

Cisco Unified Survivable Remote Site Telephony 8.0 Music On Hold Enhancement

First Published: October,21, 2009

Last Updated: October,21, 2009

This document describes the Music On Hold Enhancement introduced in Cisco Unified Survivable Remote Site Telephony 8.0 (Cisco Unified SRST).

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “[Feature Information for Cisco Unified SRST 8.0](#)” section on page 17.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS, Catalyst OS, and Cisco IOS XE software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for Cisco Unified SRST 8.0

- Cisco Unified SRST 8.0
- Cisco IOS Release 15.0(1)XA

Information About MOH Enhancement for Cisco Unified SRST 8.0

To configure Music On Hold Enhancement feature, you should understand the following concept:

- [Music On Hold Enhancement, page 2](#)
- [Caching MOH Files for Enhanced System Performance, page 2](#)
- [Cisco Unified SRST and Cisco Unified Communications Manager, page 3](#)

Music On Hold Enhancement

Cisco Unified SRST 8.0 and later versions enhance the MOH feature by playing different media streams to PSTN and VoIP G.711 callers who are placed on hold. The MOH enhancement allows you to configure up to five additional media streams supplied from different media files stored in a router's flash memory and eliminates the need of separate routers for streaming multiple MOH media files.

Cisco Unified SRST 8.0 MOH enhancement creates five MOH groups for Cisco Unified SRST voice gateway and allows you to associate phones with different MOH-groups on the basis of their extension numbers to receive different MOH media streams. When Cisco Unified SRST is in fallback mode, callers to the extension numbers configured under the extension-range defined in MOH groups can listen to MOH media streams when they are placed on hold.

You can configure up to five MOH groups with media source files for ephones in different departments in a branch. Each MOH media file can be of 100 KB file size. For configuration information, see the [“Configuring MOH-groups for Cisco Unified SRST \(fallback\)” section on page 4](#).

Following precedence rules are applicable when an ephone caller is placed on hold:

- If an ephone falls within an extension-range defined in a voice MOH-group, then the MOH defined in that voice MOH-group takes precedence.
- Ephones that do not fall in any extension-ranges defined in a voice MOH group default to MOH defined in call-manager-fallback.

Note

We recommend that departments in a branch must have mutually exclusive extension numbers and multicast destinations for configuring MOH groups,

Caching MOH Files for Enhanced System Performance

Caching MOH files helps enhance the system performance by reducing the CPU usage. However, caching requires memory buffer to store a large MOH file. You can set up a buffer file size for caching MOH files that you might use in the future. The default MOH file buffer size is 64 KB (8 seconds). The maximum buffer size (per file) can be configured anywhere between 64 KB (8 seconds) to 10000 KB

(approximately 20 minutes). You can use the **moh-file-buffer** command to allocate MOH file buffer for future MOH files, see the, [Configuring Buffer Size for MOH Files, page 7](#). To verify if a file is being cached and to update a cached moh-file, see the, [Verifying MOH File Caching, page 9](#)

**Note**

If the file size is larger than the allocated buffer size, caching is disabled.

Cisco Unified SRST and Cisco Unified Communications Manager

When the Cisco Unified SRST is in “standby” mode the Cisco Unified Communications Manager is in operation and all ephones are registered to Cisco Unified Communications Manager. The Cisco Unified SRST is not involved in processing any hold request. Media packets are streamed from different MOH files to several multicast and loopback addresses. An accurate mapping of multicast address and extension numbers is required between Cisco Unified Communications Manager and Cisco Unified SRST routers so that the phones can listen to the correct MOH media stream when placed on hold. For more information see “[Mapping Phone Extensions and Multicast Addresses \(standby mode\)](#)” section on page 10

How to Configure Cisco Unified SRST 8.0 New Features

This section contains the following tasks.

- Configuring MOH-groups for Cisco Unified SRST (fallback), page 4
- Mapping Phone Extensions and Multicast Addresses (standby mode), page 10
- Verifying Music on Hold Enhancements, page 12

Configuring MOH-groups for Cisco Unified SRST (fallback)

To configure voice MOH-groups on Cisco Unified SRST, perform the following steps:

Prerequisites

- Cisco Unified SRST 8.0 or a later version.
- You must configure at least one ephone and directory number (DN), even if the gateway is not used for Cisco Unified SRST.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **voice moh-group *moh-group-tag***
4. **description *string***
5. **moh *filename***
6. **multicast moh *ip-address* *port* *port-number* route *ip-address-list***
7. **extension-range *starting-extension* to *ending-extension***
8. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
	Example: Router> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example: Router# configure terminal	

Command or Action	Purpose
Step 3 moh-group tag Example: Router(conf)#voice moh-group 1 Router(config-voice-moh-group)#	Enters the voice MOH-group configuration mode. You can create up to five voice MOH-groups for ephones receiving music on hold audio files when placed on hold. Range for the voice MOH-groups is 1 to 5.
Step 4 description string Example: Router(config)# Router(config)#voice moh-group 1# Router(config-voice-moh-group) # description this is a moh group for sales	(Optional) Allows you to add a brief description specific to a voice MOH group. You can use up to 64 characters to describe the voice MOH group.
Step 5 Moh-filename Example: Router(config)# voice moh-group 1 Router(config-voice-moh-group) #description this is a moh group for sales Router(config-voice-moh-group) #moh flash:/minuet.wav	Enables music on hold from a flash G.711 audio file. This file must exist on flash. The MOH filename should be unique among all MOH-groups. MOH filename length should not exceed 128 characters. You must provide the directory and filename of the MOH file in URL format. For example: moh flash:/minuet.au <ul style="list-style-type: none"> If you specify a file with this command and later want to use a different file, you must disable use of the first file with the no moh command before configuring the second file.
Step 6 multicast moh Example: Router(config)# voice moh-group 1 Router(config-voice-moh-group) #description this is a moh group for sales Router(config-voice-moh-group) # moh minuet.wav Router(config-voice-moh-group) # multicast moh 239.1.1.21 port 16384 route 10.1.4.31 10.1.1.2	Specifies that this audio stream is to be used for multicast and also for MOH. The multicast IP address must be unique among all MOH groups. <p>Note This command is required to use MOH for internal calls and it must be configured after MOH is enabled with the moh command.</p> <ul style="list-style-type: none"> ip-address—Destination IP address for multicast. port port-number—Media port for multicast. Range is 2000 to 65535. We recommend port 2000 because it is already used for normal RTP media transmissions between IP phones and the router. route—(Optional) List of explicit router interfaces for the IP multicast packets. ip-address-list—(Optional) List of up to four explicit routes for multicast MOH. The default is that the MOH multicast stream is automatically output on the interfaces that correspond to the address that was configured with the ip source-address command. <p>Note For MOH on internal calls, packet flow must be enabled to the subnet on which the phones are located.</p>

Command or Action	Purpose
Step 7 <code>extension-range starting-extension to ending-extension</code> <p>Example: Router(config)# voice moh-group 1 Router(config-voice-moh-group)#description this is a moh group for sales Router(config-voice-moh-group)# moh minuet.wav Router(config-voice-moh-group)# multicast moh 239.1.1.21 port 16384 route 10.1.4.31 10.1.1.2 Router(config-voice-moh-group)# extension-range 1021 to 1021 </p>	<p>(Optional) Identifies MOH callers calling the extension numbers specified in a MOH group during Cisco Unified SRST fallback mode. Extension number must be in hexadecimal digits (0-9) or (A-F). Repeat this command to add additional extension ranges. Multiple extension-ranges can be defined in a MOH-group.</p> <ul style="list-style-type: none"> • <i>starting-extension</i>—Lists the starting extension number for a moh-group. • <i>ending-extension</i>—Lists the ending extension number for a moh-group. <p>Note The ending extension number must be greater than the starting extension number. Extension-ranges must not overlap with any other extension-range configured in any other MOH-groups.</p> <p>Note If an ephone number does not match any extension ranges in any MOH-groups, the caller will default to the MOH configuration in ccm-manager-fallback.</p>
Step 8 <code>end</code> <p>Example: Router(config)# end</p>	>Returns to privileged EXEC mode.

Configuring Buffer Size for MOH Files

Prerequisites

- Cisco Unified SRST 8.0 or a later version.

Restrictions

- MOH file caching is prohibited if live-feed is enabled for MOH-group 0.
- MOH file buffer size must be larger than the MOH file size that needs to be cached.
- Sufficient system memory must be available for MOH file caching.

SUMMARY STEPS

- enable**
- configure terminal**
- call-manager-fallback**
- moh-file-buffer *file size***
- end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	call-manager-fallback Example: Router(config-cm-fallback) #	Enters call-manager-fallback configuration mode.

Command or Action	Purpose
Step 4 <code>moh-file-buffer file size</code> Example: Router(config-telephony) # moh-file-buffer 2000	(Optional) Allows to set a buffer for the MOH file size. You can configure a max file buffer size (per file) anywhere between 64KB (8 seconds) to 10000 KB (approximately 20 minutes), Default moh-file-buffer size is 64 KB (8 seconds). Note A large buffer size is desirable to cache the largest MOH file and a better system performance.
Step 5 <code>end</code> Example: Router(config-ephone) # end	Returns to privileged EXEC mode.

Examples

The following example shows a moh-file-buffer size of 2000 KB assigned for future moh files under the call-manager-fallback configuration mode.

```

!
!
!
!
call-manager-fallback
max-conferences 8 gain -6
transfer-system full-consult
moh-file-buffer 2000
!
!
line con 0
exec-timeout 0 0
line aux 0

```

Verifying MOH File Caching

- Step 1** Use the **show ephone moh** command to verify if the a MOH file is being cached. The following example shows that the minuet.au music file in MOH group 1 is not cached. Follow steps a through d to verify the MOH file is being cached.

```
Router #show ephone moh
Skinny Music On Hold Status (moh-group 1)
Active MOH clients 0 (max 830), Media Clients 0
File flash:/minuet.au (not cached) type AU Media_Payload_G711Ulaw64k 160 bytes
Moh multicast 239.10.16.6 port 2000
```

- a. If the file is not cached as in MOH group 1 in the above example, then check file size in the flash.

For example:

```
Router# dir flash:/minuet.au
Directory of flash:/minuet.au 32 -rw- 1865696 Apr 25 2009 00:47:12 +00:00 moh1.au
```

- b. Under telephony-service, configure “moh-file-buffer <file size>”. Default file size is 64 KB (8 seconds). Make sure you enter a larger file size to cache large MOH files that you may use in future.

For example:

```
Router(config)# telephony-service
Router(config-telephony)# moh-file-buffer 2000
```

- c. Under voice moh-group (*group tag*), configure “no moh”, and immediately configure “moh (*filename*)”. This allows the system to read the file immediately from flash again.

For example:

```
Router(config-telephony)# voice moh-group 1
Router(config-voice-moh-group)# no moh
Router(config-voice-moh-group)# moh flash:/minuet.au
```

- d. Depending on the size of the file, you should see the MOH file caching after a few minutes (approximately, 2 minutes).

For example:

```
Router #show ephone moh
Skinny Music On Hold Status - group 1
Active MOH clients 0 (max 830), Media Clients 0
File flash:/moh1.au (cached) type AU Media_Payload_G711Ulaw64k 160 bytes
Moh multicast 239.10.16.6 port 2000
```

Mapping Phone Extensions and Multicast Addresses (standby mode)

To map the multicast address and extension number between Cisco Unified Communications Manager and Cisco Unified SRST routers, use the following command on Cisco Unified Communications Manager version 5.0 or later platform CLI.:

```
un sql select D.name, M.mohaudiosourceid, M.multicastaddress, M.multicastport, C.name
codec from mohservermulticastinfo as M, device AS D, OUTER typemohcodec as C WHERE
M.fkdevice = D.pkid AND M.tkmohcodec = C.enu
```

Note

Running the above command on Cisco Unified Communications Manager version 5.0 and later platform CLI allows you to find the multicast addresses used by a MOH group.

Table 1 shows the difference between incrementing on an IP address and incrementing on a port number, using the base IP address of 239.1.1.1 and the base port number of 16384. The table also matches Cisco Unified Communications Manager audio sources and codecs to IP addresses and port numbers.

Table 1 *Example of the Differences Between Incrementing Multicast on IP Address and Incrementing Multicast on Port Number*

MOH Group	Codec	Increment Multicast on IP Address		Increment Multicast on Port Number	
		Destination IP Address	Destination Port	Destination IP Address	Destination Port
1	G.711 mu-law	239.1.1.1	16384	239.1.1.1	16384
1	G.711 a-law	239.1.1.2	16384	239.1.1.1	16386
1	G.729	239.1.1.3	16384	239.1.1.1	16388
1	Wide band	239.1.1.4	16384	239.1.1.1	16390
2	G.711 mu-law	239.1.1.5	16384	239.1.1.1	16392
2	G.711 a-law	239.1.1.6	16384	239.1.1.1	16394
2	G.729	239.1.1.7	16384	239.1.1.1	16396
2	Wide band	239.1.1.8	16384	239.1.1.1	16398

For example, as seen in [Table 1](#), IP address 239.1.1.1 port 16384 for G.711 mu-law codec is assigned to audio source group 1 and 239.1.1.5 port 16384 for G.711 mu-law is assigned to audio source group 2. It is important to configure a Cisco Unified Communications Manager IP address and port number that use a G.711 audio sources for Cisco Unified SRST multicast MOH.

The MOH Server Configuration window is also where the multicast audio source for the MOH server is configured. For Cisco Unified SRST multicast MOH, the Cisco Unified Communications Manager MOH server can use only one audio source. An audio source is selected by inputting the audio source's maximum number of hops.

The Max Hops configuration sets the length of the transmission of the audio source packets. Limiting the number of hops is one way to stop audio packets from reaching the WAN and thus spoofing Cisco Unified Communications Manager so Cisco Unified SRST can multicast MOH. If all of your branches run Cisco Unified SRST, use a low number of hops to prevent audio source packets from crossing the WAN. If your system configuration includes routers that do not run Cisco Unified SRST,

enter a high number of hops to allow source packets to cross the WAN. For more information on setting up the MOH on Cisco Unified Communications Manager see the [*Cisco Unified Communications Manager Administration Guide*](#)

Verifying Music on Hold Enhancements

- Step 1** Use the **show voice moh-group** command to display one or the entire MOH group configuration. The following example shows six (include MOH group 0) MOH groups. MOH group 0 is configured under call-manager-fallback configuration and all the other MOH groups are configured under voice MOH-group.

```
Router# sh voice moh-group
call-manager-fallback
moh flash:/alaska.wav
Moh multicast 239.1.1.1 port 16384 route 10.1.4.31 10.1.1.2

voice moh-group 1
description (not configured)
moh flash:/1001.au
multicast moh 239.1.1.5 port 16384 route 10.1.4.31 10.1.1.2
extension-range 1001 to 1001

voice moh-group 2
description (not configured)
moh RedRedWine8bitmulawg711.wav
multicast moh 239.1.1.9 port 16384 route 10.1.4.31 10.1.1.2
extension-range 1006 to 1006

voice moh-group 3
description (not configured)
moh flash2:/enter_dest1.au
multicast moh 239.1.1.13 port 16384 route 10.1.4.31 10.1.1.2
extension-range 1011 to 1011

voice moh-group 4
description (not configured)
moh flash:/audio/dir_menu.au
multicast moh 239.1.1.17 port 16384 route 10.1.4.31 10.1.1.2
extension-range 1016 to 1016

voice moh-group 5
description (not configured)
moh flash:/moh-f1004-on1s-off1s-g711u.wav
multicast moh 239.1.1.21 port 16384 route 10.1.4.31 10.1.1.2
extension-range 1021 to 1021
```

- Step 2** Use the **show ephone moh** to display the status of different MOH groups configured for ephones. The following example shows five MOH groups configured for ephones.

```
Router #show ephone moh
Skinny Music On Hold Status (moh-group 1)
Active MOH clients 0 (max 830), Media Clients 0
File flash:/minuet.au (not cached) type AU Media_Payload_G711Ulaw64k 160 bytes
Moh multicast 239.10.16.6 port 2000

Skinny Music On Hold Status (moh-group 2)
Active MOH clients 0 (max 830), Media Clients 0
File flash:/audio/hello.au type AU Media_Payload_G711Ulaw64k 160 bytes
Moh multicast on 239.10.16.6 port 2000 via 0.0.0.0

Skinny Music On Hold Status (moh-group 3)
Active MOH clients 0 (max 830), Media Clients 0
File flash:/bells.au type AU Media_Payload_G711Ulaw64k 160 bytes
Moh multicast on 239.10.16.5 port 2000 via 0.0.0.0

Skinny Music On Hold Status (moh-group 4)
Active MOH clients 0 (max 830), Media Clients 0
File flash:/3003.au type AU Media_Payload_G711Ulaw64k 160 bytes
Moh multicast on 239.10.16.7 port 2000 via 0.0.0.0

Skinny Music On Hold Status (moh-group 5)
Active MOH clients 0 (max 830), Media Clients 0
File flash:/4004.au type AU Media_Payload_G711Ulaw64k 160 bytes
Moh multicast on 239.10.16.8 port 2000 via 0.0.0.0
```

How to Configure Cisco Unified SRST 8.0 New Features

- Step 3** Use the **show voice moh-group statistics** command to display the MOH subsystem statistics information. In the following example, the MOH Group Streaming Interval Timing Statistics shows the media packet counts during streaming intervals.

MOH Group Packet Transmission Timing Statistics shows the numbers the time it takes for the MOH groups to send out the packets. These numbers are microseconds in maximum and minimum.

The MOH Group Loopback Interval Timing Statistics is available when loopback interface is configured as part of the multicast MOH routes as in the case of SRST. These counts are loopback packet counts within certain streaming timing intervals.

```
Router# show voice moh-group statistics
MOH Group Streaming Interval Timing Statistics:
Grp# ~19 msec    20~39      40~59      60~99      100~199     200+ msec
===== ===== ===== ===== ===== ===== =====
0:      25835  17559966  45148      0          0          1
1:      19766  17572103  39079      0          0          1
2:      32374  17546886  51687      0          0          1
3:      27976  17555681  47289      0          0          1
4:      34346  17542940  53659      0          0          1
5:      14971  17581689  34284      0          0          1

MOH Group Packet Transmission Timing Statistics:
Grp# max(usec) min(usec)
===== =====
0:      97      7.
1:      95      7.
2:      97      7.
3:      96      7.
4:      94      7.
5:      67      7.

MOH Group Loopback Interval Timing Statistics:
loopback event array: svc_index=1542, free_index=1549, max_q_depth=31
Grp# ~19 msec    20~39      40~59      60~99      100~199     200+ msec
===== ===== ===== ===== ===== ===== =====
0:      8918821 8721527  10023      0          1          1
1:      9007373  8635813  7184       0          1          1
2:      8864760  8772851  12758      0          1          1
3:      8924447  8715457  10464      0          1          1
4:      8858393  8778957  13017      0          1          1
5:      9005511  8639936  4919       0          1          1

Statistics collect time: 4 days 2 hours 5 minutes 39 seconds.
```

- Step 4** Use the **clear voice moh-group statistics** command to clear the display of MOH subsystem statistics information.

Example:

```
Router# clear voice moh-group statistics
All moh group stats are cleared
```

Feature Information for Cisco Unified SRST 8.0

[Table 2](#) lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Note

[Table 2](#) lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

Table 2 **Feature Information for Cisco Unified SRST 8.0**

Feature Name	Releases	Feature Information
Cisco Unified SRST 8.0	15.0(1)XA	<ul style="list-style-type: none"> • Adds support for Music on Hold Enhancement.

Cisco and the Cisco Logo are trademarks of Cisco Systems, Inc. and/or its affiliates in the U.S. and other countries. A listing of Cisco's trademarks can be found at www.cisco.com/go/trademarks. Third party trademarks mentioned are the property of their respective owners. The use of the word partner does not imply a partnership relationship between Cisco and any other company. (1005R)

Any Internet Protocol (IP) addresses used in this document are not intended to be actual addresses. Any examples, command display output, and figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses in illustrative content is unintentional and coincidental.
