[Introduction](#)

Dans la plupart des cas, un PIX distant qui se connecte à un PIX central n'utilise pas le traduction d'adresses de réseau (NAT). Au lieu de cela, le PIX distant utilise une adresse IP statique extérieure. Dans un exemple où un PIX central qui exécute la version 7.x et plus se connecte à un PIX distant utilisant NAT, il est identique à un petit bureau à domicile tel qu'un PIX 501 ou 506 connecté à un modem filaire ou DSL utilisant le Dynamic Host Control Protocol (DHCP). PIX 7.x et plus et Cisco Adaptive Security Device Manager (ASDM) ne fonctionnent pas sur un PIX 501 ou 506. Par conséquent, avec cet exemple le PIX distant avec le DHCP et NAT est présumé être pour un PIX 501 ou 506 qui exécute le code 6.x. Cette configuration permet au PIX central d'accepter des connexions IPsec dynamiques. Le PIX distant utilise NAT pour joindre les périphériques adressés en privé derrière celui-ci au réseau adressé en privé derrière le PIX central. Le PIX distant peut initier des connexions au PIX central (il connaît le point d'extrémité), mais le PIX central ne peut pas initier des connexions au PIX distant (il ne connaît pas le point d'extrémité).

Dans cet exemple de configuration, Tiger est le PIX distant et Lion est le PIX central. Puisque l'adresse IP de Tiger est inconnue, vous devez configurer Lion pour qu'il accepte dynamiquement les connexions depuis n'importe quel endroit en connaissant la clé pré-partagée générique. Tiger sait quel trafic doit être chiffré (parce qu'il est spécifié par la liste d'accès) et où se trouve le point de terminaison Lion. Tiger doit initier la connexion. Les deux côtés exécutent NAT et nat 0 afin de contourner NAT pour le trafic IPsec.

En outre, l'utilisateur distant dans cette configuration se connecte au PIX central (Lion) à l'aide du Client VPN Cisco 4.x. L'utilisateur distant ne peut pas se connecter au PIX distant (Tiger), car les deux côtés ont attribué dynamiquement des adresses IP et ne savent pas où envoyer la demande.

Référez-vous à [Configuration de PIX à PIX Dynamic-to-Static IPsec avec NAT et Cisco VPN Client](#) afin d'en savoir plus sur le même scénario dans PIX 6.x avec Cisco VPN Client 3.x.

Conditions préalables

Conditions requises

Aucune spécification déterminée n'est requise pour ce document.

Components Used

Les informations contenues dans ce document sont basées sur les versions de matériel et de logiciel suivantes :

- Logiciel Cisco PIX Firewall version 7.x et ultérieure (PIX central)
- Logiciel Cisco PIX Firewall Version 6.3.4 (PIX distant)
- Client VPN Cisco Version 4.x

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

Pour plus d'informations sur les conventions utilisées dans ce document, reportez-vous à [Conventions relatives aux conseils techniques Cisco](#).

Configuration

Cette section vous fournit des informations pour configurer les fonctionnalités décrites dans ce document.

Remarque : utilisez l'[outil de recherche de commandes](#) (clients [enregistrés](#) uniquement) pour obtenir plus d'informations sur les commandes utilisées dans cette section.

Diagramme du réseau

Ce document utilise la configuration réseau suivante :

Configurations

Ce document utilise les configurations suivantes :

- [Lion](#)
- [Tigre](#)

Vérification

Référez-vous à cette section pour vous assurer du bon fonctionnement de votre configuration.

[L'Outil Interpréteur de sortie \(clients enregistrés uniquement\) \(OIT\) prend en charge certaines commandes show](#). Utilisez l'OIT pour afficher une analyse de la sortie de la commande **show**.

Remarque : Vous devez exécuter les commandes **clear** en mode de configuration.

- **clear crypto ipsec sa** - Réinitialise les associations IPsec après des tentatives échouées de négociation d'un tunnel VPN.
- **clear crypto isakmp sa** - Réinitialise les associations de sécurité ISAKMP (Internet Security Association and Key Management Protocol) après des tentatives infructueuses de négociation d'un tunnel VPN.
- **show crypto engine ipsec** : affiche les sessions chiffrées.

Dépannage

Clés prépartagées identiques

Si le tunnel IPsec LAN à LAN (L2L) n'est pas établi, vérifiez si la clé pré-partagée pour

DefaultRAGroup et la clé pré-partagée pour DefaultL2LGroup sont identiques. Si c'est le cas, le PIX/ASA termine d'abord le tunnel sur le groupe DefaultRAGroup et le tunnel L2L est susceptible d'échouer. Assurez-vous que les clés pré-partagées des deux groupes de tunnels par défaut sont différentes.

Dépannage des commandes

L'[Outil Interpréteur de sortie \(clients enregistrés uniquement\) \(OIT\)](#) prend en charge certaines commandes **show**. Utilisez l'OIT pour afficher une analyse de la sortie de la commande **show**.

Remarque : Consulter les [renseignements importants sur les commandes de débogage](#) avant d'utiliser les commandes de **débogage**.

- **debug crypto ipsec** - Utilisé pour voir si un client négocie la partie IPsec de la connexion VPN.
- **debug crypto isakmp [/level]** - Utilisé pour voir si les homologues négocient la partie ISAKMP du VPN.

Exemples de résultats de débogage corrects

Voici quelques exemples de bons résultats de commande **debug** :

- [PIX central \(7.0.0\)](#)
- [NAT dynamique PIX distant \(6.3.4\)](#)
- [Client VPN 4.0.5 sur Central PIX 7.0](#)

[PIX central \(7.0.0\)](#)
