identifier
VCR	Virtual Configuration Register
VINES	Virtual Network System
VLAN	virtual LAN
VMPS	VLAN Membership Policy Server
VTP	VLAN Trunking Protocol
VVID	voice VLAN ID

W

WFQ	weighted fair queueing
WRED	weighted random early detection
WRR	weighted round-robin

Χ

XNS Xerox Network System

Acknowledgments for Open-Source Software

The Catalyst operating system software pipe command uses Henry Spencer's regular expression library (regex). The most recent version of the library has been modified slightly in the Catalyst operating system software to maintain compatibility with earlier versions of the library.
