## Introduction

Este documento fornece uma configuração de exemplo para o Comutador de Diretor Multicamada (MDS - Multilayer Diretor Switch) Fibre Channel Over TCP/IP (FCIP) para MDS.

O FCIP descreve os mecanismos que permitem a interconexão de ilhas de SANs (Storage Area Networks, redes de armazenamento) Fibre Channel (FC) em redes baseadas em IP para formar uma SAN unificada em uma única malha FC. O FCIP depende de serviços de rede baseados em IP para fornecer a conectividade entre as ilhas de SAN através de redes locais, redes de área metropolitana ou redes de longa distância.

Figura 1: SANs Fibre Channel conectadas pelo FCIP

O FCIP usa o Transmission Control Protocol (TCP) na porta 3225 como um transporte da camada de rede.

## Prerequisites

## Requirements

Certifique-se de atender a estes requisitos antes de tentar esta configuração:

- O backbone IP deve estar operacional e fornecer a largura de banda necessária para suportar os aplicativos que são executados nos links FCIP—pode ser uma topologia de Camada 2 (L2) ou Camada 3 (L3).
- Se for uma topologia L3, os roteadores intermediários ou switches multicamada devem ser configurados e configurados para encaminhar adequadamente o tráfego IP entre os endereços IP origem e destino dos túneis FCIP. Se a Qualidade de Serviço (QoS - Quality of Service) ou a modelagem de tráfego for aplicada em qualquer dispositivo de rede no caminho entre os peers FCIP, o gerente de rede que administra a infraestrutura IP deve ser consultado para obter os detalhes necessários antes de configurar quaisquer parâmetros e recursos relacionados ao TCP no(s) perfil(s) FCIP do Switch Diretor Multicamada (MDS - Multilayer Director Switch).
- Os Switches Ethernet adjacentes aos MDSs devem suportar e ser configurados para entroncamento 802.1Q, se subinterfaces estiverem configuradas no módulo de serviços de armazenamento IP (IPS) MDS.

## Componentes Utilizados

As informações neste documento são baseadas nestas versões de software e hardware:

- MDS 9509 com módulo de serviço IPS (DS-X9308-SMIP) que executa a versão 1.2.(2a)
- MDS 9216 com módulo de serviço IPS (DS-X9308-SMIP) que executa a versão 1.2.(2a)
- Catalyst 6509 que executa o Catalyst OS (CatOS) 7.4(3)
- Win2003 Server (HPQ Pro-Liant-P4) com Emulex LP9K HBA
- IBM Storage Array (ESS-2105-F20)

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

## Conventions

Consulte as [Convenções de Dicas Técnicas da Cisco para obter mais informações sobre convenções de documentos.](#)

## Informações de Apoio

O FCIP consiste nas seguintes especificações:

### ANSI T11

1. FC-SW-2 descreve a operação e a interação de switches FC, incluindo E\_Port e operação de estrutura.
2. FC-BB-2 é um mapeamento que diz respeito à extensão de redes comutadas FC através de um backbone de rede TCP e define modelos de referência que suportam E\_Port e B\_Port.

### Grupo de Trabalho IPS IETF

1. FC sobre TCP cobre os requisitos de TCP/IP para transportar quadros FC através de uma rede IP.
2. O encapsulamento de quadro FC define o formato comum de encapsulamento de fibra.

Uma interconexão entre dois switches SAN ou malhas em FCIP é chamada de link FCIP e pode conter uma ou mais conexões TCP. Cada extremidade de um link FCIP é associada a uma porta E virtual (VE\_port) ou a uma porta B\_port, dependendo da implementação. FC-BB e FC-BB-2 estão descrevendo as diferenças entre as duas abordagens. O módulo de serviços IPS (DS-X9308-SMIP) suporta ambos os modos, mas assume como padrão VE\_Port, que também é o modo recomendado para ser executado se todos os correspondentes relevantes forem módulos DS-X9308-SMIP. Neste exemplo de topologia, são discutidos parâmetros de configuração FCIP sobre PortChannels, TCP para configurar e FSF (quadro especial).

## Configurar

Nesta seção, você encontrará informações para configurar os recursos descritos neste documento.

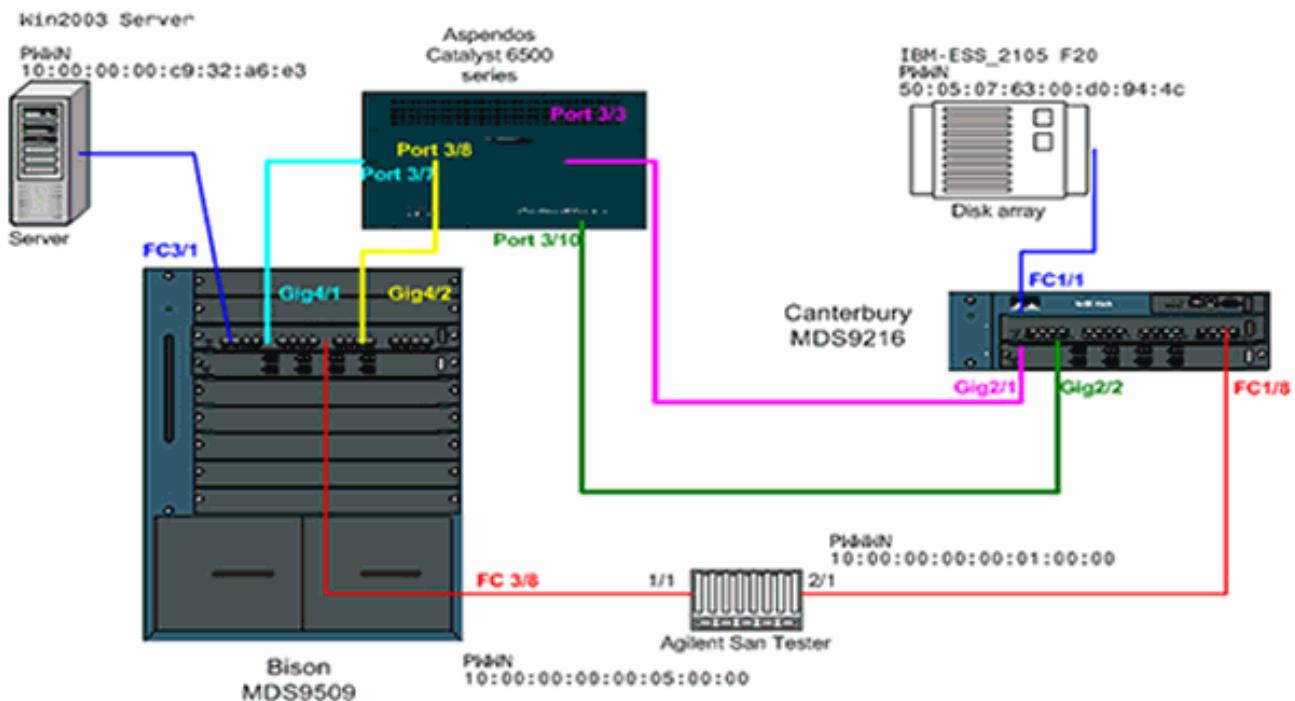

Nos MDSes, você precisa familiarizar-se com os guias de configuração do IP para as duas plataformas. Você pode encontrar a versão mais recente dos manuais em [Configuring IP Storage](#) em Cisco.com.

Nota: Use a Command Lookup Tool (somente clientes registrados) para obter mais informações sobre os comandos usados neste documento.

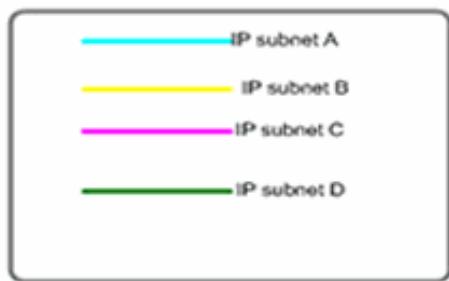

## Diagrama de Rede

Este documento utiliza a seguinte configuração de rede:

### **Figura 2 - Topologia 3**

**Topology 3 - PortChannel of two FCIP interfaces**

A topologia 3 descreve um canal de porta FCIP formado por dois túneis FCIP individuais; as interfaces de peer estão em uma nuvem IP. A nuvem IP é recolhida em um switch multcamada (Catalyst 6500) que roteia o tráfego da sub-rede A para a sub-rede C e da sub-rede C para a sub-rede A (e da sub-rede B para a sub-rede D e da sub-rede D para a sub-rede A). As sub-redes são definidas da seguinte forma:

- Sub-rede A: 100.100.100.0/30 - Bison int Gig4/1
- Sub-rede B: 100.100.100.4/30 - Bison int Gig4/2
- Sub-rede C: 200.200.200.0/30 - Canterbury Gig2/1
- Sub-rede D: 200.200.200.4/30 - Canterbury Gig2/2

A topologia fornece uma **largura de banda máxima conhecida de 100 Mbps** e uma **largura de banda mínima de 100 Mbps**, que é o perfil sendo executado para nosso tráfego IP relevante por meio dessa nuvem IP . A configuração inicial mostra os aspectos do Port Channeling baseado em FCIP e do condicionamento de tráfego TCP. Nas seções seguintes FSF, as interfaces Passivas TCP e o Timestamp FCIP serão explicados mais adiante.

## Configurações

Este documento utiliza as seguintes configurações:

- [MDS 9509 \(Bison\) com módulo IPS-8](#)
- [MDS 9612 \(Canterbury\) com módulo IPS-8](#)

bootflash:/s122a sup-2 boot kickstart bootflash:/k122a
sup-2 ip domain-name cisco.com ip name-server
144.254.10.123 ip route 200.200.200.0 255.255.255.252
100.100.100.2 distance 2 ip route 200.200.200.4
255.255.255.252 100.100.100.6 distance 2 !--- FCIP
interfaces are on separate IP subnets, so in order to
reach the FCIP !--- peer IP address, you need adequate
static routes to an L3 device that !--- knows how to
forward the packets to the final destination. Multiple
routes !--- to the same destination IP subnet are
allowed, and the distance parameter !--- can be used to
specify a preferred next hop. Multiple next hops would
!--- require a subnet mask providing for a larger number
of host; for example, !--- a 28-bit subnet mask. ssh key
dsa 768 force ssh server enable switchname bison zone
default-zone permit vsan 600-601 interface
GigabitEthernet4/1 ip address 100.100.100.1
255.255.255.252 switchport mtu 3000 no shutdown !--- MTU
size is defined as 3000 bytes. Make sure that all
intermediate network !--- devices between this interface
and the peer IP address are capable of !--- switching
and routing Jumbo frames. In order to avoid FC Frame
split, !--- an MTU value of 2300 is required; 3000 is
used in the configuration example !--- for simplicity.
FCIP TCP segments will normally never exceed 2264 bytes
for !--- TE ports or 2256 bytes for E ports, regardless
of the configured MTU size. interface GigabitEthernet4/2
ip address 100.100.100.5 255.255.255.252 switchport mtu
3000 no shutdown interface fc3/1 interface fc3/2
interface fc3/3 interface fc3/4 interface fc3/5

interface fc3/12 interface fc3/13 interface fc3/14
interface fc3/15 interface fc3/16 interface mgmt0 ip
address 10.48.69.151 255.255.255.128 !--- Note on TCP
Parameters !--- The following TCP parameters can be
individually configured per FCIP profile:
```

```

bison(config-profile)# tcp ?

cwm Enable congestion window monitoring
keepalive-timeout Set keep alive timeout in sec
max-bandwidth-kbps Configure maximum available path
bandwidth in Kbps
max-bandwidth-mbps Configure maximum available path
bandwidth in Mbps
max-retransmissions Maximum number of retransmissions
min-retransmit-time Set minimum retransmit time in
millisecond
pmtu-enable Enable PMTU Discovery
sack-enable Enable SACK option for TCP
send-buffer-size Send buffer size in KBytes
!--- The CWM parameter default value is 10K and should
be left untouched under !--- normal conditions.
Congestion window monitoring (CWM) is a way of !---
controlling burstiness after long idle times or loss of
Acks.
```

!--- **The keepalive-timeout** is the TCP keepalive timeout value and is !--- set to 60 seconds by default, though it can range between 1 and 7200 seconds.

!--- **The max-** and **min-bandwidth** parameters program the TCP Maximum Window Size !--- (scaling factor) and engages an internal "shaper" functionality. !--- These values should be carefully chosen and requires understanding of the !--- intermediate network's end-to-end topology. The default values are to be !--- changed according to the aforementioned requirements. !--- The Round-trip-time can be derived once you have your FCIP tunnel up and !--- running by issuing the following command:

```
bison# ips measure 200.200.200.1 interface  
gigabitetherernet 4/1
```

Round trip time is 53 micro seconds (0.05 milliseconds )  
!--- Always add an additional margin of at least a few microseconds to this value. !--- **The max-retransmissions counter** is set to 4 by default. In a healthy network !-- environment, this value should be left unchanged.

!--- **The max-retransmission timer** is set to 200 milliseconds. If you experience !--- extremely high retransmission counters, this value can be increased; but, !--- in general, changing this parameter is not required unless the RTT is !--- above 200 milliseconds.

!--- **The PMTU** (Path MTU discovery) is enabled by default. Best practice is to know !--- what is the maximum MTU size supported by all interfaces along the logical !--- path between both peers.

!--- **The SACK** feature (Selective Acknowledgment) is not enabled by default. !--- Consider enabling it when you have a lot of retransmissions occurring between !--- the two peers. SACK allows selective retransmissions of your window, which is !--- beneficial if larger maximum window sizes are configured and retransmissions !--- occur frequently. It is enabled in this sample configuration; when you do so, !--- make sure that it is enabled at both sides of the link.

!--- **The send-buffer-size** is the amount of buffers in addition to the TCP window !--- that are allowed to be transmitted out before starting to flow control the FC !--- sources. The default value is set to 0.

- Para obter mais detalhes sobre PMTU, consulte [RFC 1191 - Path MTU discovery](#) .
- Para obter mais detalhes sobre SACK, consulte [RFC 2018 - Opções de confirmação seletiva do TCP](#) e [RFC 2883 - Uma extensão para a opção de confirmação seletiva \(SACK\) do TCP](#)

## MDS 9216 (Canterbury) com módulo IPS-8

```
canterbury# sh run

## Verificar

Use esta seção para confirmar se a sua configuração funciona corretamente.

A [Output Interpreter Tool \(somente clientes registrados\) \(OIT\)](#) oferece suporte a determinados comandos show. Use a OIT para exibir uma análise da saída do comando show.

- **show interface gig x/y**—Exibe o status da interface Gigabit relevante vinculada ao perfil FCIP.
- **show ips stats tcp int gig x/y**—Exibe as estatísticas do TCP e as conexões ativas para a interface Gigabit relevante.
- **show ips arp int gig x/y**—Exibe todas as entradas do Address Resolution Protocol (ARP) para a interface Gigabit relevante; o próximo salto ou peer deve estar presente nesta lista.
- **show ips ip route int gig x/y**—Exibe as rotas específicas que passam pela interface Gigabit relevante.
- **show interface fcip x**— Exibe o status da interface FCIP e todos os detalhes relacionados a este túnel FCIP.
- **show profile fcip x**— Exibe o endereço IP ao qual o perfil está vinculado e todos os parâmetros TCP configurados.
- **show int fcip x counters**—Usado para verificar se há algum quadro passando pelo túnel FCIP.
- **show fcdomain vsan x**— Lista todos os detalhes relacionados ao domínio; usado para verificar se a estrutura é formada através dos túneis FCIP.
- **show fcns da vsan x**— Exibe todos os tipos de pwnn, FC4 e FCIDs da VSAN relevante; usado para verificar se todas as entradas esperadas são distribuídas pelo(s) túnel(s) FCIP.

## Troubleshoot

Use esta seção para resolver problemas de configuração.

Emita os comandos **show** várias vezes para criar um histórico de contadores. Os contadores que não estão relacionados a um ponto no tempo e são coletados apenas uma vez são, em sua maioria, inúteis.

Use as configurações mostradas abaixo para Troubleshooting adicional.
