[Introduction](#)

L'algorithme SEAL (Software Encryption Algorithm) est un algorithme alternatif aux normes DE (Data Encryption Standard), 3DES (Triple DES) et AES (Advanced Encryption Standard). Le chiffrement SEAL utilise une clé de chiffrement de 160 bits et a un impact moindre sur le processeur par rapport aux autres algorithmes logiciels. Ce document explique comment configurer un tunnel IPSec LAN à LAN (site à site) à l'aide de SEAL.

[Conditions préalables](#)

[Conditions requises](#)

Aucune spécification déterminée n'est requise pour ce document.

[Components Used](#)

Les informations contenues dans ce document sont basées sur les versions de matériel et de logiciel suivantes :

- Routeurs de la gamme Cisco 7200 exécutant le logiciel Cisco IOS® Version 12.3(7)T

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

Pour plus d'informations sur les conventions des documents, référez-vous aux [Conventions utilisées pour les conseils techniques de Cisco](#).

Configuration

Cette section vous fournit des informations pour configurer les fonctionnalités décrites dans ce document.

Remarque : Utilisez [l'outil de recherche de commandes](#) (clients [inscrits](#) seulement) pour en savoir plus sur les commandes figurant dans le présent document.

Diagramme du réseau

Ce document utilise la configuration réseau suivante :

Configurations

Ce document utilise les configurations suivantes :

- [Routeur 1](#)
- [Routeur 2](#)

Vérification

Cette section présente des informations que vous pouvez utiliser pour vous assurer que votre configuration fonctionne correctement.

Certaines commandes **show** sont prises en charge par l'[Output Interpreter Tool](#) (clients enregistrés uniquement), qui vous permet de voir une analyse de la sortie de la commande show.

- **show crypto map** : vérifie la configuration sur le routeur. Ce résultat provient du routeur 1.

```
R1#show crypto map
Crypto Map "cisco" 10 ipsec-isakmp
Peer = 10.10.10.2
Extended IP access list 100
access-list 100 permit ip 172.18.124.0 0.0.0.255 20.20.20.0 0.0.0.255
Current peer: 10.10.10.2
Security association lifetime: 4608000 kilobytes/3600 seconds
PFS (Y/N): N
Transform sets={
cisco,
}
Interfaces using crypto map cisco:
Ethernet1/0
```

Dépannage

Cette section fournit des informations que vous pouvez utiliser pour dépanner votre configuration.

Dépannage des commandes

Certaines commandes **show** sont prises en charge par l'[Output Interpreter Tool](#) (clients enregistrés uniquement), qui vous permet de voir une analyse de la sortie de la commande show.

Remarque : avant d'émettre des commandes **debug**, reportez-vous à [Informations importantes sur les commandes de débogage](#).

Débogues ISAMP et IPSec

- **show debugging** : affiche des informations sur les types de débogage activés pour votre routeur.

R1#**show debugging**

```
Cryptographic Subsystem:  
Crypto ISAKMP debugging is on  
Crypto IPSEC debugging is on
```

R1#

Limitations du jeu de transformation esp-phoque

L'utilisation de l'ensemble de transformation **esp-phoque** est limitée par trois restrictions :

- Le jeu de transformation **esp-phoque** ne peut être utilisé que si aucun accélérateur de chiffrement n'est présent. Cette limitation est présente car aucun accélérateur de chiffrement actuel n'implémente le jeu de transformation de chiffrement SEAL et si un accélérateur de chiffrement est présent, il gèrera toutes les connexions IPsec négociées avec IKE. Si un accélérateur de cryptage est présent, le logiciel Cisco IOS permet de configurer le jeu de transformation, mais il prévient qu'il ne sera pas utilisé tant que l'accélérateur de cryptage est activé.
- Le jeu de transformation **esp-phoque** ne peut être utilisé qu'en conjonction avec un jeu de transformation d'authentification, à savoir : **esp-md5-hmac**, **esp-sha-hmac**, **ah-md5-hmac** ou **ah-sha-hmac**. Cette limitation est présente car le chiffrement SEAL est particulièrement faible lorsqu'il s'agit de protéger contre les modifications du paquet chiffré. Par conséquent, pour éviter une telle faiblesse, un jeu de transformation d'authentification est nécessaire (les jeux de transformation d'authentification sont conçus pour déjouer de telles attaques.) Si vous essayez de configurer un jeu de transformation IPsec à l'aide de SEAL sans jeu de transformation d'authentification, une erreur est générée et le jeu de transformation est rejeté.
- Le jeu de transformation **esp-phoque** ne peut pas être utilisé avec une carte de chiffrement à clé manuelle. Cette limitation est présente car une telle configuration réutiliserait le même flux de clés pour chaque redémarrage, ce qui compromettrait la sécurité. En raison du problème de sécurité, une telle configuration est interdite. Si vous essayez de configurer une crypto-carte à clé manuelle avec un jeu de transformation basé sur SEAL, une erreur est générée et le jeu de transformation est rejeté.
