fltVnicEtherIfVlanAccessFault

Fault Code: F10000390

Message

The named vlan [name] for vNIC [name] cannot be accessed from org [name]

Explanation

This fault typically occurs when a Service Profile's vnic interface (LAN) is resolvable but the service profile does not have access to the vlan.

Recommended Action

This fault will be removed if you perform one of the following actions:

Step 1 Change the vnic's interface name to a VLAN that you have access to.

Step 2 Configure access to the named vlan by creating a vlan permit or vlan group permit in the service profile's org (or a parent org).

Fault Details

```
Severity: major
Cause: inaccessible-vlan-referenced

fltVnicEtherIfVlanSyncFault

Fault Code: F10000391

Message

The named vlan [name] for vNIC [name] cannot be pushed to UCSM

Explanation

The vlan was unable to be pushed down to UCSM. This fault typically occurs if a vlan with the same name already exists on the UCSM do main or the vlan id cannot be set because it is already taken.

Recommended Action

If you see this fault, take the following actions:

Step 1 If the vlan already exists on the UCSM domain, delete the local vlan.

Step 2 If the vlan id is already taken, change the vlan id.

Step 3 If the vlan does not exist, delete the vnic reference.

Step 4 If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltVnicFcIfVsanSyncFault

Fault Code: F10000392

Message

The named vsan [name] for vHBA [name] cannot be pushed to UCSM

Explanation

The vsan was unable to be pushed down to UCSM. This fault typically occurs if a vsan with the same name already exists on the UCSM domain or the vsan id cannot be set because it is already taken.

Recommended Action

If you see this fault, take the following actions:

Step 1   If the vsan already exists on the UCSM domain, delete the local vsan.

Step 2   If the vsan id is already taken, change the vsan id.

Step 3   If the vsan does not exist, delete the vhba reference.

Step 4   If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltLsSPMetaUngrouped-domain

Fault Code: F10000396

Message

Unable to resolve Vsans/vlans. Service profile deployed on [serverDn] failed due to an ungrouped domain.

Explanation

Server deployment failed . This fault typically occurs if the service profile uses a Vlan or a Vsan, but it is deployed on a physical blade/server that belongs to an ungrouped domain .

Recommended Action

If you see this fault, take the following actions:

Step 1   add the UCS of the physical server to a domain

Step 2   Remove the interface name from the Vnic: remove the usage of the Vlan or Vsan from the service profile

Fault Code: F10000397

Message

Service profile [name] failed

Explanation

Server has failed. This fault typically occurs if the adapter power on self-test results in major and critical errors.

Recommended Action

If you see this fault, take the following actions:

Step 1   Check the POST results for the server. In Cisco UCS Manager GUI, you can access the POST results from the General tab for the server. In Cisco UCS Manager CLI, you can access the POST results through the **show post** command under the scope for the server.

Message

Service profile [name] discovery failed

Explanation

The shallow discovery that occurs when the server associated with service profile fails. If the server is up and the data path is working, this fault typically occurs as a result of one of the following issues:

- Cisco UCS Manager cannot communicate with the CIMC on the server.

- The server cannot communicate with the fabric interconnect.

Recommended Action

If you see this fault, take the following actions:

Step 1 Check the FSM tab and view the current state of the server and any FSM operations.

Step 2 Check the error descriptions and see if any server components indicate a failure.

Step 3 If the server or a server component has failed, do the following:

  a. Check the operational state of the server.

  b. If the server is not operable, reacknowledge the server.

Step 4 If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltLsServerConfigFailure

Fault Code: F10000399

Message

Service profile [name] configuration failed due to [configQualifier]

Explanation

The named configuration qualifier is not available. This fault typically occurs because Cisco UCS Manager cannot successfully deploy the service profile due to a lack of resources that meet the named qualifier. For example, this fault can occur if the following occurs:

- The service profile is configured for a server adapter with vHBAs, and the adapter on the server does not support vHBAs.

- The service profile is created from a template which includes a server pool, and the server pool is empty.
- The local disk configuration policy in the service profile specifies the No Local Storage mode, but the server contains local disks.

Recommended Action

If you see this fault, take the following actions:

Step 1 Check the status of the server pool associated with the service profile. If the pool is empty, add more blade servers to it.

Step 2 Check the state of the server and ensure that it is in either the discovered or unassociated state.

Step 3 If the server is associated or undiscovered, do one of the following:

- Discover the server.
- Disassociate the server from the current service profile.
- Select another server to associate with the service profile.

Step 4 Review each policy in the service profile and verify that the selected server meets the requirements in the policy.

Step 5 If the server does not meet the requirements of the service profile, do one of the following:

- Modify the service profile to match the server.
- Select another server that does meet the requirements to associate with the service profile.

Step 6 If you can verify that the server meets the requirements of the service profile, create a **show tech-support** file and contact Cisco TAC.

Explanation

Cisco UCS Manager cannot access the server associated with the service profile. This fault typically occurs as a result of one of the following issues:

- The server has been physically removed from the slot.

- The server is not available.

Recommended Action

If you see this fault, take the following actions:

Step 1   If the server was removed from the slot, reinsert the server in the slot.

Step 2   If the server was not removed, remove and reinsert the server.**NOTE:** If the server is operable, this action can be disruptive to current operations.

fltLsIssuesConfigFailure

Fault Code: F10000571

Message

Service profile [name] configuration failed due to [iscsiConfigIssues] [networkConfigIssues] [serverConfigIssues] [storageConfigIssues] [vnicConfigIssues]

Explanation

The named configuration qualifier is not available. This fault typically occurs because Cisco UCS Manager cannot successfully deploy the service profile due to a lack of resources that meet the named qualifier. For example, this fault can occur if the following occurs:

- The service profile is configured for a server adapter with vHBAs, and the adapter on the server does not support vHBAs.
- The service profile is created from a template which includes a server pool, and the server pool is empty.
- The local disk configuration policy in the service profile specifies the No Local Storage mode, but the server contains local disks.

Recommended Action

If you see this fault, take the following actions:

Step 1   Check the status of the server pool associated with the service profile. If the pool is empty, add more blade servers to it.

Step 2   Check the state of the server and ensure that it is in either the discovered or unassociated state.

Step 3   If the server is associated or undiscovered, do one of the following:

- Discover the server.
- Disassociate the server from the current service profile.
- Select another server to associate with the service profile.

Step 4   Review each policy in the service profile and verify that the selected server meets the requirements in the policy.

Step 5   If the server does not meet the requirements of the service profile, do one of the following:

- Modify the service profile to match the server.
- Select another server that does meet the requirements to associate with the service profile.

Step 6   If you can verify that the server meets the requirements of the service profile, create a **show tech-support** file and contact Cisco TAC.

fltVnicFaultVlanSyncFault

Fault Code: F10000572

Message

The named vXan [name] cannot be pushed to UCSM. UCSM Message - [descr]

Explanation

The vlan/vsan was unable to be pushed down to UCSM. This fault typically occurs if a vlan/vsan with the same name already exists on the UCSM domain or the vlan/vsan id cannot be set because it is already taken. Please check the fault message for details.

Recommended Action

If you see this fault, take the following actions:

Step 1 If the vlan/vsan already exists on the UCSM domain, delete the local vlan/vsan.

Step 2 If the vlan/vsan id is already taken, change the vlan/vsan id.

Step 3 If the vlan/vsan does not exist, delete the vnic/vhba reference.

Step 4 If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltVnicMgmtIfVlanUnresolvable

Fault Code: F10000573

Message

The named vlan [name] for vNIC [name] cannot be resolved

Explanation

This fault (warning) occurs when a Service Profile's vnic interface (LAN) is unresolvable.

Recommended Action

This fault will be removed if you perform one of the following actions:

Step 1   Change the vnic interface name to an existing VLAN.

Step 2   Create the named vlan .

fltVnicMgmtIfVlanAccessFault

Fault Code: F10000574

Message

The named vlan [name] for vNIC [name] cannot be accessed from org [name]

Explanation

This fault typically occurs when a Service Profile's vnic interface (LAN) is resolvable but the service profile does not have access to the vlan.

Recommended Action

This fault will be removed if you perform one of the following actions:

Step 1   Change the vnic's interface name to a VLAN that you have access to.

Step 2   Configure access to the named vlan by creating a vlan permit or vlan group permit in the service profile's org (or a parent org).

fltVnicMgmtIfVlanSyncFault

Fault Code: F10000575

Message

The named vlan [name] for vNIC [name] cannot be pushed to UCSM

Explanation

The vlan was unable to be pushed down to UCSM. This fault typically occurs if a vlan with the same name already exists on the UCSM domain or the vlan id cannot be set because it is already taken.

Recommended Action

If you see this fault, take the following actions:

Step 1 If the vlan already exists on the UCSM domain, delete the local vlan.

Step 2 If the vlan id is already taken, change the vlan id.

Step 3 If the vlan does not exist, delete the vnic reference.

Step 4 If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltVnicEtherIfPrimaryVlanAccessFaultForIsolated

Fault Code: F10000797

Message

Primary vlan cannot be accessed from org [name] for isolated vlan [name]

Explanation

This fault typically occurs when a Service Profile's vnic interface (LAN) is resolvable but the service profile does not have access to the vlan.

Recommended Action

This fault will be removed if you perform one of the following actions:

Step 1   Change the vnic's interface name to a VLAN that you have access to.

Step 2   Configure access to the named vlan by creating a vlan permit or vlan group permit in the service profile's org (or a parent org).

fltVnicEtherIfPrimaryVlanAccessFaultForCommunity

Fault Code: F10000798

Message

Primary vlan cannot be accessed from org [name] for community vlan [name]

Explanation

This fault typically occurs when a Service Profile's vnic interface (LAN) is resolvable but the service profile does not have access to the vlan.

Recommended Action

This fault will be removed if you perform one of the following actions:

Step 1   Change the vnic's interface name to a VLAN that you have access to.

Step 2   Configure access to the named vlan by creating a vlan permit or vlan group permit in the service profile's org (or a parent org).
