

# **Network Parameters**

- Prerequisites for Defining Network Parameters, on page 1
- Restrictions for Defining Network Parameters, on page 1
- Information About Defining Network Parameters, on page 2
- Define Network Parameters, on page 4
- Configuration Examples for Network Parameters, on page 24
- Where to Go Next, on page 25
- Feature Information for Network Parameters, on page 25

# **Prerequisites for Defining Network Parameters**

- IP routing must be enabled.
- VoIP networking must be operational. For quality and security purposes, we recommend you have separate virtual LANs (VLANs) for data and voice. The IP network assigned to each VLAN should be large enough to support addresses for all nodes on that VLAN. Cisco Unified CME phones receive their IP addresses from the voice network, whereas all other nodes such as PCs, servers, and printers receive their IP addresses from the data network. For configuration information, see Configure VLANs on a Cisco Switch.
- If applicable, PSTN lines are configured and operational.
- If applicable, the WAN links are configured and operational.
- Trivial File Transfer Protocol (TFTP) must be enabled on the router to allow IP phones to download phone firmware files.
- To support IP phones that are running SIP to be directly connected to the Cisco Unified CME router, Cisco Unified CME 3.4 or later must be installed on the router.
- To provide voice-mail support for phones connected to the Cisco Unified CME router, install and configure voice mail on your network.

# **Restrictions for Defining Network Parameters**

In Cisco Unified CME 4.0 and later versions, Layer-3-to-Layer-2 VLAN Class of Service (CoS) priority marking is not automatically processed. Cisco Unified CME 4.0 and later versions will continue to mark Layer

3, but Layer 2 marking is now only handled in the Cisco IOS software. Any Quality of Service (QoS) design that requires Layer 2 marking will have to be explicitly configured, either on a Catalyst switch that supports this capability or on the Cisco Unified CME router under the Ethernet interface configuration. For configuration information, see Enterprise QoS Solution Reference Network Design Guide.

# **Information About Defining Network Parameters**

### **DHCP Service**

When a Cisco Unified IP phone is connected to the Cisco Unified CME system, it automatically queries for a Dynamic Host Configuration Protocol (DHCP) server. The DHCP server responds by assigning an IP address to the Cisco Unified IP phone and providing the IP address of the TFTP server through DHCP option 150. Then the phone registers with the Cisco Unified CME server and attempts to get configuration and phone firmware files from the TFTP server.

For configuration information, perform only *one* of the following procedures to set up DHCP service for your IP phones:

- If your Cisco Unified CME router is the DHCP server and you can use a single shared address pool for all your DHCP clients, see Configure Single DHCP IP Address Pool, on page 7.
- If your Cisco Unified CME router is the DHCP server and you need separate pools for non-IP-phone DHCP clients, see Configure Separate DHCP IP Address Pool for Each DHCP Client, on page 9.
- If the Cisco Unified CME router is not the DHCP server and you want to relay DHCP requests from IP
  phones to a DHCP server on a different router, see Configure DHCP Relay, on page 11.

### Network Time Protocol for the Cisco Unified CME Router

Network Time Protocol (NTP) allows you to synchronize your Cisco Unified CME router to a single clock on the network, which is known as the clock primary. NTP is disabled on all interfaces by default, but it is essential for Cisco Unified CME so you must ensure that it is enabled. For information about configuring NTP for the Cisco Unified CME router, see Enable Network Time Protocol, on page 12.

### **Olson Timezones**

Before Cisco Unified CME 9.0, some Cisco Unified SCCP IP phones and Cisco Unified SIP IP phones displayed exactly the same time as that of the Cisco Unified CME. For these phones, the correct time was displayed whenever the Cisco Unified CME time was set correctly. The **clock timezone**, **clock summer-time**, and **clock set** commands were the only commands used to set the Cisco Unified CME time correctly.

Other phones used only the **time-zone** command in telephony-service configuration mode and the **timezone** command in voice register global configuration mode to specify which time zone they were in so that the correct local time was displayed on Cisco Unified SCCP IP phones and Cisco Unified SIP IP phones, respectively. The phones calculated and displayed the time based on the Greenwich Mean Time (GMT) provided by the Cisco Unified CME or the Network Time Protocol server. The problem with this method is that every time a new country or new time zone was available or an old time zone was changed, the Cisco Unified CME **time-zone** and **timezone** commands and the phone loads had to be updated.

In Cisco Unified CME 9.0 and later versions, the Olson Timezone feature eliminates the need to update time zone commands or phone loads to accommodate a new country with a new time zone or an existing country whose city or state wants to change their time zone. Oracle's Olson Timezone updater tool, tzupdater.jar, only needs to be current for you to set the correct time using the **olsontimezone** command in either telephony-service or voice register global configuration mode.

For Cisco Unified 3911 and 3951 SIP IP phones and Cisco Unified 6921, 6941, 6945, and 6961 SCCP and SIP IP phones, the correct Olson Timezone updater file is TzDataCSV.csv. The TzDataCSV.csv file is created based on the tzupdater.jar file.

To set the correct time zone, you must determine the Olson Timezone area/location where the Cisco Unified CME is located and download the latest tzupdater.jar or TzDataCSV.csv to a TFTP server that is accessible to the Cisco Unified CME, such as flash or slot 0.

After a complete reboot, the phone checks if the version of its configuration file is earlier or later than 2010o. If it is earlier, the phone loads the latest tzupdater.jar and uses that updater file to calculate the Olson Timezone.

To make the Olson Timezone feature backward compatible, both the **time-zone** and **timezone** commands are retained as legacy time zones. Because the **olsontimezone** command covers approximately 500 time zones (Version 2010o of the tzupdater.jar file supports approximately 453 Olson Timezone IDs.), this command takes precedence when either the **time-zone** or the **timezone** command (that covers a total of 90 to 100 time zones only) is present at the same time as the **olsontimezone** command.

For more information on setting the time zone so that the correct local time is displayed on an IP phone, see Set Olson Timezone for SCCP Phones, on page 13 or Set Olson Timezone for SIP Phones, on page 16.

### **DTMF** Relay

IP phones connected to Cisco Unified CME systems require the use of out-of-band DTMF relay to transport DTMF (keypad) digits across VoIP connections. The reason for this is that the codecs used for in-band transport may distort DTMF tones and make them unrecognizable. DTMF relay solves the problem of DTMF tone distortion by transporting DTMF tones out-of-band, or separate, from the encoded voice stream.

For IP phones on H.323 networks, DTMF is relayed using the H.245 alphanumeric method, which is defined by the ITU H.245 standard. This method separates DTMF digits from the voice stream and sends them as ASCII characters in H.245 user input indication messages through the H.245 signaling channel instead of the RTP channel. For information about configuring a DTMF relay in a multisite installation, see Configure DTMF Relay for H.323 Networks in Multisite Installations, on page 19.

To use remote voice-mail or IVR applications on SIP networks from Cisco Unified CME phones, the DTMF digits used by the Cisco Unified CME phones must be converted to the RFC 2833 in-band DTMF relay mechanism used by SIP phones. The SIP DTMF relay method is needed in the following situations:

- When SIP is used to connect a Cisco Unified CME system to a remote SIP-based IVR or voice-mail application.
- When SIP is used to connect a Cisco Unified CME system to a remote SIP-PSTN voice gateway that goes through the PSTN to a voice-mail or IVR application.

The requirement for out-of-band DTMF relay conversion is limited to SCCP phones. SIP phones natively support in-band DTMF relay as specified in RFC 2833.

To use voice mail on a SIP network that connects to a Cisco Unity Express system, which uses a nonstandard SIP Notify format, the DTMF digits used by the Cisco Unified CME phones must be converted to the Notify format. Additional configuration may be required for backward compatibility with Cisco CME 3.0 and 3.1.

For configuration information about enabling DTMF relay for SIP networks, see Configure SIP Trunk Support, on page 20.

### **SIP Register Support**

SIP register support enables a SIP gateway to register E.164 numbers with a SIP proxy or SIP registrar, similar to the way that H.323 gateways can register E.164 numbers with a gatekeeper. SIP gateways allow registration of E.164 numbers to a SIP proxy or registrar on behalf of analog telephone voice ports (FXS) and IP phone virtual voice ports (EFXS) for local SCCP phones.

When registering E.164 numbers in dial peers with an external registrar, you can also register them with a secondary SIP proxy or registrar to provide redundancy. The secondary registration can be used if the primary registrar fails.

Note No commands allow registration between the H.323 and SIP protocols.

By default, SIP gateways do not generate SIP Register messages, so the gateway must be configured to register the gateway's E.164 telephone numbers with an external SIP registrar. For information about configuring the SIP gateway to register phone numbers with Cisco Unified CME, see Configure SIP Trunk Support, on page 20.

Note

When you configure SIP on a router, the ports on all its interfaces are open by default. This makes the router vulnerable to malicious attackers who can execute toll fraud across the gateway if the router has a public IP address and a public switched telephone network (PSTN) connection. To eliminate the threat, you should bind an interface to private IP address that is not accessible by untrusted hosts. In addition, you should protect any public or untrusted interface by configuring a firewall or an access control list (ACL) to prevent unwanted traffic from traversing the router.

# **Define Network Parameters**

### Enable Calls in Your VoIP Network

Restriction

- SIP endpoints are not supported on H.323 trunks. SIP endpoints are supported on SIP trunks only.
  - Cisco Unified CME 3.4 and later versions support Media Flow-through mode only; enabling SIP-to-SIP calls is required before you can successfully make SIP-to-SIP calls.
  - Media Flow-around configured with the **media flow-around** command is not supported by Cisco Unified CME with SIP phones.

#### **SUMMARY STEPS**

- 1. enable
- **2**. configure terminal
- **3**. voice service voip
- **4**. **allow-connections** *from-type* **to** *to-type*
- 5. sip
- 6. registrar server [expires [max sec] [min sec]]
- 7. exit
- 8. sip-ua
- 9. notify telephone-event max-duration *time*
- **10.** registrar {dns:host-name | ipv4:ip-address} expires seconds [tcp] [secondary]
- **11.** retry register *number*
- **12.** timers register *time*
- 13. end

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	voice service voip	Enters voice service configuration mode and specifies
	Example:	Voice over IP (VoIP) encapsulation.
	Router(config) # voice service voip	
Step 4	allow-connections from-type to to-type	Enables calls between specific types of endpoints in a V
	Example:	network.
	Router(config-voi-srv)# allow-connections h323 to h323	• A separate allow-connections command is required for each type of endpoint to be supported.
	Router(config-voi-srv)# allow-connections h323 to SIP	
	Router(config-voi-srv)# allow-connections SIP to SIP	
Step 5	sip	(Optional) Enters SIP configuration mode.
	Example:	• Required if you are connecting IP phones running
	Router(config-voi-srv)# sip	SIP directly in Cisco CME 3.4 and later.
Step 6	registrar server [expires [max sec] [min sec]]	(Optional) Enables SIP registrar functionality in
	Example:	Cisco Unified CME.

I

	Command or Action	Purpose
	Router(config-voi-sip)# registrar server expires max 600 min 60	• Required if you are connecting IP phones running SIP directly in Cisco CME 3.4 and later.
		Note Cisco Unified CME does not maintain a persistent database of registration entries across reloads. Because SIP phones do not use a keepalive functionality, the SIP phones must register again. To decrease the amount of time after which the SIP phones register again, we recommend that you change the expiry.
		• max sec—(Optional) Range: 600 to 86400. Default: 3600. Recommended value: 600.
		<b>Note</b> Ensure that the registration expiration timeout is set to a value smaller than the TCP connection aging timeout to avoid disconnection from the TCP.
		• min <i>sec</i> —(Optional) Range: 60 to 3600. Default: 60.
Step 7	exit	Exits dial-peer configuration mode.
	Example:	
	Router(config-voi-sip)# exit	
Step 8	sip-ua	Enters SIP user-agent configuration mode.
	Example:	
	Router(config)# sip-ua	
Step 9	<pre>notify telephone-event max-duration time Example: Router(config-sip-ua)# notify telephone-event max-duration 2000</pre>	Configures the maximum time interval allowed between two consecutive NOTIFY messages for a single DTMF event. • max-duration <i>time</i> —Range: 500 to 3000. Default: 2000.
Step 10	<pre>registrar {dns:host-name   ipv4:ip-address} expires seconds [tcp] [secondary]</pre>	Registers E.164 numbers on behalf of analog telephone voice ports (FXS) and IP phone virtual voice ports (EFXS)
	<b>Example:</b> Router(config-sip-ua)# registrar ipv4:10.8.17.40 expires 3600 secondary	with an external SIP proxy or SIP registrar server.
Step 11	retry register <i>number</i> Example:	Sets the total number of SIP Register messages that the gateway should send.
	Router(config-sip-ua)# retry register 10	• <i>number</i> —Number of Register message retries. Range: 1 to 10. Default: 10.

	Command or Action	Purpose
Step 12	timers register time	<ul> <li>Sets how long the SIP user agent (UA) waits before sending Register requests.</li> <li><i>time</i>—Waiting time, in milliseconds. Range: 100 to 1000. Default: 500.</li> </ul>
	Example:	
	Router(config-sip-ua)# timers register 500	
Step 13	end	Exits configuration mode and enters privileged EXEC
	Example:	mode.
	Router(config-sip-ua)# end	

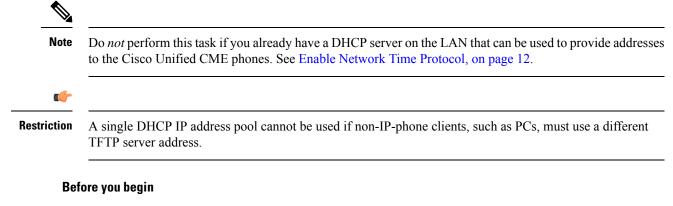

### **Configure DHCP**

To set up DHCP service for your DHCP clients, perform only one of the following procedures:

- If your Cisco Unified CME router is the DHCP server and you can use a single shared address pool for all your DHCP clients, see Configure Single DHCP IP Address Pool, on page 7.
- If your Cisco Unified CME router is the DHCP server and you need separate pools for each IP phone and each non-IP-phone DHCP client, see Configure Separate DHCP IP Address Pool for Each DHCP Client, on page 9.
- If the Cisco Unified CME router is not the DHCP server and you want to relay DHCP requests from IP phones to a DHCP server on a different router, see Configure DHCP Relay, on page 11.

### **Configure Single DHCP IP Address Pool**

To create a shared pool of IP addresses for all DHCP clients, perform the following step.

Your Cisco Unified CME router is a DHCP server.

#### SUMMARY STEPS

- 1. enable
- **2**. configure terminal
- **3.** ip dhcp pool pool-name
- 4. network *ip-address* [mask | / prefix-length]

I

- 5. option 150 ip *ip-address*
- 6. default-router *ip-address*
- **7**. end

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	ip dhcp pool pool-name	Creates a name for the DHCP server address pool and enters
	Example:	DHCP pool configuration mode.
	Router(config)# ip dhcp pool mypool	
Step 4	<b>network</b> <i>ip-address</i> [mask   / prefix-length]	Specifies the IP address of the DHCP address pool to be
	Example:	configured.
	Router(config-dhcp)# network 10.0.0.0 255.255.0.0	
Step 5	option 150 ip <i>ip-address</i>	Specifies the TFTP server address from which the
	Example:	Cisco Unified IP phone downloads the image configuration
	Router(config-dhcp)# option 150 ip 10.0.0.1	file.
		• This is your Cisco Unified CME router's address.
Step 6	default-router ip-address	(Optional) Specifies the router that the IP phones will use
	Example:	to send or receive IP traffic that is external to their local subnet.
	Router(config-dhcp)# default-router 10.0.0.1	
		• If the Cisco Unified CME router is the only router on the network, this address should be the
		Cisco Unified CME IP source address. This command
		can be omitted if IP phones need to send or receive IP traffic only to or from devices on their local subnet.
		• The IP address that you specify for default router will be used by the IP phones for fallback purposes. If the
		Cisco Unified CME IP source address becomes
		unreachable, IP phones will attempt to register to the address specified in this command.
Step 7	end	Returns to privileged EXEC mode.
	Example:	
	Router(config-dhcp)# end	

#### What to do next

- If you are configuring Cisco Unified CME for the first time on this router, you are ready to configure NTP for the Cisco Unified CME router. For more information, see Enable Network Time Protocol, on page 12.
- If you are finished modifying network parameters for an already configured Cisco Unified CME router, see Configuration Files for Phones.

### **Configure Separate DHCP IP Address Pool for Each DHCP Client**

To create a DHCP IP address pool for each DHCP client, including non-IP-phone clients such as PCs, perform the following steps.

 Note
 Do not perform this task if you already have a DHCP server on the LAN that can be used to provide addresses to the Cisco Unified CME phones. See Enable Network Time Protocol, on page 12.

**(** 

**Restriction** To use a separate DHCP IP address pool for each DHCP client, make an entry for each IP phone.

#### Before you begin

Your Cisco Unified CME router is a DHCP server.

#### SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3.** ip dhcp pool pool-name
- **4.** host *ip-address subnet-mask*
- 5. client-identifier mac-address
- 6. option 150 ip ip-address
- 7. default-router ip-address
- 8. end

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	

	Command or Action	Purpose
Step 3	<pre>ip dhcp pool pool-name Example: Router(config)# ip dhcp pool pool2</pre>	Creates a name for the DHCP server address pool and enters DHCP pool configuration mode.
Step 4	<pre>host ip-address subnet-mask Example: Router(config-dhcp)# host 10.0.0.0 255.255.0.0</pre>	Specifies the IP address that you want the phone to get.
Step 5	<pre>client-identifier mac-address Example: Router(config-dhcp)# client-identifier 01238.380.3056</pre>	<ul> <li>Specifies the MAC address of the phone, which is printed on a label on each Cisco Unified IP phone.</li> <li>A separate client-identifier command is required for each DHCP client.</li> <li>Add "01" prefix number before the MAC address.</li> </ul>
Step 6	<pre>option 150 ip ip-address Example: Router(config-dhcp)# option 150 ip 10.0.0.1</pre>	Specifies the TFTP server address from which the Cisco Unified IP phone downloads the image configuration file. • This is your Cisco Unified CME router's address.
Step 7	<pre>default-router ip-address Example: Router(config-dhcp)# default-router 10.0.0.1</pre>	<ul> <li>(Optional) Specifies the router that the IP phones will use to send or receive IP traffic that is external to their local subnet.</li> <li>If the Cisco Unified CME router is the only router on the network, this address should be the Cisco Unified CME IP source address. This command can be omitted if IP phones need to send or receive IP traffic only to or from devices on their local subnet.</li> <li>The IP address that you specify for default router will be used by the IP phones for fallback purposes. If the Cisco Unified CME IP source address becomes unreachable, IP phones will attempt to register to the address specified in this command.</li> </ul>
Step 8	end Example:	Returns to privileged EXEC mode.
	Router(config-dhcp)# end	

#### What to do next

- If you are configuring Cisco Unified CME for the first time on this router, you are ready to configure NTP for the Cisco Unified CME router. See Enable Network Time Protocol, on page 12.
- If you are finished modifying network parameters for an already configured Cisco Unified CME router, see Configuration Files for Phones.

### **Configure DHCP Relay**

C-

To set up DHCP relay on the LAN interface where the Cisco Unified IP phones are connected and enable the DHCP relay to relay requests from the phones to the DHCP server, perform the following steps.

**Restriction** The Cisco Unified CME router cannot be the DHCP server.

#### Before you begin

There is a DHCP server that is not on this Cisco Unified CME router on the LAN that can provide addresses to the Cisco Unified CME phones.

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. service dhcp
- 4. interface type number
- 5. ip helper-address ip -address
- 6. end

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	service dhcp	Enables the Cisco IOS DHCP server feature on the router.
	Example:	
	Router(config)# service dhcp	
Step 4	interface type number	Enters interface configuration mode for the specified
	Example:	interface.
	Router(config)# interface vlan 10	
Step 5	ip helper-address ip -address	Specifies the helper address for any unrecognized broadcast
	Example:	for TFTP server and DNS server requests.
	Router(config-if)# ip helper-address 10.0.0.1	• A separate <b>ip helper-address</b> command is required for each server if the servers are on different hosts.

	Command or Action	Purpose
		• You can also configure multiple TFTP server targets by using the <b>ip helper-address</b> commands for multiple servers.
Step 6	end	Returns to privileged EXEC mode.
	<pre>Example: Router(config-if)# end</pre>	

#### What to do next

- If you are configuring Cisco Unified CME for the first time on this router, you are ready to configure NTP for the Cisco Unified CME router. See Enable Network Time Protocol, on page 12.
- If you are finished modifying network parameters for an already configured Cisco Unified CME router, see Configuration Files for Phones.

### **Enable Network Time Protocol**

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- **3.** clock timezone zone hours-offset [minutes-offset]
- 4. clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]
- **5. ntp server** *ip-address*
- 6. exit

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	clock timezone zone hours-offset [minutes-offset]	Sets the local time zone.
	Example:	
	Router(config)# clock timezone pst -8	
Step 4	<b>clock summer-time</b> <i>zone</i> <b>recurring</b> [week day month <i>hh:mm</i> week day month <i>hh:mm</i> [offset]]	(Optional) Specifies daylight savings time.

	Command or Action	Purpose
	<b>Example:</b> Router(config) # clock summer-time pdt recurring	• Default: summer time is disabled. If the <b>clock</b> <b>summer-time</b> <i>zone</i> <b>recurring</b> command is specified without parameters, the summer time rules default to United States rules. Default of the <i>offset</i> argument is 60.
Step 5	ntp server ip-address	Synchronizes software clock of router with the specified
	Example:	NTP server.
	Router(config) # ntp server 10.1.2.3	
Step 6	exit	Returns to privileged EXEC mode.
	Example:	
	Router(config-telephony)# end	

#### What to do next

- If you are configuring Cisco Unified CME for the first time on this router and if you have a multisite installation, you are ready to configure a DTMF relay. See Configure DTMF Relay for H.323 Networks in Multisite Installations, on page 19.
- If Cisco Unified CME will interact with a SIP Gateway, you must set up support for the gateway. See Configure SIP Trunk Support, on page 20.
- If you are configuring Cisco Unified CME for the first time on this router and you are ready to configure system parameters. See System-Level Parameters.
- If you are finished modifying network parameters for an already configured Cisco Unified CME router, see Configuration Files for Phones.

### **Set Olson Timezone for SCCP Phones**

To set the Olson Timezone so that the correct local time is displayed on a Cisco Unified SCCP IP phone, perform the following steps.

#### Before you begin

- TzDataCSV.csv file is added to the configuration files of Cisco Unified 6921, 6941, 6945, and 6961 SCCP IP phones.
- tzupdater.jar file is added to the configuration files of Cisco Unified 7961 SCCP IP phones.

#### **SUMMARY STEPS**

- 1. enable
- **2**. configure terminal
- 3. tftp-server device: tzupdater.jar
- 4. tftp-server device: TZDataCSV.csv
- 5. telephony-service

- 6. olsontimezone timezone version number
- 7. create cnf-files
- 8. time-zone *number*
- 9. exit
- **10.** clock timezone zone hours-offset
- **11.** clock summer-time zone date date month year hh:mm date month year hh:mm
- **12**. exit
- **13.** clock set *hh:mm:ss* day month year
- **14.** configure terminal
- 15. telephony-service
- 16. reset
- 17. end

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	tftp-server device: tzupdater.jar	Enables access to the tzupdater.jar file on the TFTP server.
	Example:	• <i>device</i> —TFTP server that is accessible to the Cisco
	Router(config)# tftp-server flash:tzupdater.jar	Unified CME, such as flash or slot 0.
Step 4	tftp-server device: TZDataCSV.csv	Enables access to the TZDataCSV.csv file on the TFTP
	Example:	server.
	Router(config)# tftp-server flash:TZDataCSV.csv	• <i>device</i> —TFTP server that is accessible to the Cisco Unified CME, such as flash or slot 0.
Step 5	telephony-service	Enters telephony-service configuration mode.
	Example:	
	Router(config)# telephony-service	
Step 6	olsontimezone timezone version number	Sets the Olson Timezone so that the correct local time is
	Example:	displayed on Cisco Unified SCCP IP phones or Cisco Unified SIP IP phones.
	Router(config-telephony)# olsontimezone America/Argentina/Buenos Aires version 2010o	<ul> <li><i>timezone</i>—Olson Timezone names, which include the area (name of continent or ocean) and location (name of a specific location within that region, usually cities or small islands).</li> </ul>

	Command or Action	Purpose
		• <b>version</b> <i>number</i> —Version of the tzupdater.jar or TzDataCSV.csv file. The version indicates whether the file needs to be updated or not.
		<b>Note</b> In Cisco Unified CME 9.0, the latest version is 2010o.
Step 7	create cnf-files	Builds the eXtensible Markup Language (XML)
	Example:	configuration files that are required for Cisco Unified SCCP IP phones in Cisco Unified CME.
	Router(config-telephony)# create cnf-files	Seer in phones in cisco onnied civit.
Step 8	time-zone number	Sets the time zone so that the correct local time is displayed
	Example:	on Cisco Unified SCCP IP phones.
	Router(config-telephony)# time-zone 21	• <i>number</i> —Numeric code for a named time zone.
Step 9	exit	Exits telephony-service configuration mode.
	Example:	
	Router(config-telephony)# exit	
Step 10	clock timezone zone hours-offset	Sets the time zone for display purposes.
	Example:	• <i>zone</i> —Name of the time zone to be displayed when
	Router(config)# clock timezone CST -6	standard time is in effect. The length of the <i>zone</i> argument is limited to 7 characters.
		• <i>hours-offset</i> —Hours difference from UTC.
Step 11	clock summer-time zone date date month year hh:mm date month year hh:mm	(Optional) Configures the Cisco Unified CME system to automatically switch to summer time (daylight saving
	Example:	time).
	Router(config)# clock summer-time CST date 12 October 2010 2:00 26 April 2011 2:00	• <i>zone</i> —Name of the time zone (for example, "PDT" for Pacific Daylight Time) to be displayed when summer time is in effect. The length of the zone argument is limited to 7 characters.
		• <b>date</b> —Indicates that summer time should start on the first specific date listed in the command and end on the second specific date in the command.
		• <i>date</i> —Date of the month (1 to 31).
		• month—Month (January, February, and so on).
		• <i>year</i> —Year (1993 to 2035).
		• <i>hh:mm</i> —Time (24-hour format) in hours and minutes
Step 12	exit	Exits global configuration mode.
-	Example:	

	Command or Action	Purpose
	Router(config)# exit	
Step 13	clock set hh:mm:ss day month year	Manually sets the system software clock.
	<b>Example:</b> Router# clock set 19:29:00 13 May 2011	• <i>hh:mm:ss</i> —Current time in hours (24-hour format), minutes, and seconds.
		• <i>day</i> —Current day (by date) in the month.
		• <i>month</i> —Current month (by name).
		• <i>year</i> —Current year (no abbreviation).
Step 14	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 15	telephony-service	Enters telephony-service configuration mode.
	Example:	
	Router(config)# telephony-service	
Step 16	reset	Performs a complete reboot of Cisco Unfiied SCCP IP
	Example:	phones associated with a Cisco Unified CME router.
	Router(config-telephony)# reset	
Step 17	end	Exits to privileged EXEC mode.
	Example:	
	Router(config-telephony)# end	

### **Set Olson Timezone for SIP Phones**

To set the Olson Timezone so that the correct local time is displayed on a Cisco Unified SIP IP phone, perform the following steps.

#### Before you begin

- TzDataCSV.csv file is added to the configuration files of Cisco Unified 3911, 3951, 6921, 6941, 6945, and 6961 SIP IP phones.
- tzupdater.jar file is added to the configuration files of Cisco Unified 7961 SIP IP phones.

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. tftp-server device: tzupdater.jar
- 4. tftp-server device: TZDataCSV.csv
- 5. voice register global

- 6. olsontimezone timezone version number
- 7. create profile
- **8. timezone** *number*
- 9. exit
- **10.** clock timezone zone hours-offset
- **11. clock summer-time** *zone* **date** *date month year hh:mm date month year hh:mm*
- **12**. exit
- **13.** clock set *hh:mm:ss* day month year
- **14.** configure terminal
- 15. voice register global
- 16. reset
- 17. end

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	• Enter your password if prompted.	
	Router> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Router# configure terminal		
Step 3	tftp-server device: tzupdater.jar	Enables access to the tzupdater.jar file on the TFTP server.	
	Example:	• <i>device</i> —TFTP server that is accessible to the Cisco	
	Router(config)# tftp-server slot0:tzupdater.jar	Unified CME, such as flash or slot 0.	
Step 4	tftp-server <i>device</i> : TZDataCSV.csv	Enables access to the TZDataCSV.csv file on the TFTP	
	Example:	server.	
	Router(config)# tftp-server slot0:TZDataCSV.csv	• <i>device</i> —TFTP server that is accessible to the Cisco Unified CME, such as flash or slot 0.	
Step 5	voice register global	Enters voice register global configuration mode.	
	Example:		
	Router(config)# voice register global		
Step 6	olsontimezone timezone version number	Sets the Olson Timezone so that the correct local time is	
	Example:	displayed on Cisco Unified SCCP IP phones or Cisco Unified SIP IP phones.	
	Router(config-register-global)# olsontimezone America/Argentina/Buenos Aires version 2010o	<ul> <li><i>timezone</i>—Olson Timezone names, which include the area (name of continent or ocean) and location (name of a specific location within that region, usually cities or small islands).</li> </ul>	

I

	Command or Action	Purpose
		• <b>version</b> <i>number</i> —Version of the tzupdater.jar or tzdatacsv.csv file. The version indicates whether the file needs to be updated or not.
		<b>Note</b> In Cisco Unified CME 9.0, the latest version is 2010o.
Step 7	create profile	Generates the configuration profile files required for Cisco Unified SIP IP phones.
	<pre>Example: Router(config-register-global)# create profile</pre>	
Step 8	timezone number	Sets the time zone used for Cisco Unified SIP IP phones.
-	Example:	• <i>number</i> —Range is 1 to 53. Default is 5, Pacific Standard/Daylight Time.
	Router(config-register-global)# timezone 21	
Step 9	exit	Exits voice register global configuration mode.
	<pre>Example: Router(config-register-global)# exit</pre>	
Step 10	clock timezone zone hours-offset	Sets the time zone for display purposes.
·	<b>Example:</b> Router(config)# clock timezone CST -6	• <i>zone</i> —Name of the time zone to be displayed when standard time is in effect. The length of the <i>zone</i> argument is limited to 7 characters.
		• <i>hours-offset</i> —Hours difference from UTC.
Step 11	clock summer-time zone date date month year hh:mm date month year hh:mm	(Optional) Configures the Cisco Unified CME system to automatically switch to summer time (daylight saving
	Example:	time).
	Router(config)# clock summer-time CST date 12 October 2010 2:00 26 April 2011 2:00	• <i>zone</i> —Name of the time zone (for example, "PDT" for Pacific Daylight Time) to be displayed when summer time is in effect. The length of the zone argument is limited to 7 characters.
		• <b>date</b> —Indicates that summer time should start on the first specific date listed in the command and end on the second specific date in the command.
		• <i>date</i> —Date of the month (1 to 31).
		• month—Month (January, February, and so on).
		• <i>year</i> —Year (1993 to 2035).
		• <i>hh:mm</i> —Time (24-hour format) in hours and minutes
Step 12	exit	Exits global configuration mode.
	Example:	

I

	Command or Action	Purpose
	Router(config)# exit	
Step 13	clock set hh:mm:ss day month year	Manually sets the system software clock.
	Example: Router# clock set 15:25:00 17 November 2011	• <i>hh:mm:ss</i> —Current time in hours (24-hour format), minutes, and seconds.
		• <i>day</i> —Current day (by date) in the month.
		• <i>month</i> —Current month (by name).
		• <i>year</i> —Current year (no abbreviation).
Step 14	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 15	voice register global	Enters voice register global configuration mode.
-	<b>Example:</b> Router(config)# voice register global	
Step 16	reset	Performs a complete reboot of Cisco Unified SIP phones
	Example:	associated with a Cisco Unified CME router.
	Router(config-register-global)# reset	
Step 17	end	Exits to privileged EXEC mode.
	Example:	
	Router(config-register-global)# end	

## **Configure DTMF Relay for H.323 Networks in Multisite Installations**

To configure DTMF relay for H.323 networks in a multisite installation only, perform the following steps.

Note

To configure DTMF relay on SIP networks, see Configure SIP Trunk Support, on page 20.

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. dial-peer voice tag voip
- 4. dtmf-relay h245-alphanumeric
- 5. end

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	dial-peer voice tag voip	Enters dial-peer configuration mode.
	Example:	
	Router(config)# dial-peer voice 2 voip	
Step 4	dtmf-relay h245-alphanumeric	Specifies the H.245 alphanumeric method for relaying dual
	Example:	tone multifrequency (DTMF) tones between telephor interfaces and an H.323 network.
	Router(config-dial-peer)# dtmf-relay h245-alphanumeric	interfaces and an 11.525 network.
Step 5	end	Returns to privileged EXEC mode.
	Example:	
	Router(config-dial-peer)# end	

#### What to do next

- To set up support for a SIP trunk, see Configure SIP Trunk Support, on page 20.
- If you are configuring Cisco Unified CME for the first time on this router and you are ready to configure system parameters. For more information, see System-Level Parameters.
- If you are finished modifying network parameters for an already configured Cisco Unified CME router, see Configuration Files for Phones.

### **Configure SIP Trunk Support**

To enable DTMF relay on a dial-peer for a SIP gateway and set up the gateway to register phone numbers with Cisco Unified CME, perform the following steps.

#### **SUMMARY STEPS**

- 1. enable
- **2**. configure terminal
- **3**. **dial-peer voice** *tag* **voip**
- 4. dtmf-relay rtp-nte
- 5. dtmf-relay sip-notify
- 6. exit
- 7. sip-ua

- 8. notify telephone-event max-duration *msec*
- 9. registrar {dns: host-name | ipv4: ip-address} expires seconds [tcp] [secondary]
- **10.** retry register *number*
- **11.** timers register *msec*
- **12**. end

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Router# configure terminal	
Step 3	dial-peer voice tag voip	Enters dial-peer configuration mode.
	Example:	
	Router(config)# dial-peer voice 2 voip	
Step 4	dtmf-relay rtp-nte	Forwards DTMF tones by using Real-Time Transport
	Example:	Protocol (RTP) with the Named Telephone Event (NTE) payload type and enables DTMF relay using the RFC 2833
	Router(config-dial-peer)# dtmf-relay rtp-nte	standard method.
Step 5	dtmf-relay sip-notify	Forwards DTMF tones using SIP NOTIFY messages.
	Example:	
	Router(config-dial-peer)# dtmf-relay sip-notify	
Step 6	exit	Exits dial-peer configuration mode.
	Example:	
	Router(config-dial-peer)# exit	
Step 7	sip-ua	Enters SIP user-agent configuration mode.
	Example:	
	Router(config)# sip-ua	
Step 8	notify telephone-event max-duration msec	Sets the maximum milliseconds allowed between two
	Example:	consecutive NOTIFY messages for a single DTMF event.
	Router(config-sip-ua)# notify telephone-event max-duration 2000	• max-duration <i>time</i> —Range: 500 to 3000. Default: 2000.
Step 9	registrar {dns: host-name   ipv4: ip-address} expires	
	seconds [tcp] [secondary]	voice ports (FXS) and IP phone virtual voice ports (EFXS)
	Example:	with an external SIP proxy or SIP registrar server.

	Command or Action	Purpose	
	Router(config-sip-ua)# registrar ipv4:10.8.17.40 expires 3600 secondary		
Step 10	<pre>retry register number Example: Router(config-sip-ua)# retry register 10</pre>	Sets the total number of SIP Register messages that gateway should send. • <i>number</i> —Number of Register message retries. Range: 1 to 10. Default: 10.	
Step 11	<pre>timers register msec Example: Router(config-sip-ua)# timers register 500</pre>	<ul> <li>Sets how long the SIP user agent (UA) waits before sending Register requests.</li> <li><i>time</i>—Waiting time, in milliseconds. Range: 100 to 1000. Default: 500.</li> </ul>	
Step 12	end Example: Router(config-sip-ua)# end	Returns to privileged EXEC mode.	

### **Verify SIP Trunk Support Configuration**

To verify SIP trunk configuration, perform the following steps in any order.

#### **Step 1** show sip-ua status

Use this command to display the time interval between consecutive NOTIFY messages for a telephone event. In the following example, the time interval is 2000 ms:

#### Example:

```
Router# show sip-ua status

SIP User Agent Status

SIP User Agent for UDP :ENABLED

SIP User Agent for TCP :ENABLED

SIP User Agent bind status(signaling):DISABLED

SIP User Agent bind status(media):DISABLED

SIP early-media for 180 responses with SDP:ENABLED

SIP max-forwards :6

SIP DNS SRV version:2 (rfc 2782)

NAT Settings for the SIP-UA

Role in SDP:NONE

Check media source packets:DISABLED

Maximum duration for a telephone-event in NOTIFYs:2000 ms

SIP support for ISDN SUSPEND/RESUME:ENABLED

Redirection (3xx) message handling:ENABLED
```

```
SDP application configuration:
Version line (v=) required
Owner line (o=) required
Timespec line (t=) required
Media supported:audio image
Network types supported:IN
Address types supported:IP4
Transport types supported:RTP/AVP udptl
```

#### **Step 2** show sip-ua timers

This command displays the waiting time before Register requests are sent; that is, the value that has been set with the **timers register** command.

**Step 3** show sip-ua register status

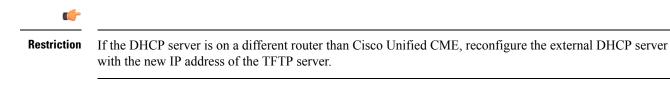

This command displays the status of local E.164 registrations.

#### **Step 4** show sip-ua statistics

This command displays the Register messages that have been sent.

### **Change the TFTP Address on a DHCP Server**

To change the TFTP IP address after it has already been configured, perform the following steps.

#### Before you begin

Your Cisco Unified CME router is a DHCP server.

#### **SUMMARY STEPS**

- 1. enable
- **2**. configure terminal
- **3. ip dhcp pool** *pool-name*
- 4. option 150 ip ip-address
- 5. end

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.

	Command or Action	Purpose	
	Router> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Router# configure terminal		
Step 3	ip dhcp pool pool-name	Enters DHCP pool configuration mode to create or modify	
	Example:	a DHCP pool.	
	Router(config)# ip dhcp pool pool2	• <i>pool-name</i> —Previously configured unique identifier for the pool to be configured.	
Step 4	option 150 ip <i>ip-address</i>	Specifies the TFTP server IP address from which the	
	Example:	Cisco Unified IP phone downloads the image configurat	
	Router(config-dhcp)# option 150 ip 10.0.0.1	file, XmlDefault.cnf.xml.	
Step 5	end	Returns to privileged EXEC mode.	
	Example:		
	Router(config-dhcp)# end		

# **Configuration Examples for Network Parameters**

### **NTP Server**

The following example defines the pst timezone as 8 hours offset from UTC, using a recurring daylight savings time called pdt, and synchronizes the clock with the NTP server at 10.1.2.3:

```
clock timezone pst -8
clock summer-time pdt recurring
ntp server 10.1.2.3
```

### **DTMF Relay for H.323 Networks**

The following excerpt from the **show running-config** command output shows a dial peer configured to use H.245 alphanumeric DTMF relay:

```
dial-peer voice 4000 voip
  destination-pattern 4000
  session target ipv4:10.0.0.25
  codec g711ulaw
  dtmf-relay h245-alphanumeric
```

# Where to Go Next

- If you are configuring Cisco Unified CME for the first time on this router, you are ready to configure system-level parameters. See System-Level Parameters.
- If you modified network parameters for an already configured Cisco Unified CME router, you are ready to generate the configuration file to save the modifications. See Configuration Files for Phones.

# **Feature Information for Network Parameters**

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to https://cfnng.cisco.com/. An account on Cisco.com is not required.

Feature Name	Cisco Unified CME Version	Modification
Olson Timezone	9.0	Eliminates the need to update time zone commands or phone loads to accommodate a new country with a new time zone or an existing country whose city or state wants to change their time zone, using the <b>olsontimezone</b> command in either telephony-service or voice register global configuration mode.

**Table 1: Feature Information for Network Parameters**
