## Introduction

Ce document décrit les étapes pour vérifier la configuration correcte d'un agent de relais DHCP sur un Nexus 9000.

## Conditions préalables

### Exigences

Cisco NXOS® vous recommande de connaître les sujets suivants :

- DHCP
- ELAM
- Ethanalyzer

### Composants utilisés

Ce document est limité à un matériel spécifique tel que Nexus 9000

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. Si votre réseau est en ligne, assurez-vous de bien comprendre l'incidence possible des commandes.

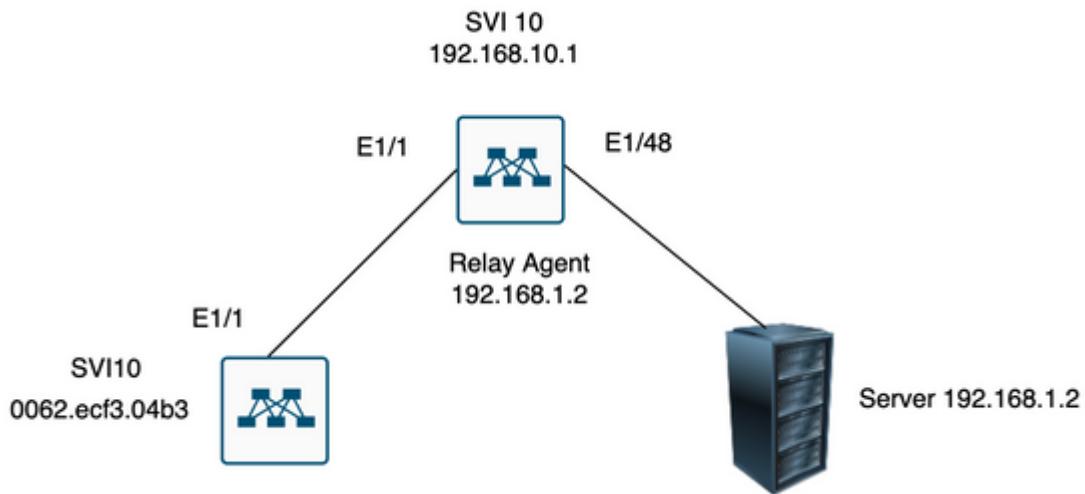

## Informations générales

Vous pouvez configurer le périphérique pour qu'il exécute un agent de relais DHCP, qui transfère les paquets DHCP entre les clients et les serveurs. Cette fonctionnalité est utile lorsque les clients et les serveurs ne se trouvent pas sur le même sous-réseau physique. Les agents de relais reçoivent des messages DHCP, puis génèrent un nouveau message DHCP à envoyer sur une autre interface.

## Topologie

Les commutateurs Nexus fonctionnent comme un relais DHCP pour fournir une adresse IP au client à partir

du serveur.

## Vérifier

- 1) Vérifiez la configuration du client (aucune adresse IP attribuée)

```
Client# show interface vlan 10
Vlan10 is up, line protocol is up, autostate enabled
Hardware is EtherSVI, address is 0062.ecf3.04b3
MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec,
reliability 255/255, txload 1/255, rxload 1/255
Encapsulation ARPA, loopback not set
Keepalive not supported
ARP type: ARPA
Last clearing of "show interface" counters never
L3 in Switched:
  ucast: 0 pkts, 0 bytes
```

- 2) Vérifiez la configuration DHCP

```
Switch1# show run dhcp
ip dhcp snooping
service dhcp
ip dhcp relay
ipv6 dhcp relay
```

```
interface Vlan10
  ip dhcp relay address 192.168.1.2
  ip dhcp snooping vlan 1,10
```

### 3) Vérifiez la connectivité au serveur

```
Switch1# ping 192.168.1.2
PING 192.168.1.2 (192.168.1.2): 56 data bytes
64 bytes from 192.168.1.2: icmp_seq=0 ttl=253 time=1.678 ms

5 packets transmitted, 5 packets received, 0.00% packet loss
round-trip min/avg/max = 1.241/1.474/1.742 ms
Switch1#
```

```
Switch1# show ip route 192.168.1.2
IP Route Table for VRF "default"
'*' denotes best ucast next-hop
'***' denotes best mcast next-hop
'[x/y]' denotes [preference/metric]

*via 192.168.1.2, Eth1/48, [250/0], 02:13:58, am
Switch1#
```

### 4) Aller de l'avant pour examiner les statistiques du DHCP pour vérifier à nouveau que les informations sont correctement envoyées.

```
Switch1# show ip dhcp relay statistics interface vlan 10

## Dépannage

- 1) Vérifiez que les statistiques sont correctes en exécutant un analyseur d'éthons.

```
Switch1# ethanalyzer local interface inband display-filter bootp limit-captured-frames 0

2) Ethanalyzer propose une option de détail qui fournit des informations supplémentaires, notamment les en-têtes du trafic capturé.

```
ethanalyzer local interface inband display-filter "((eth.addr==<MAC_address> and bootp ))" limit-capture
```

3) L'ajout de l'indicateur de détail dans la capture d'ethanalyzer fournit plus de détails sur la communication entre le client et le serveur.

[1] L'agent de relais reçoit une détection DHCP du client en tant que diffusion :

L'adresse MAC source est l'adresse MAC du client : 00:62:ec:f3:04:b3

L'adresse MAC de destination est diffusée : ff:ff:ff:ff:ff:ff

Comme le client n'a pas encore d'adresse IP, l'adresse IP source est 0.0.0.0

Adresse IP source : 0.0.0.0

Adresse IP de destination : 255.255.255.255

Port source : bootpc (68)

Port de destination : bootps (67)

Type de message : Boot Request (1)

Type de message DHCP = Détection DHCP
