- Troubleshooting, on page 61

# **Architectural Overview**

A Cisco Policy Suite (CPS) deployment comprises multiple virtual machines (VMs) deployed for scaling and High Availability (HA) purposes. All VMs present in the system should have an IP address which is a routable IP to the Network Management System (NMS). The NMS can monitor each VM using this routable IP address.

Note

The IP addresses do not need to be routable if the NMS has an interface on the same internal network as the CPS VMs.

During runtime any number of VMs can be added to the system and the NMS can monitor them using their routable IP address which makes the system more scalable. The notification alerting from the entire system derives from a single point.

When CPS is deployed in a High Availability (HA) alerting endpoints are deployed as HA as well as shown in the following illustration.

Figure 1: HA Deployment

# **Technical Architecture**

Cisco Policy Suite is deployed as a distributed virtual appliance. The standard architecture uses hypervisor virtualization. Multiple physical hardware host components run Hypervisors and each host runs several virtual machines. Within each virtual machine one-to-many internal CPS components can run. CPS monitoring and alert notification infrastructure simplifies the virtual physical and redundant aspects of the architecture.

## **Protocols and Query Endpoints**

The CPS monitoring and alert notification infrastructure provides a simple standards-based interface for network administrators and NMS (Network Management System). SNMP is the underlying protocol for all monitoring and alert notifications. Standard SNMP gets and notifications (traps) are used throughout the infrastructure.

At any point of time only one version of SNMP (either SNMPv2 or SNMPv3) will work. By default SNMPv3 is disabled. For information on configuring SNMPv3 refer to the *CPS Installation Guide for VMware* or to the *CPS Installation Guide for OpenStack* for this release.

The following illustration shows the aggregation and mapping on the SNMP endpoint (Policy Director (LB)).

Figure 2: SNMP Endpoint

# **SNMP Object Identifier and Management Information Base**

Cisco has a registered private enterprise Object Identifier (OID) of 26878. This OID is the base from which all aggregated CPS metrics are exposed at the SNMP endpoint. The Cisco OID is fully specified and made human-readable through a set of Cisco Management Information Base (MIB-II) files.

The current MIBs are defined as follows:

Table 1: MIBs

MIB Filename	Purpose
BROADHOP-MIB.mib	Defines the main structure including structures and codes.
CISCO-QNS-MIB.mib	Defines the retrievable statistics and KPI.
BROADHOP-NOTIFICATION-MIB.mib	Defines Notifications/Traps available.

A graphical overview of the CPS OID and MIB structure is shown in the next figure.

Figure 3: SNMP Notifications

Note that in the above illustration the entire tree is not shown.

## **SNMP Data and Notifications**

The Monitoring and Alert Notification infrastructure provides standard SNMP get and getnext access to the CPS system. This provides access to targeted metrics to trend and view Key Performance Indicators (KPIs). Metrics available through this part of the infrastructure are as general as component load and as specific as transactions processed per second.

SNMP Notifications in the form of traps (one-way) are also provided by the infrastructure. CPS notifications do not require acknowledgments. These provide both proactive alerts that predetermined thresholds have been passed (for example a disk is nearing capacity or CPU load is too high) and reactive alerting when system components fail or are in a degraded state (for example a process died or network connectivity outage has occurred).

Notifications and traps are categorized by a methodology similar to UNIX System Logging (syslog) with both Severity and Facility markers. All event notifications (traps) contain these items

- Facility
- Severity
- Source (device name)
- Device time

These objects enable Network Operations Center (NOC) staff to identify where the issue lies the Facility (system layer) and the Severity (importance) of the reported issue.

Note

For more information on CPS statistics, refer to CPS Statistics chapter in *CPS Operations Guide* for this release. For more information on CPS logging, refer to Logging chapter in *CPS Troubleshooting Guide* for this release.

### **Facility**

The generic syslog facility has the following definitions.

Note

Facility defines a system layer starting with physical hardware and progressing to a process running in a particular application.

#### **Table 2: Syslog Facility**

Number	Facility	Description
0	Hardware	Physical Hardware – Servers SAN NIC Switch and so on.
1	Networking	Connectivity in the OSI (TCP/IP) model.
2	Virtualization	VMware ESXi (or other) Virtualization
3	Operating System	Linux Microsoft Windows and so on.
4	Application	Apache httpd load balancer CPS Cisco sessionmgr and so on.
5	Process	Particular httpd process CPS qns01_A and so on.

There may be overlaps in the Facility value as well as gaps if a particular SNMP agent does not have full view into an issue. The Facility reported is always shown as viewed from the reporting SNMP agent.

### **Severity**

In addition to Facility each notification has a Severity measure. The defined severities are directly from UNIX syslog and defined as follows:

Table 3: Severity Levels

Number	Severity	Description
0	Emergency	System is unusable.
1	Alert	Action must be taken immediately.
2	Critical	Critical conditions.
3	Error	Error conditions.

Number	Severity	Description
4	Warning	Warning conditions.
5	Notice	Normal but significant condition.
6	Info	Informational message.
7	Debug	Lower level debug messages.
8	None	Indicates no severity.
9	Clear	The occurred condition has been cleared.

For the purposes of the CPS Monitoring and Alert Notifications system, Severity levels of Notice Info and Debug are usually not used.

Warning conditions are often used for proactive threshold monitoring (for example Disk usage or CPU Load) which requires some action on the part of administrators but not immediately.

Conversely, Emergency severity indicates that some major component of the system has failed and that either core policy processing session management or major system functionality is impacted.

# Categorization

Combinations of Facility and Severity create many possibilities of notifications (traps) that might be sent. However some combinations are more likely than others. The following table lists some Facility and Severity categorizations.

Table 4: Severity Categorization

Facility.Severity	Categorization	Possibility
Process.Emergency	A single part of an application has dramatically failed.	Possible but in an HA configuration very unlikely.
Hardware.Debug	A hardware component has sent a debug message.	NA
Operating System.Alert	An Operating System (kernel or resource level) fault has occurred.	Possible as a recoverable kernel fault (on a vNIC for instance).
Application.Emergency	An entire application component has failed.	Unlikely but possible (load balancers failing for instance).

It is not possible to quantify every Facility and Severity combination. However greater experience with CPS leads to better diagnostics. The CPS Monitoring and Alert Notification infrastructure provides a baseline for event definition and notification by an experienced engineer.

## **Emergency Severity Note**

Caution Emergency severities are very important! As a general principle CPS does not throw an Emergency-severity trap unless the system becomes inaccessible or unusable in some way. An unusable

system is rare but might occur if multiple failures occur in the operating system virtualization networking or hardware facilities.

# **SNMP System and Application KPIs**

Many CPS system statistics and Key Performance Indicators (KPI) are available via SNMP gets and walks. Both system device level information and application level information is available. This information is documented in the CISCO-QNS-MIB. A summary of the information available is provided in the following sections.

### **SNMP System KPIs**

In this table the system KPI information is provided.

Table 5: SNMP System KPIs

Component	Information
LB01/LB02	CpuUser
PCRFClient01/PCRFClient02	CpuSystem
SessionMgr01/SessionMgr02	CpuIdle
QNS01/QNS02/QNS03/QNS04	LoadAverage1
	LoadAverage5
	LoadAverage15
	MemoryTotal
	MemoryAvailable
	SwapTotal
	SwapAvailable

# **Details of SNMP System KPIs**

The following information is available and is listed per component. The root of these KPIs is .1.3.6.1.4.1.26878.200.3.2.70. MIB documentation provides units of measure.

```
+--ciscoProductsQNSComponents70 (70) |
+--ciscoProductsQNSComponentsSystemStats (1) |
+-- -R-- Integer32 componentCpuUser(1) |
+-- -R-- Integer32 componentCpuSystem(2) |
+-- -R-- Integer32 componentCpuIdle(3) |
+-- -R-- Integer32 componentLoadAverage1(4) |
+-- -R-- Integer32 componentLoadAverage5(5) |
+-- -R-- Integer32 componentLoadAverage15(6) |
+-- -R-- Integer32 componentMemoryTotal(7) |
+-- -R-- Integer32 componentMemoryAvailable(8) |
+-- -R-- Integer32 componentSwapTotal(9) |
+-- -R-- Integer32 componentSwapAvailable(10) |
```

# **SNMP Application KPIs**

Current version Key Performance Indicators (KPI) information is available at the OID root of:

.1.3.6.1.4.1.26878.200.3.3.70

#### This corresponds to an MIB of:

- .iso
- .identified-organization
- .dod
- .internet
- .private
- .enterprise
- .broadhop
- .broadhopProducts
- .ciscoProductsQNS
- $. \verb|ciscoProductsQNSC| on solidated KPIVersion|$
- .ciscoProductsQNSKPI70

# **Summary of SNMP Application KPIs**

The following application KPIs are available for monitoring on each node using SNMP Get and Walk utilities:

#### Table 6: SNMP Application KPIs - Summary

Component	Information
Policy Director (lb01/lb02)	PCRFProxyExternalCurrentSessions: It is the total number of active sessions (open connections) which are connected to lbvip01:8443 from external system (lbvip01 has public IP address). It is an active session counter (not cumulative) and as such there is no limit on active sessions.
	PCRFProxyInternalCurrentSessions: It is the total number of active sessions (open connections) which are connected to lbvip02:8080 (lbvip02 has private IP address) from internal VMs such as Policy Server (QNS), sessionmgr, OAM (pcrfclient) and so on. It is an active session counter (not cumulative) and as such there is no limit on active sessions.
OAM (pcrfclient01/pcrfclient02)	
Session Manager (sessionmgr01/sessionmgr02)	

Component	Information
Policy Server (qns01/qns02/qns03/qns04)	<b>PolicyCount:</b> It is the total number of processed policy messages by an individual Policy Server (QNS) VM. There is no limit on policy message processing.
	QueueSize: The number of entries in the processing queue. The default queue size is 500, and is configurable in Policy Builder. You can also see the number of dropped messages in the statistics files. There is a separate queue for each Policy Server (QNS) VM.
	FailedEnqueueCount: Each Policy Server (QNS) VM maintains a queue where it keeps policy messages to be processed in last-in-first-out order. This counter will be incremented when Policy Server (QNS) process fails to add policy message into policy message processing queue.
	<b>ErrorCount:</b> It is the total number of policy messages which got error while processing by an individual Policy Server (QNS) VM.
	AggregateSessionCount: This is the consolidated active subscriber sessions in CPS. The maximum limit of sessions will be based on installed license. It is only active session count not cumulative count.  AggregateSessionCount is the consolidated active subscriber sessions in CPS and kpiLBPCRFProxyInternalCurrentSessions is the open connection to lbvip02:8080.
	FreeMemory

# **Details of Supported KPIs**

The following information is available and is supported in current release. MIB documentation provides units of measure.

```
| +-- -R-- Integer32 kpiQNSAggregateSessionCount(24)
| +-- -R-- Integer32 kpiQNSFreeMemory(25)
```

#### Threshold based KPI Alarms

CPS can generate SNMP alarms for KPIs after they have reached threshold values. The threshold values are configured in the /etc/broadhop/kpi\_threshold.conf file. The kpi\_threshold.conf configuration file contains all the KPI configurations and must be configured to generate the KPI traps. The configuration file must be present on all VMs.

Events generated by the KPI script are locally logged in perfection 1/02 in the /var/log/broadhop/kpi-alarm.log file. The following table defines the configuration parameters:

**Table 7: KPI Configuration Parameters** 

Parameter	Description
GV_LOG_LEVEL	Log levels are as follows:
	• 1: DEBUG
	• 2: INFO
	• 3: WARN
	• 4: ERROR
	for example, GV_LOG_LEVEL= logging.INFO
GV_LOG_FILE	Log file path and log file name.
	For example, GV_LOG_FILE="/var/log/broadhop/kpi-alarm.log
GV_LOG_FILES	Number of log files to preserve.
	For example, GV_LOG_FILES=5
GV_LOG_SIZE	Log file size.
	For example, GV_LOG_SIZE=10 * 1024 * 1024 #10MB
GV_STATS_INTERVAL=300	Statistics collected during last 300 seconds.

Traps generated are logged in the /var/log/snmp/trap file on the active Policy Director (LB).

# **Notifications and Alerting (Traps)**

The CPS Monitoring and Alert Notification framework provides the following SNMP notification traps (one-way). Traps are either proactive or reactive. Proactive traps are alerts based on system events or changes that require attention (for example, Disk is filling up). Reactive traps are alerts that an event has already occurred (for example, an application process failed).

For example, if a threshold is crossed snmpd throws a trap to LBVIP on the internal network on port 162. On the Policy Director (load balancer) the snmptrapd process is listening on port 162. When snmptrapd sees trap on 162 it logs it in the file /var/log/snmp/trap and throws it again on corporate\_nms\_ip on port 162. This corporate NMS IP is set inside /etc/hosts file on LB01 and LB02.

# **Component Notifications**

Components are devices that make up the CPS system. These are systems level traps. They are generated when some predefined thresholds are crossed. User can define these thresholds in /etc/snmp/snmpd.conf. For example, for disk full, low memory etc. The snmpd process runs on all VMs. When the process is started, it applies the configuration from /etc/snmp/snmpd.conf file. In order to apply changes to snmpd.conf file, snmpd needs to be restarted by executing the following commands:

```
monit stap snmpd monit start snmpd
```

Component notifications are defined in the BROADHOP-NOTIFICATION-MIB as follows:

```
broadhopQNSComponentNotification NOTIFICATION-TYPE
  OBJECTS { broadhopComponentName,
    broadhopComponentTime,
    broadhopComponentNotificationName,
    broadhopNotificationFacility,
    broadhopNotificationSeverity,
    broadhopComponentAdditionalInfo }
STATUS current
DESCRIPTION "
Trap from any QNS component - i.e. device.
"
::= { broadhopProductsQNSNotifications 1 }
```

Component Notifications that CPS generates are shown in the following list. Any component in the CPS system may generate these notifications.

**Table 8: Component Notifications** 

Notification Name	Severity	Feature	
DiskFull	critical	Component	
	_	<b>Message Text:</b> < diskPath>: less than < n>% free (= REMAINING DISK SPACE%)	
	this threshold is set to 10	sk usage has passed a designated threshold. By default, 0% of total disk space allocated for the partition. This etc/snmp/snmpd.conf on each VM.	
	This situation could be a	a sign of logs or database files growing large.	
	For new deployments, this alarm is generated for following file systems in different VMs:		
	• For HA System:		
	• pcrfclient/lb: /		
	• sessionmgr: /, /var/data/session.1		
	• qns: /		
	For upgraded systems, t different VMs:	his alarm is generated for following file systems in	
	• For HA System:		
	• pcrf/lb: /, /var, /boot		
	• sessionmgr: /, /home, /boot, /data, /var/data/session.1		
	• qns: /, /home,	/var, /boot	
	clear	Component	

Notification Name	Severity	Feature		
	Message Text: < diskPath>: clear			
	<b>Description:</b> The disk usage has recovered from the designated threshold. For new deployments, this alarm is generated for following file systems in different VMs:			
	• For HA System:	• For HA System:		
	• pcrfclient/lb: /	• pcrfclient/lb: /		
	• sessionmgr: /, /	/var/data/session.1		
	• qns: /			
	For upgraded systems, this alarm is generated for following file systems in different VMs:  • For HA System:  • pcrf/lb: /, /var, /boot  • sessionmgr: /, /home, /boot, /data, /var/data/session.1  • qns: /, /home, /var, /boot			
LowSwap	critical	Operating System		
	Message Text: Running out of swap space (\$FreeAvailableSwap)  Description: Current swap usage has passed a designated threshold. This is a warning.			
	clear	Operating System		
	Message Text: Swap space recovered  Description: Current swap usage has recovered a designated threshold.			

Notification Name	Severity	Feature
HighLoad	warning (1 minute)	Component
	warning (5 minute)	
	alert (15 minutes)	
	Message Text:	
	1 min Load Average too l	nigh (= n.nn)
	5 min Load Average too high (= n.nn)	
	15 min Load Average too high (=n.nn)	
	<b>Description:</b> The load avenue threshold for a period of	verage of the system has exceeded the configured 1/5/15 minutes.
		ue is 1.5 * Number of vCPUs (allocated to VM) for ed in /etc/snmp/snmpd.conf file.
	The value must be integer	r.
	clear	Component
	Message Text:	
	Load-1 High load recovered	
	Load-5 High load recovered	
	Load-15 High load recovered	
	<b>Description:</b> The load average has recovered from more than threshold.	
LinkDown alert Operating System		Operating System
	Message Text: IF-MIB::linkDown < Interface Name >  Description: Not able to connect or ping to the interface. This agenerated for all physical interface attached to the system.	
LinkUp	clear	Operating System
	Message Text: IF-MIB::linkUp < Interface Name>	
	<b>Description:</b> Able to ping or connect to interface. This alarm gets generated for all physical interface attached to the system.	
Low Memory Alert	critical	Operating System
	Message Text: Current A threshold (Threshold mer	wailable Free Memory (total free memory) is less than nory) on \$HOSTNAME
	default threshold of 10% (	t of free memory on the VM has dropped below the as a percentage of total memory). To change the default Low Memory Threshold, on page 16.

Notification Name	Severity	Feature	
Low Memory Clear	clear	Operating System	
	Message Text: Current Available Free Memory (total free memory) is greater than threshold (Threshold memory) on \$HOSTNAME		
	<b>Description:</b> Low memor	ry alert has been cleared.	
ProcessDown	critical	Component	
	Message Text: \${PROCE	SS_NAME} process is down	
	For example, corosync pr	ocess is down	
	<b>Description:</b> This alarm is generated when the corosync process is stopped or fails. The corosync process manages the virtual IPs between the CPS load balancers in HA and GR deployments.		
ProcessUp	clear	Component	
	Message Text: \${PROCESS_NAME} process is up		
	For example, corosync process is up		
	<b>Description:</b> The alarm is cleared whenever the corosync process that was down is brought back up.		
HIGH CPU USAGE Alert	critical	Component	
	Message Text: CPU Usage is higher than threshold on 'hostname'.Threshold=\$Threshold%,Current_LOAD=\$Current%		
	<b>Description:</b> This trap is generated whenever CPU usage on any VM is detected to be higher than the alert threshold value. The system monitors the CPU usage at a specific instant (every 60 second by default), and not over a period of time like for the HighLoad Alert. To change the default threshold or the interval at which the CPU usage is checked, see Configure High CPU Usage Alarm Thresholds and Interval Cycle, on page 17		
HIGH CPU USAGE	clear	Component	
Clear		ge is below than lower threshold value on hreshold%,Current_LOAD=\$Current%	
	_	generated whenever CPU usage on any VM is lower alue. It is generated only when High CPU Usage Alert the VM.	

Notification Name	Severity	Feature
Critical File Operation	critical	Component
Aict	executed by <user name=""></user>	le Operation Alert: Command <a href="Command Executed">Command Executed</a> <a< td=""></a<>
	<b>Description:</b> This trap is generated when critical files configured in CriticalFiles.csv on VMware and critFileMonConfig: section in OpenStack gets modified.	
	<b>Note</b> This is a stateless a	alarm. There is no clear alarm for this notification.

Each Component Notification contains:

- Name of the Notification being thrown (broadhopComponentNotificationName)
- Name of the device throwing the notification (broadhopComponentName)
- Time the notification was generated (broadhopComponentTime)
- Facility or which layer the notification came from (broadhopNotificationFacility)
- Severity of the notification (broadhopNotificationSeverity)
- Additional information about the notification, which might be a bit of log or other information.

#### **Configure Low Memory Threshold**

By default the Low Memory Alert is generated when the available memory of any CPS VM drops below 10% of the Total Memory. To change the default threshold:

**Step 1** Modify the following parameter in the Configuration worksheet of the CPS Deployment template spreadsheet.

The CPS Deployment template can be found on the Cluster Manager VM:

 $/var/qps/install/current/scripts/deployer/templates/QPS\_deployment\_config\_template.xlsm$ 

- free\_memory\_per\_alert: Enter a value (0.0-1.0) for the alert threshold. The system will generate an Alert trap whenever the available memory falls below this percentage of total memory for any given VM. Default 0.10 (10% free of the total memory).
- free\_memory\_per\_clear: Enter a value (0.0-1.0) for the clear threshold. The system will generate a low memory clear trap whenever available memory for any given VM is more than 30% of total memory. Default 0.3 (30% of the total memory).
- **Step 2** Follow the steps in the Update the VM Configuration without Re-deploying VMs section of the *CPS Installation Guide for VMware* to push the new settings out to all CPS VMs.

#### **Configure High CPU Usage Alarm Thresholds and Interval Cycle**

To change the default threshold values and interval cycle for the High CPU Usage traps and apply the new values to all CPS VMs:

**Step 1** Modify the following parameters in the Configuration worksheet of the CPS Deployment template spreadsheet.

The CPS Deployment template can be found on the Cluster Manager VM:

/var/qps/install/current/scripts/deployer/templates/QPS deployment config template.xlsm

**Note** The alert threshold must be set higher than the clear threshold.

- cpu\_usage\_alert\_threshold: Enter an integer (0-100) for the alert threshold value. The system will generate an Alert trap whenever the CPU usage is higher than this value. Default 80.
- cpu\_usage\_clear\_threshold: Enter an integer (0-100) for the clear threshold value. The system will generate a Clear trap whenever the CPU usage is lower than this value and alert trap already generated. Default 40.
- cpu\_usage\_trap\_interval\_cycle: Enter an integer value to be used as an interval period to execute the CPU usage trap script. The interval value in seconds is calculated by multiplying 5 with the given value.

The default cpu\_usage\_trap\_interval\_cycle value is 12 which means the script will get executed every 60 seconds.

**Step 2** Follow the steps in the Update the VM Configuration without Re-deploying VMs section of the *CPS Installation Guide for VMware* to push the new settings out to all CPS VMs.

## **Application Notifications**

Applications are running processes on a component device that make up the CPS system. These are application level traps. CPS processes (starting with word java when we run "ps -ef") and some scripts (for GR traps) generates these traps.

Application notifications are defined in the BROADHOP-NOTIFICATION-MIB as follows:

```
broadhopQNSComponentNotification NOTIFICATION-TYPE
   OBJECTS { broadhopComponentName,
    broadhopComponentTime,
    broadhopComponentNotificationName,
    broadhopNotificationFacility,
    broadhopNotificationSeverity,
    broadhopComponentAdditionalInfo }
STATUS current
DESCRIPTION "
Notification Trap from any QNS component - i.e. runtime
"
::= { broadhopProductsQNSNotifications 2 }
```

Each Application Notification contains:

- Name of the Notification being thrown (broadhopComponentNotificationName)
- Name of the device throwing the notification (broadhopComponentName)
- Time the notification was generated (broadhopComponentTime)

- Facility or which layer the notification came from (broadhopNotificationFacility)
- Severity of the notification (broadhopNotificationSeverity)
- Additional information about the notification, which might be a bit of log or other information.

#### **Important**

Currently, third site arbiter supports only Arbiter Down and Arbiter Up traps.

Application Notifications that CPS generates are shown in the following list. Any component in the CPS system may generate these notifications.

**Table 9: Application Notifications** 

Notification Name	Severity	Feature
MemcachedConnectError	error	Application
	critical	
	Message Text:	
	\${HOSTNAME	: Memcached server is in error
	OR	
	Memcached ser	ver is in error : <with exception=""></with>

	<b>Description:</b> Realtime server is reachable. This alarm is cleared when an earlier unreachable Realtime server endpoint is now reachable.		
Stateless Alarms, Alarms which n	ravida tha infam	nation about the event occuring on the system. These	

**Stateless Alarms:** Alarms which provide the information about the event occurring on the system. These alarms do not have any state. There is no clear alarm for these notifications.

Notification Name	Severity	Feature	
HA Failover	info	Application	
	\$previous_me \${SET_NAM <b>Description:</b>	Message Text: "\${HOSTNAME}: HA Failover done from \$previous_member to \$PRIMARYNODE of \${SET_NAME}-SET\$Loop"  Description: The primary role of the replica set has been failed over to another member.	
GR Failover	info	Application	
	\$previous_me	Message Text: "\${HOSTNAME}: Geo Failover done from \$previous_member to \$PRIMARYNODE of \${SET_NAME}-SET\$Loop"	
	<b>Description:</b> another mem	The primary role of the replica set has been failed over to ber.	
Admin User Logged in	info	Application	
	terminal \$terr	t: "\${HOSTNAME}: root user logged in on `hostname` minal from machine \$from_system at \$dt"	
		<b>Description:</b> root user logged in on %hostname terminal.	
ProcessRestarted	info	Application	
	_	Message Text: \$PROCESS process is restarted on \$HOSTNAME. Old_PID:\$OLD_PID Current_PID:\$CURRENT_PID	
	_	The above event is info event so there will not be any clear ed for it. There is no need for a clearing procedure.	

# **Configuration to Generate Invalid License Trap**

Note

If you change a previously installed valid license and make it invalid, the system will not generate any trap. As system is not monitoring the license files, instead it checks the license entries present in admin database. If the database entries are correct, system will not generate any trap.

Step 1 To generate invalid license trap we need to configure the following parameter in /etc/broadhop/qns.conf file.

-Dcom.cisco.enforcementfree.mode=false

When com.cisco.enforcementfree.mode is configured as false in addition to license has not been verified yet/license is invalid/has exceeded the allowed parameters following traps will be generated:

- is Expired
- · will expire soon
- is nearing the allowed parameters

The traps will be generated only when license expiry date is set in license file.

Step 2 After adding the above entry in qns.conf file execute copytoall.sh to synchronize the configuration changes to all VMs in the CPS cluster:

copytoall.sh /etc/broadhop/qns.conf /etc/broadhop/qns.conf

**Step 3** After modifying the configuration file to make the changes permanent for future use (when any VM is redeployed or restarted) rebuild etc.tar.gz.

/var/qps/install/current/scripts/build/build etc.sh

**Step 4** Restart the CPS service.

/var/qps/bin/control/restartall.sh

Caution Executing restartall.sh will cause messages to be dropped.

# **Unknown Application Events**

All of the alarms generated by different VMs are received by the Policy Director (load balancer) VMs.

On the Policy Director VMs a script called application\_trapv1\_convert processes the received alarms and generates the new alarm based on the received information and sends it to the external NMS. Unknown alarms can come when application\_trapv1\_convert is not able to process the received alarm. In this case it will generate one of the below seven unknown alarms.

## **Table 10: Unknown Application Events**

Name	Severity	Facility
ApplicationEvent	None	_
DBEvent	None	_
FailoverEvent	None	_
ProcessEvent	None	_
VMEvent	None	_
None	None	Application
UnKnown	None	None

Note

Any unknown alarms should get reported to engineering team to take necessary action against it. Provide the alarm log (/var/log/snmp/trap) from the active Policy Director (load balancer) VMs with the ticket number.

## **Active Alarms**

To get the list of active alarms, execute the diagnostics.sh --get\_active\_alarms command. Here is a sample output:

```
#diagnostics.sh --get active alarms
CPS Diagnostics HA Multi-Node Environment
Active Application Alarm Status
id=1000 sub id=3001 event host=1b02 status=down date=2017-11-22,
10:47:34,051+0000 msg="3001:Host: site-host-gx Realm: site-gx-client.com is down"

date=2017-22-11,10:13:49,310329511,+00:00 info=corosync process is down
```

### Attention

- Due to the limitation of architecture of the CPS SNMP implementation, if the SNMP deamon or policy server (QNS) process on perfelient VM restarts, there can be gap between active alarms displayed by the diagnostics.sh and active alarms in NMS.
- The date printed for application alarm status is when the alarm was seen at perfelient VM. The time for the alarm at NMS is the time before the alarm is received from Policy Director (LB) VM. So there can be a difference in the dates for the same alarm reported in diagnostics.sh and in NMS.

The following table list the type of SNMP alarms:

Table 11: IDs - Type of SNMP Alarms

Alarm ID	Туре
1000	Application Alarm
7100	Database Alarm
7200	Failover Alarm
7300	Process Alarm
7400	VM Alarm
7700	GR Alarm

## **Stale Component Alarms**

Due to different circumstances occurring on the system (lbvip02 down, network issue, snmptrapd process on active LB down, and so on) there are chances that stale component alarm are created on the system.

If stale alarms are present on the system, then you can reinitialize the system by executing /var/qps/install/current/scripts/upgrade/reinit.sh command from Cluster Manager VM to clear the stale alarms.

Or

Restart the snmpd process on the VM for which the stale alarm is present by executing monit restart snmpd command from the VM to clear the stale alarms.

Certain component alarms such as, low memory and high CPU usage are monitored and raised by scripts executed on the VMs. The stale alarms for low memory and high CPU usage can be cleared by executing reinit.sh.

If after upgrade any stale alarms are created on the system, execute the following script from Cluster Manager VM to clear all the stale alarms:

/var/qps/bin/support/clear\_stale\_component\_alarm.sh

Each VM generates approx. 20 notifications. As the system generates the clear notification for all the resource monitored by snmpd on each VM there are multiple clear notification generated. This causes the system performance to degrade during the upgrade/reinitialization of the system.

**For example:** If the deployment contains 80 VMs, then 1600 notifications are generated on the system during upgrade or reinitialization of the system. snmptrapd on active LB VMs takes approx. 2-3 seconds to process each notification. To process 1600 notifications, it takes approx. thirty miutes. During this period if any alarms gets generated on the systems it might get delayed by approx. thirty minutes to reach to NMS.

Note

As CPS sends all the alarm notification to NMS, NMS may receive duplicate component alarm notifications.

# **Configuration and Usage**

All access to system statistics and KPIs should be collected via SNMP gets and walks from the routable IP of the VM. NMS sends the snmpwalk or snmpget request to the routable IP of the VM and gets the response. NMS should know the routable IP addresses of all the VMs available in the setup. System Notifications are sourced from lbvip01.

User can also configure snmpRouteLan: parameter which contains the value of a VLAN name which can be used to access the KPIs value provided by SNMP. For more information on the parameter, refer to the CPS Installation Guide for VMware or in the CPS Installation Guide for OpenStack.

# **Configuration for SNMP Gets and Walks**

By default, SNMPv3 gets and walks can be performed against the routable/public IP addresses of the VMs with the default read-only community string of "broadhop" using standard UDP port 161.

If you want to use SNMPv2 as gets and walks, you need to change the *snmpv3 enable* to FALSE.

For more information on SNMP related parameters, refer to general configuration section in the *CPS Installation Guide for VMware* or in the *CPS Installation Guide for OpenStack* for this release.

## Script Execution Change in CPS 20.2.0

As CPS 20.2.0 is built on CentOS 8.1, snmpwalk command has limitations and hence cannot perform a direct snmpwalk on the OID such as .1.3.6.1.4.1.26878.200.3.2.70. Instead of snmpwalk, you need to use snmpget command along with the complete OID such as .1.3.6.1.4.1.26878.200.3.2.70.1.1. The list of OIDs for the individual machines are available in /etc/snmp/snmpd.conf file. The OIDs are part of the line containing the word proxy.

## Here is an example:

```
proxy -e 0x0102030405060708 -v 3 -u cisco_snmpv3 -a SHA -m 0x71d8d544a7447e377fa5fc355d8f08f81f1a901c -x AES -m 0x71d8d544a7447e377fa5fc355d8f08f8 -l authPriv localhost .1.3.6.1.4.1.26878.200.3.2.70.1.1.0 .1.3.6.1.4.1.2021.11.9.0
```

Here .1.3.6.1.4.1.26878.200.3.2.70.1.1.0 is the OID and hence the snmpget must be triggered as follows:

```
snmpget -e 0x0102030405060708 -v 3 -u cisco_snmpv3 -a SHA -A cisco_12345
-x AES -l authNoPriv -m +/etc/snmp/mibs/BROADHOP-MIB.txt:/etc/snmp/mibs/CISCO-QNS-MIB.txt
lb01 ".1.3.6.1.4.1.26878.200.3.3.70.11.2.0"
CISCO-QNS-MIB::kpiLBPCRFProxyInternalCurrentSessions.0 = STRING: 0
```

In order to get the complete details of all the OIDs, you need to create a script locally. The following scripts are used to fetch the details of Policy Director (lb), Policy Server (qns), perfelient (OAM), and Session Manager VMs.

## For Policy Director (lb) VMs:

1. Create a file named snmp-script.sh and add the following contents:

```
#!/bin/bash
vm=$1
snmpget -e 0x0102030405060708 -v 3 -u cisco snmpv3 -a SHA -A cisco 12345 -x AES -1
authNoPriv -m +/etc/snmp/mibs/BROADHOP-MIB.txt:/etc/snmp/mibs/CISCO-QNS-MIB.txt $vm
"1.3.6.1.4.1.26878.200.3.2.70.1.10"
snmpget -e 0x0102030405060708 -v 3 -u cisco snmpv3 -a SHA -A cisco 12345 -x AES -1
authNoPriv -m +/etc/snmp/mibs/BROADHOP-MIB.txt:/etc/snmp/mibs/CISCO-QNS-MIB.txt $vm
".1.3.6.1.4.1.26878.200.3.2.70.1.1.0"
snmpget -e 0x0102030405060708 -v 3 -u cisco snmpv3 -a SHA -A cisco 12345 -x AES -1
authNoPriv -m +/etc/snmp/mibs/BROADHOP-MIB.txt:/etc/snmp/mibs/CISCO-QNS-MIB.txt $vm
".1.3.6.1.4.1.26878.200.3.2.70.1.2.0"
snmpget -e 0x0102030405060708 -v 3 -u cisco snmpv3 -a SHA -A cisco 12345 -x AES -l
authNoPriv -m +/etc/snmp/mibs/BROADHOP-MIB.txt:/etc/snmp/mibs/CISCO-QNS-MIB.txt $vm
".1.3.6.1.4.1.26878.200.3.2.70.1.3.0"
snmpget -e 0x0102030405060708 -v 3 -u cisco snmpv3 -a SHA -A cisco 12345 -x AES -l
".1.3.6.1.4.1.26878.200.3.2.70.1.1"
snmpget -e 0x0102030405060708 -v 3 -u cisco snmpv3 -a SHA -A cisco 12345 -x AES -l
authNoPriv -m +/etc/snmp/mibs/BROADHOP-MIB.txt:/etc/snmp/mibs/CISCO-QNS-MIB.txt $vm

```

### 2. Save this script and provide execute permission.

\$ chmod 755 snmp-script.sh

## 3. To execute the script pass the VM value in the script.

```
$ sh snmp-script.sh <vm name>
```

### Example:

sh snmp-script.sh lb01

#### Output:

```
[root@lb01 ~]# sh snmp-script.sh lb01
CISCO-QNS-MIB::componentSwapAvailable = INTEGER: 4193008
CISCO-QNS-MIB::componentCpuUser.0 = INTEGER: 4
CISCO-QNS-MIB::componentCpuSystem.0 = INTEGER: 3
CISCO-QNS-MIB::componentCpuIdle.0 = INTEGER: 90
CISCO-QNS-MIB::componentCpuUser = INTEGER: 4
CISCO-QNS-MIB::componentCpuSystem = INTEGER: 3
CISCO-QNS-MIB::componentLoadAverage1 = INTEGER: 59
```

```
CISCO-QNS-MIB::componentLoadAverage5 = INTEGER: 54
CISCO-QNS-MIB::componentLoadAverage15 = INTEGER: 79
CISCO-QNS-MIB::componentLoadAverage1.0 = INTEGER: 59
CISCO-QNS-MIB::componentLoadAverage5.0 = INTEGER: 54
CISCO-QNS-MIB::componentLoadAverage15.0 = INTEGER: 79
CISCO-QNS-MIB::componentMemoryTotal = INTEGER: 7999612
CISCO-QNS-MIB::componentMemoryAvailable = INTEGER: 111116
CISCO-QNS-MIB::componentSwapTotal = INTEGER: 4194300
CISCO-QNS-MIB::componentSwapAvailable = INTEGER: 4193008
CISCO-QNS-MIB::componentMemoryTotal.0 = INTEGER: 7999612
CISCO-QNS-MIB::componentMemoryAvailable.0 = INTEGER: 111116
CISCO-QNS-MIB::componentSwapTotal.0 = INTEGER: 4194300
CISCO-QNS-MIB::componentSwapAvailable.0 = INTEGER: 4193008
CISCO-QNS-MIB::kpiLBPCRFProxyExternalCurrentSessions = STRING: 0
CISCO-QNS-MIB::kpiLBPCRFProxyInternalCurrentSessions = STRING: 0
CISCO-QNS-MIB::kpiLBPCRFProxyExternalCurrentSessions.0 = STRING: 0
CISCO-QNS-MIB::kpiLBPCRFProxyInternalCurrentSessions.0 = STRING: 0
```

### For Policy Server (qns) VMs:

1. Create a file named snmp-script.sh and add the following contents:

```
#!/bin/bash
τ/m=$1
snmpget -e 0x0102030405060708 -v 3 -u cisco snmpv3 -a SHA -A cisco 12345 -x AES -1
authNoPriv -m +/etc/snmp/mibs/BROADHOP-MIB.txt:/etc/snmp/mibs/CISCO-QNS-MIB.txt $vm
".1.3.6.1.4.1.26878.200.3.2.70.1.1.0"
snmpqet -e 0x0102030405060708 -v 3 -u cisco snmpv3 -a SHA -A cisco 12345 -x AES -1
authNoPriv -m +/etc/snmp/mibs/BROADHOP-MIB.txt:/etc/snmp/mibs/CISCO-QNS-MIB.txt $vm
".1.3.6.1.4.1.26878.200.3.2.70.1.2.0"
snmpget -e 0x0102030405060708 -v 3 -u cisco snmpv3 -a SHA -A cisco 12345 -x AES -1
authNoPriv -m +/etc/snmp/mibs/BROADHOP-MIB.txt:/etc/snmp/mibs/CISCO-QNS-MIB.txt $vm
".1.3.6.1.4.1.26878.200.3.2.70.1.3.0"
snmpget -e 0x0102030405060708 -v 3 -u cisco snmpv3 -a SHA -A cisco 12345 -x AES -1
authNoPriv -m +/etc/snmp/mibs/BROADHOP-MIB.txt:/etc/snmp/mibs/CISCO-QNS-MIB.txt $vm
".1.3.6.1.4.1.26878.200.3.2.70.1.1"
snmpget -e 0x0102030405060708 -v 3 -u cisco snmpv3 -a SHA -A cisco 12345 -x AES -l
authNoPriv -m +/etc/snmp/mibs/BROADHOP-MIB.txt:/etc/snmp/mibs/CISCO-QNS-MIB.txt $vm
".1.3.6.1.4.1.26878.200.3.2.70.1.2"
snmpget -e 0x0102030405060708 -v 3 -u cisco snmpv3 -a SHA -A cisco 12345 -x AES -1
authNoPriv -m +/etc/snmp/mibs/BROADHOP-MIB.txt:/etc/snmp/mibs/CISCO-QNS-MIB.txt $vm
".1.3.6.1.4.1.26878.200.3.2.70.1.3"
snmpget -e 0x0102030405060708 -v 3 -u cisco snmpv3 -a SHA -A cisco 12345 -x AES -l
authNoPriv -m +/etc/snmp/mibs/BROADHOP-MIB.txt:/etc/snmp/mibs/CISCO-QNS-MIB.txt $vm
".1.3.6.1.4.1.26878.200.3.2.70.1.4"
snmpget -e 0x0102030405060708 -v 3 -u cisco snmpv3 -a SHA -A cisco 12345 -x AES -1

authNoPriv -m +/etc/snmp/mibs/BROADHOP-MIB.txt:/etc/snmp/mibs/CISCO-QNS-MIB.txt $vm
".1.3.6.1.4.1.26878.200.3.2.70.1.10.0"
```

2. Repeat Step 2, on page 46 and Step 3, on page 46 for perfelient (OAM) and Session Manager VMs.

# **Configuration for Notifications (traps)**

Notifications are logged locally on the Policy Director (load balancer) VMs in the /var/log/snmp/trap file as well as forwarded to the NMS destination defined during the installation of CPS.

By default traps are sent to the NMS using the SNMPv2 community string of "broadhop". The standard SNMP UDP trap port of 162 is also used. Both of these values may be changed to accommodate the upstream NMS.

Note

If SNMPv3 is enabled, Component Notifications will be sent to NMS via SNMPv3. Application Notifications will be send via SNMPv2.

To change the trap community string for SNMPv2:

1. Configure the snmp\_trap\_community in Configuration excel sheet on the Cluster Manager VM. For more information, refer to the *Cisco Policy Suite Installation Guide for VMware* for this release. For example:

```
snmp trap community cisco
```

**2.** Execute the following command to import csv files into the Cluster Manager VM:

```
/var/qps/install/current/scripts/import/import deploy.sh
```

This script converts the data to JSON format and outputs it to /var/qps/config/deploy/import/json/.

**3.** Execute reinit.sh script to apply the changes to all VMs in the network.

```
/var/qps/install/current/scripts/upgrade/reinit.sh
```

To change the destination trap port from 162:

1. To make this change the /etc/snmp/snmptrapd.conf file needs to be modified on both lb01 and lb02. In these files append a colon and the destination port to each line containing corporate\_nms\_ip. There are a total of 12 lines in each file.

For example if the NMS destination port were 1162, the line:

```
traphandle DISMAN-EVENT-MIBmteTriggerFired
/etc/snmp/scripts/component_trap_convert corporate_nms_ip
becomes
traphandle DISMAN-EVENT-MIBmteTriggerFired
/etc/snmp/scripts/component trap convert corporate nms ip1162
```

2. After these changes, save the file and restart the snmptrapd service to enable changes. Run monit restart snmptrapd from both Policy Director VMs.

# **Cluster Manager KPI and SNMP Configuration**

This section describes the steps to enable SNMP traps and KPI monitoring of the Cluster Manager so that the customer NMS can monitor the following KPIs:

- · Memory usage
- · Disk usage

- CPU
- Disk IO

KPIs are reported and recorded on the perfelient in the /var/broadhop/stats file.

SNMP traps are forwarded to lb01/lb02 and lb01/lb02 forwards the traps to the configured NMS servers in the system.

The following traps are supported for Cluster Manager:

- DiskFull
- HighLoad
- Interface Up/Down
- Swap Usage

## Install NET-SNMP

To install NET-SNMP perform the following steps:

**Step 1** On the Cluster Manager VM, execute the following command to install NET-SNMP package:

```
yum install --assumeyes --disablerepo=QPS-Repository --enablerepo=QPS-local net-snmp
```

**Step 2** To enable run levels for SNMP, execute the following command:

```
chkconfig --level 2345 snmpd on
```

## **SNMPD Configuration**

Note

The SNMP configuration mentioned in the following sections is not supported for third site arbiter.

If firewall is configured on Cluster Manager VM, then check if it contains entries for 161 and 162 ports.

If the entries for 161 and 162 ports are not there, execute the following command:

```
iptables -A INPUT -i eth0 -p udp -m multiport --ports 161,162 -m comment --comment "100 allow snmp access" -j ACCEPT
```

Check whether IPv6 tables is running and 161 and 162 ports are not there. If the ports are not displayed, then execute the following command:

```
ip6tables -A INPUT -i eth0 -p udp -m multiport --ports 161,162 -m comment --comment "100-6 allow snmp access" -j ACCEPT
```

## For SNMPv2

1. Add the following content to /etc/snmp/snmpd.conf file on the Cluster Manager:

```
com2sec6 local
                 localhost
                                     <snmp trap community>
rocommunity <snmp_ro_community>
rocommunity6 <snmp_ro_community>
group MyRWGroup v1
                        local

.1.3.6.1.4.1.2021.4.4.0
```

2. Replace the string in <tag> with the actual value. You can check the snmpd.conf from other VMs to get the values for tags. For example, /etc/snmp/snmpd.conf file on lb01.

**3.** You can also update the configuration parameter such as load 6 6 6 to some other value based on number of vCPUs present on Cluster Manager.

Note

Formula is 1.5 \* no\_of\_vCPUs. Consider only the integer value from the output.

Here is an sample snmpd.conf file configuration:

```
com2sec local
                 localhost
                                     cisco123
com2sec6 local
                 localhost

```

#### Note

For snmptrap, puppet executes the script /var/broadhop/initialize\_snmpv3\_trap.sh. The script /var/broadhop/initialize\_snmpv3 trap.sh is starting and stopping snmptrapd twice.

```
[root@lb01 broadhop]# ./initialize_snmpv3_trap.sh
Stopping monit: [ OK ]
Stopping snmpd: [ OK ]
Stopping snmptrapd: [ OK ]
Starting snmptrapd: [ OK ]
Stopping snmptrapd: [ OK ]
Starting snmpd: [ OK ]
Starting monit: Starting Monit 5.17.1 daemon with http interface at [localhost]:2812
[ OK ]
[root@lb01 broadhop]#
```

- 2. Replace the string in <tag> with the actual value. You can check the snmpd.conf from other VMs to get the values for tags. For example, /etc/snmp/snmpd.conf file on lb01.
- **3.** You can also update the configuration parameter such as load 6 6 to some other value based on number of vCPUs present on Cluster Manager.

Note

Formula is 1.5 \* no of vCPUs. Consider only the integer value from the output.

Here is an sample snmpd.conf file configuration:

4. After updating the snmpd.conf file, execute the following commands from Cluster Manager.

```
mkdir /etc/snmp/mibs;scp root@qns01:/etc/snmp/mibs/* /etc/snmp/mibs
scp root@qns01:/etc/sysconfig/snmpd /etc/sysconfig/snmpd
scp root@qns01:/etc/logrotate.d/snmpd /etc/logrotate.d/snmpd
scp root@qns01:/etc/monit.d/snmpd /etc/monit.d/
service monit restart
```

# **Validation and Testing**

This section describes the commands for validation and testing of the CPS SNMP infrastructure. You can use these commands to validate and test your system during setting up or configuring the system. Our examples use MIB values because they are more descriptive but you may use equivalent OID values if you like particularly when configuring an NMS.

The examples here use Net-SNMP snmpget snmpwalk and snmptrap programs. Detailed configuration of this application is outside the scope of this document but the examples assume that the three Cisco MIBs are installed in the locations described on the man page of snmpcmd (typically the /etc/snmp/mibs directories).

Run all tests from a client with network access to the Management Network or from lb01 lb02 (which are also on the Management Network).

## **Component Statistics**

Component statistics can be obtained on a per statistic basis with snmpget. For example, to get the current available memory on perfclient01, use the following commands:

## For SNMPv2

```
snmpget -v 2c -c broadhop -M /etc/snmp/mibs:/usr/share/snmp/mibs -m
+BROADHOP-MIB:CISCO-QNS-MIB
pcrfclient01 .1.3.6.1.4.1.26878.200.3.2.70.1.8
```

An example of the output from this command is:

```
CISCO-QNS-MIB::componentMemoryAvailable = INTEGER: 4551356
```

Interpreting this output means that 4551356 MB of memory are available on this component machine.

All available component statistics in an MIB node can be "walked" via the snmpwalk command. This is very similar to snmpget as above. For example, to see all statistics on lb01 use the command:

```
snmpwalk -v 2c -c broadhop -M /etc/snmp/mibs:/usr/share/snmp/mibs -m +BROADHOP-MIB:CISCO-QNS-MIB lb01 .1.3.6.1.4.1.26878.200.3.2.70
```

An example of the output from this command is:

```
CISCO-QNS-MIB::componentCpuUser = INTEGER: 34
CISCO-QNS-MIB::componentCpuUser.0 = INTEGER: 34
CISCO-QNS-MIB::componentCpuSystem = INTEGER: 3
CISCO-QNS-MIB::componentCpuSystem.0 = INTEGER: 3
CISCO-QNS-MIB::componentCpuIdle = INTEGER: 61
CISCO-QNS-MIB::componentCpuIdle.0 = INTEGER: 61
CISCO-QNS-MIB::componentCpuIdle.0 = INTEGER: 102
CISCO-QNS-MIB::componentLoadAverage1 = INTEGER: 102
CISCO-QNS-MIB::componentLoadAverage5 = INTEGER: 101
CISCO-QNS-MIB::componentLoadAverage5.0 = INTEGER: 101
CISCO-QNS-MIB::componentLoadAverage5.0 = INTEGER: 109
```

```
CISCO-QNS-MIB::componentLoadAverage15.0 = INTEGER: 109
CISCO-QNS-MIB::componentMemoryTotal = INTEGER: 12198308
CISCO-QNS-MIB::componentMemoryTotal.0 = INTEGER: 12198308
CISCO-QNS-MIB::componentMemoryAvailable = INTEGER: 4518292
CISCO-QNS-MIB::componentMemoryAvailable.0 = INTEGER: 4518292
CISCO-QNS-MIB::componentSwapTotal = INTEGER: 0
CISCO-QNS-MIB::componentSwapTotal.0 = INTEGER: 0
CISCO-QNS-MIB::componentSwapAvailable = INTEGER: 0
CISCO-QNS-MIB::componentSwapAvailable.0 = INTEGER: 0
```

### For SNMPv3

```
snmpwalk -e 0x0102030405060708 -v 3 -u cisco_snmpv3 -a SHA -A Cisco-12345 -x AES -X
Cisco-12345 -1
authPriv -M /etc/snmp/mibs:/usr/share/snmp/mibs -m +BROADHOP-MIB:CISCO-QNS-MIB pcrfclient01
.1.3.6.1.4.1.26878.200.3.2.70.1
snmpget -e 0x0102030405060708 -v 3 -u cisco_snmpv3 -a SHA -A Cisco-12345 -x AES -X Cisco-12345
-1
authPriv -M /etc/snmp/mibs:/usr/share/snmp/mibs -m +BROADHOP-MIB:CISCO-QNS-MIB pcrfclient01
.1.3.6.1.4.1.26878.200.3.2.70.1.2.0
```

## **Application KPI**

Application KPI can be obtained on a per statistic basis with snmpget in a manner much like obtaining Component Statistics. As an example to get the aggregate number of sessions currently active on qns01 use the following commands:

#### For SNMPv2

An example of the output from this command would be:

```
iso.3.6.1.4.1.26878.200.3.3.70.15.24 = STRING: "0"
```

Interpreting this output means that 0 sessions are active on qns01.

Similarly, all available KPI in an MIB node can be "walked" via the snmpwalk command. This is very similar to snmpget as above. As an example, to see all statistics on qns01, use the following command:

```
snmpwalk -v 2c -c broadhop -M /etc/snmp/mibs:/usr/share/mibs -m +BROADHOP-MIB:CISCO-QNS-MIB qns01 1.3.6.1.4.1.26878.200.3.3.70.15
```

An example of the output from this command would be:

```
iso.3.6.1.4.1.26878.200.3.3.70.15.20 = STRING: "0"
iso.3.6.1.4.1.26878.200.3.3.70.15.20.0 = STRING: "0"
iso.3.6.1.4.1.26878.200.3.3.70.15.21 = STRING: "0"
iso.3.6.1.4.1.26878.200.3.3.70.15.21 = STRING: "0"
iso.3.6.1.4.1.26878.200.3.3.70.15.21.0 = STRING: "0"
iso.3.6.1.4.1.26878.200.3.3.70.15.22 = STRING: "0"
iso.3.6.1.4.1.26878.200.3.3.70.15.22.0 = STRING: "0"
iso.3.6.1.4.1.26878.200.3.3.70.15.23 = STRING: "0"
iso.3.6.1.4.1.26878.200.3.3.70.15.23.0 = STRING: "0"
iso.3.6.1.4.1.26878.200.3.3.70.15.24 = STRING: "0"
iso.3.6.1.4.1.26878.200.3.3.70.15.25 = STRING: "0"
iso.3.6.1.4.1.26878.200.3.3.70.15.25 = STRING: "1434914488"
iso.3.6.1.4.1.26878.200.3.3.70.15.25.0 = STRING: "1434914488"
```

#### For SNMPv3

```
snmpwalk -e 0x0102030405060708 -v 3 -u cisco_snmpv3 -a SHA -A Cisco-12345 -x AES -X
Cisco-12345 -1
authPriv -M /etc/snmp/mibs:/usr/share/mibs -m +BROADHOP-MIB:CISCO-QNS-MIB qns01
.1.3.6.1.4.1.26878.200.3.3.70
snmpget -e 0x0102030405060708 -v 3 -u cisco_snmpv3 -a SHA -A Cisco-12345 -x AES -X Cisco-12345
-1
authPriv -M /etc/snmp/mibs:/usr/share/mibs -m +BROADHOP-MIB:CISCO-QNS-MIB qns01
.1.3.6.1.4.1.26878.200.3.3.70.15.25.0
```

## **Alarm Notifications/Traps**

Testing and validating alarms notifications requires slightly more skill than testing SNMP gets and walks. Recall that the overall architecture is that all components and applications in the CPS system are configured to send notifications to lb01 or lb02 via lbvip02, the Internal Network IP.

These systems log the notification locally in /var/log/snmp/trap and then "re-throw" the notification to the destination configured by corporate\_nms\_ip. Two testing and troubleshooting methods can be performed: confirming notifications are being sent properly from system components to lb01 or lb02, and confirming that notifications can be sent upstream to the NMS.

## **Testing Individual Traps**

CPS Troubleshooting Guide includes procedures to test each CPS trap individually.

# **Troubleshooting**

Note

For information about troubleshooting SNMP notifications and traps, refer to *Cisco Policy Suite Troubleshooting Guide*.

The scenarios mentioned in the following sections are applicable only for Application notifications.

Here are some scenarios:

## Why the clear notifications come from different sources that the alert notification sent out from?

**A:** In case of alarms, CPS supports high availability by running the monitoring scripts on both the perfelient01 and perfelient02. To illustrate this point here is a sample output from perfelient01 and perfelient02.

## pcrfclient01:

```
[root@pcrfclient01 ~] # monsum
The Monit daemon 5.17.1 uptime: 6h 6m
Process 'whisper'
                                     Running
Process 'snmpd'
                                     Running
Program 'kpi_trap'
                                     Status ok
Program 'db trap'
                                     Status ok
Program 'failover trap'
                                    Status ok
Program 'qps_process_trap'
                                    Status ok
Program 'admin login trap'
                                    Status ok
Program 'vm trap'
                                    Status ok
Program 'qps message trap'
                                    Status ok
Program 'ldap message trap'
                                    Status ok
```

### pcrfclient02:

```
[root@pcrfclient02 ~] # monsum
The Monit daemon 5.17.1 uptime: 5h 47m
Process 'whisper'
                                        Running
Process 'snmpd'
                                        Running
Program 'kpi trap'
                                       Status ok
Program 'db_trap'
                                       Status ok
rrogram 'tailover_trap'
Program 'qps_process_trap'
Program 'admin_login_trap'
Program 'failover trap'
                                        Status ok
                                       Status ok
                                       Status ok
Program 'vm trap'
                                        Status ok
Program 'qps message trap'
                                        Status ok
Program 'ldap message trap'
                                        Status ok
```

- The monitoring scripts are responsible for detecting conditions that can lead to raising or clearing a trap.
- Once a condition that can lead to an alarm is detected by both the perfelients, both perfelient01 & perfelient02 individually raise an event towards HA-Proxy.
- The HA-Proxy forwards both the events to the Fault Management System(FMS).
- The FMS raises a trap for the first event it receives and discards the second event.
- When perfelient01 raises an alert, it is because the event sent by perfelient01 reaches the FMS first. Event sent by perfelient02 is ignored by FMS.
- When perfelient02 clears an alarm, it is because the corresponding event sent by the perfelient02 reaches the FMS first. Event sent by perfelient01 is ignored by FMS.

### How to match alarm and clear for the same event, from different sources?

**A:** Every Alarms/Clear generated from CPS system has the following varbinds:

- **broadhopComponentName:** The broadhopComponentName object is used to provide the name of the individual system device being trapped.
- **broadhopComponentTime:** The broadhopComponentTime object is used to provide the date and time associated with the occurrence of the problem being trapped.
- **broadhopComponentNotificationName:** The broadhopComponentNotificationName object is used to provide the name of the notification.
- broadhopNotificationFacility: This object determines the facility or layer which notifications are sourced.
- broadhopNotificationSeverity: This object determines the severity or level of sourced notifications.
- **broadhopComponentAdditionalInfo:** This object is used to provide any additional information about the problem being trapped.

To match the alarm and clear from different host, user can use the following field information:

- broadhopComponentNotificationName
- broadhopNotificationSeverity
- broadhopComponentAdditionalInfo

Note

Ignore the text before the first colon (:) from the additional info field.

Host Independent Alarms: Alarm and clear can come from different host.

- All DB Member of replica set Up
- All DB Member of replica set Down

- InvalidLicense
- · PolicyConfiguration
- · PoliciesNotConfigured
- DiameterAllPeersDown
- ZeroMQConnectionError
- DeveloperMode

## How to match if alarm and clears coming from same source?

- **A:** To match the alarm and clear from same host, user can use the following field information:
  - broadhopComponentNotificationName
  - · broadhopNotificationSeverity
  - broadhopComponentAdditionalInfo
  - broadhopComponentName

Host Dependent Alarms: Alarm and clear come from the same host.

## Information Alarm (Alarms without clear indication)

There are no clear trap for the following alarms:

- HA Failover
- GR Failover
- Admin User Logged in
- Critical File Operation Alert

Troubleshooting
