## fltVnicEtherIfVlanAccessFault

**Fault Code:** F1000390

### Message

The named vlan [name] for vNIC [name] cannot be accessed from org [name]

### Explanation

This fault typically occurs when a Service Profile's vnic interface (LAN) is resolvable but the service profile does not have access to the vlan.

### Recommended Action

This fault will be removed if you perform one of the following actions:

- 
- Step 1** Change the vnic's interface name to a VLAN that you have access to.
  - Step 2** Configure access to the named vlan by creating a vlan permit or vlan group permit in the service profile's org (or a parent org).

## fltVnicEtherIfVlanSyncFault

**Fault Code:** F10000391

### Message

The named vlan [name] for vNIC [name] cannot be pushed to UCSM

### Explanation

The vlan was unable to be pushed down to UCSM. This fault typically occurs if a vlan with the same name already exists on the UCSM do main or the vlan id cannot be set because it is already taken.

### Recommended Action

If you see this fault, take the following actions:

- 
- Step 1** If the vlan already exists on the UCSM domain, delete the local vlan.
  - Step 2** If the vlan id is already taken, change the vlan id.
  - Step 3** If the vlan does not exist, delete the vnic reference.
  - Step 4** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

## fltVnicFcIfVsanSyncFault

**Fault Code:** F1000392

### Message

The named vsan [name] for vHBA [name] cannot be pushed to UCSM

### Explanation

The vsan was unable to be pushed down to UCSM. This fault typically occurs if a vsan with the same name already exists on the UCSM domain or the vsan id cannot be set because it is already taken.

### Recommended Action

If you see this fault, take the following actions:

- 
- Step 1** If the vsan already exists on the UCSM domain, delete the local vsan.
  - Step 2** If the vsan id is already taken, change the vsan id.
  - Step 3** If the vsan does not exist, delete the vHBA reference.
  - Step 4** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

## fltLsSPMetaUngrouped-domain

**Fault Code:** F10000396

### Message

Unable to resolve Vsans/vlans. Service profile deployed on [serverDn] failed due to an ungrouped domain.

### Explanation

Server deployment failed . This fault typically occurs if the service profile uses a Vlan or a Vsan, but it is deployed on a physical blade/server that belongs to an ungrouped domain .

### Recommended Action

If you see this fault, take the following actions:

-

## fltLsServerConfigFailure

**Fault Code:** F10000399

### Message

Service profile [name] configuration failed due to [configQualifier]

### Explanation

The named configuration qualifier is not available. This fault typically occurs because Cisco UCS Manager cannot successfully deploy the service profile due to a lack of resources that meet the named qualifier. For example, this fault can occur if the following occurs:

- The service profile is configured for a server adapter with vHBAs, and the adapter on the server does not support vHBAs.
- The service profile is created from a template which includes a server pool, and the server pool is empty.
- The local disk configuration policy in the service profile specifies the No Local Storage mode, but the server contains local disks.

### Recommended Action

If you see this fault, take the following actions:

- 
- Step 1** Check the status of the server pool associated with the service profile. If the pool is empty, add more blade servers to it.
- Step 2** Check the state of the server and ensure that it is in either the discovered or unassociated state.
- Step 3** If the server is associated or undiscovered, do one of the following:
- Discover the server.
  - Disassociate the server from the current service profile.
  - Select another server to associate with the service profile.
- Step 4** Review each policy in the service profile and verify that the selected server meets the requirements in the policy.
- Step 5** If the server does not meet the requirements of the service profile, do one of the following:
- Modify the service profile to match the server.
  - Select another server that does meet the requirements to associate with the service profile.
- Step 6** If you can verify that the server meets the requirements of the service profile, create a **show tech-support** file and contact Cisco TAC.

## fltVnicEtherIfPrimaryVlanAccessFaultForIsolated

**Fault Code:** F10000797

### Message

Primary vlan cannot be accessed from org [name] for isolated vlan [name]

### Explanation

This fault typically occurs when a Service Profile's vnic interface (LAN) is resolvable but the service profile does not have access to the vlan.

### Recommended Action

This fault will be removed if you perform one of the following actions:

- 
- Step 1** Change the vnic's interface name to a VLAN that you have access to.
  - Step 2** Configure access to the named vlan by creating a vlan permit or vlan group permit in the service profile's org (or a parent org).

## fltVnicEtherIfPrimaryVlanAccessFaultForCommunity

**Fault Code:** F10000798

### Message

Primary vlan cannot be accessed from org [name] for community vlan [name]

### Explanation

This fault typically occurs when a Service Profile's vnic interface (LAN) is resolvable but the service profile does not have access to the vlan.

### Recommended Action

This fault will be removed if you perform one of the following actions:

- 
- Step 1** Change the vnic's interface name to a VLAN that you have access to.
  - Step 2** Configure access to the named vlan by creating a vlan permit or vlan group permit in the service profile's org (or a parent org).
