Introduction

Este documento descreve a Visão Geral do Multicast de Origem Qualquer (ASM) com Ponto de Encontro Único (*RP*) no Ambiente de Acesso Definido por Software (SD-Access).

Prerequisites

Requirements

É recomendável que você tenha conhecimento do Locator ID Separation Protocol (*LISP*) e multicast.

Componentes Utilizados

Este documento não se restringe a versões de software e hardware específicas.

As informações apresentadas neste documento foram criadas a partir de dispositivos em um ambiente de laboratório específico. Se a sua rede estiver ativa, certifique-se de que você entende o impacto potencial de qualquer comando.GUI

Dispositivos usados para este artigo

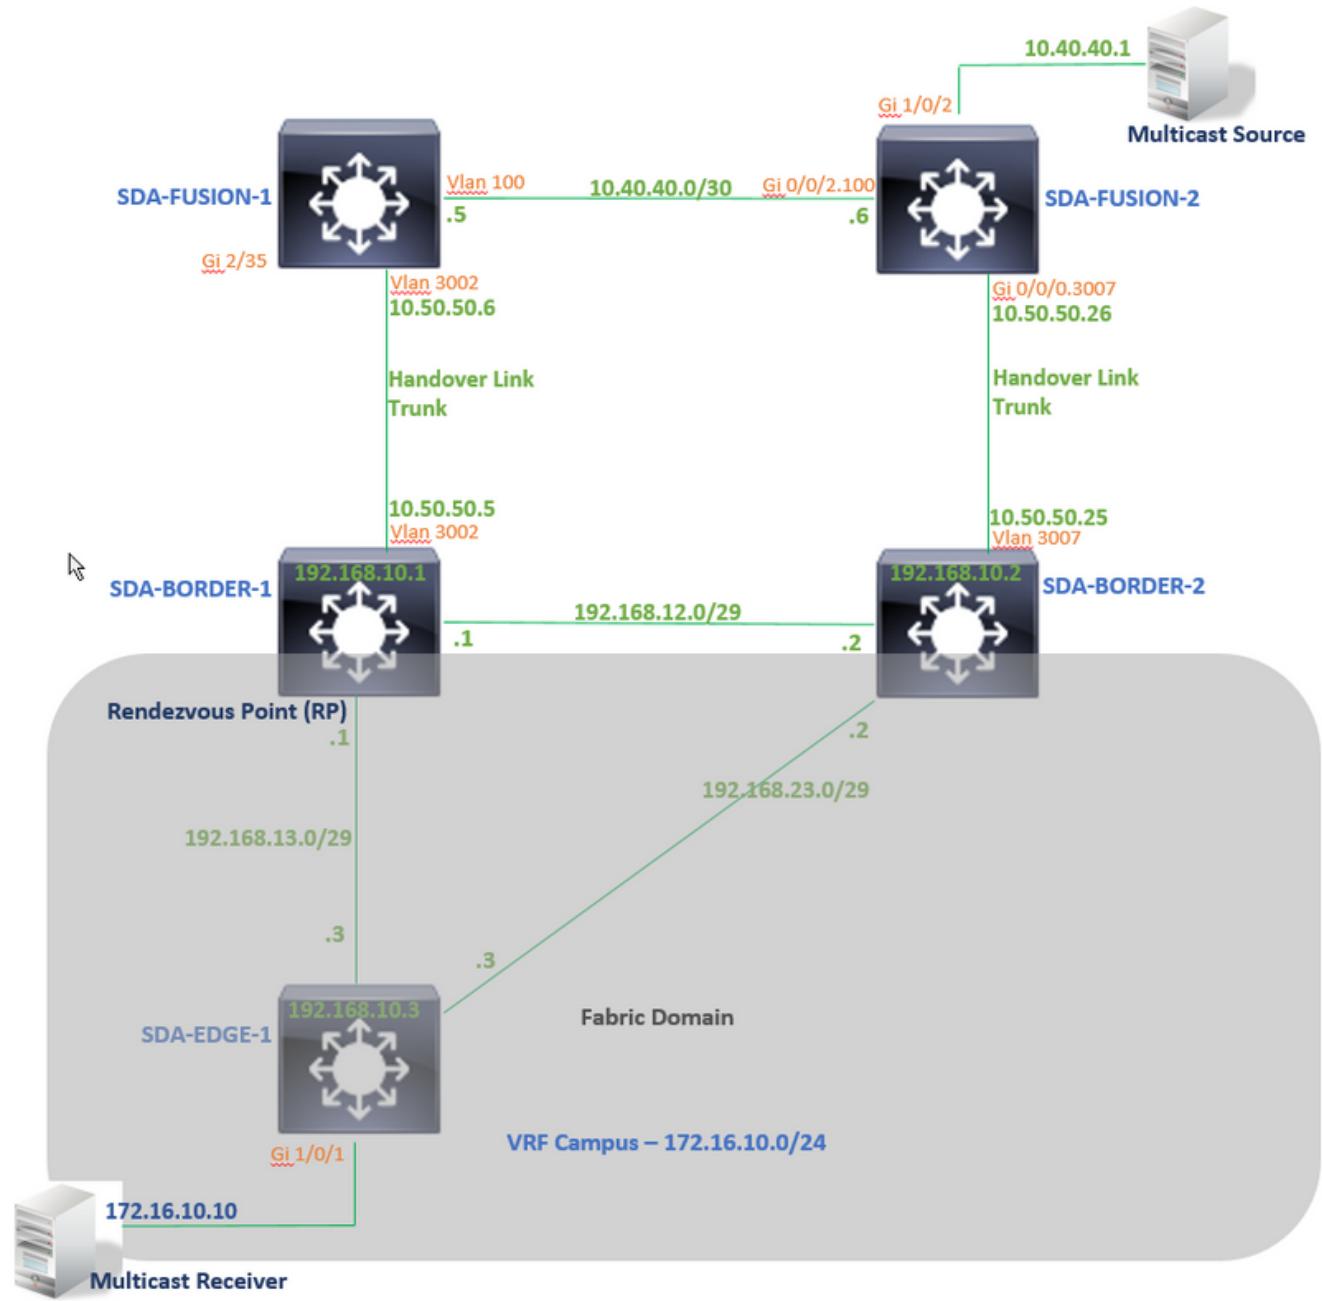

Borda e Borda Rede - Switch Cisco Cat3k

Fusion - Cisco Router com suporte para vazamento Inter-VRF (Virtual Route Forwarding)

Configurar

Diagrama de Rede

A topologia usada para este artigo consiste em dois Roteadores de Borda configurados como Fronteiras Externas e dois Roteadores Fusion com uma conexão para cada Roteador de Borda respectivo. A borda 1 é configurada como RP, a origem multicast está conectada ao Fusion-2 e o receptor multicast está conectado à borda 1.

Configurações

Este artigo não aborda as etapas para configurar o Fabric no ambiente de SDA (Software-Defined Access) e começa com uma explicação das etapas para configurar o Multicast no domínio Fabric para uma VN específica.

Etapa 1: Configure o Multicast em Dispositivos de Estrutura a partir do DNAC

Na Interface Gráfica do Usuário (GUI - Graphical User Interface) do DNAC, em Provisioning -> Fabric Workflow. O multicast é configurado pela opção "Enable Rendezvous point" no dispositivo SDA-BORDER-1.

Em seguida, escolha um Pool *Internet Protocol (IP)* a ser usado para a Configuração Multicast em VN específica. "Campus" neste exemplo.

Associate Multicast Pools to VNs

Associate Virtual Networks

- > DEFAULT_VN
- > Univ
- ▽ Campus
 - Multicast_Campus | 192.168.50.0/24
 - Select Ip Pools*
 - AP | 172.16.56.0/24
 - BGP1 | 10.50.50.0/24
 - Campus1 | 172.16.10.0/24
 - Multicast_Campus | 192.168.50.0/24

Make a Wish

Etapa 2: Verifique a configuração enviada em dispositivos

Esta seção aborda a verificação da configuração de multicast em dispositivos de estrutura.

SDA-BORDER-1

```
interface Loopback4099 <<<<<<<< Loopback Interface is created and assigned an IP from Pool selected

end

```

```

interface Loopback4099 vrf forwarding Campus ip address 192.168.50.2 255.255.255.255 ip pim
sparse-mode end interface LISPO.4099 ip pim sparse-mode end SDA-Edge1#sh run | in pim|multicast
ip multicast-routing ip multicast-routing vrf Campus ip pim ssm default ip pim vrf Campus rp-
address 192.168.50.1 <<<<<< BORDER-1 Loopback4099 is configued as RP ip pim vrf Campus
register-source Loopback4099 ip pim vrf Campus ssm default

```

Etapa 3: Configurar manualmente o PIM através do link de transferência

A origem multicast está conectada fora da estrutura para o Fusion-2 neste exemplo. Para que o fluxo do Fluxo Multicast, certifique-se de que haja um caminho PIM do RP para a Origem e do Receptor para a Origem (os caminhos podem ser diferentes!).

Peering PIM entre SDA-BORDER-1 e SDA-FUSION-1

SDA-BORDER-1

```

-----
interface Vlan3002 <<<<<< Enable PIM on Handover link in Campus VN

end

```

Processo do plano de controle

Em algum momento, o Receptor Multicast envia uma Internet Group Management Protocol (IGMP) Join para o Last Hop Router (LHR) para receber o Fluxo para um grupo específico e a Origem de Multicast (Servidor) começa a enviar o Fluxo Multicast para o First Hop Router (FHR). No nosso caso, o FHR é SDA-FUSION-2 e o LHR é SDA-EDGE-1 e o Processo de Plano de Controle é explicado no cenário em que o Receptor solicita um fluxo primeiro, e a Fonte começa a

transmitir para esse grupo depois.

IGMP Join no LHR

O receptor multicast envia um relatório IGMP (Join) para o LHR do grupo 239.1.1.1. O receptor está conectado a Gi1/0/1 (SVI 1021) no SDA-EDGE-1.

```
SDA-Edge1#debug ip igmp vrf Campus 239.1.1.1
IGMP debugging is on

*Aug 14 23:53:06.445: IGMP(4): Received v2 Report on Vlan1021 from 172.16.10.10 for 239.1.1.1

SDA-Edge1#
```

O novo serviço de monitoramento de rota multicast determina as informações de encaminhamento de caminho reverso (**RPF**) para o RP (para árvore compartilhada) e para a Origem (para Árvore de caminho mais curto (SPT)). Para endereços que podem ser acessados por LISP, o vizinho do próximo salto é representado pelo endereço de Routing Locator (RLOC) remoto do site upstream.

SDA-Edge1#
```

Criação de vizinhos

Quando as informações de RPF são obtidas apontando para a interface LISP, o PIM deve criar explicitamente uma estrutura de vizinhos para o RLOC correspondente. Isso é necessário porque o Roteador de Túnel de upstream (xTR) não envia mensagens de saudação. O novo bloco vizinho expira quando nenhuma mensagem de junção/remoção foi enviada ao vizinho após 2 vezes o tempo de intervalo padrão entre junção/remoção.

Em nosso caso, o SDA-EDGE-1 cria um vizinho PIM usando o endereço RLOC upstream/RPF.

```
SDA-Edge1#show ip pim vrf Campus neighbor
PIM Neighbor Table
```

```

Neighbor           Interface          Uptime/Expires   Ver   DR

```

A SPT está sendo podada pela Borda 1 - vamos ao LHR para ver por quê.

(S,G) Criação no LHR

Depois de receber os dados multicast encaminhados pelo RP, a entrada (S,G) é criada no LHR.

Em seguida, o LHR mudará para Shortest Path Tree (*SPT*) enviando um (S,G) Join para a origem. Isso é enviado na interface RPF em direção à Origem.

```
