Configurer le transfert Web sur WLC 5760/3850

Contenu

Introduction

Ce document décrit comment configurer la fonctionnalité de passthrough Web sur un contrôleur de réseau local sans fil (WLC).

Conditions préalables

Conditions requises

Ce document suppose que les configurations initiales sont déjà terminées sur le WLC.

Components Used

Les informations contenues dans ce document sont basées sur les versions de matériel et de logiciel suivantes :

- Un WLC 5760 qui exécute le code version 3.3
- Point d'accès allégé de la gamme Cisco Aironet 3600
- Demandeur sans fil natif de Microsoft Windows 7

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Passthrough Web sur les contrôleurs de réseau local sans fil

Le passthrough Web est une solution généralement utilisée pour l'accès invité. Le processus de passthrough Web est similaire à celui de l'authentification Web, sauf qu'aucune identification d'authentification n'est requise pour le passage Web.

Dans le transfert Web, les utilisateurs sans fil sont redirigés vers la page de stratégie d'utilisation lorsqu'ils tentent d'utiliser Internet pour la première fois. Une fois la politique acceptée, les utilisateurs peuvent naviguer sur Internet. Cette redirection vers la page de stratégie est gérée par le WLC.

Dans cet exemple, une interface VLAN est créée sur un sous-réseau distinct sur le WLC. Ensuite, un réseau local sans fil (WLAN)/SSID (Service Set Identifier) distinct est créé et configuré avec un accès Web, et il est mappé à cette interface VLAN.

   Note: Le passthrough Web ne fournit aucun chiffrement de données.

Configuration

Voici le schéma du réseau :

Wireless LAN Controller
WLC 5760

Layer 3 Switch

LWAPP

SSID: webauth|
Vous pouvez terminer cette configuration avec l'interface de ligne de commande ou l'interface utilisateur graphique.

Configuration avec l'interface de ligne de commande

Configurez la surveillance DHCP pour les VLAN que vous utilisez pour les clients. Dans cet exemple, VLAN20 est utilisé pour les clients. La réserve est configurée sur le même WLC.

TenGigabitEthernet1/0/1 du **WLC 5760** se connecte au commutateur de liaison ascendante. Si le serveur DHCP est configuré sur le serveur au-delà du WLC ou sur un serveur DHCP externe, vous devez faire confiance aux informations de surveillance DHCP et de relais.

```
ip device tracking
ip dhcp snooping vlan 12,20,30,40
ip dhcp snooping
!
ip dhcp pool vlan20
```

```
 network 20.20.20.0 255.255.255.0
 default-router 20.20.20.1

interface Vlan20
 ip address 20.20.20.1 255.255.255.0

interface TenGigabitEthernet1/0/1
 switchport trunk native vlan 12
 switchport mode trunk
 ip dhcp relay information trusted
 ip dhcp snooping trust

parameter-map type webauth global
 type consent
 virtual-ip ipv4 192.168.200.1
!
!
parameter-map type webauth web
 type consent

wlan Webauth 9 Webauth
 client vlan VLAN0020
 no security wpa
 no security wpa akm dot1x
 no security wpa wpa2
 no security wpa wpa2 ciphers aes
 security web-auth
 security web-auth parameter-map web
 session-timeout 1800
```
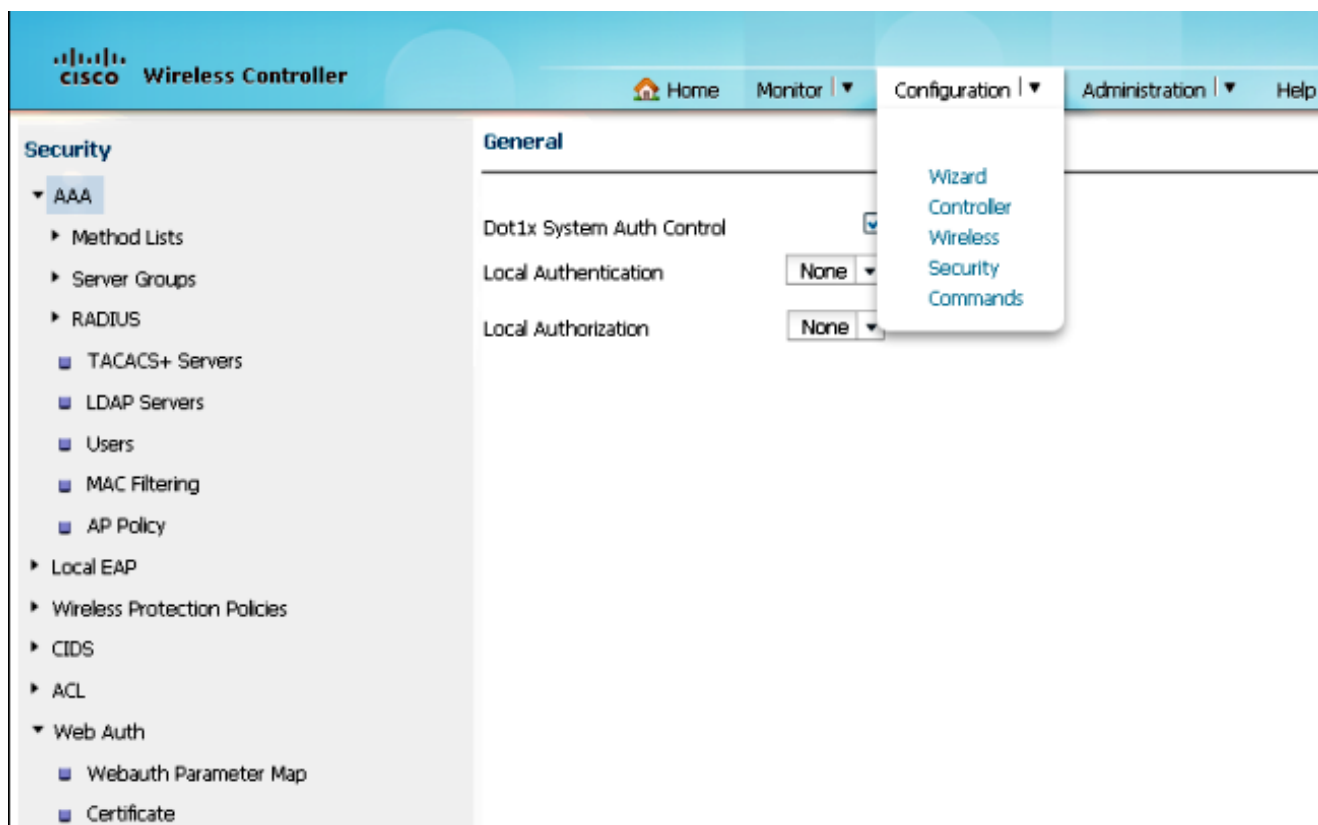

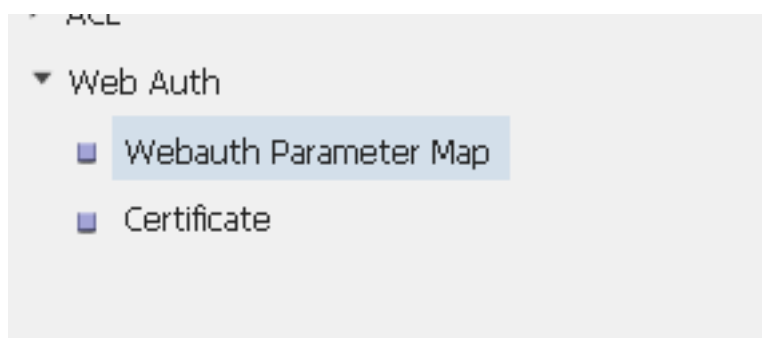

Configuration avec l'interface utilisateur graphique

Complétez ces étapes afin de configurer sur l'interface utilisateur graphique.

1. Àpartir de l'interface graphique du WLC, accédez à **Configuration > Security :**

2. En bas à droite de la page **Sécurité**, accédez à **Webauth > Webauth Parameter Map** :

3. Choisissez **global** pour le mappage de paramètres par défaut :

4. Accédez à **Webauth Parameter Map > Edit** afin de configurer l'adresse IP virtuelle. Il s'agit **de 192.169.200.1** dans cet exemple. Modifiez le type en **consentement**, de sorte que le paramètre global devienne **consentement** (passage Web).

Note: Il **n'est pas** obligatoire de configurer la carte des paramètres globaux pour qu'elle donne son consentement.

Webauth Parameter Map

Webauth Parameter Map > Edit

Parameter-map name	global
Banner	
Maximum HTTP connections(1-200)	30
Timeout (1-65535 in minutes)	2
Type	consent ▼
Turn-on Consent with Email	☐
Virtual IPv4 Address	192.168.200.1
Virtual IPv4 hostname	

5. Créez la carte des paramètres et choisissez **consentement** pour le type. Cet exemple utilise **Web** comme nom de carte de paramètre, qui est utilisé sous le WLAN pour que les utilisateurs accèdent à la page Consentement.

Webauth Parameter Map

Webauth Parameter Map > Edit

Parameter-map name	web
Banner	
Maximum HTTP connections(1-200)	30
Timeout (1-65535 in minutes)	2
Type	consent ▼
Turn-on Consent with Email	☐

Voici une capture d'écran des cartes de paramètres de l'interface utilisateur graphique :

Webauth Parameter Map

New   Remove

	Parameter-map name	Parameter-map type	
☐	global	Global	
☐	web	Named	

6. Àpartir de l'interface utilisateur graphique du WLC, accédez à **Configuration > Wireless > WLAN** afin de créer un nouveau WLAN. Cet exemple présente **Webauth** comme WLAN mappé à **VLAN20** :

WLAN
WLAN > **Edit**

| General | Security | QOS | AVC | Advanced |

Profile Name   Webauth

Type   WLAN

SSID   Webauth

Status   ☑

Security Policies   Web-Auth
                      (Modifications done under security tab will appear after applying the changes.)

Radio Policy   All ▼

Interface/Interface Group(G)   VLAN0020 ▼

Broadcast SSID   ☑

Multicast VLAN Feature   ☐

7. Accédez à **WLAN > Edit > Security > Layer2**, puis sélectionnez **None** pour Layer 2 Security :

8. Accédez à **WLAN > Edit > Security > Layer3**, puis choisissez le paramètre approprié pour **Webauth Parameter Map**. Dans cet exemple, c'est **le web**.

9. Enregistrez la configuration et elle est prête à être testée.

10. Une fois que vous vous connectez au WLAN, le client reçoit l'adresse IP. Lorsque vous essayez d'ouvrir le navigateur avec l'adresse IP virtuelle, la **page de connexion de consentement** s'affiche et vous devez cliquer sur la case d'option **Accepter**.

    Note: Si vous disposez de la configuration DNS (Domain Name Server) valide, vous n'avez pas besoin de saisir manuellement l'adresse IP virtuelle dans le navigateur.
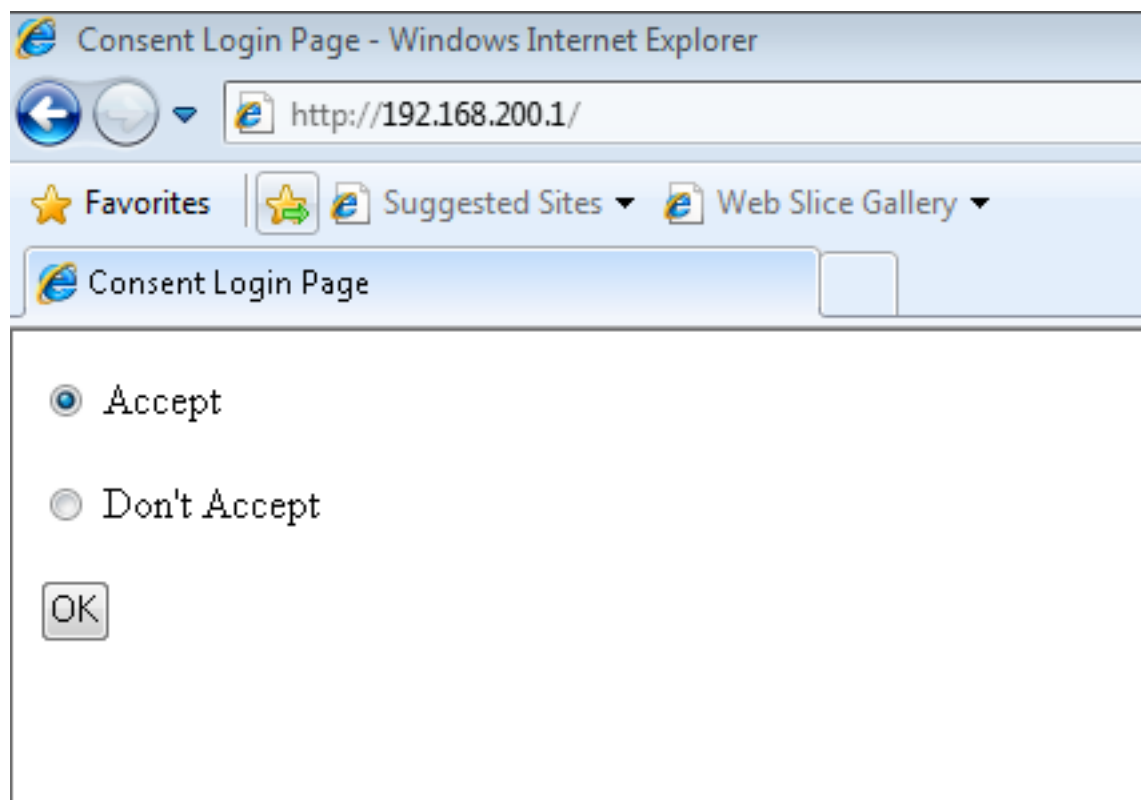

11. Une fois que vous avez cliqué sur **Accepter**, la page d'authentification réussie démarre, ce qui vous donne la possibilité de naviguer jusqu'à la page demandée.
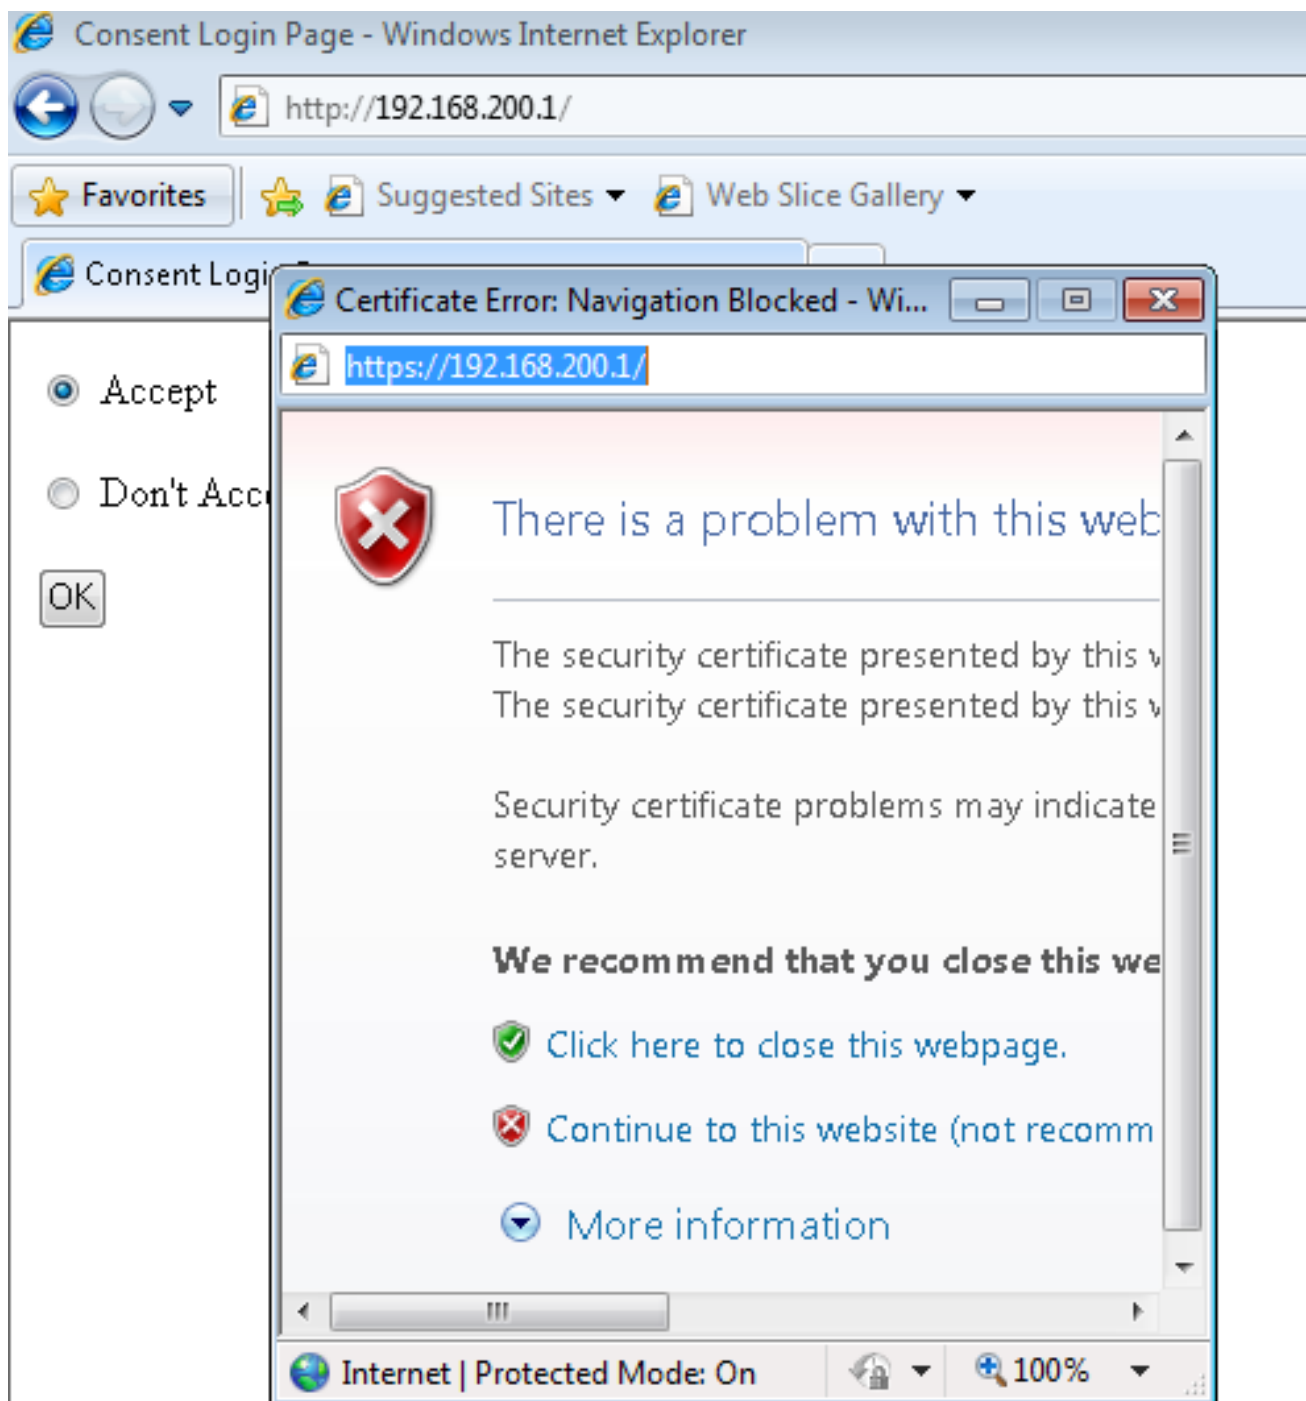

Exemple de client

Voici la capture de paquets de l'ordinateur portable client lorsque le client reçoit le DHCP :

Une fois que le client a reçu l'adresse IP, il ouvre le navigateur et saisit l'adresse IP virtuelle.

> **Note**: Si le DNS est configuré correctement, vous n'avez pas besoin d'entrer l'adresse IP virtuelle sur le navigateur.

Comme cette configuration n'utilise aucune certification Webauth, il y a des erreurs CERT dans cette capture de paquets :

Après une authentification réussie, le client est dans l'état **RUN** sur l'interface graphique du WLC.

Vérification

Aucune procédure de vérification n'est disponible pour cette configuration.

Dépannage

Note: Comme les débogages nécessitent beaucoup de processeur, vous devez exécuter les débogages dans une fenêtre de maintenance planifiée.

Entrez ces débogages afin de dépanner votre configuration :
