

Solución de problemas de adyacencia OSPF de Nexus 7000

Contenido

[Introducción](#)

[Antecedentes](#)

[La adyacencia OSPF no se conecta](#)

[Vecino OSPF atascado en el estado de inicialización \(INIT\)](#)

[Vecino OSPF atascado en un estado bidireccional](#)

[Vecino OSPF atascado en Exstart/Exchange](#)

[Vecino OSPF atascado en estado de carga](#)

Introducción

Este documento describe varios escenarios comunes encontrados donde el vecino OSPF (Open Shortest Path First) no se conecta como se esperaba. Para evitar este tipo de comportamiento inesperado en los switches Nexus de Cisco serie 7000, asegúrese de seguir las directrices y restricciones sobre la capa 3 (L3) y el canal de puerto virtual (vPC).

Antecedentes

Antes de resolver problemas, asegúrese de que se cumplen las pautas y restricciones. Consulte la [Guía de diseño y configuración: Prácticas recomendadas para Virtual Port Channels \(vPC\) en switches Nexus de Cisco serie 7000](#) para obtener más información sobre L3 y vPC.

El procedimiento utilizado para resolver problemas de adyacencia OSPF en el Nexus 7000 es similar a los procedimientos para Cisco IOS[®], pero Nexus 7000 tiene más herramientas y filtros integrados para identificar fácilmente el problema.

La adyacencia OSPF no se conecta

Hay momentos en que la adyacencia OSPF no se conecta. El comando `show ip ospf neighbor` no muestra al vecino.

```
R3#show ip ospf neighbor
```

```
R3#
```

Este problema podría deberse a:

- Problema de conectividad L2/L3
- OSPF no habilitado en la interfaz
- La interfaz se define como pasiva
- Máscara de subred no coincidente
- Intervalo de saludo/muerto no coincidente
- Clave de autenticación no coincidente
- ID de área no coincidente
- Opción de tránsito/stub/Not-So-Stubby Area (NSSA) no coincidentes

Para investigar el problema, verifique la conectividad, la configuración y la lista de control de acceso (ACL)/ política de plano de control (CoPP).

Comprobación de la conectividad L2/L3

1. Verifique la conectividad de unidifusión con ping.

Si hay un problema de conectividad, descubra si se debe al proveedor de servicios de Internet (ISP) L2, un puerto físico, un convertidor de interfaz Gigabit (GBIC) o un cable.

Nota: Suponga que no hay ACL/CoPP que bloquee el tráfico. Si el problema se debe a un hardware o un cable defectuosos, reemplácelo o muévelo a otro puerto para resolver el problema.

2. Verifique la conectividad multicast con ping.

```
N7K1-RP# ping multicast 224.0.0.5 interface vlan 5
PING 224.0.0.5 (224.0.0.5): 56 data bytes
64 bytes from 5.5.5.2: icmp_seq=0 ttl=254 time=1.739 ms
64 bytes from 5.5.5.2: icmp_seq=1 ttl=254 time=1.253 ms
64 bytes from 5.5.5.2: icmp_seq=2 ttl=254 time=0.866 ms
64 bytes from 5.5.5.2: icmp_seq=3 ttl=254 time=1.045 ms
64 bytes from 5.5.5.2: icmp_seq=4 ttl=254 time=1.89 ms

--- 224.0.0.5 ping multicast statistics ---
5 packets transmitted,
From member 5.5.5.2: 5 packets received, 0.00% packet loss
--- in total, 1 group member responded ---
N7K1-RP#
```

Verifique que la interfaz esté limpia y que no haya caídas o errores con el comando **show int ethernet 1/1**.

```
N7K1-RP# show int ethernet 1/20 | section RX|TX
RX
 340213 unicast packets  368092 multicast packets  2 broadcast packets
 708307 input packets  233094927 bytes

 0 output error  0 collision  0 deferred  0 late collision
```

```
0 lost carrier 0 no carrier 0 babble 0 output discard
0 Tx pause
N7K1-RP#
```

3. Determine si estas funciones descartan paquetes en la tarjeta de línea entrante, la interfaz o la CPU.

- ACL: entrante/saliente de la interfaz
- Calidad de servicio (QoS): en la interfaz
- CoPP

N7K1#

Verificar la Configuración OSPF

Utilice estos comandos para verificar la configuración OSPF (subred, intervalo hello/dead, ID de área, tipo de área, clave de autenticación (si la hay) y no pasivo) y asegurarse de que coincide en ambos lados.

1. Show run ospf

2. Show ip ospf 5 interfaz

3. Show ip ospf 5

Este es un ejemplo del primer comando:

```
N7K1-RP# show run ospf
```

```
!Command: show running-config ospf
```

```
!Time: Thu May 16 11:27:24 2013
```

```
version 6.2(2)
```

```
feature ospf
```

```
logging level ospf 7
```

```
router ospf 5
```

```
router-id 5.5.0.1
```

```
interface Vlan5
```

```
ip router ospf 5 area 0.0.0.0
```

```
interface loopback5
```

```
ip router ospf 5 area 0.0.0.0
```

```
N7K1-RP#
```

Este es un ejemplo del segundo comando:

```
N7K1-RP# show ip ospf 5 interface
```

```
Vlan5 is up, line protocol is up
```

```
IP address 5.5.5.1/24, Process ID 5 VRF default, area 0.0.0.0
```

```
Enabled by interface configuration
```

```
State DR, Network type BROADCAST, cost 40
```

```
Index 2, Transmit delay 1 sec, Router Priority 1
```

```
Designated Router ID: 5.5.0.1, address: 5.5.5.1
```

```
Backup Designated Router ID: 5.5.0.2, address: 5.5.5.2
```

```
1 Neighbors, flooding to 1, adjacent with 1
```

```
Timer intervals: Hello 10, Dead 40, Wait 40, Retransmit 5
```

```
Hello timer due in 00:00:00
```

```
No authentication
```

```
Number of opaque link LSAs: 0, checksum sum 0
```

```
loopback5 is up, line protocol is up
```

```
IP address 5.5.0.1/32, Process ID 5 VRF default, area 0.0.0.0
```

```
Enabled by interface configuration
```

```
State LOOPBACK, Network type LOOPBACK, cost 1
```

```
Index 1
```

```
N7K1-RP#
```

Este es un ejemplo del tercer comando:

```
N7K1-RP# show ip ospf 5
```

```
Routing Process 5 with ID 5.5.0.1 VRF default
```

```
Routing Process Instance Number 3
```

```

```

N7K1-RP#

Verifique los mensajes OSPF

Ingrese el comando **show ip ospf event-history adjacency** para verificar que el proceso OPSF envíe y reciba los mensajes de depuración.

Nota: Los últimos mensajes aparecen en la parte superior.

El resultado muestra todos los mensajes de adyacencia OSPF que se intercambian entre vecinos OSPF. Cuando se forma una adyacencia OSPF, un router pasa por varios cambios de estado antes de que se vuelva completamente adyacente con su vecino. Este resultado muestra todos los cambios de estado y las negociaciones. Si hay un problema (unidad de transición máxima (MTU), problemas de conectividad, pérdida de paquetes), se refleja en el resultado.

N7K1-RP# **show ip ospf 5 event-history adjacency**

Troubleshoot

Si la investigación de la conectividad L2/3, la configuración y el tráfico permitido por OSPF no descubrieron el problema y mostraron al vecino en la lista, abra un caso de Cisco Technical Assistance Center (TAC). Ingrese estos comandos y suministre al TAC la información de los resultados de ambos vecinos:

- 'Show run'
- Show tech-support ospf

Vecino OSPF atascado en el estado de inicialización (INIT)

Hay momentos en que el vecino se encuentra atascado en el estado INIT, lo que indica que el Nexus 7000 ve los paquetes hello del vecino, pero no ve su router-ID en el paquete hello para pasar al siguiente estado de dos vías.

```
router2#show ip ospf neighbor
```

Neighbor ID	Pri	State	Dead Time	Address	Interface
170.170.5.1	1	INIT/-	00:00:34	170.170.1.1	ethernet 1/1

```
router-2#
```

Este problema podría deberse a:

- Un lado está bloqueando el paquete hello con ACL.
- Un lado está traduciendo, con la traducción de direcciones de red (NAT), el saludo OSPF.
- La capacidad de multidifusión de un lado está dañada (L2).

Complete estos pasos para investigar el problema:

1. Verifique que el plano de control IP Multicast funcione.

```
N7K4# ping multicast 224.0.0.5 interface Ethernet 1/1
```

Si no ve la dirección IP de los vecinos en los resultados de ping, entonces hay un problema. Compruébelo en ambos lados.

2. Verifique que los paquetes HELLO se reciban del vecino.

```
N7K4# show ip ospf 5 event-history adjacency
```

Nota: No se muestran los paquetes hello salientes.

3. Habilite el debug de adyacencia OSPF en cada interfaz y verifique que se envíen paquetes hello.

```
N7K4# debug logfile debug-ospf size 10000
N7K4# debug-filter ip ospf 5 interface Ethernet 1/1
N7K4# debug ip ospf 5 adjacency detail
```

Nota: No olvide deshabilitar las depuraciones.

```
N7K4# undebug all
N7K4# no debug-filter all
N7K4# clear debug logfile debug-ospf
```

4. Verifique que los paquetes sean enviados por OSPF a 224.0.0.5.

```
N7K4# debug logfile ospf_vj
N7K4# debug-filter ip mpacket interface e1/5
N7K4# debug-filter ip mpacket direction outbound
N7K4# debug-filter ip mpacket dest 224.0.0.5
N7K4# debug ip ospf 5 hello
```

```
N7K4# show debug logfile ospf_vj
```

```

N7K1-RP# show debug logfile ospf_vj

2013-05-16 11:06:34.397553      5.5.5.2 -> 224.0.0.5      OSPF Hello Packet
2013-05-16 11:06:38.895343      5.5.5.1 -> 224.0.0.5      OSPF Hello Packet

```

Nota: Debe haber uno en el contexto de dispositivo virtual predeterminado (VDC).

Troubleshoot

Si la investigación de la conectividad L2/3, la configuración y el tráfico permitido por OSPF no descubre el problema y muestra que el vecino se vuelve COMPLETO, abra un caso TAC. Ingrese estos comandos y suministre al TAC la información de los resultados de ambos vecinos:

- 'Show run'
- Show tech-support ospf

Vecino OSPF atascado en un estado bidireccional

Hay momentos en que el vecino OSPF se bloquea en un estado bidireccional. Este escenario es normal en los tipos de red de broadcast y reduce la cantidad de inundación en el cable. Este escenario también ocurre si todos los routers están configurados con una prioridad igual a cero.

Nota: Sólo los routers de gama baja deben configurarse con una prioridad de cero para que no participen en la elección de router designado (DR).

Refiérase a [¿Por Qué el Comando show ip ospf neighbor Revela Que Los Vecinos Están Atascados en el Estado Bidireccional?](#) para obtener más información.

Vecino OSPF atascado en Exstart/Exchange

Hay veces en que el vecino OSPF se atasca en el estado Exstart/Exchange.

Si hay discordancia de MTU entre las interfaces de los vecinos OSPF o no pueden hacer ping entre sí con el tamaño del paquete de la MTU configurada debido a los medios de transmisión, entonces el vecino OSPF se atasca en el estado exstart/exchange.

```
router-6# show ip ospf neighbor
```

Neighbor ID	Pri	State	Dead Time	Address	Interface
170.170.11.7	1	EXCHANGE/ -	00:00:36	170.170.11.7	Serial2.7

```
router-6#
```

```
router-7# show ip ospf neighbor
```

Neighbor ID	Pri	State	Dead Time	Address	Interface
170.170.11.6	1	EXSTART/ -	00:00:33	170.170.11.6	Serial0.6

```
router-7#
```

Este problema podría deberse a:

- Discordancia de MTU - INTERCAMBIO en un router y EXSTART en el otro
Nota: Puede configurar con el comando `ip ospf mtu-ignore`.
- La ID del router vecino (RID) es la misma que la de su vecino - EXSTART
- La unidifusión está dañada - EXCHANGE Problema de MTU: no se puede hacer ping con más de un paquete de cierta longitud Bloqueo de ACL unidifusión: después de que OSPF bidireccional envíe paquetes de unidifusión excepto enlaces punto a punto (P2P) NAT traduce el paquete de unidifusión

Complete estos pasos para investigar el problema:

1. Verifique el ping normal con un bit Don't Fragment (DF) activado y con la MTU IP máxima en la interfaz.

```
N7K4# ping 10.10.12.2 df-bit packet-size 1472
```

Nota: En Cisco IOS, cuando ingresa el comando `ping x.x.x.x size <size>`, el tamaño hace referencia al tamaño del paquete IP. En Linux, se especifica la carga útil del protocolo de mensajes de control de Internet (ICMP) del ping en lugar de especificar el tamaño del paquete IP como en Cisco IOS. Como ya sabrá, Nexus está construido en Linux. La MTU

todavía está configurada en 1,500 bytes - 20 de esos bytes son el encabezado IP y otros 8 son el encabezado ICMP. $1,500 - 20 - 8 = 1,472$ bytes de carga útil. Por lo tanto, el tamaño real del datagrama IP es el mismo que en Cisco IOS, que es de 1500 bytes.

2. Verifique si los paquetes se descartan en las interfaces entrantes con el comando **show int ethernet 1/1**.

```
N7K1-RP# show int ethernet 1/20 | section RX|TX
RX
 340213 unicast packets  368092 multicast packets  2 broadcast packets
 708307 input packets  233094927 bytes
 0 jumbo packets  0 storm suppression packets
 0 runs  0 giants  0 CRC/FCS  0 no buffer
 0 input error  0 short frame  0 overrun  0 underrun  0 ignored
 0 watchdog  0 bad etype drop  0 bad proto drop  0 if down drop
 0 input with dribble  0 input discard
 0 Rx pause
TX
 1374131 unicast packets  324752 multicast packets  3 broadcast packets
 1698886 output packets  196282264 bytes
 0 jumbo packets
 0 output error  0 collision  0 deferred  0 late collision
 0 lost carrier  0 no carrier  0 babble  0 output discard
 0 Tx pause
N7K1-RP#
```

3. Verifique si CoPP descarta el paquete OSPF con el comando **show policy-map interface control-plane class test1-copp-class-Critical**.

```
Control Plane
service-policy input test1-copp-policy-lenient

class-map test1-copp-class-critical (match-any)

```

Consejos de investigación:

Busque mensajes MTU no coincidentes. Siga el número de secuencia y busque una retransmisión debido a la caída DBD. Compruebe si se recibe un número de secuencia DBD inesperado.

Troubleshoot

Si la investigación de la conectividad L2/3, la configuración y el tráfico permitido por OSPF no revelaron el problema y mostraron que el vecino está en línea, abra un caso TAC. Ingrese estos comandos y suministre al TAC la información de los resultados de ambos vecinos:

- 'Show run'
- Show tech-support ospf

Vecino OSPF atascado en estado de carga

Hay momentos en que el vecino OSPF se bloquea en un estado de carga.

Este problema podría deberse a:

- Se realiza una solicitud de estado de link (LS) y el vecino envía un paquete incorrecto o existe una corrupción de memoria. Ingrese el comando **show IP OSPF bad** para ver el anuncio de estado de link (LSA) incorrecto. El comando **show log** muestra el **mensaje OSPF-4-BADLSATYPE**. Se realiza una solicitud LS y el vecino ignora la solicitud.

Si un router recibe un LSA obsoleto, dañado o faltante, OSPF permanece en estado de carga y

genera el mensaje de error **OSPF-4-BADLSA**.

Ingrese este comando para investigar:

```
7K1-RP# show ip ospf traffic vlan 5
