## [Introduction](#)

Há duas maneiras diferentes de se usar o HDLC (High-Level Data Link Control) em ISDN:

- Defina a interface física para executar o HDLC. Em outras palavras, nenhum encapsulamento é definido porque o HDLC é o encapsulamento padrão usado pelo Cisco IOS® Software. Este é o modo original de configurar HDLC com Dial-on-Demand Routing (DDR) e é discutido neste documento.
- Use a interface do discador para vincular o protocolo que deseja (nesse exemplo, HDLC) a um discador específico. Este é o método mais novo e permite a uma interface física específica tratar protocolos múltiplos (por exemplo, Point-to-Point Protocol [PPP] e HDLC). Como o protocolo é configurado na interface do discador, a interface física não é restrita. Este método é conhecido como Encapsulamentos múltiplos dinâmicos e discutido em [ISDN DDR Utilizando Encapsulamento HDLC com Vários Encapsulamentos Dinâmicos](#).

## [Prerequisites](#)

## [Requirements](#)

Não existem requisitos específicos para este documento.

## [Componentes Utilizados](#)

As informações neste documento são baseadas nestas versões de software e hardware:

- Os roteadores taxbol e goya são 2500 Series Routers usados em um ambiente de laboratório com as configurações apagadas.
- O Cisco IOS Software Release 11.2(22) é utilizado em ambos os roteadores.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

## Conventions

Para obter mais informações sobre convenções de documento, consulte as [Convenções de dicas técnicas Cisco](#).

## Por que utilizar o HDLC?

A razão pela qual um usuário exige o HDLC no ISDN não é óbvia, porque ele que tem muitas desvantagens em comparação ao PPP. A única finalidade é simplificar a configuração. Contudo, ele também simplifica o acesso ao roteador para todos os hackers. Como HDLC não oferece suporte a nenhum tipo de autenticação, a melhor proteção aqui seria verificar o número chamado com o comando `isdn caller` na interface. Consulte [Configuração de Triagem CLI ou Autenticação ISDN e Retorno de Chamada com ID de Chamador para obter informações adicionais](#). A autenticação com base em CLID (Identificação de Linha Chamadora) admite que sua Telco fornece o número chamador nas mensagens de instalação ISDN. Contudo, como muitas Telcos não fornecem CLID, verifique com sua Telco antes que você configure a triagem baseada no CLID. Se o CLID não for fornecido pela Telco, todas as chamadas recebidas no roteador falharão.

Uma outra desvantagem do HDLC é que o roteador não instala um mapa dinâmico. Por isso, um mapa de discadores precisa ser configurado (em cada extremidade) para o peer HDLC.

**Observação:** se apenas um lado fizer a chamada (por exemplo, um roteador sempre aceita a chamada e não disca), certifique-se de incluir um nome para o peer remoto na instrução `dialer map` do lado receptor. Contudo, o nome pode ser um nome falsificado porque que o roteador não tem nenhuma maneira de autenticar o nome do peer para determinar se corresponde ao nome de mapa de discadores.

Por exemplo, esta é uma descrição e este número ISDN é 8130.

```
ip address 172.16.1.6 255.255.255.252
isdn caller 8129
--- This is to accept only calls from 8129.    dialer map ip 172.16.1.5 name
bogus_to_accept_command
---- This is a dialer-map with a fake name. dialer-group 1
```

## Configurar

Nesta seção, você encontrará informações para configurar os recursos descritos neste documento.

**Observação:** para encontrar informações adicionais sobre os comandos usados neste documento, use a [ferramenta Command Lookup](#)

## Diagrama de Rede

Este documento utiliza a configuração de rede mostrada neste diagrama.

## Configurações

### **goya**

```
Current configuration:
!
version 11.2
service timestamps debug datetime msec
service timestamps log datetime msec
!
hostname goya
!

isdn switch-type basic-net3
!--- The switch-type used is basic-net3. If you are in
the United States, !--- configure the correct switch-
type (for example !--- isdn switch-type basic-5ess). In
the US, you also need to !--- configure the spids under
the Basic Rate Interface (BRI) interface.

!
interface Ethernet0
 ip address 10.1.1.1 255.255.255.0
 no ip redirects
!
interface BRI0
!--- If you are in the US do not forget the SPID !---
(for example isdn spid1 01555.....) description This
ISDN number is 8129 ip address 172.16.1.5
255.255.252 dialer idle-timeout 60 !--- The idle is
set to 60 seconds. isdn caller 8130 !--- Verify the
incoming number since there is no authentication on
HDLC. dialer map ip 172.16.1.6 8130 !--- This side is
making the call to 8130. dialer-group 1 ! ip classless
ip route 0.0.0.0 0.0.0.0 172.16.1.6 access-list 105
permit icmp any any !--- This access-list is to debug
ICMP only. dialer-list 1 protocol ip permit ! line con 0
exec-timeout 0 0 transport input none line aux 0 line
vty 0 4 exec-timeout 0 0 no login ! end
```

### **traxbol**

```
Current configuration:
```

```

!
version 11.2
service timestamps debug datetime msec
service timestamps log datetime msec
!
hostname traxbol
!

isdn switch-type basic-net3
!--- The switch-type used here is basic-net3. If you are
in the United States, !--- configure the correct switch-
type (for example !--- isdn switch-type basic-5ess). In
the United States, you also need to !--- configure the
SPIDs under the BRI interface. ! Interface Ethernet0 ip
address 10.1.2.1 255.255.255.0 no ip redirects !
interface BRI0 !--- If you are in the United States, do
not forget the SPID !--- (for example isdn spid1
01555.....).

description This ISDN number is 8130
ip address 172.16.1.6 255.255.255.252
isdn caller 8129
!--- Verify the incoming number since there is no
authentication on HDLC. dialer map ip 172.16.1.5 name
goya !--- This side will not make any calls, but "name
goya" is added to complete the !--- command. This is
because a static dialer map is necessary. dialer-group 1
! ip classless ip route 0.0.0.0 0.0.0.0 172.16.1.5
access-list 105 permit icmp any any !--- This access-
list is to debug ICMP only. dialer-list 1 protocol ip
permit ! line con 0 exec-timeout 0 0 line aux 0 line vty
0 4 exec-timeout 0 0 password ww login ! end

```

## Verificar

Esta seção fornece informações que você pode usar para confirmar se sua configuração funciona adequadamente.

A [Output Interpreter Tool \(somente clientes registrados\)](#) oferece suporte a determinados comandos show, o que permite exibir uma análise da saída do comando show.

- **show interfaces bri number-** Especificar somente o número exibe o canal D para essa interface BRI.

Como nenhum encapsulamento foi definido na configuração, por padrão é HDLC. Isso pode ser verificado com o comando **show interface** como mostrado aqui:

```

goya#show interfaces bri 0
BRI0 is up, line protocol is up (spoofing)
Hardware is BRI
Description: This ISDN number is 8129
Internet address is 172.16.1.5/30
MTU 1500 bytes, BW 64 Kbit, DLY 20000 usec, rely 255/255, load 1/255
Encapsulation HDLC, loopback not set
!--- HDLC is configured automatically Last input 00:00:00, output 00:00:00, output hang never
Last clearing of "show interface" counters never Input queue: 0/75/0 (size/max/drops); Total
output drops: 0 Queueing strategy: weighted fair Output queue: 0/1000/64/0 (size/max
total/threshold/drops) Conversations 0/1/256 (active/max active/max total) Reserved
Conversations 0/0 (allocated/max allocated) 5 minute input rate 0 bits/sec, 0 packets/sec 5

```

```
minute output rate 0 bits/sec, 0 packets/sec 3933 packets input, 20462 bytes, 0 no buffer
Received 15 broadcasts, 0 runts, 0 giants, 0 throttles 0 input errors, 0 CRC, 0 frame, 0
overrun, 0 ignored, 0 abort 3926 packets output, 26100 bytes, 0 underruns 0 output errors, 0
collisions, 10 interface resets 0 output buffer failures, 0 output buffers swapped out 7 carrier
transitions
```

## Troubleshoot

Esta seção fornece informações que podem ser usadas para o troubleshooting da sua configuração.

### Comandos para Troubleshooting

**Observação:** antes de inserir o comando **debug**, consulte [Informações importantes sobre os comandos debug](#).

- **debug dialer**
- **debug ip packet detail 105** — Usado para depurar pacotes IP que são somente ICMP (consulte a lista de acesso 105 na configuração).
- **debug isdn q931** — Usado para ver o evento e pacotes ISDN Q.931.
- **debug serial interface** — Usado para debugar o HDLC.

Exemplos de debugação de ambos os roteadores são mostrados aqui:

A saída de goya:

```
goya#debug dialer
Dial on demand events debugging is on
goya#debug ip packet detail 105
IP packet debugging is on (detailed) for access list 105
goya#debug isdn q931
ISDN Q931 packets debugging is on
---- Verify that the map is correctly configured. goya#show dialer map
