[Introduction](#)

La fonctionnalité de VPN multipoint dynamique (DMVPN) permet à des utilisateurs de mieux mettre à l'échelle des VPN IPSec grands et petits en combinant les tunnels d'encapsulation de routage générique (GRE), le cryptage IPSec et le Protocole de résolution de sauts successifs (NHRP) pour fournir aux utilisateurs une configuration simple par le biais de crypto-profil, qui annulent la nécessité de définir des crypto-cartes statiques, et la découverte dynamique des extrémités du tunnel.

[Conditions préalables](#)

[Conditions requises](#)

Aucune spécification déterminée n'est requise pour ce document.

[Components Used](#)

Les informations dans ce document sont basées sur les versions de logiciel et de matériel ci-dessous.

- Routeurs Cisco 2691 et 3725
- Logiciel Cisco IOS® Version 12.3(3)

Remarque : le transfert IPSec multiple n'est pris en charge que sur les versions 12.2.2(2)XK et 12.2.1(13)T et ultérieures du logiciel Cisco IOS.

La sortie de la commande **show version** sur le routeur est montrée ci-dessous :

```
sv9-4#show version
Cisco Internetwork Operating System Software
IOS (tm) 2600 Software (C2691-IK9S-M), Version 12.3(3),

Configuration register is 0x2102

Les informations présentées dans ce document ont été créées à partir de périphériques dans un environnement de laboratoire spécifique. All of the devices used in this document started with a cleared (default) configuration. Si vous travaillez dans un réseau opérationnel, assurez-vous de

bien comprendre l'impact potentiel de toute commande avant de l'utiliser.

Théorie générale

Cette caractéristique fonctionne selon les règles suivantes.

- Chaque rayon a un tunnel IPsec permanent vers le concentrateur, et non vers les autres rayons dans le réseau. Chaque rayon s'enregistre comme client du serveur NHRP.
- Quand un rayon doit envoyer un paquet à un sous-réseau (privé) de destination sur un autre rayon, il demande au serveur NHRP la vraie adresse (externe) du rayon de destination (cible).
- Une fois que le rayon d'origine a appris l'adresse homologue du rayon cible, il peut lancer un tunnel IPsec dynamique au rayon cible.
- Le tunnel de rayon à rayon est construit sur l'interface multipoint GRE (mGRE).
- Les liaisons de rayon à rayon sont établies sur demande toutes les fois qu'il y a du trafic entre les rayons. Ensuite, les paquets peuvent contourner le concentrateur et utiliser le tunnel de rayon à rayon.

Les définitions suivantes s'appliquent à l'ensemble de règles.

- NHRP — Un protocole de routage de client et serveur où le concentrateur est le serveur et les rayons sont les clients. Le concentrateur gère une base de données NHRP des adresses d'interface publique de chaque rayon. Chaque rayon enregistre sa vraie adresse quand il démarre et demande à la base de données NHRP des vraies adresses de rayons de destination afin de construire des tunnels directs.
- Interface de tunnel mGRE - Permet à une interface simple GRE de prendre en charge des tunnels IPsec multiples et simplifie la taille et la complexité de la configuration.

Remarque : après une quantité préconfigurée d'inactivité sur les tunnels de rayon à rayon, le routeur désactive ces tunnels pour économiser des ressources (associations de sécurité IPsec [SA]).

Remarque : Le profil de trafic doit respecter la règle des 80 à 20 % : Le 80% du trafic se compose du trafic du rayon au concentrateur, et le 20% du trafic de rayon à rayon.

Conventions

Pour plus d'informations sur les conventions utilisées dans ce document, reportez-vous à [Conventions relatives aux conseils techniques Cisco](#).

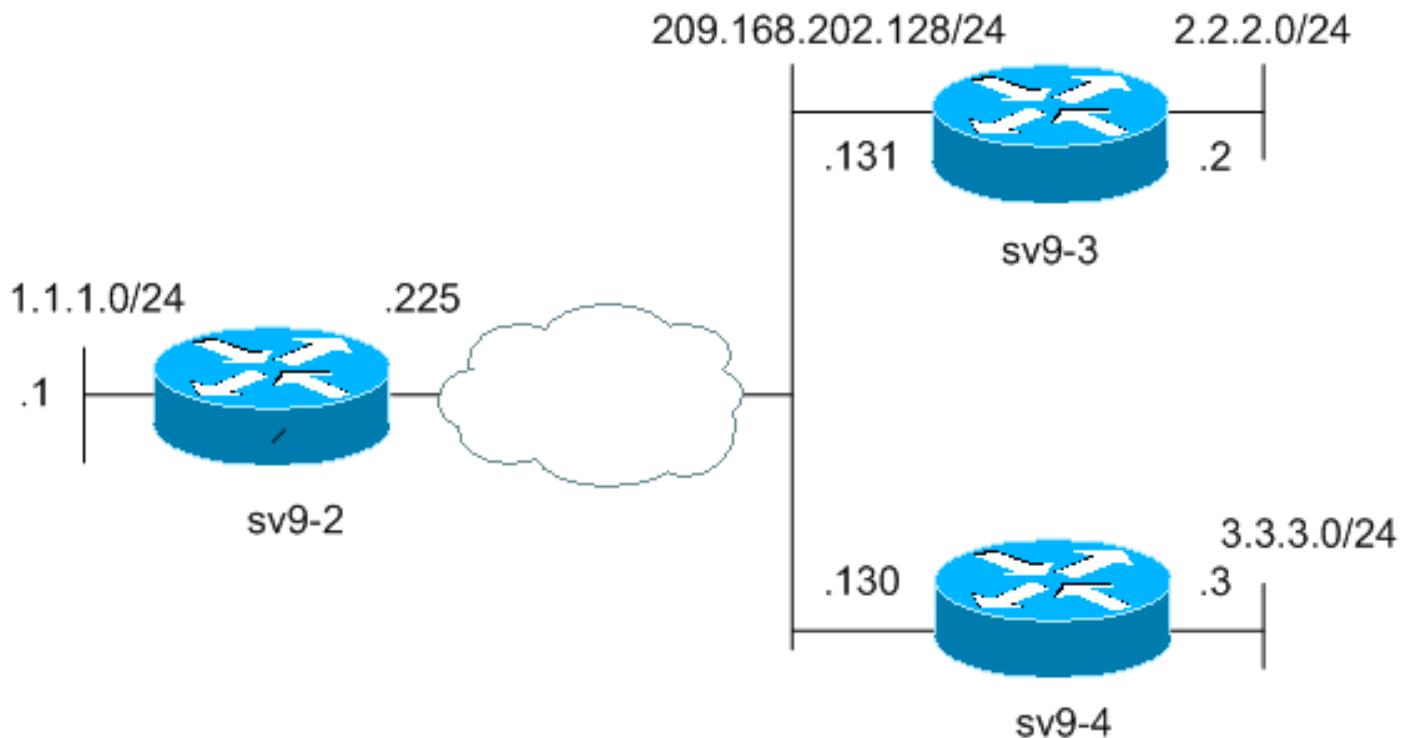

Configuration

Cette section vous fournit des informations pour configurer les fonctionnalités décrites dans ce document.

Remarque : Pour en savoir plus sur les commandes utilisées dans le présent document, utilisez [l'outil de recherche de commandes](#) (clients [inscrits](#) seulement).

Diagramme du réseau

Ce document utilise la configuration réseau indiquée dans le diagramme suivant :

Configurations

Vérification

Cette section présente des informations que vous pouvez utiliser pour vous assurer que votre configuration fonctionne correctement.

Certaines commandes **show** sont prises en charge par l'[Output Interpreter Tool](#) (clients enregistrés uniquement), qui vous permet de voir une analyse de la sortie de la commande show.

- **show crypto engine connection active** : affiche le total chiffré et déchiffré par SA.
- **show crypto ipsec sa** — Affiche les statistiques sur les tunnels actifs.
- **show crypto isakmp sa** — Affiche l'état pour le ISAKMP SA.

Dépannage

Cette section fournit des informations que vous pouvez utiliser pour dépanner votre configuration.

Le tunnel DMVPN est instable par intermittence

Problème

Le tunnel DMVPN est instable par intermittence.

Solution

Quand les tunnels DMVPN sont instables, vérifiez la proximité entre les routeurs, car les problèmes de formation de proximité entre routeurs peuvent rendre instable le tunnel DMVPN. Afin de résoudre ce problème, assurez-vous que la proximité entre les routeurs est toujours active.

Dépannage des commandes

Note : Avant d'émettre des commandes **debug**, consultez [Informations importantes sur les commandes de débogage](#).

- **debug crypto ipsec** — Affiche des événements IPsec.
- **debug crypto isakmp** — Affiche des messages sur des événements d'Échange de clés Internet (IKE).
- **debug crypto engine** — Affiche des informations du moteur de chiffrement.

Vous trouverez les informations supplémentaires pour dépanner IPSec à la section [Dépannage de sécurité IP - Présentation et utilisation des commandes de débogage](#).

Exemple de sortie de débogage

- [Débogages NHRP](#)
- [Débogages ISAKMP et de négociation IPSec](#)

Débogages NHRP

Le résultat du débogage suivant montre la requête de NHRP et la réponse de résolution NHRP. Les débogages ont été saisis à partir des rayons sv9-4 et sv9-3 et du concentrateur sv9-2.

```
sv9-4#show debug
NHRP:
NHRP protocol debugging is on

sv9-4#ping 2.2.2.2
```

Type escape sequence to abort.

Sending 5, 100-byte ICMP Echos to 2.2.2.2, timeout is 2 seconds:
 !!!!!

Success rate is 100 percent (5/5), round-trip min/avg/max = 4/4/4 ms
