Published: 2007-05-02 18:25

Product: Cisco PIX/ASA, Version: 1.0

CVSS Score: 2.7

Workarounds: No Workarounds available

Cisco ID: [CSC-43623](#)

Denial of service, remote code execution, and DHCP spoofing

Summary

Cisco

PIX/ASA versions 1.0 through 1.2.4 are vulnerable to a denial of service, remote code execution, and DHCP spoofing attack. The vulnerability is due to a buffer overflow in the DHCP server code. An attacker can exploit this vulnerability by sending a specially crafted DHCP packet to the target device. This can result in a denial of service, remote code execution, or DHCP spoofing.

7.2(2.14) and earlier versions of Cisco PIX/ASA are vulnerable to a denial of service, remote code execution, and DHCP spoofing attack.

The vulnerability is due to a buffer overflow in the DHCP server code. An attacker can exploit this vulnerability by sending a specially crafted DHCP packet to the target device. This can result in a denial of service, remote code execution, or DHCP spoofing.

The vulnerability is due to a buffer overflow in the DHCP server code. An attacker can exploit this vulnerability by sending a specially crafted DHCP packet to the target device. This can result in a denial of service, remote code execution, or DHCP spoofing.

The vulnerability is due to a buffer overflow in the DHCP server code. An attacker can exploit this vulnerability by sending a specially crafted DHCP packet to the target device. This can result in a denial of service, remote code execution, or DHCP spoofing.
