Introduction

Ce document fournit des instructions sur la configuration de l'authentification RADIUS via le Cache Engine vers Cisco Secure Access Control Server (ACS) pour Microsoft Windows NT. Vous devez exécuter Web Cache Communication Protocol Version 2 (WCCPv2) pour suivre correctement cette procédure. Reportez-vous à [Configuration du protocole de communication Web Cache version 2 sur un moteur et un routeur Cisco Cache Engine](#) pour plus d'informations sur WCCP version 2.

Conditions préalables

[Conditions requises](#)

Avant d'essayer cette configuration, assurez-vous de respecter les conditions suivantes :

- Connaissance de Cisco Secure ACS pour Windows ou UNIX.
- Connaissance de la configuration WCCPv2 sur le routeur et le moteur de cache.

[Components Used](#)

Les informations contenues dans ce document sont basées sur les versions de matériel et de logiciel suivantes :

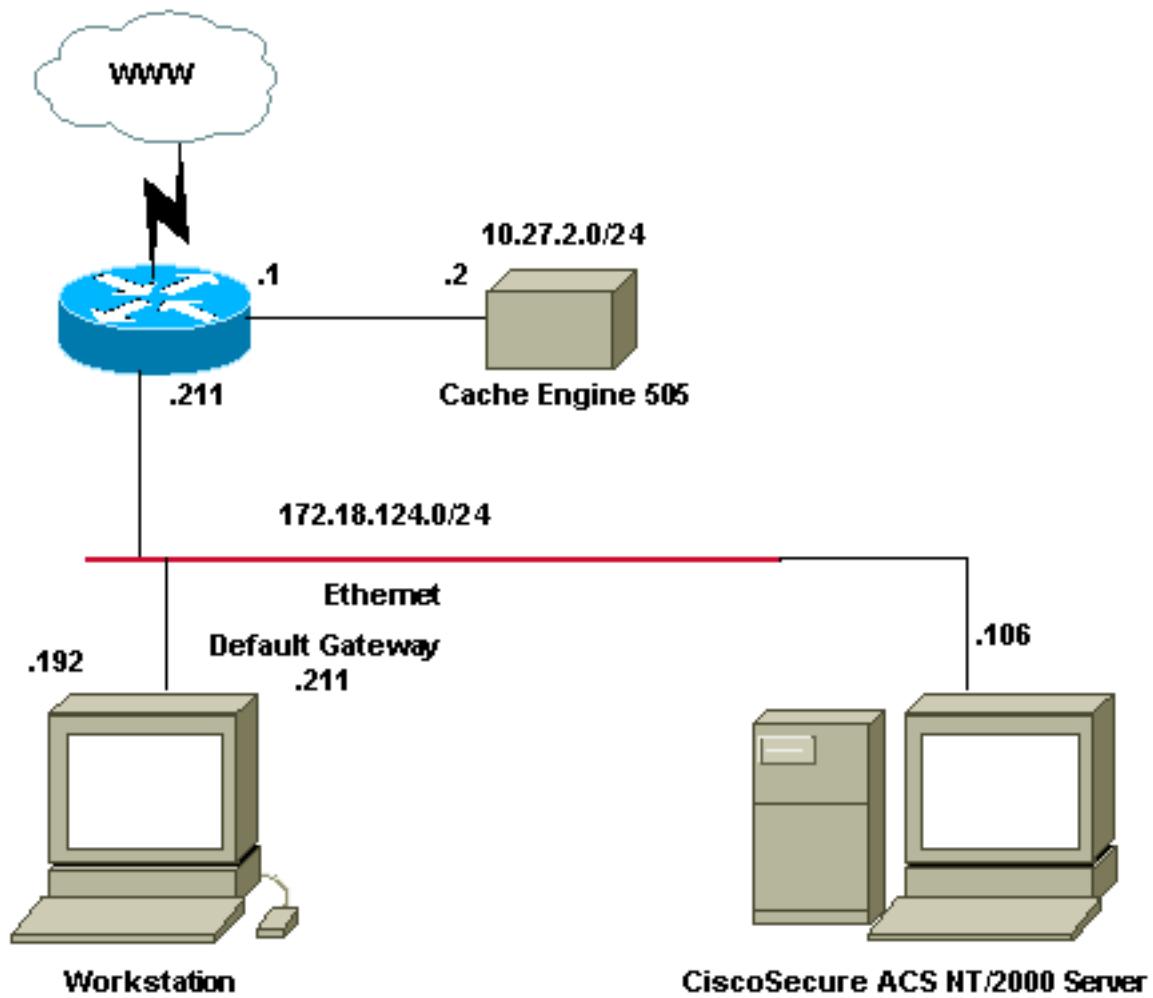

- Cisco Cache Engine 505 dans un environnement de laboratoire avec des configurations effacées

- Routeur Cisco 2600
- Logiciel Cisco Cache Engine version 2.31
- Logiciel Cisco IOS® Version 12.1(3)T 3
- Cisco Secure ACS pour serveurs Microsoft Windows NT/2000

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Diagramme du réseau

Ce document utilise la configuration réseau suivante :

Conventions

For more information on document conventions, refer to the [Cisco Technical Tips Conventions](#).

Configuration de l'authentification RADIUS via la procédure Cache Engine

Utilisez ces étapes pour configurer le Cache Engine pour l'authentification RADIUS :

1. Configurez le Cache Engine en tant que serveur d'accès au réseau (NAS) dans Cisco

Secure ACS pour Windows NT.

2. Configurez les informations utilisateur dans Cisco Secure ACS pour Windows NT.
3. Configurez le Cache Engine pour RADIUS et spécifiez l'hôte et les informations de clé.

```
radius-server host 172.18.124.106  
radius-server key cisco123
```

4. Configurez le routeur pour WCCP.Vos lignes de commande pour le Cache Engine doivent apparaître comme suit :

```
cipro#configure terminal  
!---- Enter configuration commands, one per line. !---- End with CNTL/Z.  
cipro(config)#radius-server host 172.18.124.106  
cipro(config)#radius-server key cisco123  
cipro#
```

Voici la configuration Cache Engine/NAS de Cisco Secure ACS pour Windows NT :

The screenshot shows a Microsoft Internet Explorer window displaying the Cisco Secure ACS interface. The title bar reads "CiscoSecure ACS for Windows 2000/NT - Microsoft Internet Explorer". The left sidebar has a "Cisco Systems" logo and links for User Setup, Device Setup, Network Configuration, System Configuration, Interface Configuration, Administration Control, External User Database, Report and Activity, and Online Documentation. The main content area is titled "Network Configuration" and "Edit". It shows the "Access Server Setup For cipro" section. The "Network Access Server IP Address" field is set to "10.27.22" and the "Key" field is "cisco123". The "Authenticate Using" dropdown is set to "RADIUS (Cisco IOS/PX)". Below these fields are three checkboxes: "Single Connect TACACS+ NAS (Record stop in accounting on failure)", "Log Update/Watchdog Packets from this Access Server", and "Log Radius Tunneling Packets from this Access Server". At the bottom are "Submit", "Submit + Restart", "Delete", and "Cancel" buttons, along with a "Help" button. To the right of the main form is a "Help" sidebar with links to Network Access Server IP Address, Key, Network Device Group, Authenticate Using, Single Connect TACACS+ NAS, Log Update/Watchdog Packets from this Access Server, Deleting an Access Server, Renaming an Access Server, and Log RADIUS Tunnelling Packets from this Access Server. Below the sidebar is a "Network Access Server IP Address" section with a description and a "Back to Top" link. The bottom of the screen shows the Windows taskbar with icons for Start, Internet, and other system functions.

Account Disabled Status

The screenshot shows a Microsoft Internet Explorer window with the title "CiscoSecure ACS for Windows 2000/NT - Microsoft Internet Explorer". The address bar shows the URL "http://172.18.124.106:2525/index2.htm". The main content area is titled "User Setup" and contains fields for "Password Authentication" (CiscoSecure Database dropdown, CiscoSecure PAP checkbox, Password and Confirm Password fields), "Separate (CHAP/MS-CHAP/ARAP)" (checkbox, Password and Confirm Password fields), and "Group to which the user is assigned" (Default Group dropdown). A note about token card authentication is present. Below the form are "Submit", "Delete", and "Cancel" buttons. To the right is a "Help" panel with a list of links related to account management and authentication protocols. The taskbar at the bottom shows various icons and the system tray indicates it's 1:59 PM.

Vérification

Cette section présente des informations que vous pouvez utiliser pour vous assurer que votre configuration fonctionne correctement.

Certaines commandes **show** sont prises en charge par l'[Output Interpreter Tool](#) (clients enregistrés uniquement), qui vous permet de voir une analyse de la sortie de la commande **show**.

Commandes Cache Engine :

- **show version** : affiche la version du logiciel exécutée sur le Cache Engine.
- **show hardware** : affiche la version du logiciel et le type de matériel sur le Cache Engine.
- **show running-config** : affiche la configuration en cours réelle sur le Cache Engine.
- **show stat http usage** : affiche les statistiques d'utilisation.
- **show radius stat [all | primaire | secondaire]**—Affiche les statistiques d'authentification pour les serveurs RADIUS principal et secondaire.

Voici un exemple de sortie de commande de la commande **show version** :

```
cepro#show version
Cisco Cache Engine
Copyright (c) 1986-2001 by Cisco Systems, Inc.
Software Release: CE ver 2.31 (Build: FCS 02/16/01)
Compiled: 11:20:14 Feb 22 2001 by bbalagot
```

```
Image text-base 0x108000, data_base 0x437534
```

```
System restarted by Reload  
The system has been up for 3 hours, 52 minutes, 33 seconds.  
System booted from "flash"
```

Voici un exemple de sortie de commande de la commande show hardware :

```
cepro#show hardware  
Cisco Cache Engine

!
end
cepro#

```

Commandes du routeur :

- **show running-config** : affiche la configuration en cours réelle sur le routeur.
- **show ip wccp** : affiche tous les services enregistrés.
- **show ip wccp <service-id> detail** : affiche la distribution du compartiment WCCP pour chaque cache du cluster. Par exemple, **show ip wccp web-cache detail**.

Voici un exemple de sortie de commande de la commande **show running-config** :

```

33-ns-gateway#show running-config

Dépannage

Cette section fournit des informations que vous pouvez utiliser pour dépanner votre configuration.

Dépannage des commandes

Certaines commandes **show** sont prises en charge par l'[Output Interpreter Tool](#) (clients enregistrés uniquement), qui vous permet de voir une analyse de la sortie de la commande show.

Note : Avant d'émettre des commandes **debug**, consultez [Informations importantes sur les commandes de débogage](#).

Commandes Cache Engine :

- **debug authentication all all** : débogue l'authentification.
- **debug radius all all** - Affiche le débogage du module RADIUS de l'interface Web.
- **type var/log/translog/working.log** : vérifie que les URL sont mises en cache et que l'utilisateur accède aux pages. Tout autre type de message doit être renvoyé à l'[assistance technique de Cisco](#) pour obtenir des éclaircissements. Le type de messages d'erreur le plus courant dans

ce journal est l'authentification a échoué en raison d'un utilisateur inconnu, ou de la clé de serveur incorrecte.

Voici un exemple de sortie de commande de la commande **debug radius all** et de l'authentification **debug all all** commandes :
