Introduction

Este documento descreve como configurar uma rede VPN multiponto dinâmica (DMVPN) com autenticação de certificado quando o hub DMVPN está configurado como Autoridade de certificação (CA).

Prerequisites

Requirements

A Cisco recomenda que você tenha conhecimento destes tópicos:

- Public Key Infrastructure (PKI)
- DMVPN com o uso de chaves pré-compartilhadas
- Network Time Protocol (NTP)

Componentes Utilizados

Este documento não se restringe a versões de software e hardware específicas.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Informações de Apoio

Uma prática bastante comum e a maneira recomendada de implantar uma rede DMVPN baseada em PKI é configurar o DMVPN com certificados e um servidor CA explícito. Este documento descreve como configurar uma infraestrutura de PKI com um servidor Cisco IOS[®] CA:

[Guia de configuração da infraestrutura de chave pública](#)

Conclua estes passos para portar esta infraestrutura para uma implantação DMVPN:

1. Faça com que o(s) hub(s) e o(s) spoke(s) se registrem e autenticuem-se com o servidor CA como qualquer outro roteador, como mostrado neste exemplo.

```
crypto pki trustpoint dmvpn
enrollment url http://192.168.1.1:80
revocation-check none
rsa-keypair dmvpn
```

2. Adicione esse comando para alterar a política de autenticação do método de autenticação para usar PKI em vez de uma chave pré-compartilhada.

```
crypto isakmp policy <number>
authentication rsa-sig
```

Note: O método de autenticação não é exibido aqui, pois PKI é a configuração padrão. Insira o comando **show run all** no roteador para ver a configuração.

```
crypto isakmp policy 2
encr aes 192
group 2
```

No entanto, o que acontece quando o hub DMVPN (ou qualquer outro roteador que faça parte da infraestrutura DMVPN) também é necessário para atuar como CA? Para que o PKI funcione com êxito, ambas as extremidades do túnel precisam ter um certificado assinado pela mesma CA. No entanto, se um dos roteadores DMVPN é o próprio CA, como fazer com que esse roteador específico seja um membro ativo da infraestrutura PKI?

Conclua estes passos para registrar o roteador para si mesmo:

1. Configure o roteador como uma CA.

```
crypto pki server dmvpn-ca
issuer-name CN=rtpvpnoutbound7.cisco.com
grant auto
lifetime certificate 25
lifetime ca-certificate 30
auto-rollover
database url nvram
```

2. Configure um ponto confiável na CA com uma URL de inscrição que aponte para a própria CA.

```
crypto pki trustpoint dmvpn
enrollment url http://192.168.1.1:80
revocation-check none
rsa-keypair dmvpn
!
```

```
interface GigabitEthernet0/1 // <-- interface on the same router.
description utfwb0rder01
ip address 192.168.1.1 255.255.255.252
duplex full
speed 1000
!
```

Inscreva-se e autentique a AC para si própria com os procedimentos padrão.

```
crypto pki authenticate <trustpoint>
crypto pki enroll <trustpoint>
```

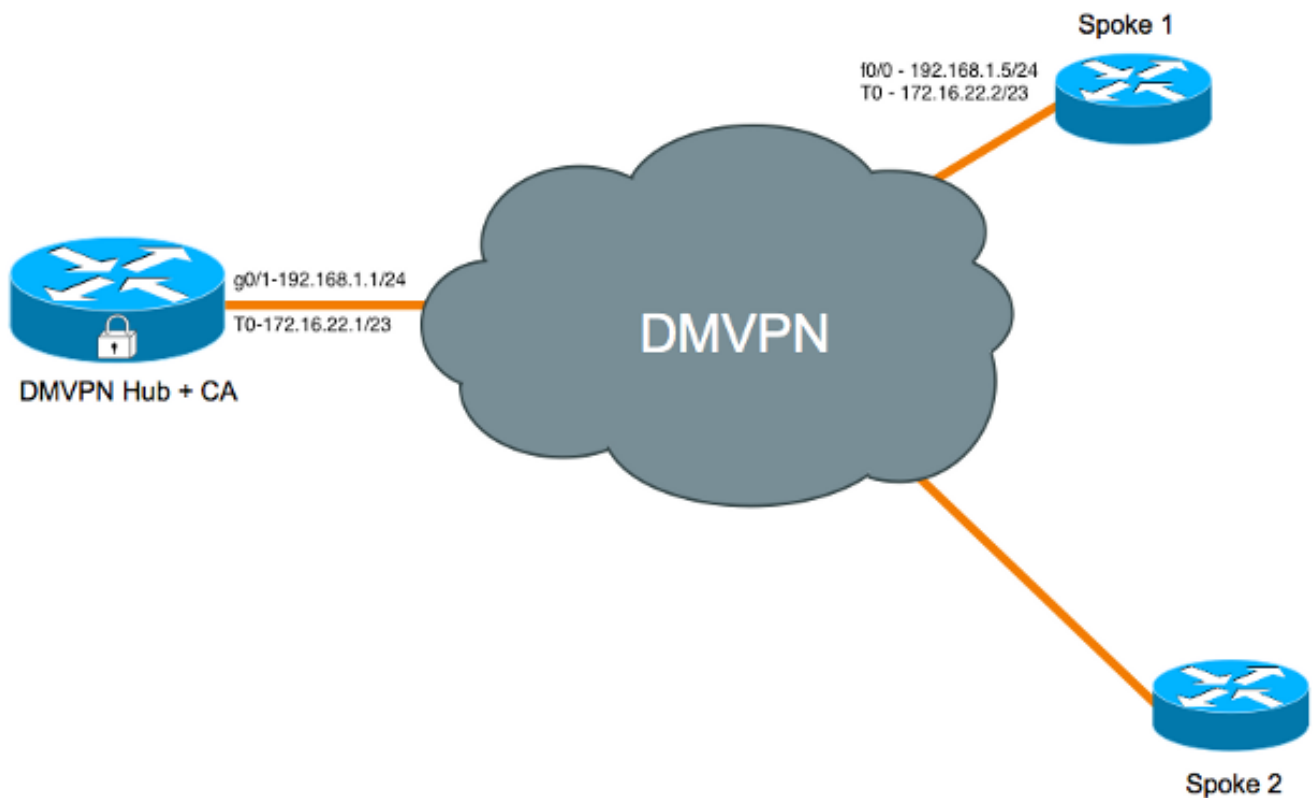

3. Configure os outros roteadores que fazem parte da infraestrutura DMVPN para se inscrever e autenticar na CA.
4. Configure a política ISAKMP (Internet Security Association and Key Management Protocol) para usar PKI para autenticação conforme descrito anteriormente.

Dica: a Cisco recomenda o uso do NTP para manter sincronizados os relógios nos roteadores DMVPN. Para obter informações sobre como configurar o NTP, consulte [Configurando o NTP](#).

Configurar

Note: Use a [Command Lookup Tool \(somente clientes registrados\) para obter mais informações sobre os comandos usados nesta seção.](#)

Troubleshoot

Esta seção disponibiliza informações para a solução de problemas de configuração.

O Cisco CLI Analyzer (somente clientes registrados) aceita alguns comandos show. Use o Cisco CLI Analyzer para visualizar uma análise da saída do comando show.

Note: Consulte [Informações Importantes sobre Comandos de Depuração antes de usar comandos debug](#).

Problemas relacionados ao IPSec

Essas depurações devem ser ativadas em ambos os endpoints afetados do túnel.

debug dmvpn all - Este comando específico ativa este conjunto de depurações:

```
Spoke1#debug dmvpn all all
DMVPN all level debugging is on
Spoke1#show debug
```

```
NHRP:
NHRP protocol debugging is on
NHRP activity debugging is on
NHRP extension processing debugging is on
NHRP cache operations debugging is on
NHRP routing debugging is on
NHRP rate limiting debugging is on
NHRP errors debugging is on
IKEV2:
IKEV2 error debugging is on
```

```
IKEV2 terse debugging is on
IKEV2 event debugging is on
IKEV2 packet debugging is on
IKEV2 detail debugging is on
```

Cryptographic Subsystem:

```
Crypto ISAKMP debugging is on
Crypto ISAKMP Error debugging is on
Crypto IPSEC debugging is on
Crypto IPSEC Error debugging is on
Crypto secure socket events debugging is on
```

Tunnel Protection Debugs:

```
Generic Tunnel Protection debugging is on
```

DMVPN:

```
DMVPN error debugging is on
DMVPN UP/DOWN event debugging is on
DMVPN detail debugging is on
DMVPN packet debugging is on
DMVPN all level debugging is on
```

Essas depurações detalhadas nem sempre são necessárias e não devem ser ativadas arbitrariamente, pois podem sobrecarregar o dispositivo. Geralmente, é melhor criar um subconjunto de depurações mais relevantes a partir desse superconjunto e ativá-las.

Problemas relacionados ao PKI

Servidor CA

Esses comandos são relacionados ao servidor PKI. Você precisa inserir um comando terminal monitor se conectar com Telnet ou Secure Shell (SSH).

Comando

Descrição

debug crypto pki messages	Exibe os detalhes da interação (dump de mensagem) entre a CA e o roteador
debug crypto pki server	Exibe a depuração de um servidor de certificado PKI criptografado
debug crypto pki transactions	Exibe a interação (tipo de mensagem) entre a CA e o roteador

Spokes DMVPN

Esses comandos são para headend ou filial. Para ver a saída de depuração, insira um comando terminal monitor se Telnet/SSH foi usado para se conectar ao roteador.

Comando

Descrição

debug crypto pki messages	Exibe os detalhes da interação (dump de mensagem) entre a CA e o roteador
debug crypto pki server	Exibir depuração para um servidor de certificado PKI criptografado
debug crypto pki transactions	Exibe a interação (tipo de mensagem) entre a CA e o roteador
debug crypto isakmp	Exibe mensagens sobre eventos ISAKMP e IKE
debug crypto ipsec	Exibe eventos de IPSec
debug crypto engine	Exibe mensagens de depuração sobre mecanismos de criptografia, que executam criptografia e descryptografia
